Chapter XI, the last, and nearly the longest, is wholly given up to descriptions of six American railways, commencing with the New York, New Haven & Hartford. This American work has been very fully discussed and described in the technical Press of both hemispheres. The problems offered by the New York, New Haven & Hartford line were particularly difficult at the time, including the requirement of running through from New York on 12 miles of direct-current track. The magnitude of the work done, between 500 and 600 miles of track, at an expense of £3,000,000, and the claims for lower capital expenditure and higher all-day efficiency put forward by the engineers, together with a large amount of experimental work of which many results have been freely published, tend to make this the typical single-phase main line, and the centre of controversy. It is, therefore, well that Mr. Austin has made his description full, and has been able to illustrate it lavishly. It is at least possible that this particular line will considerably modify the present system of operation before long, so that the record noticed may have historical value as showing a step in evolution towards settled practice.

The electrification of the Hoosac Tunnel, nearly five miles long, presented the difficulties usually found in adapting overhead work to a tunnel originally built for steam traction. How these were overcome is shown in detail, and as the working pressure is 11,000 volts the precedent is valuable. The insulators in use in the tunnel are two in series, each nominally capable of carrying 150,000 volts, so the factor of safety is large. It is noted that travelling in the tunnel is now quite a pleasure in hot weather, and that the tunnel is divided into three block sections with automatic signalling, so that its traffic capacity is trebled. The trains, with their steam locomotives complete, are hauled through the tunnel by the electric locomotives. This particular case is, therefore, an example of electrifying a tunnel section on which steam working is specially handicapped. The construction work was by no means easy. During steam working it was found that men could only work two hours per day in the tunnel, and were often rendered unconscious by the engine fumes. To assist matters during the electrification, traffic was carried on by oil-burning locomotives, which were also used on the two construction trains, each of which included a dining car! and compartments for the men to retreat to during the passage of steam trains, furnished with compressed air stores to keep out the smoke.

The St. Clair Tunnel, on the Grand Trunk, between Michigan and Ontario, is another example of a difficult tunnel electrified to increase its traffic capacity. The approach gradients of 1 in 50 added to the difficulties of steam working. This particular tunnel is a "tube" of cast-iron segments 20 ft. in diameter. The pressure used is 3,300 volts. Although the tunnel is damp, no insulation troubles have been met with.

In concluding this notice, special praise must be given to the illustrations, especially the numerous diagrams of connections and line drawings of details, which are generally clear and satisfactory. If some of the connection diagrams require

some puzzling out, that is due to the intricacies of the subject, and is in most cases eased by the textual descriptions. The lettering and figuring of these diagrams is clear, though sometimes minute enough to require a lens for easy reading. There is, of course, a large number of process block illustrations, but whilst these are not of so much technical value as the line drawings, they are of more illustrative value than is sometimes the case, and they add to the appearance, being generally excellently reproduced.—H. M. S.

Principles of Direct-Current Machines. By A. S. LANGSDORF. London: Hill Publishing Co. Price 12s. 6d. net.

The author's preface states that "this book has been prepared with the object of placing before junior and senior students of electrical engineering a reasonably complete treatment of the fundamental principles that underlie the design and operation of all types of direct-current machinery."

The first chapter consists of 42 pages on general laws and definitions. The matter is well chosen and presented in an exceptionally clear manner. The methods of the calculus are freely used here, and, in fact, throughout the book, but a decided effort has been made to give prominence to the physical concepts of the various equations. Chapter II discusses the dynamo, the treatment being on orthodox lines and quite praiseworthy.

Armature windings are next dealt with. A full derivation of the rules covering armature windings (following Arnold) is included in addition to the usual description of typical windings. Chapter IV is devoted to the magnetisation curve and to magnetic leakage. The treatment of the saturation curve of machines is modern, the correction for the pole arc and slots due to Carter being given.

The complex subject of armature reaction next receives attention. The effect of fractional pitch armature windings and other refinements are much more thoroughly treated than usual.

Chapters VI and VII are occupied with the discussion of the characteristics of generators and motors. They include a considerable amount of new material, the treatment being largely graphical. The three-dimensional diagram is used for depicting the mutual relationships among the several variables. Several of the constructions are the same as are given in Arnold's "Die Gleichstrommaschine."

In Chapter VIII is developed a much more extensive treatment of the subject of commutation than has been heretofore easily accessible to students of the type for whom the book is intended. The treatment appears to be based very largely on Arnold's work, and on articles in the *New York Electrical World*. A good deal of advanced mathematical analysis is necessary before a student can read this chapter with advantage; in fact, this chapter is above the heads of the vast majority of ordinary students in technical colleges.

Efficiency, rating, and heating of direct-current machinery are next discussed on standard lines. The usual empirical curves for iron losses, &c., are included. The book concludes with a lengthy chapter on boosters, balancers, and train-lighting systems.

There can be little doubt that the author has succeeded in his purpose as set out in the extract from his preface above. The ground covered is comprehensive and the treatment thorough and rigorous. It should be distinctly understood that a competent knowledge of mathematics is necessary for the successful use of the book. The volume is well bound, the type very clear, and, as things are nowadays, it is worth its price.—H. G. S.

IMPORT TRADE OF CHINA.

THE Chinese Imperial Maritime Customs have just issued an additional volume giving the countries of origin of the principal imports into China during 1912-14. The following figures, showing the value of imports in 1913 and 1914 of goods of interest to the electrical engineering industry, have been extracted from this new volume, and the increases and decreases shown. It is to be noted that the average value of the Haikwan Tael in 1913 was 3s. 0½d., and in 1914 2s. 8½d.

1916 EDITION

READY.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

THIS subject formed the text of an interesting discussion which took place at the Institution of Electrical Engineers last week, and is reported elsewhere in this issue. The theme is by no means a new one in electrical circles, but Mr. E. T. Williams, who was responsible for bringing the matter forward, has undoubtedly helped to focus our attention on a problem, the importance of which the events of the last twenty months have amply demonstrated.

The proposals put forward by Mr. Williams represent in the main the logical sequel to the insistent demands for conservation of our national fuel resources, and the no less pressing necessity of improving our industrial equipment with a view to securing the maximum of efficiency in industry after the war. The suggestion, for the purpose of discussion, is, briefly, that the control of the electricity supply of Great Britain should be vested in an Electricity Board, having the weight of Government authority, and that the area in question should be divided into sections, each with an engineer manager responsible for its electrical well-being, who would occupy a seat on the Board, together with legal, accounting, financial, and Parliamentary members—one of each. The other essentials of the scheme are the provision of a bulk supply network to connect the existing generating stations and new ones which may be added by the Board. It is important to note that interference with existing stations and the capital invested in them is not contemplated, and it is anticipated that the benefits to be derived from the mutual interchange of load via the proposed bulk supply network will eventually lead to the smaller and less favourably situated generating plants disappearing.

Stress is laid on the possibility of equipping on a large scale at once, and fully loading within a brief period, any new stations feeding into the proposed network, with resulting all-round efficiency; Mr. Williams might have gone further and emphasised the important fact that only by means of such a scheme can our generating engineers make up the enormous leeway which exists between present British practice, as regards the size of unit employed, and the largest and most efficient units which are commercially obtainable. We must, as Mr. Williams hints, be prepared to depart from "cut-and-dried" methods, and such a scheme would enable us to fit the load to the most efficient station in the neighbourhood—to rule out the present disturbing and efficiency-destroying factor of load variation in the most modern plants, and so to obtain the maximum efficiency from them at least.

Judging by the experience gained from the inter-linking of the London power stations, and the progress made in that direction, it is more than probable that provincial areas will follow suit, thus forestalling in part the larger scheme.

It seems very doubtful, however, whether such partial methods of mutual assistance, especially if dependent on local initiative, can take the place of a co-ordinated general scheme, although this was suggested by Mr. Merz. The tendency would be to super-develop certain supply areas which are already being developed, but the small towns, the villages, and the farms would be no better off than they are at present.

We regard it as essential that electricity supply shall be brought within reach of the agricultural

industry at the earliest possible moment; in farming, as in other directions, the methods of the past will not serve, and there is every reason to believe that those of the future will be largely electrical, if we choose to make them so. Possibly the Board of Agriculture might be disposed to lend its aid to such a scheme, in view of the serious position which has arisen in connection with that industry, and to which Lord Selborne drew attention in the House of Lords last week. It seems likely that difficulty would arise in connection with the financing of a scheme of this nature unless its national character led to some form of Government guarantee being given; but our ideas on most things are undergoing revision, and it would seem scarcely consistent, after spending five millions a day for many months on war, to quibble about the expenditure of a few millions a year for two or three years on an epoch-making industrial development, as some people are disposed to do, because an immediate return on the money might not be visible.

If it is conceded that a supply of cheap electricity is likely to be a factor—and we believe it to be an essential factor—in our future commercial prosperity as a nation, then we must fearlessly accept the condition, put forward by Mr. Chattock, that no direct financial return should be expected for some years, but that the country should shoulder the loss in the meantime—if, indeed, that can be called loss which confers so many indirect benefits on a nation, and which holds the certainty of ample returns in years to come.

The electrical manufacturing industry in this country has been held back for years by our unenterprising and inelastic methods of electricity supply; but were it assured of the enormous home demand which would result from the supply of electricity on a wholesale scale in this country, its operations abroad could also be conducted with the same facility and success as those of its great rivals, in so far as these are due to their manufacturing resources.

Clearly the matter is one deserving of the closest consideration at the present time; so many interests are involved, however, and many of them of a non-electrical character, that it will be necessary to enter on a campaign of general enlightenment in order to obtain the needful support—we must, in fact, talk hard and keep on talking, if we are to attract public attention and arouse enthusiasm. In this connection Mr. Roles's suggestion as to enlisting the support of the chief engineers of existing undertakings, by giving suitable guarantees that they shall not be displaced, is worth consideration; we believe that engineers and managers would be in increased demand rather than otherwise under such a scheme, and that public servants have, as a rule, little to complain of in the matter of compensation, &c., when they relinquish a post to please the public, but it appears to be an easy way of securing five or six hundred missionaries, who would necessarily bring influence to bear on the various public bodies, and thus possibly enlist the services of some of the most prolific talkers in the kingdom in aid of the scheme.

Copper.

RECENT vague indications of a falling off in the general demand for copper, possibly under the influence of the more hopeful views that were entertained as to the duration of the war, have proved rather deceptive. The abstention of buying, indeed, has been only temporary, as it was to some extent due to the opinion expressed by certain American critics that prices had been forced up to a point as high as could be reasonably expected even under the more stringent conditions. There was certainly a little more inclination on the part of a few smaller American producers to consider lower offers for forward shipment, but this change of sentiment has not exerted the least influence on the arbitrary attitude of the

big American producing interests, who latterly have been more sparing in their offers for forward deliveries owing to another extension of buying, first by our Continental Allies, and subsequently on the part of American consumers, whose takings within the last few months have grown at a stupendous rate. Prices for distant shipment have certainly stiffened to a notable extent. The serious scarcity encountered in covering needs over the Spring now looks like spreading over the whole of the summer months, for which period extensive orders have apparently already been placed, which leaves the copper magnates in absolute command of the situation for an indefinite period, or so long as the chronic scarcity of spot metal continues. European stocks are virtually exhausted, as shown by the statistics, and there is no prospect of a replenishment for some time at any rate. Fairly liberal shipments are, it is true, pretty regularly made to this side from American Atlantic ports, but the whole of this copper is already sold, and the great bulk thereof goes straight into the hands of munition manufacturers, whose operations are in full swing at this critical stage of the great struggle. Never before in the history of the copper market has the demand for the metal been so extensive and so urgent. There has been for some time past a phenomenal wave of industrial activity across the Atlantic, in addition to which munition work on a considerable scale is apparently now being carried on in the United States as a precautionary measure. The world's production of copper has now by far eclipsed all previous records, but the extension of requirements has been no less marked, and this must be expected to continue for months to come, so that anything like a retrograde movement in prices is rather unlikely, unless unexpected developments arise in the war situation, calculated to hasten a conclusion of hostilities. The fact is worth noting that in spite of an absence of speculation in warrant copper under the Government prohibition, prices have steadily broken into new high records, owing to the famine conditions. The price has in the past week risen to about £126, and offers are as scarce as ever.

Water for Condensing Purposes.

THE question whether a manufacturer can lawfully take water from a river for the purpose of condensing steam is one which is of increasing importance, having regard to the rising price of coal. There are few cases on the subject; and such cases as there are do not cover many of the important points. For instance, suppose a riparian owner has a mill which is worked by water power derived from the stream. He will naturally want all the water he can get to flow into his mill dam. Then suppose that another owner, a little higher up, takes water from the stream, uses it for condensing, and returns it, undiminished in quantity, below the dam. Has the mill owner any right of action? The authorities clearly establish certain propositions. In the first place, a riparian owner may take water from a stream for all ordinary purposes, e.g., domestic purposes, supplying cattle, watering his garden, and even for irrigation. He cannot, however, draw off water and sell it to a water company for supplying a town. In the second place, every riparian owner may divert the water of a stream for purposes in connection with his land or for other purposes; but he is bound to return the water which he has diverted into the stream again before it leaves his land, substantially undiminished in volume and unaltered in character; for a lower riparian owner, subject to the rights of an upper owner, is entitled to have the water flowing in the natural bed of the stream come to him unaltered in quality and quantity, and to come to his land in its ordinary and accustomed channel. There is no case which holds that a man may abstract water for con-

densing purposes and return it undiminished in quantity or quality lower down. Indeed, such a decision would appear to be contrary to the principle above enunciated. Where, however, he takes water for condensing, and returns it to the stream substantially at the same point on his own land, it has been held that he does not infringe the rights of the lower riparian owners (see *Kensit v. Great Eastern Railway*, 27 Ch. D. 122). All persons taking water for condensing purposes would therefore do wisely to see that it is returned to the river on their own land.

The Wire-Drawing Industries.

THE increasing difficulties experienced by wire manufacturers in obtaining supplies of copper for rolling and drawing down, and the holding back of trade inquiries, in consequence of the abnormally high price ruling in the metal market, have resulted, during the past few weeks, in a decline in the output of many of the leading firms in this country. This, in some measure, is to be regretted, as, with fewer restrictions in obtaining shipment of goods, more attention could be devoted to the important question of the development of the overseas trade, a section which in the near future should prove to possess many attractive and promising features for enterprising firms.

In the home trade section, however, there is probably much yet to be done in the direction of preventing a repetition after the war of the German wire manufacturers' acquisition of trade in these markets with the same successful results as hitherto. It cannot be too often repeated that the basis of the German wire manufacturers' success in this country, and in the British markets overseas, has been a thorough and comprehensive system of personal representation. This fact, besides being now more than ever fully appreciated by British firms, has been vouched for in confidence on more than one occasion during the past few years by successful Germans themselves, who have made good in these markets with practically no opposition as regards being first in the field. Moreover, influential buyers in the cable and electrical industries in this country have confessed of late that frequently in the past the attractions and inducements to trade with German firms, in preference to British firms, have been due, not so much as has often been erroneously supposed, to undercutting in price and cheaper production, as to superior all-round attention in the matter of personal representation by qualified men.

Hydro-Electric Power in Tasmania.

OPERATIONS that are in progress in lines are already more or less familiar to our readers, but Mr. C. T. Milne, H.M. Trade Commissioner in Australia, has recently reported on this matter, as mentioned here a few weeks ago, he having been in Tasmania at the end of last year. In order to bring the scheme to the notice of Australian manufacturers and other light and power users, the Government is carrying out a publicity campaign, and has, it is believed, made arrangements for the sale of about 9,000 H.P. Works are being projected, and apparently United Kingdom interests are investigating the possibility of erecting woollen mills. The general manager, in an interview with Mr. Milne, stated that there would be an increased demand in Tasmania for electrical fittings and appliances, and he suggested that the time was ripe for more active steps to be taken by our manufacturers of such goods to bring them to the notice of consumers. Firms in the United Kingdom can secure information regarding reliable firms in Tasmania who would be ready to undertake their representation, from Mr. Ashbolt, the Imperial Trade Correspondent, at 23, Old Wharf, Hobart, Tasmania.

AN 11,000-VOLT SUBMARINE CABLE.

THE city of San Francisco is situated on the southern shore of the Golden Gate, the narrow entrance to the land-locked San Francisco and San Pablo Bays. Until recently, hydro-electric power has been supplied to the city from the Pacific Gas & Electric Co.'s power plants by a roundabout route extending from Cordelia sub-station, round the southern extremity of San Francisco Bay, and along the shore to the Martin station at San Francisco, a distance of 107 miles.

As the hydro-electric plants to the northward increased in number, it was considered desirable to provide a more direct supply route, as the San Francisco steam stations could then more readily serve as relays for the rest of the system. Quite recently a pair of cables were laid across the water from Oakland on the other side of the bay, which somewhat relieved the situation, but still left much to be desired, and in May, last year, it was therefore decided to make use of the 60,000-volt line from Cordelia to San Rafael, by constructing a con-

CONNECTIONS FOR CABLE TESTING.

necting line to Sansalito, where a step-down sub-station has been erected; to connect this by means of a short pole line with the northern shore of the Golden Gate, and to lay two submarine cables across the latter, a distance of 13,000 ft., to the southern shore, and from a cable terminal house on the latter to lay four underground cables, a distance of 6,500 ft. to couple up to sub-station F of the San Francisco system.

The installation was designed to deliver 18,000 H.P. at a pressure of 11,000 volts, which is the H.T. distribution pressure at San Francisco.

The cables were laid across the "forbidden anchorage" area between the two shores, as the best route; consideration had to be given to the 6-knot tide, to the depth of water, which exceeded 200 ft., and to the question of repairs subsequently.

TEMPERATURE CURVES—SOLID FOR SUBMARINE CABLES AND DOTTED FOR SHORE ENDS.

as the strain on the cable itself when lifted from a 200-ft. depth would be excessive.

It was therefore decided to use the messenger cable method of laying, in which a steel rope is laid from shore to shore and securely anchored, and acts as a guide line in laying the power cable. The messenger cable is picked up at the shore end and laid across a barge on which power cable reels are mounted; the former cable passes over sheaves and through a cable gripper in charge of an operator, who controls the movement of the barge while it is being towed across the water by a launch.

The power cable was attached to the messenger before paying out, and after a length of cable was laid, the barge was anchored to the messenger and another length spliced on, the four reels of cable carried representing about 5,000 ft. of cable.

The free end of the cable was then sealed and lowered overboard, the barge towed to shore (under-running the messenger), and reloaded with cable. The messenger was then picked up at the free shore end, laid across the barge, and under-run until the free end of the cable was recovered, when the

splicing and laying were repeated as before. The messenger cable takes the strain, relieving the cable and joints from all tension.

The steel messenger cables are 14 in. in diameter, each composed of 37 strands of galvanised steel wire, woven in one length of 14,000 ft. and having a breaking strength of 90 tons.

Each of the power cables consists of three stranded copper conductors, having an area of 350,000 circ. mil. at the shore ends and 250,000 circ. mil. for the deep-water sections; this represents a finished diameter of 4½ in. and weight of 22 lb. per foot in the former case, and a finished diameter of 4 in. and weight of 19 lb. per foot in the latter.

The conductors are insulated with rubber and varnished cambric, and enclosed in a 5/32 in. lead sheath; over this two layers of jute were applied to form a cushion for steel wire armouring, and the latter was in turn jute covered, and a final coating of sand and asphaltum applied for mechanical protection. Each cable contains a twisted pair of telephone wires, cambric insulated, cotton braided, and laid in the jute filler between the main conductors of the cable. These telephone wires are protected at the shore ends by telephone insulating transformers.

The cable-laying barge was 70 ft. long and 30 ft. wide, and of 125 tons capacity; for laying the messenger cable it was towed across the tide, but for laying the power cable it was towed sideways to minimise interference of the tide, a 50-H.P. launch being usually employed.

On the barge itself the messenger was laid across a 40-in. sheave on either side of the deck, a rigging preventing it from leaving the sheaves no matter what position the barge

Continuous megger tests were carried out during laying from the sub-station on the north shore, and full 22,000-volt tests were made on the splices.

The opportunity was also taken to carry out heating tests on the submarine cables, on which little data has previously been available.

By means of a 650-volt 1,000-kw. direct-current generator and by connecting the cables, as shown, diagrammatically, it was possible to circulate current through the conductors of the submarine cable.

The telephone wires in the cable and on the San Francisco shore were used as pressure cables, and it was possible to determine the voltage drop for any given load. From observations the temperature curves shown on page 443 were plotted, the water temperature being 12 deg. C. Laboratory tests under similar conditions were arranged to determine the temperature rise in the splices, for which also curves are shown.

The shore ends of 350,000 circ. mil. cable are not entirely under water, and further tests were made on these cables, the dotted curves showing the temperature rise. As the life of the rubber insulation depends largely on the temperature to which it is subjected, it can be seen that the safe carrying capacity of the cables is approximately 350 amp., owing largely to the radiating capacity of the splices and the large size of the shore ends, although under emergency conditions the cables could safely carry 400 amp. The specification called for a test pressure of 30,000 volts for 30 minutes at 60 cycles between conductors and between conductors and ground at the factory. The telephone conductors were to withstand a pressure of 4,500 volts between conductors and between con-

BARGE SERVING MACHINE. RINGS TO HOLD ARMOURING DURING SPLICING. AND VIEW OF BARGE.

might take up. The power cable was fed from the reels round spools, and both it and the messenger were passed through a serving machine, driven by a petrol engine; this machine was used to bind the two cables together by a continuous winding of two galvanised wires, but every 20 ft. the movement of the barge was stopped by the grip, and a number of turns wound on at one point, in order to ensure connection at 20 ft. intervals. The speed when laying the cable was 8 ft. per minute.

To make the joint mechanically strong it was necessary to lap the armour about 15 ft., which involved cutting off 15 ft. of the cable projecting from the water; the armour was folded back and held in shape by rings.

The copper conductors were sweated together and insulated with rubber and cambric; the telephone conductors were spliced and insulated, the twisted pair being transposed between cores at each joint; finally, a 4½-in. lead sleeve was wiped to the main sheath, and the joint filled with "ozite" poured in at a temperature of about 460 deg. F., sealed, and lapped, and the armouring put back into place.

As the barge was held fast to the messenger during jointing operations, the serving machine was mounted on rollers, so that it could travel along while binding the wire over the joint. Every 12 in. the serving wires were soldered together to provide against unwrapping should the wire break.

The cable was not attached to the messenger for a distance of 8 ft. on each side of a splice, to allow it freedom of movement independent of the splice. There were 11 splices in each completed cable.

After the final splice was made, the cable and messenger were under-run to a point mid-way between two splices, when both were hoisted off the reels and lowered to the bottom by ropes.

Cable laying was commenced on September 26th, and the two cables were laid and tested by October 30th, the connection through to San Francisco being completed on November 5th.

ductors and ground. On test it required 100,000 volts to puncture between conductors of the main cable and 46,000 volts between the conductors of the telephone cable.

In conclusion, we have drawn on articles recently appearing in the *Electrical World* and *Journal of Electricity* for much of the information here given.

A LARGE BATTERY SUB-STATION.

THE Metropolitan Electricity Supply Co. have recently completed a large battery sub-station in Eagle Street, Holborn, in order to increase the facilities for supply in that district. Provision is made in the building for four complete batteries, and one of these has been installed in the basement; it has been supplied by the Chloride Electric Storage Co., Ltd. The battery consists of 110 cells of their C.V.W. 26 type accumulator, in lead-lined pitch-pine boxes, and has a capacity of:—

1,200 amps. for 10 hours to 1.8 volts per cell =	12,000 A.H.
2,000 amps. for 5 hours to 1.78 volts per cell =	10,000 A.H.
3,800 amps. for 2 hours to 1.7 volts per cell =	7,600 A.H.
6,000 amps. for 1 hour to 1.65 volts per cell =	6,000 A.H.
8,000 amps. for 35 minutes.	
12,000 amps. for 1 minute.	
15,000 amps. momentarily.	

The normal maximum charging rate of the battery is 1,400 amps., and the maximum continuous charging rate 2,570 amps. The maximum charging voltage is 2.6 volts per cell.

The positive plates are of a special Planté type, in which the active material is in the form of pure lead rosettes, supported in a strong and rigid antimonial lead framework, which is unaffected by the chemical changes which take place during the life of the cells and retains its strength. The negative plates are of the cage type, each plate consisting of an antimonial lead cage in two halves riveted together; the face of the plate presents a smooth surface of perforated sheet lead,

the intervening pockets constituting receptacles for the active material. The plates are separated by wooden dowels, which also act as supports to special wood diaphragm separators, and are held in the correct position by means of india-rubber rings. The plates are suspended on stout glass slabs, resting on and held in position by lead shoes. The positive and negative plates in adjoining cells are connected by means

mate weight of the complete battery, exclusive of the stands, is 298½ tons. Each cell is supported on 12 glass insulators of the "mushroom" type. The stands are of pitch-pine, and are supported on strong glazed earthenware insulators. The different rows of cells are connected together by means of flat copper bars bolted to copper take-offs, cast into the channel bars at the ends of the cells; each connection is composed of

FIG. 1.—PART OF CHLORIDE 1,320-KW. BATTERY.

of massive channel bars. The efficiencies guaranteed are: amp.-hour efficiency at all rates, 90 per cent. Watt-hour efficiency, 75 per cent. at 5-hr. rate; 72 per cent. at 2-hr. rate; 70 per cent. at 1-hr. rate. There are 25 positive and 27 negative plates in each cell, the former 7/16 in. thick and the latter 5/16 in. thick; both plates measure about $16\frac{1}{2} \times 46\frac{1}{2}$ in. The overall dimensions of one

four bars, each 4 in. \times 4 in., air spaces being left between the bars. These bars are suspended from the ceiling by means of iron rods, insulated from the copper by globe strains and insulated turnbuckles.

The battery-room floor is of special construction (see fig. 6); metalline bricks are laid on edge, in rows of sufficient width to carry the glazed earthenware insulators for supporting the

FIG. 2.—NEGATIVE SWITCHBOARD.

FIG. 3.—E.C.C. BOOSTERS AND B.T.H. SWITCHGEAR.

cell are $21\frac{1}{2}$ in. \times $49\frac{1}{2}$ in. \times $65\frac{1}{2}$ in., the height overall being 68½ in. Sections of the cell are given in fig. 5.

The weight of the positive plate is 90 lb., and of the negative 41 lb., except the outside plates, which weigh 34 lb. each; the total weight of the plates in one cell is 3,452 lb., of the acid 1,700 lb., and of the complete cell 6,080 lb. The approxi-

battery stands in grout; the rows are 9 in. wide, and stand directly on the cement screed of a concrete floor. A space of about ½ in. is left between the bricks, and is filled in with cement to a depth of about 1 in. from the bottom of the bricks. Acid-proof asphalt compound 1 in. in thickness is laid over the whole of the cement finish to floor; a fillet is formed

round the bricks to 1½ in. above the level of the surrounding asphalt, and is ironed against the rough surface of the bricks. The ½ in. spaces between the bricks are also filled with this compound to the level of the top face and sides of bricks, thus forming an acid-proof floor and making a solid foundation for the batteries, which are illustrated in figs. 1 and 4.

Two motor-driven boosters have been installed to deal with the present battery; they were supplied by the Electric Construction Co., Ltd., of Wolverhampton. Each consists of one interpole motor of 115 h.p., at 210/240 volts, 500 r.p.m., and two interpole boosters, the fields of which can be reversed

FIG. 4.—PART OF BATTERY.

so as to boost up or down; each booster is capable of giving 1,800 amps. at 16.7 volts continuously, 2,500 amps. at 12 volts for two hours, and 3,000 amps. at 10 volts for one hour. The boosters are separately excited at 210/240 volts, and each has a single commutator, which is ventilated through slots in the centre of the commutator between two steel rings, as shown in fig. 3. The machines, which are connected by Zolde-Voith flexible couplings, have four bearings on one combination bedplate, and are fitted with carbon brushes.

FIG. 5.—VERTICAL SECTIONS OF CHLORIDE CELL.

The efficiencies of each booster under the loads given above are respectively 69, 62, and 56 per cent. The efficiency of the motor is 91 per cent., with each booster giving 30 kw.

The switchgear for each motor is mounted on a panel fixed to the bedplate of the machine. The starting switch consists of nine interlocked slow-break knife switches, and the booster field regulators are of the pedestal potentiometer type. The boosters are shown in fig. 3.

A battery milking booster made by the Electric Construction Co. has also been installed, consisting of an interpole motor driving an interpole booster, which gives 1,500 amps.

at 10 volts, 575 r.p.m. It is provided with four bearings and mounted upon a combination bedplate, together with the necessary switchgear. The booster is connected up to copper bars supported by globe struts under the ceiling of the basement as shown in fig. 4. Portable flexible leads are used for the connections from these bars to the cells.

The switchgear, which was supplied by the British Thomson-Houston Co., Ltd., consists of one main board for feeders, motors, and battery, one negative and battery panel, one positive and battery panel, and one instrument panel.

The main switchboard, shown in fig. 3, accommodates the battery connections, field and motor connections, and 21 triple-concentric feeders. It consists of six feeder panels, one motor and battery panel, and one panel carrying four 4,000-amp. switches for dividing the feeders into two sections, the neutral bar having a covering plate for this purpose. There are double positive and negative copper bus-bars, so arranged that feeders or battery and motors can be connected to either the top or bottom bus-bar, the battery through two 4,000-amp. switches in parallel on either pole, and the motors and feeders through switch fuses, each feeder having two fuses in parallel.

Twelve of the company's feeders forming part of the network in Eagle Street were cut, both ends of each feeder being brought into the station and connected to the bus-bars through neighbouring fuses. The feeders can, therefore, be boosted up as required, and the battery current is available in the feeders in either or both directions.

The negative and positive booster and battery switchboards

FIG. 6.—DETAILS OF FLOORING.

are at opposite sides of the machine room, as shown in fig. 3. The negative switchboard is shown in fig. 2. Mounted on it are two 5,000-amp. switches for No. 1 booster, two 5,000-amp. switches for No. 2 booster, and one 8,000-amp. switch for the battery connection, four voltmeters, one recording voltmeter, and one recording ammeter. The switches on the positive board are similar to those on the negative panel, the instruments being two voltmeters, one ammeter, and one charge and discharge Aron watt-hour meter. These switchboards are

FIG. 7.—8,000-AMP. SWITCH.

arranged so that either the first or the second machine, or the two in parallel, can be connected to the existing battery or to a second battery. An instrument panel carrying five ammeters is fixed by the side of the positive panel.

The basement is ventilated by means of two fans, belt-driven from a motor. One is a low-pressure fan drawing air from outside, and discharging it into the basement through wooden trunks situated on the floor, and carried nearly the full length of the building at either side; a portion of one of these trunks is shown in fig. 1. The other is a high-pressure fan drawing air through a wooden trunk fixed to the ceiling

of the basement, and discharging at the top of the building; a portion of this trunk is shown in figs. 1 and 4.

The building consists of a basement, ground, first, and second floors. The basement and ground floor were designed to carry each two batteries similar to the one now installed. The first floor was designed to carry all the boosters required for the four batteries, and also the necessary switchgear. For the present, however, the boosters and switchgear are erected on the ground floor, thus saving a considerable amount of copper.

The contractors for the building were Messrs. Geo. Andrews and Co. The steelwork was supplied by Messrs. Drew, Bear, Perks & Co., the architect being Mr. J. W. Stanley Burnmaster. The building and plant were erected under the supervision of the Metropolitan Electric Supply Co.'s engineers, to whom we are indebted for the foregoing particulars.

THE ELECTRICITY SUPPLY OF GREAT BRITAIN.

AN important discussion took place last week at the INSTITUTION OF ELECTRICAL ENGINEERS on this subject. It was introduced by Mr. ERNEST T. WILLIAMS, M.I.E.E., who in January submitted a paper dealing comprehensively with the present state of the electricity supply industry; the new conditions brought about by the war, and the urgent need for electrical engineers to work together for meeting the country's need for a cheaper and more extensive electricity supply; and a proposed scheme to meet this need.

The Council's decision to hold a general discussion on this subject made it desirable to reduce considerably the ground covered by the introductory paper, and for this reason the first two sections have been almost entirely deleted.

Mr. WILLIAMS pointed out that the time had now arrived when we must think of the supply industry not as a large number of independent detached schemes having separate areas, but for the country as a whole. If the policy of centralising generating plants in larger power stations had been economically sound, even though this involved transformation losses and additional mains, why should they hesitate in taking the next logical step of considering the eventual replacement of the large number of small, costly, comparatively inefficient electric supply stations by a few modern interconnected power stations for dealing with the electricity supply of the country as a whole?

Such a method of dealing with the problem would result in lower capital costs per unit of output and lower working costs per unit generated.

Against this must be set the increased cost of bulk distribution mains and transforming plant, and the loss in efficiency due to the transformation.

The area of Great Britain was comparatively small, but no country offered so great promise for a sound and economical electricity supply, if taken as a whole.

Technical considerations offered little difficulty, and financial issues could be dealt with under the guidance of present experience and knowledge. It was the basis of organisation which most urgently demanded attention, and the author had endeavoured to evolve a scheme on which the organisation might be based. It was imperative that the scheme should be formulated to draw in existing interests instead of acting in direct opposition to them.

The public control of electricity supply should be co-ordinated by a central body directly responsible to Parliament. Such a body should not be an existing Government department having various other interests; it should not be a Government department at all in the accepted sense of the word. At the same time, this central body must have all the weight of Government authority and be able to authorise or raise big loans on Government security at low rates of interest.

Such a body would have to be created with the necessary powers under a special Act of Parliament. It could be designated the Electricity Board, and its purpose would be the co-ordination, control, and development of the electricity supply of the whole kingdom for the public good.

He would assume that the whole country of Great Britain was divided into, say, six sections; an electrical engineer manager would be appointed for each district, where he would reside in a central position. On him would devolve primarily the responsibility of seeing that the best interests of the electricity supply for the public good were being developed and maintained, and in him would be co-ordinated the various electrical interests of the district, and the management of such portion of the electricity supply as might be directly handled by the Electricity Board.

One of the most interesting examples of a new quasi Government department was that of the Public Trustee, whose great and rapid success proved the value of having a faithful and sympathetic public servant available for certain purposes. The electrical engineer managers would act in a similar way in their own districts, whose electrical well-being would be their primary interest and endeavour, and these gentlemen holding well-paid and authoritative positions would be members of the Electricity Board and take part in all its deliberations.

Such public boards to be most efficient should be kept as small in size as possible. It was, however, desirable that they should be self-contained and fully representative of the departments of the Board—legal, accounting, financial, and Parliamentary. The heads of these four departments, like the electrical engineer managers, should be men of authority and repute in their several professions, so that the Board, constituted of these ten and two other members, would represent an efficient and responsible body of high permanent officials and recognised experts.

The President of the Board should be a man of wide knowledge and experience in public affairs, whose name carried weight and inspired confidence in the public and men of affairs. Like the other members, he should preferably be a paid official and expected to devote most of his time and interests to the work of the Board. Finally, the Board would have its permanent secretary, in whom—under the president—the organisation would be centralised.

To the Electricity Board proposed in the foregoing clauses all the questions relating to the electricity supply of Great Britain would be referred. It would become the authority—under Act of Parliament—on all the various questions and issues involved in the supply and application of electricity. Matters now dealt with by the Home Office, the Board of Trade, the Local Government Board, and by Parliament itself, would be gathered together under its control. The only reservation would be the right of appeal from the Board's decisions to the higher authority of Parliament.

Never before in the history of this country had it been so evident that they must conserve their capital and resources. Thus to launch forth on to theoretical considerations of the generation of electricity without using to the utmost the present sources of supply would be to court failure.

The suggested scheme would, therefore, at the outset interfere with present generating stations to the minimum extent. When, however, stations under municipal control reached the limit of their capacity, or desired to replace their obsolete plant, they would require to obtain the Board's authority for the expenditure. It would then be for the Board to decide in each case whether the interests of the district and of the electricity supply of the country as a whole would best be served by allowing such additional plant to be purchased by the Corporation and installed in the generating stations, or whether it would be better for the additional load to be supplied in bulk from a bulk network.

It would be for consideration whether limited companies should be brought compulsorily under this ruling or not, for they were placed under different conditions from municipalities and generally would prefer to purchase their current in bulk, if by so doing they could obtain it at a lower cost, than to sink further capital in their existing generating stations.

Several large stations in the country were highly efficient, modern, and capable of extension in large units; these would be the initial ones in the greater scheme which would be planned in order to embrace them. They would be interconnected by a bulk-supply network, to which they would supply their surplus power. Though additional new stations would be required from time to time as the demand increased, and it would probably be preferred for such stations to be erected and worked directly under the Board, it by no means followed that the control of the existing power stations which it might be decided to incorporate in the scheme should pass out of the hands of the present authorities, whether municipal or company owned.

Waste blast-furnace gas, surplus water power, and other sources of energy would be utilised.

The lower the price at which they could supply electrical energy, the greater would be the demand, and, conversely, the greater the demand the lower the cost at which they could supply. The result was thus cumulative, and if the cost could be brought low enough the demand would be so great as absolutely to dwarf the present load. The two chief items of generating cost at present were the capital charges and fuel, and it was very evident that under favourable conditions and with a sufficient demand these could be reduced to a small fraction of the present average generation costs throughout the country. With the diversity factor of such a demand the load factor on the stations would be high, and the plant factor, or proportion of time the plant when running was on full load, would be almost unity; this would be brought about by the interconnection of the stations.

The scheme would enable much greater freedom of departure from "cut-and-dried" methods to be embarked upon due to the fact that a station could be laid out and built on a large scale at once, for, if it was to feed into a network to supply the whole country with a rapidly growing demand, the time would be comparatively short before the station would be required to give its full output. Thus early utilisation of the capital sunk in the station would remove one of the disabilities under which the designer of an ordinary large power station now laboured. More important, however, would be the fact that the failure of any new departure to obtain fully the anticipated results would not be the same serious matter which a similar partly successful experiment would be in an ordinary power scheme to-day. This was important, for development must be progressive.

A number of the stations would probably be arranged for running on gas-fired boilers with modern plant for the recovery of the by-products of the fuel in large quantities, and near such stations would probably be established chemical

production companies making large demands for electrical energy for electrochemical processes.

The main bulk-supply network should be the property of the Board, which would have the right to carry its overhead or underground mains through any district. The subsidiary network might belong either to the Board or to existing undertakers, according to circumstances; for example, there appeared no reason why the power companies and the large municipal undertakings should not themselves supply current in bulk on their own mains, taking the supply from their own power stations, from the Board's bulk network, or from both.

The bulk network would have to be designed with a view to ensuring reliability of supply, so that if any one power station failed it would not affect the main supply, or if any one section of the bulk network was destroyed the supply of current would go on automatically to the subsidiary network. Reliability of supply was of the utmost importance, taking the premier place even before low cost. One of the strongest arguments for the new scheme would be its greater reliability, owing to the number of stations and the alternative routes of cables.

The question of giving a supply in any part of the country would require to be regarded not alone from the standpoint of whether it would pay to run the electric mains for the immediate demand, but also from the larger standpoint of whether giving such supply was for the good of the country as a whole. In this way many districts would be given a cheap supply of electricity, which under the ordinary commercial conditions of a company operating in a smaller area would not obtain.

The transformation and distribution of electricity to the small and medium-size consumer was well and efficiently filled by the present undertakings, and, with the exception of removing a few anomalies and arranging for developments to be on lines which would tend to greater uniformity throughout the country, the scheme would not interfere with the present arrangements. If those interested in the existing undertakings could clearly see that the scheme would not be detrimental to them, but otherwise, it would readily receive their support.

By leaving the local distribution under local control, the inter-departmental questions which arose, such as opening roads for laying mains, lighting roads, pumping water electrically, &c., would be more readily dealt with, and local control, whether municipal or company, would create a local interest in the question of electricity supply which would tend to its more rapid and favourable development.

In districts where there were no electricity supply authorities, the detail distribution would have to be carried out by the Board itself in order that no district in the country should be without its cheap electricity supply. This would not be a difficult matter, for undoubtedly under the new conditions all the railways, main line and suburban, would eventually be electrically operated, and this would carry the electricity supply wherever there was a railway, from which the supply would radiate to the country around. This desirable state of things would not be brought about in a day, and progress must go hand in hand with sound finance and common sense.

In the author's opinion, one of the indirect results of the scheme would be the resuscitation of our canal system. Hitherto, the question of electrical propulsion had been partly held back by the cost of the electric power system, but when power mains were running along canal routes for other purposes the problem would be simplified.

Similarly, the great agricultural interests of this country, which it was so important to revive, would receive a great stimulus from a cheap electricity supply. In other lands electricity was being largely adopted in agriculture; and much was to be gained by its aid for lighting, power, heating, and transport. Not only directly, but indirectly, must they assist agriculture by reducing the cost of artificial fertilisers, whether as by-products of generating stations worked with gas-fired boilers or through the cheap supply of current to electrochemical industries.

It was felt that the time was now ripe to launch this or a similar scheme on to the public notice. There was evidence on every side that men's minds were already actively employed in considering what could be done to enable the nation to support the burden brought about by the war. In what ways could the nation prevent waste and economise, and in what manner could production be increased? The electricity supply problem could play a leading part in both these departments, and because of this there had never been a more favourable time in which a united electrical profession could rapidly obtain public interest in and public support for its schemes.

There was too much said and written in these days which brought no results. Let them determine that if it should not be so in this case.

When it was understood that these proposals could be brought into early operation by Act of Parliament without disturbing existing concerns, and that the policy of the proposed Board would not become self-supporting at no distant date—ultimately neither requiring any financial assistance from the Exchequer nor operating for profit—it would probably receive the immediate support of all political parties, and a Bill could be rapidly passed through Parliament.

In a paper read before the International Engineering Congress, San Francisco, last summer, Mr. C. H. Mitchell demonstrated the wisdom and success of the policy of the

Ontario Hydro-electric Commission. In this Commission was embodied, by Act of the Canadian Parliament, the control of the electricity supply of the Province of Ontario. Its aim was to enable electricity to be given at the cheapest rate to the people; and it supplied, without profit, electricity in bulk to various supply authorities, obtaining this supply largely from existing power companies and distributing it through the Commission's bulk supply mains. The costs of the Commission's operations were borne by the authorities to whom the supply was given. The formation of the Commission was considerably criticised. Its remarkable success spoke for itself, and should any further argument be necessary it would form a convincing one for the scheme herein outlined for Great Britain.

They should avoid large committees and voluminous reports, and by keeping the subject on concise and clear lines, and dealing with it in a businesslike manner, they would more readily attain their end.

It should be clearly understood that the proposed scheme was not for the nationalisation of our electricity supply, nor was it for the municipalisation of that supply. Its true function was the co-ordination into one body of the control of the electricity supply, assisting existing undertakings whether municipal or company owned, and taking upon itself only those functions of generation and distribution which were essential to the furtherance of wise development and a supply at the lowest cost.

The scheme proposed no confiscation of the rights, privileges, and property of other electricity companies or municipalities, and in the event of its being recognised as essential in certain special cases to take any of these over, full compensation should be paid not only of the value of the actual plant, but of reasonable allowances for potential values.

The whole basis and policy of the organisation would be heartily to recognise what had been done by the existing authorities, whether public or private, and, instead of sweeping away, to conserve and build up, guiding future policy and co-operating with the present authorities for the well-being of the whole.

The author, having occupied responsible positions in Government, municipal, and private concerns, and having seen the inner workings of each, submitted the opinion that each had its proper sphere of action which it alone could best perform, and that the highest efficiency and greatest progress were only attained when these interests worked together in the common cause, none trying to usurp the place of the other, but all recognising that the success of the whole meant success of each in its own department.

The initial operations of the Board could be undertaken without huge financial operations, and the avoidance of drastic proposals for sweeping changes either in the ownership or control of existing undertakings would cause otherwise potential opponents to become adherents and advocates of the scheme, for all thinking men realised that something should and must be done to place the electricity supply of the country on a sounder basis.

Finally, these days of grave responsibility were also days of great privilege and opportunity. Never again would they find the same mental and moral attitude which was necessary to bring some such a scheme as here outlined to early fruition. Let it not be said of them that they failed.

Mr. C. H. Menz, who followed Mr. Williams, said he wished Dr. Ferranti had been there to take part in the proceedings, for he had no doubt as to the best arrangement for electric supply in Great Britain. It was worth while considering why the general idea outlined by Mr. Williams and others in the past had not made greater progress. Similar ideas had been proposed 20 years ago, and very numerous schemes of a similar character had been brought forward since, yet but little progress had been made, and he asked why. The author said organisation was the difficulty, but he (the speaker) differed. The reason, he suggested, was because the profession as a whole was not convinced that such a scheme was the ideal, and if that was so, they must face the fact and see whether the majority were right. They must make up their minds that what was right for other countries was not necessarily the right thing for this country. Argument was at a low level when it was urged that we must follow a certain course because another country did so; it was not the consideration which had influenced us in the past, and our aim should be to lead rather than to follow. As the electrical industry was not convinced, how was the question to be solved? The United Kingdom differed as regards its distribution problem from America and Germany, and they would be wrong in following the American idea of interconnected distribution areas. British areas were much more congested. The present war and general considerations had emphasised the importance of security of supply, and they had considerable areas solely dependent on one central station, which arrangement, if continued, would be likely to lead to trouble. The more these areas developed electrically, the greater the importance of not putting "all their eggs into one basket." As a remedy, such adjoining areas should be interconnected and worked conjointly, the linked stations being treated—as regards the size of generating units and proportion of spare plant—as one. Such an arrangement would lead to greatly reduced capital expenditure and improve operating conditions; he suggested that it was the only logical system on which electricity supply could be properly developed, and the most economical. With the larger units a coal economy of from 30 to 60 per cent. was

possible compared with what could be done with independent stations. Every day it was becoming more apparent that small stations could not adopt the rebudgements necessary to high economy. The most important result would be the improvement of load factor, and, as an instance of the possibilities in this direction, he cited the load curves of the North-East Coast system, which showed that they were able to get up to 60 per cent. The first step was for the technical side to agree as to the right lines of development; he discounted the idea of Parliamentary assistance, especially if they were not agreed amongst themselves. It was important that they should promote a "fashion" for electrical engineers to deal with their distributing systems exactly as they asked their consumers to deal with their own plants, &c.

Mr. B. A. CHATTOCK said he was interested to see that Mr. Williams was covering similar ground to that covered by himself in his presidential address to the Municipal Electrical Association two years ago, and that he had further developed the idea. However, sufficient emphasis was not laid on the justification for such a scheme, which turned on the necessity of attracting the consumer, and involved a reduction in the cost of energy. It was well to help the idea by creating a fashion, but a much more powerful incentive would be found if the manufacturer's pocket benefited. Price was the great attraction to industry, which looked forward to future reductions, and they must stimulate the idea, towards which Mr. Williams's scheme would help. There was enormous scope for development yet, but the hampering influence was the large number of small stations and too high cost of operation of some of the large ones. A scheme of the kind suggested should be run on broad-minded principles, not so much to produce large profits and, possibly, with a loss in sight for some years. But the loss should fall on the community as a whole, as the scheme would benefit industry at large. The scheme put forward was the logical development of our present experience. He did not quite agree with the idea of not interfering, with existing stations; if they were inefficient plants they should certainly be dispensed with at once, and each subsidiary area should be treated as if it were a sub-station area. Probably the number of large stations necessary would be quite considerable, and probably we should come to the interconnected station idea, with plants of, say, 300,000-kw. capacity each, as lowering the price of electricity would bring an enormous demand. He quite realised that a bulk supply network would be an expensive and difficult thing to arrange, and that a great difficulty would arise in connection with wayleaves, for which drastic powers would be required if the scheme were not to be crippled. There was no reason why such a scheme should not be prepared now in readiness for the opportunity to develop it.

Mr. J. S. HIGHFIELD said it was most important that they should come to some agreement on the subject, but when the previous speaker suggested that they must spend money and expect no return for some time, it reminded him of the dreadful times when electricity supply was developing in London, and there was no profit at all. He considered it would be quite hopeless to raise the money with such prospects, and that the principle was all wrong, as there must be some hope of a return on capital. Such a scheme would not lead to any practical result. He considered that the existing supply over large areas of the country was very good; there were few towns where industry could not be satisfied electrically, and he thought it was unnecessary to belittle our present position. Probably in no part of the world were better results obtained than in the North-East Coast area. He thought if any one industry had suffered from legislation, it was the electrical industry, and pointed out that all the largest industries in the country had been developed by private enterprise, and that when Parliament stepped in trouble resulted. They did not want too much legislation. He believed that if the same opportunities had been given as in the case of the railways, the electrical industry would be in a much better position now. Mr. Williams suggested a board of control, which reminded him of the Water Board, but who were the board to be responsible to? He thought if they removed the commercial element from the proposed board, making it a technical board, he could agree with it.

Mr. H. FARADAY PROCTOR said he differed from both Mr. Williams and Mr. Merz, believing that technical considerations should be dismissed, and the proposed board formed to get on with the work; if left to the Institution, the scheme would be stifled by the conflicting interests. The proposed scheme did not interfere with the existing concerns; he was afraid that Mr. Chattock's idea of scrapping existing plants would tend to delay matters indefinitely. He agreed that such a scheme would do more to cheapen supply than any independent effort. The proposal to use canal routes for transmission lines should be extended to railways, and one controlling body should supervise matters; until some such procedure was adopted we could not hope to get prices down to the desired level.

Mr. W. B. WOODHOUSE said it was important that electrical engineers should first agree what to do. Mr. Williams had put forward a scheme for electricity supply, but that was only a link in the fuel problem, for fuel economy depended on the realisation of electricity supply on a gigantic scale. On the broad principle of centralisation of supply, he hoped they were all agreed; they might differ as regards organisation, but if they agreed on the broad principle they had gone a long way. They must give security for capital; but the large

schemes would necessarily be to some extent speculative. On the other hand, if the Government would advance the capital, it would be beneficial. He was afraid he could not agree as to the basis of organisation. To achieve success, the public must be educated to an appreciation of the dogma to be followed; they must tell the public about it, and keep on telling them before any progress would be achieved.

Mr. C. H. WORDINGHAM said he had looked at the subject of electricity supply from all points of view; now he looked at it from a detached point of view, and, as a result of his experience, was quite convinced that a number of the power companies were in business from "purely philanthropic motives." He had been interested in Mr. Merz's remarks, but his suggestions that night represented something very different from the original ideas of promoters of power schemes, who asked for a single large power station. The real secret of economy was to get diversity. The linking-up proposal of Mr. Merz was admirable, but where was it to stop? The most successful power supply scheme had a large number of linked-up power stations. Turning to Mr. Williams's proposals, he deprecated any form of Government interference; the scheme must be run on commercial lines and show a financial return. No Government department could successfully conduct a commercial undertaking, and under Government control all the time would be occupied in receiving inspectors and making returns.

Mr. MADGEN took exception to the description of the Ontario Hydro-Electric Commission's work; of all the bodies he had met with, none carried out its work in a more reprehensible manner. The Commission not only regulated the supply industry as a whole, but it also competed with other independent undertakings, resulting in the crushing out of enterprise. The consulting engineer branch was gradually disappearing! He thought in regard to the proposed board, that if it was divested of the business of operation it might do well.

Mr. THOS. ROLDS considered that the electrical profession was agreed on the right scheme of electricity supply, and that engineers would support the proposal put forward, especially if they happened to be on the suggested electricity board. The success of the proposal really depended on the human factor, and it was asking a good deal of the engineers of smaller undertakings if they were to efface themselves for the benefit of the country as a whole. The fate of the engineers of those undertakings which had been absorbed in the past was known. If all the engineers could be brought into the scheme, they would get a body of opinion in its favour; if they could safeguard the engineers, it would not be long before the engineers would convince their committees. But the talking should cease, and he thought the Institution was the right body to take action, as it would combine the widespread interests.

The PRESIDENT (Mr. C. P. SPARKS) agreed that the stumbling block was the human factor, and cited the cases where engineers had rejected the idea of bulk supply to their undertakings. The real principle at the bottom was the conservation of fuel, which was more important than cheap power. He was sure that the Council would consider the views expressed during the evening.

THE BUSINESS SIDE OF SCIENCE.

At a meeting of the NORTH-EAST COAST INSTITUTION OF ENGINEERS AND SHIPBUILDERS, on April 7th, Mr. T. O. ELDER (of the British Electrical and Allied Manufacturers' Association) delivered an address on the part that would be played by science in the coming economic crisis. Referring to the conference recently summoned by the Royal Society, at which it was decided to form a joint board of scientific societies, to promote the application of science to industry, he remarked that in the past the relationship between these two parties had seemed to be based on a sort of mutual contempt; but the times had changed, old methods must be abandoned, and the business of industrial production and distribution must in future be carried on with greater efficiency—i.e., on more scientific lines. As a result of the war, the capacity of British engineering works had been immensely increased; at the end of the war they must find outlets for their products, and this could only be done by the cultivation of the scientific habit and method in the economic system of the country. The accounts of manufacturing concerns were annually subjected to a minute investigation by professional experts, so that the true financial position should be disclosed; surely, if this had been found a salutary process, it ought to be extended to other departments. Competent men for such work, who could overhaul the purchasing department, revise the technical designs, appraise the efficiency of the machinery, or devise improved methods of promoting sales, were scarce and expensive, but he would suggest a practical solution of this difficulty. The principle of association was gaining ground, but there was a danger of associations becoming mere hindrances to progress; the kind of association that was wanted was one that would act as a persistent stimulus, not as a technical debating society. He looked to the manufacturers' associations for a method of pooling the experiences of members and providing the equivalent of a system of auditing for various departments. The great fault of most manufacturers

who entered such associations was that they did not make full use of the powers so developed, but struggled to retain their own freedom. Such associations could generalise from a wider range of particulars than came within the purview of a single firm, and could help their members in respect of the purchase of materials, conditions of labour, the establishment of co-operative sales agencies in foreign markets, and so on. They should themselves be assisted in their attitude towards public policy by a board representative of the scientific and technical institutions, especially as regarded our unscientific and unbusinesslike system of education and our inefficient executive government. These associations should combine in a campaign of popular enlightenment, to demonstrate the importance of British engineering to civilisation, its immense earning power, and its social and economic possibilities. In brief, Mr. Elder urged that scientific institutions should jointly prepare plans for the reform of our educational system, combine with commercial associations to increase industrial efficiency (and, therefore, national prosperity) all round, enlighten public opinion on questions of industrial economy, showing the workers that it was to their interest to extend, rather than to limit, production, and find effective means of expression in Parliament. The public, having been protected by engineering from a ruthless enemy, should now protect engineering, and they should mix business not with revenge, but with patriotism, politics and science, so that those industries in particular which were indispensable to peace and prosperity should be given full freedom of development for the security and progress of the Empire.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Institution of Electrical Engineers.

I am one of many who feel that the I.E.E. yields a totally inadequate return for the annual subscription to the vast majority of its members. All they receive is a copy of papers submitted by their fellow members and the discussion thereon, which they can equally well obtain by subscribing to your paper.

The Institution should be representative of the industry throughout the Empire, and its work and standing such that this position is generally recognised. In Canada the position it should hold is held by the American I.E.E.; in South Africa it has no standing whatever; there is supposed to be a Local Section in Cape Town, but in practice this does not exist, whilst in Johannesburg (the centre of a large and active electrical community) an excellent independent Institution has been established. I cannot speak of the state of affairs in other Colonies, but I fear it is no better than in those I mention.

In discussing the situation in Johannesburg with a member of their committee, he said: "We had to give up all pretence of being a Local Section of the home concern, as they demand 75 per cent. (or thereabouts) of our income, for which we get little or nothing, and the balance was totally inadequate to carry on efficiently here," and this is true elsewhere.

It seems to me that the Institution, to serve its purpose, must:—

1. Be so strong that its influence carries real weight with the Government and other public bodies.
2. Take a lead in electrical research work throughout the Empire.
3. Take a lead in technical education throughout the Empire.
4. Take active steps to develop our electrical trade abroad and to increase our prestige generally. To these ends it should use its influence to place its members where possible, in the many responsible positions available abroad.
5. Have such a number of sub-committees as will reasonably represent the interests of the various branches of the industry (these committees need not necessarily meet in London; Manchester would, perhaps, be a convenient centre for the manufacturers' section; Sheffield for central-station engineers; Birmingham for education, &c.).

To develop properly these suggestions I think, in addition to its present staff, the Institution should employ at least one active, highly-trained, practical engineer of recognised standing. Then, the social side needs developing; the opportunity of meeting other engineers, including those outside the scope of our Institution, is very valuable. This, I think, may best be achieved by the formation of Engineers' Clubs, on the lines of that in existence in Manchester, say, in London, Newcastle, Glasgow, &c., with interchange of membership. These clubs, of course, should be self-supporting when once started.

All these objects need money, and the Institution has it, but, unfortunately, it is sunk in that great "white elephant" on the Embankment (incidentally, an eminent central-station engineer tells me that he has calculated the load factor of that place so far as our members are concerned to be between .040 and .045 per cent., but I am sure it is not nearly so high

in the case of most members). This building should be sold, or other steps taken to reduce our rent charges in London to, say, £1,000 or £1,200. This would leave a considerable annual sum free for the above objects, including the treatment of members attached to Local Sections on equitable lines with the fortunate residents around London, who not only have the daily privilege of viewing the "white elephant," but are provided with a free annual conversation, institution-aided dinner, &c., all of which the great majority of members are denied.

I have discussed these matters with many of our members, and with members of the "Mechanicals," many of whom hold similar views regarding their Institution, and it seems to me that much is to be gained by both parties (and, possibly, other engineering societies) by a close co-operation without in any way disturbing the integrity of each. Thus, by such co-operation, the question of housing accommodation in London and for the Local Sections could be put on a satisfactory basis, and also the development of the club idea suggested above; but, more important than all, a really "heavyweight" joint committee representing the allied branches of engineering could be formed.

Care should be taken in future that, as far as possible, the Council of our Institution contains a fair representation of the various branches of the industry. At present there is a strong tendency for members holding public or semi-public positions to predominate. I do not think one of our large general manufacturers is represented just now, unless through a Local Section, although, both in the matter of providing "papers" and adding to the discussions, they are a most active class.

In support of my opening statement, may I point out that, although we have been at war some 20 months, and the industry has badly needed a lead, all the Institution has apparently done during that time (apart from the reading of papers and adding to the discussions, they are a most active class.

M. I. E. E.

Decimal Coinage and the Metric System.

The enclosed printed copy of the report of the Decimal Association and your own strong and valuable lead in this matter must be my excuse for appealing to you for further attention. The Association propose the division of the shilling into 50 parts (cents). Surely this is wrong.

1. It is unjust to the great mass of the people. Why should the limit of justice remain at 2 per cent. when it is simple and easy to set the scales to 1 per cent.? Whether we like it or not, the shilling is the standard coin, and will remain so. The shilling should, therefore, be divided into 100 parts (cents), and so make an adjustment of prices possible within 1 per cent.

2. We are trying to introduce a sound decimal system; can the system be called sound which will make ten shillings consist of 500 cents?

3. We are trying to get into step with the other nations, who have long ago adopted the decimal system; can it be called getting into step if we take one to their two? Will any amount of persuasion make the French, the Belgian, the Italian, the Scandinavian, and other nations think of our shilling as 50 cents when their own corresponding and standard coin consists of 100 cents?

The two great stumbling blocks seem to be: (1) The desire to keep a coin as near as possible to our farthing as the comfort for the poor, and (2) the wish to divide the pound sterling into 1,000 as comfort for the richer. Undoubtedly the change to the decimal system can be made at the present moment much more easily than before the war, but let us keep in step with our Allies, even if our enemies are marching to the same tune.

C. Thorkelin.

[Provided that the system is decimal, we see no great advantage in making the shilling the standard unit. The only current coin of the same value is the German mark! The Russian rouble is equivalent to 2s. 1d., the Chinese tael to 2s. 5d., the Argentine peso to 1s. 9d., the Brazilian milreis to 1s. 4d., the Canadian and American dollar to 4s. 2d., the Dutch gulden to 1s. 8d., the Indian rupee to 1s. 4d., the Japanese yen to 2s., the Mexican dollar to 2s., the Peruvian sol to 2s., the franc and allied coins to 9d.—where is the uniformity attributed to the shilling?—Eds. Elec. Rev.]

WAR ITEMS.

After the War in France.—The Conseil-General of the Department of the Seine has adopted (says a correspondent of the "Daily Telegraph") the conclusions presented in the report of MM. Sellier and Deslandres on the economic measures to be taken for the organisation of labour on the demobilisation of the armies after the close of hostilities. The programme of public works outlined comprises most important plans for railway extension, and an enlargement on a great scale of the canal system, as well as the general improvement of the seaports.

Exemption Applications.—At the Stockport and East Cheshire Appeal Tribunal, a young man employed on the clerical staff of the Manchester Corporation Tramways Department stated that he had a conscientious objection to combatant or non-combatant service under the military authorities. He had resigned his position in the Manchester Tramways Department because he could not implicate himself by handling correspondence in relation to munitions. The decisions of the Tribunal were not made known publicly.

The Preston County Appeal Tribunal last Thursday heard an appeal by an electrical engineer, aged 26, who urged that his ability in his profession would be of more service to the country in a civil capacity than in the service of the Army. The appeal was dismissed, and the military representative was asked to recommend the man for service with the Royal Engineers.

At Douglas (Isle of Man), the tribunal has granted absolute exemption to Mr. Thomas Sheard, electrician in charge of the Government electrical plant at the Athol works.

At Poole, the Bournemouth Electricity Co. appealed for 12 employés. Mr. E. L. Ingram, for the company, said it was prepared to release two of the men who were in certified occupations, and withdraw two other claims. The appeals were for a stoker, two charge engineers, one works manager, two switchmen, and two motor-wagon drivers. Before the war the company had between 135 and 155 men, and at present the staff consisted of 85 men and boys, and they had over 75 men with the Colours, and were paying over £700 a year in separation allowances. The tribunal granted exemption to six men as being in certified occupations, and refused the appeals as to the motor-wagon drivers.

At Stroud (Glos.), Messrs. Edwards and Armstrong, Ltd., electrical engineers, appealed for 32 employés, who had attested, on the ground that they were in a reserved occupation. It was stated that time was needed to replace some of the charge men who were going to join up. Since the outbreak of war 30 men had left to join the army. It was arranged that nine men should be exempted for 14 days, and the remainder conditionally exempted until September 29th.

The Lowestoft Town Council has secured exemption for the remaining employés at the electricity works.

Dartford Rural Tribunal has granted two weeks' exemption to Mr. A. Brakefield, electrician to Mr. A. J. Hewings, of Northumberland Heath.

At the Newcastle-on-Tyne military tribunal, on Monday, an army captain, who has a business as an electrical engineer, applied for the exemption of his brother, in order to carry on the concern. All but two of his men had enlisted, while his other brother was in the Navy. They were both married men, and they had a mother to support. Conditional exemption was granted.

Conditional exemption has been granted to Mr. Charles F. Clayton, who is in charge of electrical plant at Stone (Kent).

At Salford a firm of electrical engineers appealed for a man engaged in armature coil winding, and stated that all the work was for public use or for places engaged on munitions. Fifty per cent. of their employés left early in the war, and women had been engaged to do light work. Exemption was granted conditional on the man remaining at his present occupation.

Before the Cheshire Appeal Court, the Military appealed against three months' exemption allowed the managerial secretary of the Weaverham Electric Supply Co., on the ground that he was not devoting the whole of his time to the work. Respondent said that the whole burden of the concern, except the engineering, fell upon him, and his duties required a great deal of technical knowledge. The appeal failed.

The Workshop tribunal has granted temporary exemption to the Station Superintendent at the Urban District Council electricity works, and also to two stokers, a cable joiner, and a fitter, all of whom are married, and until September 1st to the meter tester, who is single.

At Maidenhead Tribunal, the appeal of Mr. R. C. Walker, who had been refused exemption, was withdrawn by Mr. G. F. Craven, manager of the Reading Corporation tramways, Mr. Walker being medically unfit.

At Yarmouth, an electrician of two picture palaces was granted two months' exemption.

At St. Albans, Mr. A. Flower, electrical and motor engineer, appealed on the ground that he was in sole control of machinery engaged on Government work. The case was adjourned for 14 days.

At Brighton Tribunal, an electrician who had previously been granted 14 days' postponement for one of his men, appealed, stating that the man was the only one capable of undertaking any repairs that might come in. Two months' exemption was granted.

German Dumping.—A political correspondent of the "Daily Telegraph" says that the statements with reference to great preparations for a dumping of accumulations of German manufacturers may be accepted too readily. They do not square with information in the possession of our Foreign Office and the Board of Trade. Any extensive German preparations would certainly have been heard of

through neutral channels. The known state of German industries leads the Government to discount the statements.

German Dumping After the War.—The Exchange Telegraph Company's special correspondent at Stockholm describes the great dumping plan under which Germany, by exporting vast quantities of cheap goods now ready, is to pay for raw materials and to regain at a bound her lost markets. Manufacturers' associations of a new kind are being formed, which will aim at common action and prevent excessive production of some products, or insufficient production of others. They will also rule certain technical questions and questions of saleability arising out of the changing public taste. Makers of optical and surgical instruments, electrical machinery and machine tools are all working together. The amount of dump goods which is considered necessary is distributed for production among different factories on lines which ensure economy and division of labour. The production price has been cut so low that the 90 per cent. of sale value, advanced by the State to enable production to be carried on, has been reduced. In the campaign for economy factories and workshops are being standardised and specialised. Where two shops in a given area formerly produced indiscriminately two classes of goods, one factory has now taken over altogether one class and the other factory the other class. Sometimes machinery has been exchanged. There is no doubt that neutral States and, if they allow it, enemy States, will be badly hit by German competition, especially if, as Germans themselves predict, a period of industrial depression follows the war.—"The Times."

Nitrogen for Munitions.—A lengthy question was addressed to the Minister of Munitions by Mr. T. M. Healy in the House of Commons, last week, with regard to the relations between his department and the Nitrogen Products and Carbide Company, which uses the Ostwald process of manufacturing nitrate of ammonia and nitric acid. It was suggested that the process, which was purchased at the price of £652,108, had been superseded by the Harber process of the Bädische Anilin-Fabrik, that money provided by the Government had been used to erect works in this country for the treatment of nitrolim, and that the process had exceedingly injurious effects upon the health of the workmen employed; also that in the flotation of the company large blocks of shares were given free to certain persons and firms. In reply, Mr. Lloyd George stated that a contract had been placed with the company on favourable terms, under which the Government advanced, not £400,000, as alleged, but £50,000 at 5 per cent. interest, repayable by deductions from the price of the goods supplied; enemy shareholders held only about 2 per cent. of the capital, and the process had not been superseded by the Harber process, by which ammonia was manufactured, and not nitric acid or nitrate of ammonia. There were no deleterious effects upon the workmen employed, not a single case of disease having occurred through its use, although very large quantities of the material had been produced, and the persons named received no free shares, their holdings having been paid for in cash and by the surrender of equivalent shares in other companies.

Trading with the Enemy.—The Board of Trade directs the particular attention of all manufacturers and traders concerned to the need for scrupulous care in the transaction of their business abroad, in view of the fact that some traders in some neutral countries are making themselves agents for the supply of goods to and from enemy countries. Especial care should be taken in opening new accounts in neutral countries, and in relation to any orders or inquiries of an abnormal character. In any case of doubt as to particular firms abroad, business should be suspended pending reference as regards firms in foreign countries outside Europe to the Controller, Foreign Trade Department, Lancaster House, St. James's, London, S.W.; and as regards firms in Europe to the Chairman, War Trade Intelligence Department, Broadway House, Tothill Street, Westminster, London, S.W.—"The Times."

After-the-War Trade Policy.—In the House of Commons last week, in reply to a question whether Ministers were taking steps to formulate a trade policy to come into operation after the war, Mr. Asquith stated that a Committee of the Cabinet was appointed some time ago to deal generally with all questions of reconstruction, including those connected with commercial and industrial problems likely to arise at the close of the war. Investigations of particular aspects of the problem were being carried on by sub-committees. As to the most important, the Government were in communication with the Dominions.

Trade with Russia.—The Vice-Chairman of the Sales Managers' Association, Mr. William H. Beable, is leaving for Russia as the representative of various important British business firms to open up new trade with our Ally. He is going with the cognisance and approval of the Government, and his Majesty's diplomatic and Consular officers have been given instructions to offer him every assistance they can. His stay will be of not less than six or eight months.

Prohibited Trading.—The "London Gazette" for April 14th contains a schedule of additions to the list of persons and firms with whom trading is prohibited, in Argentina

and Uruguay, Brazil, Cuba, Ecuador, Netherlands, Netherland East Indies, Persia, Peru, Portugal, and Sweden.

No Ministry of Commerce.—In reply to a question in the House of Commons, as to whether the Prime Minister would take early steps for rearranging the business at present dealt with by the Home Secretary, the President of the Board of Trade, and the President of the Local Government Board, with a view to creating, while the war is in progress, an adequate Ministry of Trade and Commerce, Mr. Asquith said that he was not prepared to adopt this suggestion.

Companies to be Wound Up.—The Board of Trade has ordered the following companies to be wound up:—Rhine-land Manufacturing Co., Ltd., Wells Street, Oxford Street, London, W., importers of ball bearings for machinery, &c.; controller, L. F. Goodricke, 10, Coleman Street, E.C.; Nitsche and Gunther Optical Co., Ltd., Hatton Garden, E.C., manufacturers of optical instruments, &c.; controller, B. E. Mayhew, Alderman's House, E.C.

Naturalised Aliens.—The Baltic Mercantile and Shipping Exchange, which has excluded from its premises not only all alien enemies, but also naturalised persons of enemy origin, except those over 60 years of age or having sons serving with the Colours, has further decided to ascertain by circular from the members whether the majority wish to exclude all persons of German origin.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Church Lighting with Concealed Sources.

The artificial illumination of a church is a problem which stands by itself, and calls for the soundest judgment and a cultivated sense of the artistic and appropriate qualities which are too often conspicuous by their absence from the scheme adopted. Indirect, or semi-indirect, lighting is seldom practicable, owing to the height of the roof and its dark surface, hence direct lighting must be adopted; but it does not follow that the lamps or their fittings should be visible. That satisfactory lighting can be secured with concealed light sources is proved by the scheme that has been adopted at St. Dunstan's Church, East Acton. This installation is of special interest, not only because the system employed is novel and most effective, but on account of the low cost for which it has been carried out.

When it was decided to replace gas by electricity for lighting the church, the funds available were somewhat limited, and allowed of but a small margin for the purchase of fittings after the wiring costs had been met. The contractors for the work, MESSRS. DUNCAN WATSON & CO., 62, Berners Street, Oxford Street, after

even with books having the smallest type, a condition that prevails in very few churches, the light distribution usually being very uneven.

For the lighting of the chancel, a pair of similar reflectors, each with two 60-watt lamps, is placed on the east side, just above the lower capitals of the pillars supporting the main arch while light is thrown upon the altar by single trough reflectors placed within the reveals of the two side windows.

A telescopic standard carrying a conical reflector which conceals a standard lamp is placed behind the vicar's stall, and this also illuminates the book on the lectern alongside. The music on the organ is lighted by a tubular lamp, with an adjustable reflector. The circuits are so controlled that almost any variation in the light can be secured at will.

The installation was designed and carried out under the supervision of Mr. A. A. Blythton, of Messrs. Duncan Watson & Co., the wiring being enclosed in heavy-gauge screwed barrel throughout. Although it has been run on the surface, especial care was taken to make the runs as inconspicuous as possible, and at a casual glance no evidence of the conduit is visible. Current is supplied from the D.C. mains of the Metropolitan Electric Supply Co., at 230 volts. The accompanying illustration has been reproduced from an untouched photograph taken by the unaided light of the fittings installed, and shows that no fittings are visible.

Electric Foot Warmer for Policemen.

Policemen on point duty, regulating traffic, &c., in cold weather are likely to suffer from cold feet in the literal sense. To cope with this trouble, the City Council of Pittsburgh, U.S.A., has adopted a device worked out in conjunction with Mr. Drew Johnston, of the Duquesne Light Co. It consists of a warming plate, 18½ in. square and 1½ in. thick, connected with an electric plug and switch on a pole at the curb. The intermediate connection is a flexible armoured conduit about 10 ft. long. The policeman, when he leaves his post or when the weather is not severe, carries his heater to the curb and pulls the plug from the socket. Mr. Johnston took the matter up with the experimental department of the Westinghouse Electric and Manufacturing Co., and the heaters were made by it. The switch controlling the heater permits of four temperatures, which can be changed to meet the rigors of the weather. At no time does the foot plate develop a temperature that will burn the soles of the shoes; the idea is not so much to warm cold feet as to keep the feet from getting cold. For all ordinary weather conditions the heater can be operated on less current than is required for two ordinary 40-watt lamps, such as are used in residence illumination.—*Elec. Review and W. Electrician.*

The Insulation of Joints in High-Tension Cables.

The extremely unfavourable conditions, such as limited space, damp atmosphere, &c., under which most high-tension cable joints have to be made have emphasised for a long time the desirability of improvements in joining methods and materials. Such improvements should, as far as possible, accomplish the following objects: (1) Minimise the time of exposure of the open ends of the cable; (2) facilitate the mechanical joining of the conductors by solder-

FIG. 1.—EXAMPLE OF CONCEALED CHURCH LIGHTING.

consultation with the illuminating engineering department of the British Thomson-Houston Co., Ltd., hit upon the happy idea of dispensing entirely with fittings as usually understood, and of lighting the church by trough reflectors concealed between the mouldings of the arches at the points where the latter spring from the pillar capitals.

Three Mirolox extensive type trough reflectors, each equipped with two 60-watt standard Mazda lamps, are provided on the east side of the pillars on both sides of the nave. Persons passing up the church, therefore, can see neither the fittings nor the light sources, the illumination being thrown forward and distributed with remarkable evenness throughout the building. The lamps and fittings can be seen, of course, when passing down the building from the east end. The value of the illumination on the working plane, e.g., on the top of the pews, averages between 2½ and 3-ft. candles, which is well above the figure usually allowed for church lighting. This permits of the congregation following the service in comfort,

FIG. 2.—CROSS-SECTION OF COMPLETED JOINT.

ing all three at the same time, thus avoiding the necessity of bending the conductor ends away from their usual position; (3) eliminate the necessity of replacing insulation over the exposed section of the conductors by hand-wrapping; (4) provide insula-

FIG. 3.—ASSEMBLED CELL PARTITIONS, ENCLOSING SLEEVE, AND ONE OF THE CONDUCTOR-SPACING BLOCKS

tion in such form as entirely to eliminate the variations and uncertainties due to workmanship, and so design the insulation of the joint that it is reduced to a simple mechanical assembly of

parts that when assembled must necessarily be in the proper position and uninjured.

To meet these conditions and produce a joint insulation which will equal that of the cable, the materials and joining method described below have been developed. The insulation, known as "Conducell," comprises a seamless outer sleeve of a material (micaite) of high dielectric strength, and three identical inner sections of such shape that they may be assembled singly after the three conductors are metallically joined. When the three parts are assembled there is an unusually long leakage path between conductors. Furthermore, the spacing around each individual conductor is elliptical, so that ample room is provided for the filling compound to flow freely into all spaces and leave no voids. The three inner sections when assembled interlock and present a uniform circular contour on their outer surface over which the seamless sleeve may be drawn. These insulating barriers are held in positive relation to the conductors by means of porcelain blocks like the one shown in fig. 3. The blocks ensure equal separation and amount of insulation between the conductors, as well as between them and the lead sheath. The length of exposed individual conductor is relatively short, resulting in materially reduced over-all dimensions of the joint.

The three inner sections, owing to their shape, may be placed between their respective conductors and brought into final position very readily. The operation requires only a few minutes, and no assistance from the splicer's helper. Besides reducing the cost of labour, this method of assembly minimises the length of exposure of the cut ends of the insulation to the atmosphere.

Tests on various sizes of commercial joints of this type have shown that they will withstand 200 per cent. normal pressure indefinitely and that the ultimate breakdown pressure is higher than that of the cable itself. A special compound has been developed for use with this type of joint.—*Electrical World*.

LEGAL.

ELECTRIC SWITCH MANUFACTURERS AND THEIR PREMISES.

In the Shoreditch County Court, on Tuesday last week, before his Honour Judge Graham, K.C., Mary Ann Rowlandson, sued Messrs. Marbro, Ltd., of Hackney, electric switch manufacturers, to recover £12 10s., being two months' rent of the premises they occupied, and an order for possession. It appeared that the present company purchased the business of another firm, who had entered into an agreement as to the premises as far back as 1909. The present company contended that theirs was a yearly tenancy, so long as they paid the rent, and that they were actually in negotiation for another lease for three years when they got the notice to quit.

For the defence, Mr. POYSER said the notice to quit was dated March 10th, and the plaintiff had actually taken rent to April 10th, which quashed the notice to quit. Mr. Rowlandson admitted receiving a cheque, and also paying it into the bank, but pending seeing his solicitor he had not sent any receipt.

JUDGE CLUER said the paying in of the cheque was fatal to the plaintiff's case, as legally it was the acceptance of rent. There would have to be a verdict for the defendants, with costs. No doubt more would be heard of the case later.

MUNITIONS CASES.

AN interesting decision was given last week by the Oldham Munitions Tribunal, in a case in which a fitter employed by Messrs. Ferranti, Ltd., asked for a leaving certificate, so that he could take up a foreman's position in a new National shell factory. The case for the man was based on the fact that it was for the National advantage that his skill and personal qualifications should have wider scope than he had in his present employment, and Sub-Sec. 5 of Sec. 5 of the Munitions of War Act, 1916, was quoted. This Sub-Sec. states that in determining whether the grant of a certificate had been unreasonably refused the Tribunal should take into consideration the question whether the workman had left or desired to leave his work for the purpose of undertaking any class of work in which his skill or other personal qualifications could be employed with greater advantage to the National interests. Mr. Asa Schofield (A.S.E.), who appeared for the man, said he could get another man to replace him in his present job. His present wages were 46s. for a week of 53½ hours, and there was overtime, and at the new shell factory he would receive £3 10s. for a week of 54 hours, and overtime at a corresponding rate. On behalf of Messrs. Ferranti's, Mr. Whittaker said they would be glad to have twice as many men in the tool room as they had now. It was imperative that this man should remain, and they were prepared to take every tool maker the Labour Exchange could supply. Mr. Schofield said he was satisfied that the skill of the man would be better utilised in the new job and he would replace him with an efficient tool maker. The Tribunal decided to grant the leaving certificate asked for, and Mr. Whittaker said he would appeal to the Ministry of Munitions against the decision. Mr. J. F. Hodgson (chairman) said the case was of importance to both sides, and he would afford every possible facility for appealing.

A girl employed as an armature winder applied to the Manchester Munitions Tribunal, last week, for a leaving certificate, on the ground that her health was endangered by her employment. No doctor's certificate was produced, and the firm stated that the girl's work was very important. The Tribunal refused the application.

LIGHTING REGULATIONS.

At the Police Court of a town in the North-Eastern counties on 13th inst., the assistant engineer-in-charge of an electric power station was charged with not obeying the instructions of the authorities to extinguish all lights. For the prosecution, it was stated that on a recent night, Zeppelins visited the county and dropped bombs. The police conveyed an official warning to the defendant, and the lights at the station were extinguished with the exception of those in the boiler house. These were allowed to remain lit from 10.38, when the order was given, until shortly after 11. Four bombs were dropped in a certain district, and at that time lights in the boiler house were on, but immediately after the report of these bombs, the lights were put out for the first time. Very shortly afterwards, two more bombs were dropped. The lights complained of were in a shed 150 ft. long, with a glass panel 6 ft. wide running along the roof, whilst in the side of the building there were six or eight windows 4 ft. square. The glass had all been whitewashed, but that was not sufficiently effective. The light could be seen for a distance of 400 yards on that particular night.—For the defence, it was stated that the lights were small and were left on to illuminate the water gauges. There were also four lights beneath the coal bunkers, and it might be that some degree of light escaped from these, though all the glass had been obscured with black paint. Defendant turned off the lighting current to the outside world, but unfortunately omitted to turn off the lights in the boiler house. When defendant heard the report of a bomb which was dropped four or five miles away, he woke up to his duties, pulled the switch and turned off the lights in the boiler house. It was a serious offence, and the defendant regretted it, but there was no wilful or felonious intent. The Chairman of the Bench, in announcing a fine of £10, together with £2 2s. solicitor's fee and £1 for witnesses, or 43 days' imprisonment in default, observed that at such a time a man in defendant's position should have been exceedingly careful, as it might have proved a serious thing both for himself and the people in the neighbourhood. However, the fact of defendant having lost his situation had prompted the magistrates to take a rather lenient view of the case.

DISPUTE ABOUT SPRINGS.

In the City of London Court, on April 13th, before his Honour Judge Atherley-Jones, K.C., an action was brought by the Lion Spring Co., Ltd., Oldbury, near Birmingham, against the Carleon Electrical Co., Ltd., 13, Queen Street, E.C., to recover £39 for 25,000 percussion springs and 25,000 detent springs, supplied to their specification, at 1s. 6d. per gross, for the Government. It seemed that the defendants had a contract to supply the springs to the Government in May of last year. The work was carried out, and cash was to be sent on delivery. Defendants refused to pay on the ground that the springs were not made in accordance with the specification, as they were too weak, and some of them were returned. Plaintiffs said that the Government Inspector agreed to pay for the springs because they were made before the specification drawing was altered. The defence was that the springs had not been accepted by the Government, and therefore plaintiffs could not expect to be paid. The Government official, when called, admitted that his inspection was not final.

JUDGE ATHERLEY-JONES said that that being so, the plaintiffs could not recover, and must be non-suited, with costs.

JUDGMENT SUMMONS.

In the Shoreditch County Court, on Tuesday last week, before his Honour Judge Graham, K.C., Messrs. R. Becker & Co., of 53, City Road, N.E., talking-machine electric motor manufacturers, sought to enforce the payment of a judgment debt of 12s. 9d., out of £5 12s. 9d., for goods supplied, from Wm. Saunders, of Cedric Works, Forest Gate. The defendant said the machinery at his place was not worth £100, but it might be worth £40 to £50; but all the same his business was in such a state that he was unable to pay 5s. a month. He used to have 22 men, but now had only four, as the rest had gone to the war: he was doing his best to keep his business going.

JUDGE CLUER: And you mean to say you cannot pay 5s. a month?

DEFENDANT: No, your Honour.

JUDGE CLUER: Committed for five days, suspended for 10 days.

KRUPP'S PATENTS FOR MAGNETIC SEPARATORS.

ON Thursday last, in the Patents Court, applications for licences to manufacture under these patents on the part of Messrs. Edgar Allen & Co., Ltd., were heard by the Controller of Patents. The previous hearing of the application of the Rapid Magnetising Machine Co., Ltd., was reported in our issue of April 14th. Sir G. Croydon Marks stated that Messrs. Edgar Allen & Co., Ltd., had an order from the Government for three Ullrich magnetic separators, which were urgently needed. They proposed to pay a royalty of 5 per cent. on the net selling price.

The CONTROLLER inquired as to the relationship between Messrs. Krupp and the patentee Ullrich, and it was stated that the patents were not the property of Krupp's.

The CONTROLLER granted both applications, the royalties to go to the Public Trustee: he said that the presence of an English machine already on the market took away any exceptional character which might be claimed to attach to Krupp's.

IDEAS AND ACTION.

THOUGH the Government restrictions on paper consumption form a very considerable handicap to journals whose object it is to encourage national trade and industry, they have not stopped the production of pamphlets and other literature concerning the trade and cognate problems arising out of the war. A number of these lie before us at this moment calling for attention. One writer,* in language giving no uncertain sound, argues against letting the Germans off easily, and states that a perfectly cold-blooded consideration of right and policy points to a relentless but impassioned treatment of a ruthless and unscrupulous enemy. The revulsion that is engendered by the horrors of war should, in his estimation, be the basis upon which our present and future attitude toward the German nation and the German individual should stand. The ineradicable dishonesty of the Germans in political and in economic affairs, their underhand intrigues, their organised hypocrisy, and their unscrupulous abuse of international hospitality, their use of their embassies and consulates as hotbeds of intrigue, are all summarised, once more leading up to the conviction that we must never again live with murderous thieves at large in our house. The bestialities and outrages on land and on sea, together with a review of the degeneracy of the people as revealed in German criminal statistics of peaceful life in their own land, are also produced by this writer to stamp the German people as "now and for ever beyond the pale," and our only way is to permanently deprive such a people of all power to impose their will by violence or intrigue. Until a new generation of Germans one day arises "we need not hate, but we must refuse to associate or to allow our people to associate with a nation rotten with a moral leprosy." Here the record ends—the sentiments are natural, we all hold them, we have expressed very much the same views ourselves a score of times, but the writer would have added to the value of his contribution if he had told us how all this was to be done, and how our international transactions as a whole would be affected if we were to decline to have relations with all the peoples of the earth whose standards of morality at home were different from our own. Moral depravity of a race has not generally been a bar to commercial transactions—we never should have made those early pioneering foreign trade relations to which we owe so much if we had first asked "for a certificate of marriage." Yet it is the Allies' duty to see that it is impossible for Teutonic commercial success to prepare the way for military measures in the future.

From this epistle of the hard-hitting quarantining apostle, whose sentiments we repeat, multitudes of men of British birth must share in these awful times, we turn to a second pamphlet in which Mr. A. W. Yeo, M.P., sends us his views on "Trade After the War." We agree with his prefatory note that a satisfactory commercial outcome of the war is only second in importance to our being victorious over our enemies in the field and on the sea. Mr. Yeo pictures the state of things when "immediately" the war is over five million citizen soldiers and workers on Army contracts will be clamouring for work. Nearly every one of our industries has been disorganised, and he dreads the interval between the cessation of war and the getting into our regular commercial stride, and he proceeds to give the advice already so frequently tendered, "Be Prepared!" He goes on to show how largely in our Home and Colonial domestic and industrial purchases, from toys to machinery, we have depended upon Germany, and holds out before us the prospect of benefiting British industry by keeping this

trade to ourselves. Free Traders, he says, must be prepared for a modification of our policy, but he adds that together with such modification we must of necessity devise precautions against the avarice of manufacturers—"the State must absolutely prevent the manufacturers from becoming unduly rich at the expense of the retailers and consumers." We find what is working in Mr. Yeo's mind in the "object lesson in paper"—the case certainly powerfully appeals to our journalistic sympathies. The Government restricted the import of pulp; there were vast stocks of paper in the country which had already borne the full cost of production; yet the State did not prevent the holders of these finished stocks from raising their prices from 100 to 300 per cent. "absolutely without justification," and thus "the State made to these paper merchants a gift variously estimated at from three to five million pounds," and the journals which foster the trade of the country, among others, must stand the racket. This illustration Mr. Yeo uses as an argument against the State interfering with the laws of supply and demand, and to show that if such interference is necessary, "such scandals" must be prevented. He would rather see us leaving the manufacture of cheap toys to Germany, and employing our present reducing volume of labour on more useful and profitable lines—machinery, gas and electrical fittings and motors are among those lines. Mr. Yeo says that owing to the increase in the employment of female labour, which "has come to stay," we shall, when the war is over, have increased our productive workers by two million persons, who within three years would increase the value of our output of goods by £300,000,000. But to do this we "shall require machinery and plant costing some £40,000,000, and there's the rub!" A scheme has been put before the Board of Trade which finds a way for getting that money.

We do not think that Mr. Yeo can have the engineering industries in mind, for they have vastly increased their plant capacity. He appears to think that the report of the Advisory Committee on Key Industries was not worth the cost of printing, but we hardly think that those who sit in a certain office in Kingsway will entirely agree with him. The Board of Trade was urged a year and a half ago to study every one of our 250 trades in detail, and to carefully select for development such trades as are the "most necessary, most profitable, and most practicable." We ourselves did our own little bit of urging even at that early date, and we deeply regret that it is only now that a series of specialised trade committees are beginning their inquiries. Mr. Yeo is appalled at the prospect of the great German dump, which he puts at £500,000,000. We heard a manufacturer say in public the other day that it was £300,000,000. The difference is not material—only £200,000,000—it is the menace of the dump that is the haunting spectre. We do not know upon what good authority the estimate rests—Germany is scheming a great dumping operation which may or may not affect electrical and engineering industries, that is the thing that matters. But in presence of this menace which some people, including, we believe, the Board of Trade, regard as more imaginary than real, what does Mr. Yeo advocate? Unlike Mr. Ford, he does not want to "quarantine Germany," what he wants is that the British nation shall be prepared. We quote:—

Inhumanly though she has acted, Germany is a country of seventy million people, and she must do trade in order to compensate Belgium. . . . I do not want to encourage German trade, but I know and feel that we really must have some of her wares as soon as the conflict ceases—as little as possible, but really there is much she produces, because of low wages and great skill, in which we cannot compete. It is foolish, then, to shout about doing no more trade with Germany. Surely, it is better to make such arrangements as will secure that we are top dog.

* P. J. Ford, "Quarantining Germany."

The conclusion to which all this leads Mr. Yeo is that our prospects of trade after the war are magnificent, but they are remote because (a) we have not taken, nor are we arranging to take, the proper steps such as intelligent discrimination, &c.; (b) we are not preparing to provide ourselves with the machinery required for commercial development. We must at once alter our plans, failing which "there is ahead of this country a period of great destitution, ending only when we come to our senses."

Now before we proceed to the third stage in our consideration of these literary productions, let us note that while Mr. Ford left Germany in quarantine, Mr. Yeo leaves her people free to trade because it is natural and necessary to do so, but he wants the Government and "we," whoever may be meant, to be prepared to employ our increased labour by laying out £40,000,000 to assist British manufacturing, so that we do not buy anything from Germany that we could and should be making advantageously ourselves. Mr. Yeo is at least an advance on Mr. Ford, who simply left us strafing.

We leave the "strafer" and the politician and turn to the philosopher.* Mr. Dunlop is nothing if not a philosopher, and though we confess that at times "much reading is a weariness to the flesh," we find his book on "British Destiny" on the whole a very interesting and profitable study, one that every thinking man in the industry, and out of it, too, would do well to study. We wish that we had more space to devote to it, for we agree with him that it is "ideas" that count in these anxious times when so many things are in the melting pot. He is unmoved by sentiment, makes us proud of our British civilisation, and sees reason to hope that we shall emerge from present disastrous happenings as a people refined in the fire, strengthened in character, more spiritual, drawn back to that high standard and tradition from which we were gradually falling until the clash of arms came, reminding us of our historic high moral standard as an example to the other nations of the earth. Mr. Dunlop leads us on through discussions on the equilibrium of society, the philosophy of co-operation, competition for quality, and the magic of industry, to a chapter on Free Trade or Protection. He has shown in an earlier chapter that a policy of reprisals is opposed to our lofty aims and traditions, and here he shows that in the matter of trade "time and energy will be wasted if we spend them in devising means of retaliation." "Methods of revenge will not promote our own national security—they will but perpetuate antagonism." "We must not be anti-German; we must be pro-British." Only a calm, collected, philosophical mind could traverse in thought with such a measured tread the bloody soil of Belgium, haunted by the abominations of terrible lust and outrage; or sail the Atlantic seas remembering the *Lusitania*; or travel among the wrecked cottage lanes of England, where babies and women were murdered by cowardly bomb-droppers, telling even the lofty British race not to be "anti-German." Pro-British yes; we will all be that, but let us be anti-German too—for a time at least. Who can help it—if he have a heart wherewith to love his friends and to hate the enemies of civilisation? But we must keep that "anti-German" spirit well in rein—that we rather imagine is what Mr. Dunlop would really ask of us. He is sufficiently anti-German—or, out of respect to him, we will say "pro-British"—to adopt a Protective Tariff as an instrument "required by present international conditions," and to be used wisely by a strong nation in order to estab-

lish reciprocity on equal terms between nations—"an instrument of negotiation"—and to finally prepare the way for international Free Trade. We presume that all the preceding chapters are intended to lead up to the scheme for Industrial Federation, which is outlined in the last. He advocates that the functions of many different organisations, each of them important in its sphere, should be co-ordinated without sacrificing or nullifying their individual work. The first step advocated is a conference of a few men with the co-operative spirit from each of the associations named, representing trade, employers, labour, scientific and learned societies, co-operative agriculture, and finance. They should establish a Federation, the general aim of which would be to preserve and promote national efficiency and the traditions and ideals which are the basis of the British Empire.

Now where do all these different writers lead us? Mr. Ford would put the enemy in quarantine until the national character is purged; Mr. Yeo says put your own house in order by encouraging essential industries; Mr. Dunlop leads us on to a high plane with noble conceptions of British destiny, and says assure that destiny by protective tariffs suited to the emergency and for the emergency alone, and by federating all the national forces of Capital and Labour, of science, industry, finance and agriculture, so as to make that destiny permanent and secure.

Do these things satisfy our industrial hunger? Are they food for men who have eaten humble pie too long, and who cast longing eyes toward an Economic Conference at Paris, who look for a compact between Great Britain and her Colonies and the Allies, who want to have more substantial relations with us in the near future? Ideas are all-important if they lead us on to right decisions when we descend to the deliberations of a practical conference of the kind that is awaited. It seems to us that one of the very first duties to be performed in connection with such a conference, or at any rate one that should follow it immediately, is an exhaustive inquiry by each of the nations engaged in it respecting their requirements in the matter of imports and their abilities in respect of exports. With such material at hand, together with some fairly reliable conjectures as to the possibilities of developing manufacture under the altered conditions that now obtain, and may probably obtain after the war, it ought to be possible to draft a practical scheme. But how can such material be ready in time unless it be now preparing?—the work would be of vast proportions. And how can such material be trustworthy unless it be prepared in part by industrial and business minds who know the factors? And how can it be well done if the Government policy be to "wait and see" until it is "too late"?

THE SELLING SIDE OF ELECTRICITY SUPPLY.—VI.

In the first of this series of articles we devoted our space to suggestions which would be useful to those having the management of showrooms; there were a number of observations that we were inclined to make, but refrained from, as they appeared to be obvious; that they might have been made with advantage will be seen from the following account of a visit recently paid to a London showroom.

This showroom is in a good situation in a flourishing district, and a considerable amount must have been spent in fitting it out. It is a thousand pities that such outlay should be practically wasted as far as advertising the advantages of electricity is concerned. The windows were not used to any good purpose, for they only contained a few hot-wire radiators of poor design, none of them alight; the

* "British Destiny: The Principles of Progress," by D. N. Dunlop, A.I.E.E.

one radiator running was a six-lamp pattern; four of the lamps were on, the two that were not alight were black and dirty. Several table standards, with tarnished metal parts and shabby silk shades, were alight. The other uses of electricity were "advocated" by a toaster and a few kettles, all of which wanted a good cleaning. Much the same state of affairs was discovered inside. The walls were sparsely covered with candelabra, of which the candles were leaning at various angles. The electric kitchen consisted of one modern cooker and several obsolete ovens; all the metal parts were dull and the insides dirty. On a table stood a disk boiler; the white cloth it stood upon was scorched in a dozen places through over-heating of the legs. There was also a very discoloured nickel-plated iron without connector or flex. Some vacuum cleaners were displayed; perhaps the dust on the floor and the cobwebs noticed on a fitting were being preserved for the time when a demonstration could be made. The only thing the writer fancied was a very nice sideboard. On a table, prominently placed, was a selection of publicity matter in which, amongst other claims for electricity, cleanliness was prominently mentioned. Comment is needless.

Unfortunately, this is not a solitary case. It were far better if showrooms were left out, than be so badly managed as to be a discredit to the whole service.

Those responsible for such exhibitions should disabuse themselves of the idea that the selling of electricity places them in a position of inherent superiority to other businesses. Merchandising electrical accessories and apparatus to be successful must follow ordinary commercial principles. Granting that our efforts are circumscribed by the shortage of many things owing to the war, there is no excuse for running what should be an up-to-date showroom as a museum or a curiosity shop. Rather than let stock accumulate and fall behind the times, there is no reason why a sale should not be held.

It is difficult to keep many of the nickel-plated and other metal finished apparatus smart. The best and cheapest way is to effect quick sales and a rapid turn-over of stock. Our remarks in previous articles as to frequent changes in the shop-window display were apparently unread, certainly not acted upon. We have at heart the improvement in methods and scope of the business-getting side of electrical supply, and an earnest desire to assist those engaged in this work. A showroom run on slipshod lines is an offence against the interests of the industry at large, and the undertaking to which it is attached in particular. It is clearly the duty of every profit-earning department to make that profit as large as possible. To allow the publicity department to be an unnecessary burden on the current revenue is to admit the arguments of those who take an adverse view of this enterprise in salesmanship.

There is no gainsaying the fact, whatever may be the causes, that our electrical showrooms in general make a very poor showing compared to the large well-fitted and well-stocked establishments of the rival industry. Let us, therefore, strive to remedy this; new departures may be out of the question for the moment, but there is nothing to prevent the showrooms already existing from making the most of themselves. A well-thought-out plan of operations should be determined upon. Dress the windows this month with irons, and offer a free trial; next month show vacuum cleaners at work; the following month, say, toasters and kettles—demonstrate them. Let your management be characterised by vigour, enterprise, and push. In salesman talk, don't be ashamed to express the faith which is in you. Believe in what you are saying if you wish your customer to believe it too. Yours may be only a small part, but play it for all you are worth if you want a larger. Never forget the rule: "What your hand findeth to do, that do with all your might," and you will eventually find yourself on top.

Application for Extension of Patent.—An application has been made by F. G. Creed, W. A. Coulson, and Messrs. Creed, Bille & Co., Ltd., for the extension of the term of patent No. 22,653 of 1902.

BUSINESS NOTES.

Bankruptcy Proceedings.—J. T. PEDDIE, mechanical engineer, Exhibition Buildings, Aldwych Site, W.C.—A composition of 5s. in the £ is payable on April 18th at the offices of Messrs. Elles, Salaman, Costes & Co., 1-2, Bucklersbury, E.C.

Liquidation.—MESSRS. H. A. HARVEY & CO., LTD. (in liquidation).—Mr. W. A. Henderson, the liquidator of this company, intends to apply for his release; any objection must be notified to the Board of Trade within 21 days of April 14th. The receiver for the debenture-holders, having now realised all the available assets of the company, can pay a dividend to the debenture-holders only; consequently, there will be no funds for the ordinary creditors of the company, or for the expenses of the liquidation.

Catalogues and Lists.—MESSRS. ED. BENNIS & CO., LTD., 28, Victoria Street, S.W.—Folder relating to their conveyors and elevators for handling coal and ash. A comprehensive catalogue will shortly be issued.

MESSRS. MARSHALL & PLUMTREE, 20, High Holborn, W.C.—Leaflets describing the "Hold-heat" electric glue-pots and cookers, fitted with thermostats to keep the temperature constant at the right value, in various sizes, and the "Clearway" electric horn.

Book Notices.—"Elementary Strength of Materials." By E. S. Andrews. London: Chapman & Hall. Price 4s. 6d. net.

The *Wireless World* for April has assumed a new cover, on which is represented the latest type of mast arrangement for receiving stations; the contents have also undergone rearrangement, and include a variety of interesting articles, technical and otherwise. It is a very "live wireless" production.

The Caxton Translations Institute, of Caxton House, S.W., has issued a wall card giving brief but useful information respecting the different countries of the world—population, imports and exports, ports, consulate address in London, &c.

We have received an advance copy of the Special China Number of the *Manchester Guardian*. A number of interesting articles serve to emphasise the greatness of the market and its opportunities for engineering and other traders.

Trade Announcements.—MESSRS. F. PAINE & SON, electrical and mechanical engineers, have removed to larger premises at 21, Old Road, Frinton-on-Sea.

MESSRS. AUSTIN WALTERS & SON have removed to larger premises owing to expansion of business. The new works at 57, Lower Mosley Street, Manchester, are five times as large as the old. A new department which has been fully equipped, regardless of expense, for the repair and rewinding of all types of armatures A.C. and D.C. has been opened, and the firm is specialising in traction work. The works have modern drying stores, and special attention is given to the careful test of all repair work.

LIGHTING AND POWER NOTES.

Accrington.—PLANT EXTENSIONS.—At the General Purposes Committee, on April 13th, communications were read from the L.G.B., &c., intimating that sanction had been given to the scheme for the extension of the electric generating plant and the erection of a new chimney and flues in connection with the destructor. The new generating plant will cost £14,000, and the boiler, chimney and flues £7,000. It was decided to proceed with the work. The provision of a tubular boiler, at a cost of £3,000, was regarded as unnecessary, and has, consequently, been dropped for the time being.

Altrincham.—NEW PLANT.—The Altrincham Electric Supply, Ltd., has successfully put into commission its first turbo-alternator set, which is one of 1,850 K.A.A., supplied by the B.T.H. Co., with a (C)le, Marohent & Morley surface condenser and Rees-Roturbu pumps.

Argentina.—The Government of the Province of Cordoba has authorised Messrs. Trelesi and Riesco to install and exploit an electrical service at Villa Huidobro, Department of General Roca.

Australia.—The gross revenue of the Melbourne City Council's electric supply undertaking for the year 1915 was £182,594, an increase over the previous year of £17,806; the expenditure was £82,745, leaving a gross profit of £99,849. The revenue derived from private and bulk supplies increased by £17,736; from private lighting the increase was £70. The increase in revenue from bulk supplies to adjoining municipalities amounted to £2,122, notwithstanding a considerable reduction in the price of current. Interest payments amounted to £22,219; and contributions to the sinking fund and depreciation and reserve fund absorbed £7,471 and £33,512 respectively. The net profit for 1915 of £35,569 was in addition to interest on capital and sinking fund charges, which together represented a return of over 10 per cent. on the £651,000 borrowed. The Electric Supply Committee in its report points out the desirability of forming a reserve fund for depreciation of machinery and non-remunerative expenditure, such as the storage of coal; £29,000 had been contributed to the town fund, including £2,200 deficiency in the lighting rate, the total contributions to the fund to date amounting to £108,645. The Committee proposes to transfer £165,394 from the depreciation and renewal fund,

and to write down capital expenditure by that amount, thereby reducing it to £581,748, and leaving at the credit of the renewals fund £55,131.

Barton-on-Humber.—STREET LIGHTING.—With reference to the dispute between the U.D.C. and the Electric Supply Co. over the public lighting account, the Council has decided by 10 votes to 6 to pay the amount claimed, less 10 per cent., without prejudice. The L.G.B., in declining to express any opinion on the matter, referred the Council to the remarks of Mr. Justice Low, in the Leiston case.

Continental.—PORTUGAL.—A Bill has been presented to the Chamber of Deputies to authorise the Municipality of Amarante to contract a loan of about £17,500, to be devoted to a hydro-electric installation for the production of power for lighting and other purposes.—*B. of T. Journal.*

SPAIN.—The Ministerio de Fomento has granted permission to Don Tomás Garmendia to utilise the waters of the Reburdiejos and Sejos streams, in the district of Los Tojos (Province of Santander), for the production of electric power for industrial purposes.—*B. of T. Journal.*

Application has been made for a concession to put down a plant to utilise the water power of the river Mendo, near San Pedro de Oza, in the generation of electrical energy for lighting and power purposes in the town named and surrounding neighbourhood. A derivation canal about a mile and a half in length will be necessary in connection with the plant.

Gravesend.—PRICE INCREASE.—The T.C., owing to the continued advance in the price of coal, has decided to add 25 per cent. to consumers' accounts from the quarter ending March 31st, the increase to be reduced to the original advance of 10 per cent. when fuel costs less than 25s. per ton.

Ilford.—STREET LIGHTING, &c.—The estimate in respect of public lighting for the ensuing six months, just approved by the Electricity Committee, shows an allowance of £1,000 for reduced lighting. The chairman of the Committee and the electrical engineer have been authorised to place orders for an additional 1,000 tons of coal for delivery over the next four or six months.

Ivybridge (Devon).—The local Electricity Supply Co. has leased Union mills for its undertaking.

London.—POPLAR.—The Electricity Committee is of opinion that a temporary increase of prices for current for power and public lighting purposes is necessary, and has fixed the increase at 10 per cent. as from April 1st last. It is estimated that the proposed increase, after making allowance for probable decreased demand, will enable a surplus of not less than £5,000 to be earned, while if coal is obtained at 2s. 6d. per ton less than estimated, the estimated surplus would be raised to £10,000 for the ensuing year. An annual surplus of not less than the latter sum is required to meet all demands upon the undertaking, and maintain the policy of providing for the cost of new services, meters, &c., and the writing down of plant out of revenue. It is not considered desirable to increase the charges for private lighting. The Committee proposes to adopt, experimentally, the Cumberland electrolytic process on a Babcock boiler and economiser at the works, at a cost of £200. Should the process achieve the results claimed for it, the Committee anticipates that the cost of installation can be met within a year. The Council has been recommended to grant a war bonus to the staff of 10 per cent. on present normal salaries and wages (including emoluments) under £200 per annum; 7½ per cent. on £200 and under £300, and 5 per cent. on £300 and upwards. In the case of the electricity department, it is proposed that those who have received a war bonus, or increase due to the war, should have the amount made up to 10 per cent., and should a profit bonus be available at the end of the ensuing year, the aggregate amount paid as war bonus during the year, as proposed, will be deducted from each individual share in profits.

ISLINGTON.—The Lighting Committee has adopted the electrical engineer's suggestion that during the war certain arc lamps should be altered by substituting high C.P. metal-filament lamps in the globes. The annual saving, exclusive of energy, will amount to £85 per annum.

L.C.C.—The Finance Committee recommends the Council to sanction the borrowing by the Bermondsey B.C. of £2,773 for electricity purposes, being £978 for mains, £1,410 for house services, and £385 for meters; also that sanction be granted to the Stepney B.C. to borrow £3,000, being part of the cost of the two new boilers in connection with the electricity undertaking; and to the Woolwich B.C. in regard to £27,115 for plant, and £385 for mains.

Manchester.—Tenders in connection with the scheme to increase the output of the Stuart Street electricity station have been approved. Mr. Pearce, the electrical engineer, submitted at a meeting of the Sub-Committee the total estimated capital cost of the scheme at £30,000.

Middleton.—STREET LIGHTING.—The town clerk gave notice, on the 13th inst., that the charge for current for lighting purposes has been increased by ½d. per unit, and that for power and heating purposes by 1½ per cent.

Radcliffe.—YEAR'S WORKING.—It was reported, at a meeting of the U.D.C. last week, that there was every possibility of a small net profit resulting from the year's trading of the electricity department.

Swinton.—PRICE INCREASE.—The U.D.C. has decided that owing to the extra cost of current, the charge to consumers be increased by 1½ per cent. It was stated that a Sub-Committee is to review the conditions on which consumers are supplied, and where it is found that they were served at a loss steps would be taken to terminate the contract and make fresh arrangements.

Ulverston.—E.L. SCHEME.—The R.D.C. has agreed with the Coniston Electric Lighting Co. as to the basis of the terms for electrically lighting the village of Coniston. No higher rate than 8d. a unit is to be charged, and the Council will have the option of purchasing the undertaking at any time after 10 years at the fair market value. The Council was also recommended that the proposed agreement shall contain a clause preserving the right of the Rural District Council or other local authority, or any company or person, with the consent of the local authority, to obtain a licence or provisional order.

Wafford.—PROPOSED LOAN.—The U.D.C. has applied to the L.G.B. for a loan of £3,300 for electrical supplies needed for war purposes.

TRAMWAY and RAILWAY NOTES.

Australia.—The half-yearly report of the Adelaide (S. Australia) Municipal Tramways Trust, to January 31st, 1916, shows that the net revenue was £63,401, the full statutory charges being £64,579, leaving a deficit for the half-year of £1,322. The gross revenue for the half-year was £160,463, or £7,180 more than in the preceding half-year, and £3,313 more than in the corresponding half-year ended January 31st, 1915. The capital cost of the revenue-earning portion of the electric traction system, excluding purchase money and stores, was £1,447,584. The surplus revenue over operation expenses (excluding the Port Adelaide horse-car account), was £63,401, and the percentage of working expenses to revenue was 60.333. The surplus revenue over operating expenses equalled 8.758 per cent. on the capital cost. The reserve fund for renewals now amounts to £97,426, and the insurance reserve to £7,926.

A motion by the Minister of Public Works, in the N.S.W. Legislative Assembly, that a bridge should be constructed to connect Sydney and North Sydney, at a total cost of over £3,000,000, was recently agreed to by 42 votes to 8. The bridge would carry a double electric railway track, double tramway track, vehicle and motor roads, and a footway.

Belfast.—At a meeting of the Tramways and Electrical Committee last week, it was intimated that at the present time there were 297 motormen and 298 conductors in the service of the Corporation. Of these 227 motormen and 182 conductors were in the service before the war, and 70 motormen and 116 conductors had volunteered into the Army—most of them for the famous Ulster Division. Only four unmarried men of military age have joined the tramway department since the war started, 62 under military age, and a number of over-age men, and some medically unfit and discharged soldiers.

It has been decided to give the new manager of the tramway system—whoever he may be—an annual salary of £800. The original figure mentioned was £700.

Croydon.—STRIKE.—On Monday, the T.C., by 34 votes to 17, refused an amendment to refer the matters in dispute with its tramway employés to arbitration. A further amendment, referring the matter to the arbitration of five local gentlemen, was lost by 26 votes to 22. There are 163 employés on strike, and 25 have remained loyal to the committee.

L. & Y. Railway Electrification.—The new electric train service between Manchester and Bury, on the Lancashire and Yorkshire Railway system, was inaugurated on Monday.

London.—The Holborn B.C. offers no objection to the application of the L.C.C. to the B. of T. for an extension of time for the construction of a junction line to connect the existing tramways in Clerkenwell Road with those in Farringdon Road.

Southport.—FEMALE LABOUR.—The Trades Council has decided to send a protest to the Corporation against the employment of women as tramway drivers. One member of the Council stated that, as one who had driven a car, he could unhesitatingly say that the job was not one that was suitable for women.

Sunderland.—The Tramways Committee recommended: "That on and from the 1st inst. the war bonuses be payable to employés in the tramways department varying from 2s. to 3s. 6d. per week, and that no employés shall receive, by reason of such bonus, a sum in excess of 50s. per week, including emoluments, and that the wages of tramway inspectors be advanced from 7d. to 7½d. per hour." It was stated that the advances recommended would mean an additional wage expenditure of £78 a year and the temporary advance in respect of bonuses of £624 a year. An amendment that the bonus recommendations should be struck out was lost by 27 votes to 3.

Worsley.—The U.D.C. is petitioning the South Lancashire Tramway Co. for the provision of additional shelters.

TELEGRAPH and TELEPHONE NOTES.

FORTHCOMING EVENT.

Belfast Association of Engineers.—Thursday, April 27th. Annual General Meeting.

Australia.—Wireless telegraphy throughout the Commonwealth will in the future be under the control of the Navy, and all men employed will wear uniform and belong to the "Royal Australian Navy Radio Service." This is a new branch of the Australian Navy. At present there are about 120 employed, many of whom were taken over from the Postal Department by the Navy Department in October last. It is intended at a later date to appoint an engineer for radio-telegraphy for the Commonwealth. In the meantime, Engineer-Lieutenant F. G. Cresswell will be acting, and the Minister for the Navy has made arrangements with Mr. J. G. Balsillie for him to have a retaining fee as consulting engineer for six months.

Wireless by Gramophone.—At the suggestion of the Marconi Co., gramophone records are now being made which reproduce the Morse signals as they appear in the microphone of a wireless receiver. These records commence with the simple Morse code, pass on to dummy messages, including figures, fractions, Stock Exchange terms, and other items of business importance, and culminate with examples of "jamming."

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—SYDNEY.—May 24th. N.S.W. Government Railways and Tramways. 16/600-volt D.C. motors for tramway stores, Randwick.*

MELBOURNE.—April 26th. Victorian Government Railways. Car-lighting material—cables, switches, fuses, &c.*

May 1st. City Council. Meters and maximum-demand indicators. See "Official Notices" April 7th.

May 10th. Victorian Government Railways. Motor-generator set and accessories for battery-charging of baggage trucks.*

May 17th. Victorian Government Railways. One 2-ton electrically-operated goods elevator for Julimont car-shed.*

New Zealand.—June 23rd. Oamaru Borough Council. Overhead mains and street-lighting equipment (Contract No. 2); power-station equipment (Pelton wheels, alternators, &c.) (Contract No. 3); service meters (Contract No. 4); line transformers and accessories (Contract No. 5).*

Salford.—May 8th. Electricity Department. High-pressure steel steam pipes and separator, also cast-iron pipes and valves. See "Official Notices" to-day.

Walthamstow.—April 26th. U.D.C. Water-softening plant for the Electricity Department. See "Official Notices" April 7th.

Warrington.—April 26th. Electricity and Tramways Committee. Boiler plant and economiser. See "Official Notices" April 7th.

West Hartlepool.—April 28th. Electricity Department. Two water-tube boilers with superheaters and mechanical stokers. See "Official Notices" April 14th.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Barnes.—The tender of the Pirelli General Cable Works, Ltd., has been accepted by the U.D.C., at £188, for 440 yards of three-core distributing cable.

Burnley.—B. of G. Electrical requirements: Messrs. F. Thornton & Co.

Dundee.—The T.C. has accepted the tender of Messrs. Venner Time Switches, Ltd., for time switches for the coming year, and that of Messrs. Chamberlain & Hookham, Ltd., for meters.

London.—L.C.C.—Seven tenders have been received for the construction of foundations, &c., for the third additional turbo-generator at the Greenwich generating station:—

W. Downs, Ltd.,	(accepted)	£4,751
W. M. Under & Co.,		4,927
G. G. Mann & Sons,		4,900
J. Jarvis & Sons, Ltd.,		5,290
J. E. White & Co.,		5,449
James Ford,		6,450
Charles Wall, Ltd.,		6,853
Architect's estimate, £4,500.		

The Stores and Contracts Committee recommends that the Committee or the chairman or the vice-chairman of the Committee be each authorised during the Easter recess to open tenders for the supply of electric traction glow-lamps for the Tramways Department.

A SENSITIVE RELAY FOR WIRELESS TELEGRAPHY.

THOUGH a great deal of energy has been expended in devising relays to make possible the calling and autographic recording of wireless messages, there is still plenty of room for fresh devices, and the relay illustrated diagrammatically in the accompanying figure presents a number of interesting features. It is claimed that the new instrument is superior to Dary, Ducretet and Brown's relays in respect of natural frequency and sensitivity. As described by E. Leimer in the *E.T.Z.*, the instrument consists essentially of a separately excited pot magnet, in the narrow air gap *d c* of which there is a coil *e*, consisting of several hundred turns of No. 50 insulated copper wire, wound in one layer on a pot-shaped celluloid former, which is carried by fine metal wires *f, g*, serving also as leads. The celluloid former moving with small clearance on the centre pole *c* provides damping, and the wires *f, g*, terminating on torsion and tension screws, provide a free suspension adjustable for sensitivity and frequency. Either a third wire parallel to *f* or *g* (in which case torsion screws are unnecessary), or a fine wire spiral carries relay current to a platinum contact *i*, opposite which is an adjustable contact screw *h*.

The relay is in effect a thread galvanometer, and is connected in the detector circuit. It can be made to respond to 4 microamperes when adjusted to a natural frequency of 0.5 second. In normal

working, natural frequency and sensitivity are adjusted, so that certain relay contact is made with about 25 microamperes in the moving coil. Limiting the permissible heating of the coil *b* to 40° C. in half an hour, a field of about 18,000 gauss is obtainable in the gap *d c*. Varying this field provides 1:15 or so variation in sensitivity, and the latter can be more than doubled again by the use of 0.02 mm. silver wire, instead of 0.03 mm. copper wire, in the coil *e*. Such fine silver wire can be insulated sufficiently for the present purpose by coating with a carbon-bisulphide lacquer, or by blackening in solutions containing carbon-bisulphide or sulphurated hydrogen.

In this and similar relays certain precautions are necessary to prevent sticking at the relay contacts. The moving contact should be a domed disk of burnished platinum of very small diameter, and the stationary contact should be tipped with a fine platinum wire, pointed and polished. The whole instrument should be spring-suspended under a dust-tight glass bell, and the local current controlled by the relay contacts should not exceed 100 microamperes at 1.5 volts; this current may be used to operate a step relay actuating a Morse printer. The inductance of the step relay must be neutralised by a non-inductive resistance in parallel and by a condenser across its contacts. Only by this means and by removing the step relay, Morse printer and current-carrying leads as far as possible and by bifilar winding of the spiral connecting to the contact *i*, can the main relay be kept reasonably free from outside influences when set to maximum sensitivity. The sensitivity of the primary relay may be appreciated from the fact that it records the ringing of a house bell, whose circuit passes 25 ft. away from the wireless installation, and the starting and stopping of electric trams 500 yards away.

The relay is only suitable for use with electrolytic detectors; crystal detectors give no results. By using two or more electrolytic detectors in parallel the relay can be made to record signals which do not affect it when a single detector is used; telephone reception weakens as the number of detectors is increased. For example, a single electrolytic detector received eight microamps. from Clifden (780 miles), but five detectors in parallel and balanced among themselves by potentiometer adjustment gave 30 microamps, and good relay-working, though with some elongation of dots. As few detectors should be used as will give good relay working.

A novel suggestion worth investigation is that a sensitive mirror galvanometer be used to throw light on or off the vanes of a "light-mill" or radiometer, the latter operating adjustable contacts, say, by magnetic effect.

NOTES.

Australian Engineers for Australia.—According to the *Melbourne Age* of February 26th, a competitive examination, held by the Government authorities for the purpose of selecting an electrical engineer for the telephone branch in Adelaide, at a salary of £528 a year, has resulted in the appointment of Mr. R. Lawson, formerly assistant engineer on the staff of the chief electrical engineer. Nine officers competed, and Mr. P. Kennedy, of Western Australia, was second on the list. The examination was held as the result of a protest by the Professional Officers' Association against the appointment of imported officers over the heads of Australians. The Postmaster-General decided that the merits of all officers should be tested. Mr. Lawson is an imported officer.

Complaints are being made in Australia with regard to the appointment, it being alleged that imported candidates were favoured, to the detriment of Australians, in the examination. An impartial inquiry into the circumstances is demanded by Commonwealth engineers.

One Too Many.—Owing to our having to proceed to press two days earlier than usual, we are unable to include the following letter in our "Correspondence" columns:—

As "one of the speakers who is connected with the electrical trade" referred to by you in your last week's issue under the above heading, I was very pleased to read your article, which, though somewhat severe in its criticisms, I gladly welcome as written with that frankness and openness which cannot fail to assist our common aim, viz., to bring about a complete change as well as a military victory over our enemy.

Let me assure you that the "British Manufacturers' Association, 1915" should be entirely acquitted of any narrow or one-sided views such as the article in question imputes to them, and the absence of any reference to efforts emanating from other sources was not due to any petty jealousy.

The Association is not unmindful of such other movements as you refer to, but, to imitate your own perfect frankness, it fails to find in them that "substantial progress" of which you speak.

I entirely agree with your argument that one strong representative organisation is what is needed, and this is indeed exactly what I advocated, but it must be strong in business ability and determination to act, and must not rely for its influence and standing on an executive composed of men of title or mere party speakers—enlisted as such—apart from any fitness for the real objects of such an organisation.

It was with these points in view that the British Manufacturers' Association was formed, and it is more than ready to act in union with any movement, old or new, that will tackle firmly and imperially the position which confronts us.

I trust you will do me the favour of inserting this letter in your widely read paper, in the hope that it may elicit criticism and exchange of views, useful to all those who are willing and anxious to help in these times to secure Britain for the British.

ARTHUR BERKELEY, M.I.E.E.

London, E.C., April 17th, 1916.

Electrochemistry in the United States.—The Niagara Falls section of the American Electrochemical Society in February discussed the development of power from the Falls in connection with the electrochemical industries. According to *Metallurgical and Chemical Engineering*, complaints were made with regard to the restriction of power development at Niagara by the U.S. Government. It was stated that the Niagara Falls Power Co. generated 90,000 H.P., and the Hydraulic Power Co. 100,000 to 125,000 H.P., all the latter, except 15,000 H.P., being employed in the electrochemical industries. Mr. F. J. Tone said that the year 1915 had taught them that a nation must be economically and industrially independent and self-contained. Crude potash, formerly obtained from Germany, had risen from £7 to £80 per ton; ferromanganese, derived from England, had been placed under an embargo, and its price had risen from £76 to £25 per ton, while many commodities had become almost unobtainable. Few realised to what extent their great basic American industries depended upon electrochemistry, particularly the electrochemical products of Niagara power. Steel manufacture, the greatest of all American industries, was absolutely dependent upon Niagara power for ferro-alloys; ferro-silicon was an essential element in the production of 15 million tons of steel; ferrochromium, ferrotungsten, and ferrovanadium were indispensable to the manufacture of high-speed tool steel, while ferrochrome was the hardening element in armour-plate and armour-piercing projectiles, and electrical transformer steel was equally dependent upon the products of Niagara power. Artificial abrasives to the amount of 20,000 tons a year were produced at Niagara, and were indispensable to many industries; aluminium and calcium carbide were the largest of the electrochemical industries at Niagara; nitrogen fixation works had been established on the Canadian side of the river, but employed only 25,000 H.P., whereas in Europe over 300,000 H.P. was devoted to the production of nitrogen fertilisers. For the spectacle of Niagara they were paying the price of a million tons of coal a week.

It was stated that from 125,000 to 150,000 H.P. was transmitted into the United States from the Canadian side, and that the continuance of this supply depended upon permits revocable by the Canadian Government. The generation of large quantities of additional power at Niagara on the American side was the only

way to avoid a "frightful dislocation of American industry." The development of the electrochemical industries had been the salvation of Germany, and should equally be undertaken by the United States as a matter of preparedness in national defence.

Late Legal.—READ v. STELLA CONDUITS CO.—The Court of Appeal, composed of the Master of the Rolls, Lord Justice Phillimore, and Mr. Justice Sargant, have delivered their reserved judgment on the appeal by the plaintiff in the action of Read v. The Stella Conduits Co.

The action was brought for an injunction, damages, and the usual ancillary relief for the alleged infringement of Letters Patent No. 18,375, of 1905, granted to James William Brooks and Albert Edward Read for an improved means for connecting tubular electrical conduits together, and for connecting the said electrical conduits to the fittings without screwing.

Mr. Justice Joyce held that the gripping arrangement was a well known and common one, and that as there was no invention in the patented appliance the patent was invalid. He therefore dismissed the action, with costs, and the plaintiff appealed from this decision.

The arguments upon the appeal concluded upon March 30th, when their Lordships reserved judgment.

Mr. Justice Sargant, who read the judgment of the Court, said that apart from one small variation the plaintiff's appliance was the same whether it was used for connecting a tube and a fitting or connecting two tubes, and, in the latter case, whether the two tubes were of equal or unequal diameter. What, therefore, was the invention as claimed by the plaintiff? So far as each function taken by itself was concerned, the method described in the plaintiff's specification was undoubtedly old. No doubt, however, in view of that fact the refreshingly short and intelligible claim in the plaintiff's specification was not for a method or appliance for effecting a simple single junction or connection of this nature with one tube, but for an appliance for connecting together the ends of two tubular electrical conduits or fittings in the manner described. Did this double connection, as distinguished from a single connection, disclose sufficient subject matter or sufficient invention to support the plaintiff's letters patent? In the opinion of the Court it did not.

The judgment of the Court below was therefore right, and the appeal must be dismissed, with costs.

On Monday an action by the Pritchett & Gold and Electrical Power Storage Co., Ltd., against Hamble, River, Luke & Co., Ltd., with reference to a contract for an electrical installation at the premises of a Mrs. Currie, began hearing before Mr. Justice Sargant. The hearing was adjourned.

Fatalities.—An inquest was held at Eston, on Wednesday last week, touching the death of Charles Morgan, an electric crane driver, who succumbed to injuries sustained at the Cleveland Steel Works of Messrs. Bolckow, Vaughan & Co., Ltd. John Steel, a crane driver, stated that he examined deceased's crane immediately after the mishap. Morgan had apparently stepped out of the cabin on to a beam, and had not taken the precaution to switch off the current. He had then evidently come in contact with a live wire, the resulting shock causing him to fall a distance of 40 ft. to the ground. William Anderson, electrical engineer, said the wires conveying current to the cranes could not be covered, and there was an alternating pressure of 440 volts. Dr. J. Steel deposed that Morgan's case was hopeless. Death was due to the shock from the fall, although it was very probable that the electric shock alone would have caused death. Verdict, "Accidental death."

Arthur Henry Booker, an electrical engineer employed at Messrs. Cammell, Laird's works at Sheffield, was recently killed owing to a plank, which fell from scaffolding on the roof of the power station, striking him on the head. At the inquest the verdict was "Accidental death."

Zinc Smelting in Norway.—H.M. Minister at Christiania states that the electrical refining of zinc has been developing on a gradually increased scale at Trollhattan for some years past, and has now reached an output of over 6,000 tons of refined zinc per annum. The ore is first smelted in the raw-material furnaces, and the ordinary spelter thus produced is then re-distilled in the refining furnaces. Refining is also being carried on at Sundlokken. For some time past plans have been discussed for increased facilities for smelting the ore, and it has now been decided to secure the necessary water power from the Glimfjord waterfalls, situated in Nordre Helgeland, in Nordland. These falls have been purchased by a company formed for the purpose, and when fully harnessed are calculated to yield 125,000 H.P. The works are expected to be completed by 1918, and the hydraulic power obtained will be used for smelting the ore and the refining process connected therewith.—*Board of Trade Journal*.

American General Electric: Bonus to Employés.—The General Electric Co., U.S.A., has announced that all employés in the service of the company for a period of five years or more will receive a bonus of 5 per cent. of a year's salary, payable in two instalments. This will mean a distribution of over £1,000,000 per annum to employés. The first instalment will be payable on or before August 1st of this year, and will be a sum equivalent to 5 per cent. of the individual earnings for the six months ending June 30th, 1916. By the arrangement of two payments many employés, who would not be entitled to participate in the distribution if all were paid in one instalment, will share in the second distribution, having completed the five years' service between June

30th and December 31st. The distribution, as stated by officials of the company, is being made by the company to signify its appreciation of the services of the employees who have been with the company for a term of years, and is a result of a desire to promote long, faithful and efficient service by its employees.—*American Electrical Review*.

L.C.C. Tramway War Bonuses.—The Rolling Stock Conciliation Board has considered the claims of the several grades of men in the rolling-stock section of the L.C.C. tramways to the war bonus of 4s. a week, and find that the moulders belong to a class dealt with by a decision of the Committee on Production dated April 17th, 1915, and that the other grades belong to a class dealt with at the conference on April 21st, 1915, and the Board therefore awards them the advance of 4s. per week as war wages.

A question having arisen as to the grades included in the memorandum of the conference of April 21st, 1915, the matter was submitted to the London and District Association of Engineering Employers and the London, Edith and Southall District Allied Engineering Trades Joint Committee. Having considered the replies of these two bodies, the Conciliation Board has decided that an advance up to 4s. a week, to be regarded as war wages, shall be paid to the undermentioned grades of employees in the rolling-stock section:—

Armature winders, wiremen, magnet and coil winders, armature banders, controller testers, body-makers, coach-painters, brush-hands, solderers, light and power attendants, controller repairers, machinery greasers, car greasers, stokers, plough repairers, locomotive drivers, crane drivers, steam lorry drivers, plough changers, controller and motor cleaners, assistant brakemen, truckmen, brakemen and re-wheels, writers, carpenters, wheelwrights, coach-trimmers, shunters, labourers (wood-working, electrical and mechanical), leading labourer (mechanical), tool-store attendants, traversermen, gate constable and patrol constable.

Except as regards armature winders and wiremen, the payment of the advance is to be made as from the first pay-day in March, 1916.

The payment of the advances to armature winders and wiremen is to be made as from the first pay-day in September, 1915.

Australian Electrical Contract Conditions.—With reference to the note appearing under this title in our issue of January 7th, Mr. R. H. Butler, secretary of the Australian Electrical and Allied Contractors' Committee of Melbourne, writes correcting the statements which we reproduced from an Australian contemporary. Mr. Butler says that the whole of the information is quite erroneous, and that his Committee "undertook the work of preparing conditions of contract to be applied to electrical and engineering contracts in Australia, and having drawn up a set of conditions, submitted them to the Federal Council of the Electrical Association of Australia, which body approved of them with slight amendments. The report of the *Australian Mining Standard* reverses the origin of these conditions by attributing them to the Electrical Association of Australia, and stating that they had been approved by representatives of electrical contractors."

The Royal Mint Report.—The Deputy Master, Sir Thomas Elliott, in his report for 1914, shows that the activities of the Mint were such that the previous record production of coins in 1913 was exceeded by more than 28 millions. Of the total coinage of 213 millions in 1914, 188 millions were for Imperial, and 25 millions were for Colonial issues. The Imperial coinage consisted of 19 million gold, 92 million silver, and 77 million bronze pieces.

The memorandum of Sir Edward Rigg, superintendent of the operative department, states that over 2,300 tons of metal were converted into coinage bars, this figure being more than double the average of the previous 10 years. In the machinery branch, the staff has been considerably supplemented and employed since August in the year under review on special work undertaken by the department. The electrical plant has been subject to a steady increase in the demands made upon it. Motors in use number 106 (gross H.P. 950), as compared with 102 (gross H.P. 877) in 1913. The extended use of high candle-power incandescent lamps has led to a reduction in the number of arc flame, and silica lamps from 64 to 57. The number of incandescent lamps in private residences in the Mint—121—remains unchanged, but those in official use have been increased from 1,151 to 1,298, mainly in consequence of the local lighting requirements for new machine tools in connection with the special work referred to above. The average monthly output of the Mint generators for the year—39,917 Board of Trade units—is 5,600 units above that for 1913.

In the Inland Revenue department, 1 copper, 173 nickel and 232 steel-faced electros were grown, in connection with the preparation of postage stamp plates and dies for postcards and wrappers. The work of preparing master plates and electros of the postmen's inscriptions in the Tower of London (see *EL. REV.*, October 13th, 1914, page 565) has been completed. In all, 45 electros and 66 master plates were produced, the total area of the former amounting to 3,200 sq. ft.

Sir Thomas Rose, chemist and assayer, in his memorandum, refers to the question of electrolytic refining of gold. The main drawbacks to the process at present are the length of time occupied, and the consequent impossibility of bringing the metal in a refinery to account daily. From experiments he has made in the department, he states that it would appear that by the use of an electrolyte containing 20 per cent. gold in the form of chloride, and 30 per cent. free hydrochloric acid, a current of 5,000 amperes per sq. metre can be employed, instead of the 500 to 1,000 amperes now used

with weaker baths. With this heavy current the percentage of silver in the anodes is of comparatively little importance, and the silver cells can be dispensed with in most cases, and, in addition, 80 or 90 per cent. of the time required in the gold cells can be saved. Under these conditions, the rich gold can be refined and brought to account within the limits of each working day.

Mr. A. Ventri, superintendent at the Perth branch, reports that on account of the extended use of compressed air for other purposes than the original one in connection with gold refining, a 10-H.P. motor has been fixed in place of one of 5 H.P. originally employed. An automatic controller, for regulating the speed of the motor-driven blower, has also been installed in the melting-house office. A hand regulator was formerly used in the blower room, but proved unsatisfactory, as the resistance units were destroyed by the action of chlorine. The new apparatus, which was made locally, has given good results, and maintains a uniform air pressure in the main, irrespective of the number of furnaces used.

In the memorandum of the assayer of the Ottawa branch, Mr. R. Pearson, it is stated that a trial has been made of the gold-plated silver hooks and strips referred to in the previous report (see *ELECTRICAL REVIEW*, October 23rd, 1914, page 566). The strips were found to be quite as efficient as those made of fine gold. That portion of the hook which passes through the hole in the end of the anode (and is virtually a part of it), is only 1 in. distant from the warm electrolyte. The moist hydrochloric acid fumes condense there, and, under the influence of the current, in about one month dissolve the gold plating, and the silver becomes coated with silver chloride, thus increasing the resistance to the passage of the current. It is intended to use plated strips in place of fine gold in future.

Institution and Lecture Notes.—**Institution of Electrical Engineers.**—The annual meeting of the NEWCASTLE-ON-TYNE LOCAL SECTION of the Institution was held on the 10th inst., Mr. P. V. Hunter presiding. The report of the Committee stated that the membership had not been greatly affected by the war except in the Students' Section. The average attendance of members had been slightly better than in the preceding session. With regard to the Tees-side Section, the report stated that owing to the war no meetings had taken place. The following were the officers elected for the ensuing session for Tees-side:—Chairman, Mr. M. G. S. Swallow; vice-chairmen, Messrs. H. G. A. Stedman and J. Pigge; Committee, Messrs. L. F. Haslam, R. M. Longman, J. R. P. Lunn, C. E. Taylor, J. Wright, and G. N. Wright; joint secretaries, Messrs. P. S. Thompson and C. O. Bretelle. Many members of the Newcastle Local Section and associated Sections hold commissions in H.M. Forces, or are otherwise engaged in the prosecution of the war, and the Committee regretted to announce that one member of the Local Section, Second-Lieut. W. Winkworth, had already laid down his life for his country. The officers elected for the next session were as follows:—Chairman, Mr. H. W. Clothier; vice-chairmen, Messrs. A. H. Marshall, A. P. Pyne; Committee, power supply undertakings, Messrs. W. F. T. Pinkney, G. L. Porter; manufacturers and contractors, Messrs. T. Carter, W. Cross, W. G. G. Guss, J. H. Holmes, M. G. S. Swallow; Post Office, Mr. F. G. C. Baldwin; technical colleges, Mr. W. T. MacCall; borough electrical engineers, Messrs. H. S. Ellis, C. Turnbull; consulting engineers, Messrs. J. R. Beard, R. W. Gregory, W. C. Mountain, G. Stoney; North-Eastern Railway Co., Mr. H. Henderson; hon. treasurer, Mr. C. Vernier; hon. secretary, Mr. J. R. Andrews; assistant hon. secretary, Mr. G. L. Drury; hon. auditors, Dr. W. M. Thornton, Mr. E. Fawcett. Dr. Thornton afterwards delivered a short technical address.

Ipswich Engineering Society.—At a meeting of the Society last month, Prof. A. Humboldt Sexton gave a lecture on fuel economy and gaseous fuel, in the course of which he emphasised the extreme importance of economy in the use of coal. He recommended water-gas as the best fuel gas obtainable, and looked forward to the time when the domestic use of coal would cease, and the smoke nuisance would disappear.

Royal Institution.—Recently Dr. Strahan, Director of the Geological Survey of Great Britain, lectured before the ROYAL INSTITUTION on the search for new coalfields in England. He pointed out that much progress had been made in developing the concealed coal measures of Yorkshire, Nottinghamshire, Denbighshire, and Kent. The latter was peculiar in that it was concealed everywhere. Referring to our happy-go-lucky methods of coal mining, under which it was not necessary to publish any record of borings, he mentioned that for a time the only published account of the Kent borings appeared in a German publication, and to-day some of the boreholes are not described anywhere else.

Homerton Sawmills.—On page 300, in our article on Mr. Sherry's sawmills an error occurred in the specification: for "50 per cent. overload for an hour and a half," read "50 per cent. for half an hour."

Municipal Loans for Storage Batteries.—The Local Government Board has, on an application made by the B.E.A.M.A., extended the period for the repayment of loans in respect of storage batteries from seven years to ten years, satisfactory guarantees being given.

Appointments Vacant.—Engineer-in-charge (45s. to 50s.), for the Northern Command, Catterick Camp; shift engineer, for the Northampton Corporation tramways. Belfast Corporation is to appoint a new general manager of the tramways, at a commencing salary of £800 per annum: "An Irishman Preferred."

Australian Preference.—At a meeting of the Sydney City Council, in February, the following proposal was discussed:—"That during the present war a 30 per cent. preference be given to goods manufactured by British companies on the price of works, and a 10 per cent. preference be given to goods manufactured by allied companies."

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Sydney City Council has been discussing the appointment of a deputy-manager of the electricity supply department. The proposal to appoint Mr. P. T. DAVIES, of Montreal, to the position was referred back by 12 votes to 11. The qualifications of Mr. S. J. MALING, of the Melbourne electricity department, have also been reported upon.

Mr. J. P. CROWTHER, electrical engineer to the Worksop U.D.C., has enlisted in the Electrical Corps of the Royal Engineers.

The Ashton-under-Lyne T.C. has agreed that the salary of Mr. HOLT, the tramways manager, be increased from £200 to £260 per annum, the amount paid to his predecessor.

Mr. HARRY PILLING, manager of Accrington Corporation Tramways, appears in the list of nine selected candidates for the general managership of Oldham Corporation Tramways.

Second-Lieutenant JOHN SEAR GIBSON, A.M.I.E.E., Royal Sussex Regiment, charge engineer at the Tunbridge Wells electricity works, was married to Elsie May Dean, of Wells-stone, Kent, on April 15th, 1916, at Sutton.

General.—Referring to notes which have previously appeared in this column, Mr. CHARLES H. BEST, of Bradford, writes:—"My attention has been called to a paragraph in your issue of April 7th, which refers to the relations between Mr. Charles Pullan and myself. I do not for one moment suppose that these relations are a matter of serious interest to your readers, still I cannot allow Mr. Pullan's statement to pass unchallenged. My connection with Mr. Pullan came definitely and finally to an end on February 4th. He knows this perfectly well, and I cannot imagine what purpose he thinks is served by the publication of a statement to the contrary. It is a question of legal fact, and not a question of anybody's opinion. Mr. Pullan is still consulting engineer to one or two existing village supply schemes, which he and I have jointly carried through, but in the case of all the new schemes in which I am interested, I am seeking the assistance of other consulting engineers. He has no interest whatever, in any of my work in connection with these new schemes since February 4th. I shall be very much obliged if you will kindly give the same prominence to this letter as you did to that of Mr. Pullan."

Mr. T. M. CAREY, until recently electrical engineer at the Golden Horseshoe Mine, Boulder, W.A., has been appointed electrical engineer to the Perth (W.A.) City Council. Mr. C. A. UNBEHAUN, electrical engineer, G.P.O., Adelaide, South Australia, has retired after 39 years' service.—*Commonwealth Engineer.*

Roll of Honour.—Sergeant JAMES MAGUIRE, of the Manchester Regiment, formerly employed in the Manchester tramways department, who was recently awarded the D.O.M., has been killed.

Private JOHN WILCOCK, of the King's (Liverpool) Regiment, who was formerly employed at the works of the Chloride Electrical Storage Works, Clifton Junction, has been killed.

The Distinguished Conduct Medal has been awarded to Lance-Corporal W. A. GOODR, Royal Engineers, who was formerly in the switch shop of Siemens Bros. Dynamo Works, Stafford. He joined in September, 1914, and gained the D.C.M. for voluntarily repairing, under heavy fire, telephonic lines of communication.

Private ALBERT HILL, of the King's (Liverpool) Regiment, who has died from wounds, was formerly employed at the British Westinghouse Works, Trafford Park.

Private L. BROWN, of the Manchester Regiment, who has been killed in action, was formerly employed in the Manchester electricity department, at the Dickinson Street station.

The Military Cross has been awarded to Lieutenant A. C. SPARKS, R.E., A.M.I.E.E., "for conspicuous gallantry and initiative when taking part with some infantry in a raid on the enemy's trenches. With a small R.E. party he made a very successful reconnaissance of the enemy's trenches, and then exploded charges in two concrete structures."

The following have been mentioned in dispatches (according to the last issue of the I.E.E. Journal):—

Major A. S. ANGIN, A.M.I.E.E., Lowland Signal Service, R.E.

Captain H. CAREY-THOMAS, A.M.I.E.E., London Army Troops, R.E.

Major L. EVANS, A.M.I.E.E., R.E.

Lieutenant R. K. MORCOM, M.I.E.E., Divisional Engineers, R.N.D.

CITY NOTES.

Marconi Wireless Telegraph Co. of America.

The report for 1915 states that before allowing for reserve, the net income was \$288,994, as compared with \$271,888 in 1914. Income from investments amounted to \$104,932, and, after setting aside reserves, the net profit was \$177,316, an increase of 18.3 per cent. on 1914. This has been added to the surplus, bringing it up to \$541,837 at December 31st last. The reserve at the same date amounted to \$373,415. Nearly 500 ships are fitted with Marconi apparatus managed by the company; a contract for standard installations on 36 large power barges for the Mississippi River has been secured, and since the beginning of 1916, 35 ships have been equipped. There has been no change in the commercial status of the trans-Atlantic stations, the high-power equipments remaining closed to business on account of the war. The British Admiralty still holds for Imperial Government use the English plants constructed to operate with the company's Belmar and New Brunswick duplex stations, and thus far, because of the war, it has been impossible to open similar direct service with Norway and Northern Europe through the newly completed high-power stations at Marion, Mass., and Chatham, Mass. Reliable and rapid service has been maintained between stations in California and Hawaii, and the volume of traffic shows steady improvement. The Hawaiian stations are known as two-way stations, being constructed so as to work with California and Japan simultaneously. The Japanese Government recently notified that its new wireless stations at Funabashi and Otetsu, near Tokyo, are complete and tests are now being made daily with a view to early inauguration of a public service, spanning 5,600 miles of the Pacific. Negotiations on traffic regulations are now in progress with the Japanese Government Department of Communications, and it is expected that by means of the Japanese Government cables the service will be extended to China, Manchuria, and other Far Eastern countries. The new circuit connecting the United States with Alaska was opened in August, 1915. All of the year's production of the factory at Aldene, New Jersey, has been rented, sold to patrons, or installed on steamships, in addition to which a number of sets have been manufactured on special order for the United States Government.

South Wales Electrical Power Distribution Co.—The report states that the business of the company shows a material increase during the year, the units sold amounting to 28,967,656, as compared with 26,510,198 sold in 1914. After payment of all working expenses and interest on prior lien debenture stock, and making provision for depreciation of new plant, the surplus amounts to £6,756, as compared with £5,347 in 1914. The indebtedness of £13,500 to certain members of the Treforest Co. for extra-charges having, as stated in the last report, been provided for, this surplus has enabled payment to be made of the interest on the old debenture stock for the half-year to December 31st last—£5,000—leaving £1,756 to be carried to suspense account, and making, with the balance to the credit of this account at the end of 1914, a total of £3,999.—*Financier.*

Great Northern Telegraph Co., Ltd.—At the general meeting, which will be held at Copenhagen on May 6th, the board will propose to pay a total dividend and bonus of 22 per cent. for the year 1915, including the 5 per cent. already paid, and to transfer to the reserve and renewal fund (reduced by £233,202 on account of depreciation of securities) and to the pension fund the following amounts, namely, £138,889 and £22,222 respectively. It is, further, proposed to transfer an amount of £27,778 to the renewal fund for cable steamers, and to set aside £83,333 for extraordinary income taxes.

Dawlish Electric Light and Power Co., Ltd.—The war considerably affected the undertaking during 1915, but though there was a standstill in consumers and in revenue for current supplied, and a great increase in cost of coal and stores, the gross profit was very little less than in 1914. £200 has been put to depreciation fund for investment in 5 per cent. Exchequer Bonds. The net revenue balance applicable for dividend was £205, and, after paying a dividend of 1½ per cent., free of income-tax, on the ordinary shares, £121 is carried forward.

Reading Electric Supply Co., Ltd.—The accounts for 1915 show that, after providing for interest charges and setting aside £3,500 for depreciation, a credit balance of £1,262 brought in was reduced to £453.—*Financial News.*

Anglo-American Telegraph Co., Ltd.—Interim dividend for the quarter ended March 31st, 1916, of 15s. per cent. on the ordinary stock and £1 10s. per cent. on the preferred stock, less income-tax.

Vickers, Ltd.—Final dividend of 1s. 6d. per share, or 7½ per cent., free of income-tax, making 12½ per cent. for the year.

Telephone Co. of Egypt, Ltd.—Including £164,276 brought in, the accounts for 1915 show a profit of £232,143. A further dividend of 6 per cent. is recommended on preferred and deferred shares, making the usual 10 per cent. for year, carrying forward £193,469.

La Plata Electric Tramways, Ltd.—The accounts for 1915, including £6,614 brought in, and after providing for debenture stock and other interest, show a credit balance of £12,142, which is to be carried forward.

Brazilian Traction, Light and Power Co., Ltd.—A dividend of 1 per cent. on the issued ordinary capital stock, is announced.

STOCKS AND SHARES.

SATURDAY AFTERNOON.

As usual at the Easter season of the year, publishers' exigencies render it necessary to write well in advance of the usual day of the week. The only reason for drawing attention to the sub-heading of this column is that quotations may have altered before the middle part of next week, and therefore it is advisable to point out that these notes are being written on Saturday afternoon.

Dramatic rises have occurred in the shares of the telegraph companies. This is due to the fact that the two Eastern undertakings and the Western Telegraph have all increased their dividends from 7 per cent. to 8 per cent. for the year, a surprise that was as pleasant as it was unexpected. The effect has been to stiffen quotations for other telegraph issues; and the difficulty is to get hold of any stocks in this market.

The position as a whole in the Stock Exchange is decidedly good; and although business fell away to some extent as the Easter Holidays approached, there is still sufficient to keep a fair proportion of its members profitably occupied. A steady rise in the price of the War Loan created a good impression upon all the investment markets. Practically every section dealing with industrials is in a thoroughly healthy condition as regards prices, and some of them are remarkably busy. The feature amongst Home Rails is a recovery in Metropolitan and a further rise in Underground income bonds.

Metropolitans spurred to 25½, being a rise of ½ on the top of their previous advance of 1½. At the present price, the yield on the basis of last year's dividend of 1 per cent. is under 4 per cent. on the money, so obviously there must be some further reason than yield to be sought for the rise. This reason has not yet become apparent, although there are various rumours current to account for it. Underground Electric incomes have again improved, this time to a small extent. In Districts there is not much doing, and some of the buyers who got in just before the three-points rise are evidently not unwilling to take their profit.

The three telegraph companies alluded to above have all declared dividends of 8 per cent., against their previous 7 per cent. This is the first time that the Eastern has made a change for 18 years, and the Eastern Extension for 27 years; while the Western has paid 7 per cent. for the past quarter of a century. The immediate effect upon prices was to send them up with a leap, and to render stock almost unobtainable. We know of one case in which a buyer was lucky enough to get stock at 137, which he sold, within an hour 4 points higher up. The companies are to be cordially congratulated upon their achievements; and the intensely conservative character of the boards is ample guarantee that the change would not have been made unless the directors felt entirely convinced that the increased distributions could be maintained.

Other telegraphs are better in sympathy. Great Northerns and Indo-Europeans are both somewhat nominal, inasmuch as the offer of shares is wanted and there is no supply. Globes rose to 11. The American group is not affected. Marconi shares eased off to 2 3/16 sellers on the appearance of the report of the American company, which is not as good as some people had hoped it would be, having regard to the recent buying of the shares from the United States.

The manufacturing shares of the telegraph group have not yet sympathised with the rise in the cable companies' issues, but it is taken for granted that they are pretty sure to do so. Iron and Steel concerns, and those connected with chemical companies—e.g., Castner-Kellner—are showing marked strength, with demand eager not only from the provinces, but from London, too. British Westinghouse preference are conspicuously good, securing a gain of 1/16 on top of the deduction of 3s. dividend.

The electrical supply shares are steady, without exhibiting any particular alteration. Indeed, this section of the industrial market is still almost the quietest of them all. There is, of course, nothing to attract popular attention just now; while the advent of summer affords an additional reason to those already familiar for the market quietude. Nevertheless, the good yields obtainable from the principal shares are not lost upon investors with sufficient patience to investigate their proposed purchases in advance. South Metropolitan ordinary

are better at 14s., but no shares have changed hands for the last two months.

Most of the Mexican stocks and shares have given way, upon what looks like a joining of forces between Villa and Carranza, in opposition to the United States. This novel turn of the kaleidoscope seems to have disturbed the Americans rather badly, although it was not wholly unlooked for by London observers of the situation.

The report of the Mexican Northern Power Co. throws interesting light upon conditions in the country. Between last October and December the Villa currency had no purchase value whatever. During this period the company continued to issue Villa money up to 25 per cent. of the pay roll, but redeemed all money so paid out by various temporary devices, the principal of which was the establishment of a butcher's shop. So ingeniously were payments of wages arranged that the result, says the report, was that "the labour cost per unit of work done was only about one-half of that which it had been in normal times." Brazil Traction is a little easier at 54, and the Argentine department is inclined to be heavy.

The most active part of the Stock Exchange is the rubber market, where, notwithstanding a fall in the price of the raw stuff, an extraordinary amount of buying continues day by day. For this the issue of the spring reports is mainly responsible, because they show that the leading companies, and many of the younger producers, are earning extremely handsome profits, while the big dividends now being declared are likely to be exceeded by those to be paid in respect of the current year.

ELECTRICITY IN MINES.

THE Report of the Chief Inspector of Mines (Sir R. A. S. Redmayne) for the year 1914, Part II, deals with the Report of the electrical inspectors.

It appears that on the outbreak of war Mr. Nelson, who was the Electrical Inspector of Mines, took up military duties, and his work was taken over by two junior inspectors, Messrs. W. E. T. Hartley and W. J. Charlton, the former taking Scotland and the Northern divisions, and the latter the four other divisions.

The following table shows the aggregate horse-power of electric motors in use above and below ground for the various divisions :—

Division.	Surface. H.P.	Underground. H.P.	Total. H.P.
Scotland	30,183½	106,972½	137,155½
Northern	78,936½	90,875½	169,811½
York and North Midland ...	65,857½	57,790½	123,648½
Lancashire, North Wales and Ireland	13,117½	22,502½	35,620
South Wales	93,832½	100,443½	194,276
Midland and Southern ...	12,164½	41,105½	53,270½
Total	294,092½	419,689½	713,782½

The following table shows the increase in 1914 over the figures for 1913, which is very satisfactory, and shows that electricity is steadily making headway in mines :—

	1913.	Per cent. increase on preceding year.	1914.	Per cent. increase on preceding year.
Surface... ..	256,675½	32·24	294,092	14·58
Underground ...	371,421½	17·29	419,689	13·00
Total	628,097½	22·97	713,782	13·64

The number of electrically-driven coal-cutting machines in use at the end of 1914 was 1,415, an increase of 108 over the number in use at the end of 1913.

During the year 1914 there were in all nine fatal accidents, definitely due to electricity, investigated by H.M. Inspectors of Mines, causing nine deaths.

Of the nine electric-shock accidents above referred to, five took place on the surface and four below ground. The figure for electric-shock accidents below ground, which last year had begun to show an upward tendency, has decreased considerably as will be seen below :—

Number of persons killed by electric shock below ground in coal mines—1907, 10; 1908, 12; 1909, 13; 1910, 15; 1911, 9; 1912, 7; 1913 and 1914, 4.

The figure for 1914 by comparison with 1913 is very satisfactory considering that the horse-power of electric plant in use below ground increased by 13 per cent. during the year. We have previously given details of these accidents.

In regard to machine mining, the following table gives the number of machines in use and the quantity of mineral obtained by their use.

DIVISION.	Number of collieries where machines are at work.	Number of Machines.	Worked by			Number of face coal at work.
			Electricity.	Compressed air.	Mineral obtained. Tons	
Scotland... ..	230	913	747	166	9,195,615	128
Northern	92	702	556	546	3,574,302	68

Rotary heading	—	11	6	—	—	5	22
Total	166	546	375	365	87	139	1,678
Total in 1914	913	702	725	399	131	223	3,093
Total in preceding year	876	665	673	393	115	175	2,897

* As these machines cannot be driven by electricity, the table really shows that out of 1,678, 922 *must* be driven by compressed air, whilst the remainder, 756, *might* be electrically driven.

In regard to shot-firing, it is interesting to note the usefulness of electric city in this dangerous undertaking. The following table shows the amount of explosive used and the number of shots fired by electricity, fuse, and squibs, from which it will be seen nearly half the total were fired by electricity.

DIVISION.	Quantity of explosives used, lb.	Estimated number of shots fired.			Total.
		By electricity.	By fuse.	By squibs.	
Scotland... ..	7,170,725	1,741,643	8,438,409	643,971	0,884,023
Northern... ..	9,051,904	7,012,173	1,094,354	8,538,275	16,644,784
York and North Midland ...	1,894,810	3,606,076	504,681	900	4,111,657
Lancashire, North Wales and Ireland ...	1,918,654	4,930,905	242,390	—	5,173,292
South Wales	2,401,728	2,918,872	985,756	269,475	4,174,106
Midland and Southern ...	3,053,277	2,624,364	2,167,89	309,521	5,101,784
Total in 1914	25,521,098	22,834,030	13,493,488	9,762,128	46,089,646
Total in preceding year	26,335,195	23,179,841	14,608,721	11,015,720	48,834,286

The use of electric safety lamps is also extending, as is shown in the following table :—

DIVISION.	Total number in use.	Method of locking.			
		Lead rivet.	Magnetic.	Screw.	Other.
Scotland... ..	3,365	290	3,047	—	24
Northern	6,987	4,510	2,469	—	8
York and North Midland	38,055	5,516	32,443	—	76
Lancashire, North Wales and Ireland	2,398	1,532	851	—	15
South Wales	23,066	1,195	21,866	—	5
Midland and Southern ...	1,856	744	1,096	—	16
Total in 1914	75,707	13,787	61,772	4	144
Total in preceding year...	37,823	14,604	22,756	219	214

The figures show that nearly 40,000 electric lamps replaced a similar number of oil lamps. The total number of oil lamps in use during the year 1913 was 740,001, which was reduced to 679,572 in 1914.

THE EFFICIENCY OF LABOUR.

By E. E. HOADLEY, M.I.E.E.

An oft-quoted definition of an engineer is "A man who can do for eightpence that which any fool can do for half-a-crown"; in other words, an engineer is a man whose duty it is to make the most out of anything and to use material and labour to the greatest advantage.

In the domain of Central Station Engineering (to which the writer only intends the present article to apply), it has been his impression, gathered from a large number of central stations that he has visited, that in some of them, at any rate, greater efforts are made towards economy in material than towards economy in labour. The word economy is here used in its best sense and has no connection with parsimony.

At times such as the present, when conditions in the labour market are about as bad as they possibly can be, and when mighty happenings in the relations between capital and labour are being conceived in the brains of the leaders of labour, it behoves everyone who is in a position to do so, to help in however small a way in drawing employers and employed more closely together and convincing them that after all, and in the widest sense, their apparently divergent interests are in the main identical.

The writer wishes to make it quite clear that this article is intended to be absolutely non-political and non-socialistic, and that he is merely putting on paper his convictions, the result of many years' experience, as they apply to electricity supply.

In any manufacturing works, economy in the cost of output depends to a certain extent, either greater or less, on the way in which the workers perform their allotted jobs.

It may be urged that an electricity generating station is not a manufacturing works, in the usual acceptance of the definition, but I think it will be agreed that the conditions are sufficiently alike for the goodness or badness of the labour employed to have a very decided effect on the financial results.

The methods and means by which labour in an electricity works can be employed most profitably are management and supervision—management being the brains that so apportion and arrange the work that each man is working efficiently; supervision, seeing that those arrangements are being carried out. But, in spite of good management and good supervision, the best results cannot be obtained unless the men themselves have their hearts in the work and are made to realise by some means or other that in doing their best for their employer they are also doing the best for themselves.

For many years past bonus schemes or profit-sharing schemes have been in operation in electricity supply stations, but until quite recently conditions have not been stable enough to enable a satisfactory scheme to be got out which should at the same time be simple, equitable, and easily understood by the men.

The writer has evolved several schemes of this nature, and one or two have been put into operation, with more or less satisfactory results, but owing to various causes they have all died a natural death.

It is much easier in a company-owned concern to draw up a scheme which shall be to the advantage both of the men and of the company, than it is in a municipally-owned undertaking; the reason being that in a company-owned supply the primary object is admittedly the making of profits in order to pay dividends to the shareholders, which at once gives the basis of a satisfactory scheme. In a municipally-owned undertaking, the first aim of those responsible is, or should be, to give a supply at the lowest possible price consistent with keeping the under-

taking in a sound financial condition, and not the making of large profits. This complicates any system of co-partnership based on profits.

The author has tried a system based on cost per unit sold, but here again the constant alteration in conditions, brought about by the installation of more economical plant, finally brought the scheme to an end.

After carefully reviewing the various schemes which have been and are in operation in municipally owned undertakings, and after giving much thought to the problem, the writer is strongly of opinion that a scheme of this nature makes for the best interests of the undertaking and of the men themselves.

The next question is—How shall it be worked out and on what shall it be based? Here again, after much argument and weighing the pros and cons of the various bases for a scheme, the author considers that at the present time most supply stations are proceeding along more or less regular lines, and it is possible to estimate with fair accuracy the revenue and costs for twelve months' ahead. It is, or should be, possible so to arrange the charges for the supply as to ensure the total costs being covered and a margin of a predetermined amount left over and above these, this margin being net profit.

With these premises it is not difficult to draw up a scheme, having as its base profit-making, giving to the staff a certain percentage of the profits and increasing the percentage on all profit made over and above the estimated amount.

The method of dividing up the bonus due to the staff has had a good deal of consideration, and in the end the author considers the simplest and fairest method is to divide up the total amount in the proportion of the total annual earnings of each man as wages.

The writer is about to put a scheme drawn up on the above lines into operation in the station of which he has control, and it will be interesting to see how far his hopes and ideals are borne out in actual practice.

There is, in addition to the general bonus scheme outlined above, another special bonus scheme on which the writer sets great store, and which he has had in operation for some years with much success. This is a bonus payment to the stokers, based either on the lb. of coal burnt per unit generated or on the lb. of water evaporated per lb. of coal burnt. The details of such a scheme are easily worked out for the local conditions pertaining to each station, but in the writer's case 10 per cent. of the saving in fuel costs below a certain fixed figure is divided among the stokers. The figures for each quarter are fixed beforehand and posted in the boiler house.

This coal bonus to the stokers should be worked in addition to the stokers participating in the general bonus scheme, as in all but the largest stations the work of the stokers has a large influence on the costs.

The above schemes are, in the opinion of the writer, well worthy of consideration; that they are open to improvement is beyond doubt, but time and future circumstances will enable these improvements to be made. In the main, however, any arrangement such as the above must do a certain amount of good, as it convinces the men that they are working for the best of all masters—themselves; in so doing they realise that any saving they can make is for their benefit as well as that of their employers, and the general body of the men will not tolerate for long a man who is a slacker and not doing his best.

In settling the amounts to be paid as bonus to the men, the writer considers that the amount it is possible for each individual to earn should be substantial, and enough to make the man try his best, yet it should not be sufficiently large to be looked on by the man in the same light as wages.

In conclusion, the author would express his thanks to Mr. Bowden, of Poplar, Mr. Hall, of Burton-on-Trent, and Mr. Seabrook, of Marylebone, for help and suggestions received.

SWITCH CONTROL FOR AUTOMOBILES.

(COMMUNICATED.)

THE great popularity at present enjoyed by automobile electric lighting and starting sets is to be traced in no small degree to the ease of control available, a simplicity of arrangement, however, which has unfortunately resulted in a lack of investigation on the part of designers and others most closely concerned. The advantages and conveniences of electric light may be enormously increased by an intelligent appreciation of switch control, for this is a matter which, in the hands of a few, has undergone even more wonderful changes than the design of the electrical fixtures themselves.

The correct disposition of the light units and the advantages of an electrical supply are but two of the points to consider when an electrical installation has been decided upon.

The third, and equally important point, is the switching arrangement adopted. Given a clear grasp of the latter, then, and only then, can the manifold advantages of an electrical supply be fully appreciated.

The matter is one which is closely allied with that of the furtherance of the motor industry in this country.

The American sets are nearly all standardised, and, having decided upon a particular method of control, the same is incorporated as a fixed unit of a standard machine. In our country it is almost safe to say that the choice of the electrical equipment and control thereof is left to the individual taste and requirement of the customer. The result is lack of standardisation and a corresponding increase in the cost of the set provided.

There should be a standardised method of control adopted for each particular case requiring consideration. The necessary switch-gear is available, and by a closer co-operation between the various interested parties a step in the direction of standardisation of electric sets for car purposes would be taken.

In the following notes some brief control outlines are indicated, and while not claiming originality for the same, the author is of the opinion that consideration and criticism may lead to a more intelligent appreciation of the advantage and ease of electrical control taking place.

Improved Controls Available.—The interior lighting of cars is usually left in the hands of the occupants. Improvement is possible by arranging a dual control, a two-way circuit, with one switch inside and the other outside near the driver, enabling the latter to switch on when the car is about to be occupied, or to switch off if the late occupants should have forgotten to do so.

It is possible also to arrange for the control of electric heaters in much the same way. A heater should be controlled by a pilot switch and a pilot lamp fitted in a conspicuous place, independent control being given to the driver if a two-way circuit is used with the pilot lamp.

Automatic step or foot-board lighting is easily arranged for by the insertion of a spring-on switch let into the door jamb, and the convenience of this form of control should lead to its universal adoption for all enclosed cars, at least.

The usual method of signalling to the driver is open to objection, and frequently it is impossible in traffic to make oneself heard from the inside of the

car. Silent communication by means of coloured lights is, however, a perfectly sure and safe method at all times of the day or night.

All that is required is two small dash lamps and a switch inside the car. The "Twinob" switch, to quote one example, arranges for the operation in the following way: Right-hand lamp on—Turn right. Left-hand lamp on—Turn left. Both lamps on when running—Stop. Both lamps on when standing—Start.

In this way all communication dangers, which are always present, especially in traffic, are avoided, and a simple standardised method of control is adopted.

The elimination of unnecessary switches and the corresponding simplification of the wiring are points that should appeal to all who are interested in the furtherance of the motor-car industry.

In many cases a single switch may be made to perform numerous operations, such as putting both head and side lamps in parallel or series for full or dim running, while at the same time providing a control for the tail light.

Other combinations can quite easily be arranged, as it is merely a matter of stating the requirement and then choosing the switch capable of performing the necessary operation.

The whole point is that the improved controls are available, and that far from being in any way mysterious they are the simplest pieces of mechanism, and are merely the results of pushing electrical considerations to a logical conclusion.

What is needed is co-operation between those interested in the sale and utilisation of electric sets and those manufacturers who have studied the means of utilising the current to the best advantage. In this way quite unnecessary cost and complication can be eliminated. The system can be reduced to the simplest one possible, satisfying the necessary requirements, and a standardised method of control arrived at. Intelligent co-operation is the secret of the whole matter.

REVIEWS.

Wireless Telegraphy. By DR. J. ZENNECK. Translated from the German by A. E. SEELIG, E.E. London: Hill Publishing Co. Price 17s.

This book is not, as the author is careful to explain in the preface, merely an abridged edition of his original German publication. In adapting it to keep pace with the progress of the subject it has become essentially a new work.

As one of the foremost German authorities on the theory, if not also the practice, of wireless telegraphy, the book possesses great interest as a disclosure of the theory and practice as it is viewed in Germany at the present time. In the first chapter on condenser oscillations there is evidence of thoroughness and clear grasp of principles in many directions which make the usual slipshod text-book explanations appear feeble. As an instance, in referring to the energy losses in the spark gap, the author is careful to term the effect concerned "gap decrement" and to explain the precise factors involved in this quantity rather than to talk in a loose and misleading way of the resistance of the spark gap, as though it were a fixed and definite, instead of a highly variable, quantity. The degree of ionisation of the spark gap, and, therefore, its conductivity, necessarily varies with the current passing at any instant; the resistance therefore suffers a large cyclic change in each half-period of the oscillations, and a full appreciation of the magnitude of this change and the various factors controlling it is necessary to a proper understanding of spark gap effects, especially quenched spark gaps.

A useful part of the second chapter is that dealing with the theory of series capacity and inductance inserted in linear oscillators or antennae. In developing the explanation of these cases the author does not appear to have expanded the treatment to cover the effect in receiving. This is important in view of a proper perspective being obtained with regard to the selectivity of such antennae, and in view of the fallacious methods of obtaining selectivity which hold at the present day in this country and elsewhere. Reading between the lines, the author is probably quite alive to the weakness of the premises on which many methods in practice are based, but he refrains from any direct criticism of them.

In a very clear exposition of the effects of resistance, capacity, and self-induction in high-frequency circuits some room is left for a fuller explanation of the many elusive effects

of self-capacity of coils, especially where idle windings of many turns are concerned. The chapters devoted to the discussion of coupled circuits and resonance curves are of a highly informative character, and deal largely with investigation and measuring work. Useful practical hints as to means of obtaining accuracy and checking results of tests are given; thus the means of eliminating errors due to eddy currents occurring in the coatings or plates of condensers forming part of an oscillatory circuit are explained. In this connection, however, the student might very usefully have his attention drawn to a source of error which is often very serious in large transmitters, namely, losses due to the degree of proximity of the ground, walls of building, his own body, or any material substance which is neither a perfect conductor nor a perfect insulator, and which is within reach of the oscillating electro-magnetic field. Mention is made of an interesting method of completely suppressing one of the wave components of a coupled transmitter giving a double wave, the suppression occurring so far as the measuring instrument is concerned. The author is no doubt alive to the bearing of this method in other directions which he does not specify. In a chapter devoted to the antenna, the author gives special consideration to the important question of grounding and its equivalent, as in the counterpoise method. In his analysis he appears to have overlooked at least one very important consideration, to which it may be as well not to refer specifically in present circumstances, though the omission may be intentional.

Much of the interest that will be felt in this work will no doubt turn upon the comparisons between quenched spark and unquenched spark systems, the former representing standard practice in Germany. In appraising the quenched spark method, both with the Wien type spark gap and the mechanically-quenched gap which Marconi claims to be using in high-power stations, sufficient attention is not paid to the impure character of the wave emitted during the period prior to quenching, representing considerable energy waste. It is necessary to have regard to the fact that the antenna oscillations have grown to their maximum amplitude when the primary spark is quenched, and that the radiation taking place during this period is practically wasted. Probably the really effective radiation only commences after the primary circuit is quenched. As a general proposition, in spark systems a wave train is impure to just the extent that decrement or increment exists in the train. An absolutely pure wave is, therefore, unattainable; but the nearer the amplitude reaches uniformity the purer and more efficient the radiation. It is, therefore, just a question whether it is better to make the wave increment very large and the subsequent decrement small, as in quenched spark methods, or to keep both the increment and the decrement small, as in lightly-coupled unquenched systems. This cannot be fully elucidated theoretically, as practical limitations are concerned.

In the theory of wave propagation much prominence is given to the so-called surface wave theory of Sommerfeld. Essentially, however, this theory is merely an elaboration of a very early theory first published in the *ELECTRICAL REVIEW* in A.D. 1900. As rendered by Sommerfeld, it is rather in the nature of an artifice to resolve wave propagation into two parts which can have no separate existence, but which resolution renders the propagation more amenable to analytical treatment. One part is treated as a wave following the contour of the earth's surface, and the other as a free space wave. It is not clear that this point of view results in any very marked elucidation of most of the observed facts of long-distance transmission. A point of criticism in reference to this part of the work is that the student is apt to be led to overestimate largely the effect and importance of the conductivity of the ground at a large number of wave lengths' distance from the source of the waves. It is never explained to him that the resistance of the annulus of surface occupied by the base of an advancing wave becomes progressively less as the wave expands. Hence, the effect of the specific resistance of the soil may become practically negligible.

A separate chapter is devoted to detectors, from which much valuable information may be gleaned. By a somewhat remarkable oversight, the author appears to regard the simple rotating magnet form of magnetic detector as a practicable instrument. It is also rather surprising in a German book of this character to find no reference to the anti-coherers of Neuschwender and Bela Schafer, though that of de Forest is fully described. There are some questionable statements with regard to coherer methods and appliances. Here the author distinctly does not shine, for he is repeatedly caught depicting the Morse circuit tapped off through choking coils from the terminals of the coherer—a disastrous proceeding in practice. Marconi is given undue credit for the initiation of the receiving transformer as used with the coherer. For the development of it, such as it was, he is entitled to the credit, but he received the first suggestion from the British Post Office. The chapter on receiving-station arrangements contains one or two doubtful assertions, such as the statement that a high receiving aerial is at a disadvantage because it radiates the energy too quickly. Such a statement is distinctly open to challenge, at least in respect of the reason advanced. In the matter of resonance curves, the author follows the usual course of basing his conclusions as to the degree of selectivity attained between a pair of stations on the curves obtained by wave meter methods. If a method of tracing out the curves at the receiving station be used it will

be found that, in the case of spark transmitters at least, the merging of wave lengths by the receiver so entirely swamps any ordinary differences in sharpness of resonance exhibited by the transmitter, from such causes as changes of coupling, that double wave emission is no longer traceable. This means that undue stress has hitherto been laid on the need for highly-tuned spark transmitters in order to avoid interference.

In the theoretical treatment of wave reception there is a rather remarkable and serious omission which calls for comment. The theory of arrest of waves by the receiving antenna and mode of extraction of wave energy from surrounding space, together with limitations concerned in the process (that is, the reverse of the actions which occur at the transmitting antenna), are not touched upon. Other omissions of a more excusable character are in respect of later developments of systems (German and other), developments of vacuum tube amplifiers and transmitters. Neither does the book contain precise information as to difficulties met and results given by long-distance communications, of which a considerable number have now been established for some time. Indeed, the degree of secrecy observed by all commercial undertakings in this matter carries with it a strong hint of disappointment.

In general, also, the perusal of the work gives the impression that whereas Prof. Zenneck is a reliable authority on transmitters and transmission effects, he is much less so with regard to receivers and receiving effects.

The book contains a vast amount of useful information, though many of the quantitative results of measurements are not yet ripe for full acceptance. They will bear much cross-check, by the application of entirely different methods, for their full confirmation.

Though some criticism has been made in the foregoing, there can be no doubt that neither engineers nor students can afford to ignore this work if they are to make the best use of available knowledge and improve British practice in many needful directions.

Useful tables, data, and a valuable bibliography of some 355 references to original papers and publications complete the work in a fitting manner. There is a number of minor slips or misprints in the letterpress, illustrations, and tables, many of which are, however, sufficiently obvious.—J. E. T.

The Telephone and Telephone Exchanges: Their Invention and Development. By J. E. KINGSBURY. London: Longmans, Green & Co. Price 12s. 6d. net.

Twenty years ago Mr. Kingsbury said "it was quite impossible to deal with any question of early telephone history without quoting Mr. Lockwood." Henceforth, it may safely be said, no one dealing with telephone development generally can avoid reference to Mr. Kingsbury.

In the introductory chapter the earliest attempts at the transmission and amplification of sound are summarised, and we are led from the Otacousticon exhibited at the Royal Society in 1668 to the views of Sir Charles Wheatstone on the subject of molecular transmission of sound waves. There, however, the matter remained until the advent of the Bells, father and son, when electricity was called upon to aid in the transmission of speech; and in this connection it is interesting to read the letter of Graham Bell, written in 1875, to his parents, describing an interview he had had with Prof. Henry, in which he states that he frankly admitted to Henry that he did not possess the electrical knowledge necessary to overcome the difficulties which he saw before him, and got for answer the laconic reply, "Get it." The world little knows how much it probably owes to these two words, spoken at a time when Bell was living in an atmosphere of blank discouragement. To-day we read (*ELEC. REV.*, January 7th, 1916): "Dr. A. Graham Bell conversed with his assistant of 1876, Mr. T. A. Watson, over 3,400 miles of line between New York and San Francisco!"

Nine chapters are devoted to the development of the telephone and its eventual employment for commercial purposes. Chapter IX deals with the inception of the telephone exchange, suggested in the first instance by Dumont, of Paris, who took out a British patent in 1851 for the interconnection of telegraph lines through a central office. In 1881 the first Post Office exchange in this country was opened at Swansea.

The evolution of the variable resistance transmitter and microphone is dealt with, and the work of Hughes, Edison, Blake, and Hunnings in this field is adequately summarised.

Passing over the sections on Philip Reis, call bells, switchboards, &c., we come to that which deals with the advent of the telephone in Europe, the commercial developments of which "were initiated by American patentees assisted by a few influential and far-seeing people in each country."

Pages 207-11 are of peculiar interest inasmuch as they depict the official attitude in this country towards the telephone in 1879. In that year Sir Wm. Preece—then Mr. W. H. Preece—giving evidence before a Select Committee in the House of Commons, in answer to Lord Lindsay's question, "Do you consider that the telephone will be an instrument of the future which will be largely adopted by the public?" answered "I do not." This was the view of the Electrician to the British Post Office, and though it is always safe to predict after the event, yet had Preece recognised the potentialities of the instrument, and had the Department purchased the Bell patent which was then offered it, how differently might not its policy have been affected in the years that were

to follow. But Preece's opinion appears to have been formed from a consideration of the inductive troubles to which the instrument was subject, and which at that time appeared insuperable, and remained so until Brooks, in 1881, patented the metallic circuit and solved the problem.

Chapters on multiple switchboards, line construction, the evolution of the dry core cable, and early exchange systems are followed by a chapter on telephone engineering on a scientific basis, in the course of which Mr. Kingsbury refers to the acute diversity of opinion which obtained in 1896 on the merits and demerits of the vertical and horizontal switchboards. We recall that in the discussion of Mr. Dane Sinclair's paper, the author and Mr. Preece were the two most prominent opponents of the flat board; but Mr. Kingsbury studiously avoids any reference to Mr. Preece's moral objection, or to Mr. Sinclair's effective rejoinder!

Fairly long chapters on branching systems and the common battery system lead up to the "Automatic" treatment of which, on account of its brevity, will prove disappointing to many of our readers; but as Mr. Kingsbury says, "It has been preferred to give in greater detail particulars of the earlier work and to discuss the general principles involved in the later developments," and, in connection with the controversy still being waged on "Auto" versus "Manual," he adds, "results cannot be recorded for some time yet, and any definite forecast is to be deprecated."

An echo of another famous controversy is to be found on page 433, where we have retold the duel between Mr. Preece and Prof. Silvanus Thompson on the essential elements in long-distance transmission.

In pages 430-35 Preece's K.R. law and Heaviside's biting criticism of the same are brought under review. Pupin's practical application of loading coils to telephone circuits is discussed, and in this connection it is interesting to read (page 441) of the demonstration given by Sir W. Slingo to members of the technical Press last year, of the transmission of speech over a loaded underground cable 660 miles long. No cross-talk was observable from the other wires in the cable, and immunity from disturbance was absolute and complete.

An interesting chapter is devoted to the first Anglo-French telephone cable, designed by Mr. H. R. Kempe, late chief electrician to the Post Office, and is accompanied by a unique illustration of the late King Edward speaking his congratulatory message to the President of the French Republic. Our older readers will have no difficulty in identifying the various personalities forming his *entourage* on that memorable occasion.

The concluding chapters deal with instruments, rates, economics of the telephone, and the telephone and Governments.

Fig. 2.

EXPERIMENTS ON IGNITION MAGNETOS.

Fig. 3.

Mr. Kingsbury is to be congratulated on the production of a book which, we do not doubt, will take the place in its own sphere that Sir Charles Bright's work occupies in submarine telegraphy.

A word of praise is also due to the publishers, Messrs. Longmans, Green & Co., on the general excellence of production which characterises the work throughout.—A. F.

Mechanical Technology. By PROF. G. F. CHARNOCK, M.I.C.E. London: Constable & Co., Ltd. Price 7s. 6d. net.

There is an interesting flavour even about the title of Prof. Charnock's book. It seems to suggest, by analogy with chemical technology, a wide and comprehensive field full of all sorts of attractive possibilities. And that suggestion is found to be borne out when we come to investigate this 635-page treatise "on the materials and preparatory processes of the mechanical industries." The reader is not likely to be disappointed in the author's attempt to bring together in one volume "a connected and systematic account of the

chief operations underlying mechanical trades and handicrafts." Of course, the book is not exhaustive, nor is it intended so to be; but it is quite sufficiently encyclopedic for the average work-a-day engineer who wants to know briefly and quickly the "why and wherefore" of his materials and processes.

A workmanlike plan is adopted by the author in the arrangement of his matter. Thus the chapters comprising Part I discuss "the production and properties of the chief materials of construction," a big field, admittedly, since it covers iron, steel (including electro-thermic steel), alloy steels, non-ferrous metals and alloys, timber, stone, leather, and rubber, to mention but a fraction of a list of the things with which engineers have to deal.

Next comes Part II, where "preparatory processes depending upon the property of fusibility" are detailed. Here we find described the foundry, methods of moulding, production of castings, defects in castings and their remedy, this section being followed by a final one (comprising Part III) devoted to "processes depending upon the properties of malleability and ductility." These processes include forging, stamping, rolling, tube drawing, and the manipulation of sheet metal. Last of all, the author gives us a bibliography which makes it possible to see what books to turn to if fuller information than that given by the author is required. Altogether, we can strongly recommend Prof. Charnock's volume to all but the most advanced workers; and it is to be questioned if even they would not have to admit that a perusal of the book, and of its numerous and excellent illustrations, had taught them many things that they did not previously know, so extensive is the ground covered by the author.—G. S. S.

IGNITION MAGNETOS.

In *La Revue Electrique* for March 3rd, Messrs. D. Nobili and G. Campos (engineers of the Italian "C.G.S. Co.") refer to the article of M. Armagnat, which was abstracted from the same journal in the *ELECTRICAL REVIEW* of October 15th and 22nd, 1915, and describe some experiments which they have recently made to determine the energy output of magnetos.

It being necessary to avoid wattmeter methods, and generally every method based upon the use of circuits directly connecting the high-pressure terminals in any way whatever, the authors adopted a direct method of measurement of the energy of the spark, with the help of a calorimeter. The instrument employed for this purpose (Fig. 1) had a bulb filled with nitrogen at atmospheric pressure, containing a spark-gap with platinum points and a spiral of resistance wire, the latter being connected to an independent circuit and serving to calibrate the instrument with direct current. To any given height of the mercury column there corresponded a definite expenditure of energy, derived either from the heating of the spiral wire or from the spark passing between the platinum points. The speed of operation or rotation of the magneto gave the number of sparks per second.

The conditions of working of a magneto in connection with the calorimeter are obviously different from those under which the ignition spark passes in the cylinder of an internal-combustion

engine, where the discharge takes place in inflammable gas under pressure; it is possible, however, not only to compare the performances of different magnetos by this means, but also to obtain results in all probability not greatly differing from those which correspond to the actual conditions of operation, for it is evident that the amounts of energy stored up in the magnetic circuit are equal in both cases. In fact, tests made with widely differing lengths of spark have given results not greatly discordant.

Measurements carried out with four snap magnetos for aviation motors at various speeds gave the results shown in fig. 2; other tests, made on magnetos with rotating armatures, are shown in fig. 3. These curves indicate that, at any rate in the case of the types of magneto experimented on, the energy per spark remains practically constant from low to high speeds, or, in some cases attains a maximum at a particular speed.

The authors state, also, that the minimum and maximum values obtained for the energy of the sparks are included between the limits calculated by M. Armagnat for the energy available in the magneto; they are, however, far removed from his maximum

limit, showing that the apparatus has a low electrical efficiency. This is not a serious drawback owing to the small quantity of energy that suffices for the ignition of even large engines; nor is it surprising, seeing that in the case of such a generator of electrical discharges, which are probably oscillatory, a large proportion of the energy is dispersed in the metallic masses.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

URUGUAY.—A Presidential Decree, dated January 25th, amends Articles 211-13 of the Consular Regulations, concerning the manifests of goods shipped to Uruguayan ports. Manifests must conform to the model annexed to the Decree, and must contain the following particulars:—

1. The class, flag, and name of the vessel, the name of the master, the ship's registered tonnage, the port of departure, and the Uruguayan ports for which bound;

2. The numbers of the bills of lading, the marks, numbers, quantities, kind and contents of the packages, the gross weight or measurement of the packages, and the net weight of each package;

3. The name of the shipper and of the person to whom the goods are consigned, or an indication that the bills of lading are "to order";

4. Country of origin of the goods (except for goods declared "in transit"); total value of the goods (if possible, expressed in Uruguayan gold pesos); freight rates (except in the case of goods declared "in transit"), and amount of freight paid.

Four copies of each manifest (instead of three, as previously) are to be presented to the Uruguayan Consular Agent, at least two of which must be drawn up in, or translated into, Spanish. Two copies of the manifest are to be "legalised" by the Consular agent.

In cases where Consular agents cannot obtain from shippers the particulars as to freight (see under 4 above), they are to calculate the figures at the rates current in their place of residence during the week in which the shipment is made.

Annexed to the Decree is a model of the certificate of origin which Uruguayan Consuls are empowered by the Decree of September 13th, 1915, to issue in respect of goods destined to be imported into Uruguay.

The provisions of the Decree came into force on April 1st, 1916; and the complete text of the Decree, and of the forms of manifests and certificates of origin annexed thereto, may be seen in the Commercial Intelligence Branch of the Board of Trade.

BRITISH INDIA.—*New Import Duties taking effect on March 1st.*—The general 5 per cent. tariff is raised to 7½ per cent. Certain classes of machinery and railway material, which were formerly free, are now subject to a duty of 2½ per cent., and motor lorries, formerly free, now pay 7½ per cent.

JAPAN.—A Government Bill has been introduced into the Diet proposing to modify the Customs duties on various articles imported, among which are the following. Proposed additions to the text of the Tariff are indicated by italics.

	Rate of duty.	
	Present.	Proposed.
	Yen.	Yen.
	Per 100 kin.	Per 100 kin.
Brass and bronze bars and rods—		
(a) For steam turbines	7.55	16.00
(b) Others	7.55	7.55
Gas engines, petroleum engines, and hot-air engines—		
Other (each weighing more than 2,500 kilograms.)—		
Each weighing not more than 10,000 kilograms	5.00	5.00
Each weighing not more than 50,000 kilograms	5.00	4.50
Each weighing not more than 100,000 kilograms	5.00	4.00
Other	5.00	3.50
Dynamo-electric motors, transformers, converters, armatures, and alternating current variable speed electric motors	Rates unchanged.	
Dynamics combined with gas engines, petroleum engines or hot-air engines—		
Other (each weighing more than 5,000 kilograms.)—		
Each weighing not more than 10,000 kilograms	5.80	5.80
Each weighing not more than 50,000 kilograms	5.80	5.50
Each weighing not more than 100,000 kilograms	5.80	5.20
Other	5.80	4.90

[Yen (100 sen) = 2s. 0½d.; 100 kin = 132.277 lb.]

GREECE.—In the issue of the REVIEW of March 17th particulars were given of a Decree providing for the duty-free importation into Greece of certain tools, machinery, instruments, and utensils of agriculture and the branches of industry connected therewith, when imported by Agricultural Associations. A further Royal Decree has now been issued providing that all the articles in question are exempt, on importation into Greece from abroad, for a period of four years from January 1st/14th, 1916, from State import duty, and from harbour, communal, municipal, or other tax.

ONE of the most interesting and important classes of scientific investigation that have attracted attention in recent years is that which relates to the psychological and physiological conditions of labour, and their bearing upon the output and physical well-being of the worker. The subject has been studied from various aspects—from the points of view of the works manager, the professional psychologist, and the social economist—and many valuable deductions have been made from the data accumulated by experiment and experience. Mr. F. B. Gilbreth, an American engineer, was early in the field with his extended researches into the elimination of wasted effort, the results of which were embodied in his classic work on "Motion Study," a book which ought to be in the hands of every works manager and foreman; particularly in view of the supreme necessity with which we are now confronted, of economising labour and increasing output to the utmost, is it desirable that the lessons taught in this book should be laid to heart and carried into practical effect by every manufacturing firm, and we should be glad to see instructional classes established for the promulgation of the ideas which Mr. Gilbreth has developed. The point of view of the psychologist is admirably set forth in "Psychology and Industrial Efficiency," by a German-American, Prof. Hugo Münsterberg. This author studied the application of psychological experiment to the service of commerce and industry; whereas Gilbreth was concerned with the movements of the limbs and body of the workman, Münsterberg investigated the operations of his mind, the mental qualities and peculiarities of individuals, and the fitness of each person for his chosen vocation, together with the numerous problems arising out of these researches. This, again, is a work with which every manager should be familiar.

Within the past year the Health of Munition Workers' Committee has made a study of the causes and effects of industrial fatigue, the fruits of which have been embodied in a Memorandum that has recently been issued, and in this case not only the production of the workman, but also its reaction upon his person have been considered, with scientific thoroughness. We are taught that industrial fatigue is a nervous not a muscular phenomenon, and that by the proper organisation of periods of work and rest the nervous system may be so trained as to attain far higher efficiency than could otherwise be reached. It is to this aspect of the industrial problem that we wish to direct particular attention.

The bodily sensations which suggest to us the onset of fatigue have in fact little to do with the question; real fatigue "is shown and is measurable by the diminished capacity for performing the act that caused it." The fundamental condition for maximum efficiency—that is, maximum output combined with the maximum of comfort and health to the worker—is the proper alternation of work and rest periods. This is one of the conditions laid down by Mr. Gilbreth also.

Rest should not be deferred until symptoms of muscular fatigue appear, for nervous fatigue commences to show its effects before the former by an unobserved but measurable slackening of speed.

READY.

H. ALABASTER, GATEHOUSE & CO.,
4, Ludgate Hill, London, E.C.

Moreover, if the fatigue is allowed to progress too far, its effects cannot be dispelled by the normal period of rest, but will be felt during the following work period. Hence such conditions of working are wasteful and should be avoided.

In the report before us, emphasis is laid upon the fallibility of mental impressions as to output and upon the necessity of measurement in order to obtain reliable guidance; this is a very significant circumstance, for it reveals the fact that empirical methods and guesswork are being replaced by scientific methods of investigation. Accurate measurement is the foundation stone of all branches of science; some subjects of study cannot readily be subjected to measurement, and have consequently remained to this day in what Lord Kelvin used to call the "natural history" stage of development, whilst others, more amenable to measurement, have long been on the "natural philosophy" plane. The fact, therefore, that measurement is now seen to be essential to the securing of reliable results in the study of industrial fatigue indicates that great progress has been made towards its scientific treatment.

We have not space here to quote freely from this valuable report, but may say that results described as "astonishing" have already been gained in other countries by the application of experiment; that reduction of working hours and the adoption of a week-end rest have been proved to increase the output of workers to an extraordinary degree. Not only is slackness—or rather staleness, for it is observed in the most willing workers—an inevitable accompaniment of long hours and lack of rest, but also the effect upon the physical condition of the workmen is deplorable.

It is stated in the report that management based upon the experimental science of industrial fatigue is far less common in this country than in the factories of America and Germany; this is a grave circumstance urgently demanding a remedy, and we earnestly commend the document to the attention of all works managers, in the hope that they will profit by its teachings; we cannot afford to be handicapped in the industrial conflict which is impending. The subject has also been dealt with by a committee of the British Association, and references to publications bearing upon it will be found in our "Notes" to-day.

BUSINESS-GETTING ABROAD.

It is an extremely difficult matter at the present time to gauge the general industrial situation. There are certain sections of manufacturing, including parts of the electrical branch, which, if rumour be trustworthy, are experiencing a slight falling off in orders from the Government, while others report a drop in Colonial and foreign demands. The former, it is thought, may be due to the new Government munitions factories being now ready to assist materially in meeting the needs of the Forces, thus rendering private works less indispensable than they have been. If it be correct it may be only temporary—but who outside the charmed circle can say? If it is not temporary it means that the released factories, or part thereof, may be freer to undertake ordinary manufacturing business, assuming that sufficient suitable labour remains available after the Government draughts for the Forces and the Factory have been satisfied. The falling off in Colonial and foreign demands—if there be such a drop—may be due to the growing impression abroad that British manufacturers are unable to handle export business, or that the available shipping facilities are insufficient; it may be due to a definite fall in requirements owing to works being deferred; but it is little use trying to guess the causes until we know for a fact that there is

an actual drooping of electrical export demand, for information from some of the Colonial markets and from Russia shows clearly that the shelves of the electrical stores are empty and that supplies of certain classes of goods are sold before they arrive; traders want all that they can get. The electrical export values for the last few months ought to be known in all our markets, to show purchasers how well we are maintaining such business. The shipping difficulty is undoubtedly a great one, and our trans-Atlantic cousins, whose assistance we appreciate, have not been slow to observe the adverse effect upon us, and the favourable effect upon themselves, of the great delays that have been involved in obtaining export permits from our Government departments. If export trade helps us to finance the war, the granting of permits should be speeded up. Indeed, everything that is possible should be done to convince the outer markets of our ambitions to supply their needs. Reference to speeches delivered at one of the cable manufacturing companies' meetings shows that the trading of the past year has raised the serious question whether refusal of orders under the stress of war conditions will mean loss of goodwill ultimately. In normal times it is easy enough to lose export connections; we remember the times when a good foreign connection having been made, a happy and prolonged relationship followed; there was little foreign competition in those days—the world naturally turned to England. Recently, even in peacetime, a foreign connection had to be continually nursed. In war-time, connections have had to be sacrificed, not at the bidding of competitors, but at the snorting of the war-horse. Can such connections be regained? What will happen in that matter will depend upon the hold that other manufacturing nations are able to gain while we are otherwise engaged, and upon whether such a service will be given at such a price that there shall be no inducement to change again. Of the activity of these other nations in pursuit of current business there is in our mind no doubt whatever. Reports from the different markets are a fairly safe guide, though we are interested to gather from an article in the *Daily Telegraph* that Mr. Edgcombe Brighton, who has lately returned from the United States, finds that American business men are too concerned in reaping the harvest of the present trade boom to concern themselves with preparations for capturing overseas trade after the war. The present activities—apart altogether from anything special which may follow—must, however, be reckoned with, and British manufacturers cannot afford to allow any wrong impression regarding their future intentions to gain currency. We are told to-day on one hand that our engineering manufacturing capacity has been so greatly increased during the last twenty months that we shall have little difficulty, allowing for due adaptation, in meeting an enormously increased demand. This view was supported recently by Mr. G. Sutton in expressing his views regarding the future of the cable manufacturing industry, and he, as an experienced leader of the electrical industry, is entitled to our listening ear when he suggests as one possibility of such increased capacity, a cutting of prices between cable-makers. That is of course assuming that there will not be enough business available to keep all the works fully occupied. Mr. Sutton is a man who knows the world—we mean he is as capable as anybody of judging the prospects for future business in other countries, having, to his company's credit, among other things, the booking, just prior to the war, of perhaps the biggest export orders for electric power and traction cables—for Australia and South America—ever received in these islands. There is another view that is put forward, namely, that so huge will be the demand from the British Colonies and Dependencies,

from Allied countries and from neutral markets, almost immediately the war concludes, that we shall be unprepared to meet it satisfactorily. And between these two views there interposes the uncertainty as to the position that Germany and Austria will be permitted to occupy as electrical exporters after the war. Now if Mr. Sutton's view respecting the cable trade holds good in regard to other branches of electrical and engineering industry, one of the most urgent of all demands upon us is to take every precaution to strengthen and extend the selling organisation and keep ourselves well to the fore—even in these days, when we can only with difficulty meet the demand—in those parts of the world where we desire to trade. We may thus be ready to secure an increased demand which shall help to prevent the need for competitive cutting. If next we consider the interposing factor—possible resumption of German competition in some Colonies and present satisfactory neutral markets, we see again the necessity for following up our industrial organisation at Home with a boldly conducted campaign of salesmanship and publicity so that British ability and British quality shall be common knowledge among purchasers everywhere. Or, again, if we consider that the industrial menace of Germany will be broken at Home and in the Colonies and Allied countries so that the demand upon the new England's factories will be almost overwhelming, we shall still do well if we see to these important commercial aspects of our affairs. The British manufacturer needs to do more to impress the buyer abroad. The latter wants to know who's who; where he can buy this and that; and something about the suppliers and their works and ways. Our readers will think that we are reiterating a very old piece of our own trade advice. We do so because the present situation seems to us to call imperatively for a most spirited and energetic salesmanship and publicity policy on the part of the greater part of the industry. Our co-operative schemes are excellent—as far as they have gone; our discussions as to what we want, or ought, to do, or what somebody else ought to do, have been good, and we hope that their influence will spread; but we have yet to be convinced that there is an earnest, well founded, and general effort being made with a view to assuring that the Colonial and foreign markets shall yield us such a volume of business as shall make it possible to utilise to the full all the added factory capacity, after the war. What is the use of talking further about a Ministry of Commerce and other matters of the same class and *waiting*? We have got to help ourselves, and a strong self-help policy throughout the industry would mean definite action now to draw definite business later. Why not use part of the war profits now being earned, on this very reasonable expenditure? The war has disorganised ordinary business; to place it on a proper footing again certain measures of reorganisation will be essential; those measures will involve higher commercial activity, the cost of preparing for which can surely be treated as a legitimate working expense!

The Electrical Trade After the War.

An important announcement has just been issued by the President of the Board of Trade. The Committee which is to consider and report upon the position of the Electrical Trades after the war, with special reference to international competition, and is to indicate what steps, "if any," are necessary or desirable in order to safeguard that position, has been appointed. Sir Charles Parsons, F.R.S., of turbine fame, and of C. A. Parsons & Co., Ltd., of Heaton Works, Newcastle-on-Tyne, is to be chairman, and the other members are:—Mr. J. Annan Bryce, M.P., Chairman of the British Westinghouse Electric and Manufacturing Co., Ltd., whose views on our trade rela-

tions with the enemy after the war, expressed at the annual meeting of that company, and reported in our issue of April 14th, page 431, assume an added interest by reason of his appointment; Mr. T. O. Callender, managing director of Callender's Cable and Construction Co., Ltd., who is also connected with several leading electric power companies and other undertakings, and who, by his long practical experience of the industry, is pre-eminently fitted to assist in these important trade deliberations; Mr. James Devonshire, A.I.E.E., managing director of the London United Tramway Company, who, as a director of a number of other power and tramway undertakings connected with the B.E.T. group, is well versed in matters relating to finance; Mr. Bernard M. Drake, M.I.E.E., chairman of the well-known business of Drake & Gorham, Ltd., and of the D.P. Battery Co., Ltd., who has known the electrical industry intimately for a very lengthy period; and Sir John Snell, a past president of the Institution of Electrical Engineers, and member of the eminent consulting engineering firm of Preece, Cardew, Snell & Rider. All communications for the committee should be addressed to the Secretary, Electrical Trades Committee, 7, Whitehall Gardens, S.W. Our only comment at the moment is that we hope that the committee have power to add to their number.

Lead.

THE position of lead has continued to be the subject of considerable interest. Between the restrictions imposed upon trading by the new regulations, and the growing scarcity of supplies consequent upon the general small arrivals for some time past, the market has been quickly affected by the least sign of buying or selling pressure, which is only natural at the rather dangerously high level of prices. Fundamental conditions, however, have remained quite strong. The outlet for the manufacture of war munitions is certainly as big as ever, against which there is as yet no indication of freer supplies from the chief producing countries. War requirements in Allied countries, such as France, Italy, Japan, and Russia, being to a notable extent covered direct, this tends to restrict the tonnage diverted to home ports, and with America having but little to spare for shipment to this side, it is hardly likely that the big deficit in our imports so far this year as compared with last, will be made good for some time at any rate. The absence of a free market for the commodity due to the drastic action on the part of the authorities intended to restrict operations to bonâ-fide business, had at the same time proved a serious drawback for lead manufacturers. The latter, indeed, now find considerable difficulty to cover themselves by forward purchases against new forward contracts for their products. Dealers do not care to make forward sales which might be regarded as speculative and involve them under the Defence of the Realm Act. "Hedging" operations of this kind on the part of manufacturers are as a rule of frequent occurrence, but they are now almost impossible, so that trading in manufactured products is likewise suffering. After a renewed rise recently up to about £35 10s. for early shipment with a fair amount of business, the market just prior to the holidays reacted to well below £35, but there has been no great pressure to sell, although fair quantities of metal near at hand came on the market. There has been no material change in the American position, which remains firm, although prices have eased to well under 8 cents per lb., and the equivalent of prices realised in America continues pounds a ton above those ruling in this market. There has been very little American lead shipped to this side for some time past against old contracts. Operations in Mexico are virtually at a standstill, and the position in Spain is still anything but satisfactory.

GAS-FILLED RECTIFIERS.

In the *General Electric Review*, for April, an account is given of recent progress in connection with the hot-kathode argon gas-filled rectifier, by Mr. G. S. MEIKLE, of the Research Laboratory of the General Electric Co., U.S.A. The kenotron and the Coolidge X ray tube, which have been described in the *ELECTRICAL REVIEW*, employ the phenomenon of electronic emission, or "thermionic current," in bulbs from which all residual gases have been eliminated; in these high-vacuum types of apparatus the current is limited by the "space charge effect," of the nature of a back E.M.F., which is manifested by a drop of voltage in the kenotron, used as a rectifier, of the order of 100-150 volts, so that this device cannot be used on low-voltage circuits, though it is capable of supplying rectified currents up to 250 milliamperes at pressures up to 100,000 volts. The "space charge" is due to the electrons emitted from the hot cathode, which produce an electrostatic field around it which limits the motion of electrons towards the cold electrode; but in the presence of positive ions the space charge is more or less neutralised. By introducing minute traces of gas into the kenotron under certain conditions, a sufficient number of positive ions may be formed to neutralise the space charge completely, thus greatly reducing the voltage required to set up a given current. The nature of the gas is important; oxygen, whether free or combined, cuts down the emission of electrons from a pure tungsten cathode, but inert gases have no such effect. But with minute traces of gas present the positive ions acquire a very high velocity, and, striking the cathode, bring about its rapid disintegration. When the pressure of the gas is increased, the velocity of the ions is diminished, but their number is so much greater that the effect of their bombardment may be even more disastrous than with minute traces of gas present. Investigations covering a period of several years have revealed the conditions that must obtain in order to prevent cathode disintegration and other detrimental effects; by proper adjustment of the pressure of a suitable gas, disintegration has been eliminated, and it has also been found possible to secure conditions under which the emission of electrons from the cathode has been sufficient actually to cool it, when rectifying excessive currents. As a result of these investigations, in fact, it has been

severe, has no appreciable effect upon the life and operation of a rectifier of this design. A graphite anode mounted on a heavy tungsten lead is shown, as graphite has been found to be a very desirable anode material for rectifying high currents. All leads are sealed directly through the glass, and, for currents between 20 and 45 amperes, into a 5-in. spherical bulb.

All tubes are carefully exhausted and filled with gas in a high state of purity. Certain impurities, even though present in small quantities, produce a very rapid disintegration of the cathode, and also have a very marked effect upon the voltage characteristics of the rectifier. It is advisable in certain types of gas-filled rectifiers to introduce substances which react chemically with such impurities as are introduced with the gas, or are given off by the parts during the operation of the rectifier. The reaction which occurs keeps the gas in a pure state. It is found convenient in certain types of the low-current rectifier to introduce the purifying agent in the form of an anode. As the impurities are distilled from the anode or cathode, or from the over-heated glass parts, the arc drop increases. The increased energy consumption automatically causes evaporation of the anode material until the high state of purity is re-established, when the evaporation ceases. In figs. 1, 2, and 3, the purifying agent is shown as a coil wound around one of the leads.

FIG. 4.—CONNECTIONS OF HALF-WAVE RECTIFIER.

FIG. 5.—TWO HALF-WAVE RECTIFIERS CONNECTED TO RECTIFY THE WHOLE WAVE.

FIGS. 1 AND 2.—LOW-CURRENT RECTIFIERS.

FIG. 3.—HIGH-CURRENT RECTIFIER.

demonstrated that "a rectifier filled with gas at pressures within a more or less definite range can be designed to rectify currents from a few milliamperes to exceedingly high values, at voltages varying between several volts and several thousand volts."

Fig. 1 shows a sketch of a rectifier in which the cathode consists of a filament of small tungsten wire coiled into a closely wound spiral, and a tungsten anode of relatively large cross-section, with a comparatively smooth surface. The filament ends are welded to heavy tungsten wires, while the anode lead is swaged from, though still a part of, the anode. All leads are sealed directly through the high heat-resisting glass into 3-in. spherical bulbs of a similar glass. Although the anode of the tube shown consists of tungsten, other materials have been used with good results.

The rectifier shown in fig. 2 differs only in the shape of its parts. The cathode is shown as a straight filament of small tungsten wire, which, if properly proportioned and mounted, consumes a minimum of energy for a maximum number of electrons emitted. The anode is shown in the form of a thin disk, made large in diameter, to give a big radiating surface, which is found to be desirable when such metals as copper are used.

Fig. 3 illustrates a gas-filled rectifier designed to rectify high currents at low voltage. Two cathodes are shown: one is in filament form identical with that shown in figs. 1 and 2, and is used for starting; the other is a tungsten rod cathode with beaded tip (the middle rod), used during the operation of the tube. The constriction between the bead and the lead suffices to prevent conduction of heat from the tip. The object of using such a cathode is to secure a long operating life. Any disintegration, unless very

During ageing it is evaporated, and re-deposits on the sides of the bulb, carrying with it the impurities in their respective chemical combinations.

The experimental work with argon indicates that rectification is possible in all pressures of gas. With an increase in the gas pressure the potential at which the arc is established increases. At the higher pressures, the temperature of the filament is also a factor in determining the starting voltage. After the arc is formed, the arc drop increases very gradually for big increases in gas pressures. For the low-voltage tubes a pressure of argon between 3 and 8 cm. (measured cold) gives very good results and is therefore used.

The half-wave type shown in figs. 1-3 has the advantages of simplicity of construction and installation. A typical circuit, consisting of a 40-watt transformer for filament excitation, a load, and a regulating resistance, is shown in fig. 4. If high efficiency is necessary, the line voltage is transformed to a value which enables regulation to be dispensed with. Two half-wave rectifiers can be connected as in fig. 5, thus using the whole of the alternating current; the compensating transformer is designed to transform the voltage to the desired value and to supply current for exciting the filament. Where the load can be divided, as in battery charging, the half-wave rectifiers with their individual loads can be connected up so that half of them are rectifying one loop of the wave, and the other half the other loop, thus attaining the same result.

Fig. 6 shows the full-wave gas-filled rectifier, with two anodes and a common cathode, which is used with the circuit shown in fig. 7.

The rectifier illustrated in figs. 1 and 2 has the advantage of being self-starting. In the low-current rectifier the cathode filament is excited continuously during operation, though the tube would continue to act as a rectifier when the arc was formed

FIG. 6.—FULL-WAVE RECTIFIER.

FIG. 7.—CONNECTIONS OF FULL-WAVE RECTIFIER.

without external excitation, the balance of advantage resting with the former method; in the high-current rectifier, however, the filament is used only for starting. A three-pole switch closes the filament circuit, and also connects it with the anode; the gas is immediately ionised, and current begins to flow to the operating cathode, which is acting temporarily as anode. When the latter

becomes hot enough to emit electrons, the rectifying arc is established between it and the anode. The tube can be made to start automatically by placing a D.C. relay in the rectified-current circuit, which opens the three-pole switch when the arc is formed.

When constant purity of the gas can be relied upon, the filament is used both as a starting and as an operating kathode, even in the high-current rectifier. Rectified currents as high as 80 amperes have been drawn from a tungsten filament 20 mils in diameter for short periods, without injury to it. But, in general, it is advisable to use the point kathode.

The persistency of ionisation in argon seems to be particularly marked, and this makes it possible even without filament excitation to use the rectifier for supplying current for very low frequencies. For the same reason, it is possible to operate the tube on very low current when the kathode is not externally excited.

No auxiliary starting load is required when beginning a battery charge. The supply switch is closed and the charging current picks up immediately, giving a slightly tapering charge as the battery voltage increases. On a resistance load, the current is very constant, due to the fact that the kathode spot does not wander.

The efficiency of the tube depends upon the supply voltage, increasing with it as the voltage become higher, and upon the energy consumed in the arc, indicated by the voltage drop. The arc drop of the low-current low-voltage rectifier, in which the filament is externally excited, is between 4 and 8 volts, measured on a direct-current circuit. The power consumed in keeping the filament kathode hot enough to produce initial ionisation is less than 40 watts. Therefore, for a 6-ampere tube the energy consumed by the arc and filament is equivalent to that of a rectifier having an arc drop of 10.66 to 14.66 volts. The actual drop in this tube without filament excitation is, however, somewhat higher than indicated by these values.

FIG. 8.

FIG. 9.

FIG. 8.—RECTIFIER CHARGING IGNITION CELLS; 6.1 AMPS.

FIG. 9.—RECTIFIER CONTAINING PURIFYING AGENT; 29.6 AMPS.

The tube operates satisfactorily on current ranging from a fraction to many amperes. With a properly excited kathode, the rectifying arc is started on alternating-current supply voltages as low as 20 volts and is maintained on voltages as low as 14 volts.

The life of the low-current low-voltage rectifier, upon which the greater part of the work has been done, varies from 900 to over 3,000 hours. Some of the high-current half-wave tubes have a life of over 1,000 hours, and many of 500 hours. Many of the low-current tubes have been in actual service for over 18 months charging batteries at central stations. In a case that is cited, a rectifier was charging 89 cells at 6.2 amperes; the D.C. voltage was 224 volts (average value) over the cells, and 235 volts (average) over the cells and regulating resistance; the A.C. voltage was 236 volts (root-mean-square value). A larger number of cells could have been charged by reducing the resistance to zero.

Fig. 8 shows oscillograms obtained from a rectifier charging a battery: the upper curve represents the rectified current (6.1 amperes D.C.), the middle curve the voltage across the battery terminals, and the lower curve the A.C. voltage. In fig. 9, from a rectifier containing an active purifying agent, the top curve represents the direct current (29.6 amperes), the middle curve the voltage across the arc (inverted), and the bottom curve the A.C. voltage. It will be seen that rectification in each case was perfect.

METER ERRORS IN PARALLEL SUPPLY OF FLUCTUATING LOADS.

THOUGH complete electrification of factories and workshops, using central station supply, has become almost standard practice so far as concerns new installations, there are still a number of works in which such a considerable amount of mechanical driving equipment or electrical generating plant is installed and working with such high efficiency, that the problem of providing for further power requirements becomes one of special difficulty. On a simple basis of fuel and working costs, the central station engineer can generally show a material saving to the works' owner in purchased as compared with home-made electrical energy, but the question of capital cost of conversion is a serious item, particularly in large works where the existing plant is still in good condition. It is easy to prove that extending the private generating plant would be poor policy in most cases, so that the only alternative to immediate and costly scrapping is to use purchased current for all extensions of load, and keep the existing plant working till analysis of costs shows that it would be cheaper to replace it by purchased energy.

During the intermediate period, when purchased current is being used to supplement home-made mechanical or electrical energy, the two sources of supply are connected in parallel—either electrically, by connecting the public and private mains to a common bus-bar; or mechanically by using, say, the private steam engine and an electric motor supplied from the public mains to drive a transmission system which is mechanically continuous. Under such circumstances the works would look after its own prime mover and generator (if any), and the central station would charge for supplementary energy supplied. In practically all cases this supplementary supply would be sold by meter on a sliding scale,

FIG. 1.

FIG. 2.

From mains, clear; to mains, shaded.

and it is important to note that the readings of a meter used under such circumstances are liable to be anything up to 100 per cent. slow, due to reverse running during low load when the load curve is very fluctuating.

On steady or reasonably steady loads the trouble does not arise, but if a rapidly fluctuating load is concerned (as in textile mills, particularly spinning mills) the private power plant runs at full output continuously; the central station supply is drawn upon during the peaks of the load curve, and more or less of this amount of energy is returned during the troughs of the load curve. As an example (from a paper in *Elektrotech. u. Maschinenbau*), the two cases represented by figs. 1 and 2 may be considered. The left-hand diagram in each case represents the total demand to be supplied. In fig. 1A it amounts to 100 kw. for 1 second and zero for 1 second; if the output of the private generator be constant at 50 kw., the demand on the mains during one-half of the load cycle is replaced during the next half, so that the net meter reading is zero, and the works owner gets the benefit of peak load assistance for nothing. In fig. 2 the load varies periodically between 60 and 15 kw., and the private output is 30 kw. (constant), so that in this case the replacement is less than the withdrawal (see fig. 2C), but the meter still has a large negative error. The conditions in the two cases and the total deficiency in meter reading per hour of working under these load curves, are summarised in the following table:—

	Case (1).		Case (2).	
	Peak.	Trough.	Pak.	Trough.
Total load, kw. ...	100	0	60	15
Home generated, kw. ...	50	50	30	30
Taken from mains, kw. ...	50	—	30	—
Supplied to mains, kw. ...	—	50	—	15
Deficiency in meter record, units per hour. ...	25		7½	
Meter error, per cent. ...	100		50	

Magnetic Survey.—According to a telegram received by the U.S.A. Department of Terrestrial Magnetism, the *Carnegie*, under the command of Mr. J. P. Ault, arrived at Port Lyttelton, New Zealand, on April 1st, having successfully completed the circumnavigation of the globe between the parallels 55 degrees south and 60 degrees south. Errors in the existing magnetic charts to the extent of 12 to 16 degrees were found.—*Science*.

In general, if K_1 = power taken from the mains during the peak load; K_2 = power supply by private plant; and K_3 = minimum power demanded during the trough of the load curve; the meter record is actually—

$$w = K_1 \cdot t_1 + (K_2 - K_3) \cdot t_2$$

where t_1, t_2 = durations of peak and trough periods respectively. Hence, the percentage meter error is—

$$\rho = (1 - w/K_1 t_1) \times 100 \text{ per cent.}$$

One way of obviating error due to reversal in the above manner is to provide the meter with some form of locking gear which prevents the armature making more than one backward revolution, but even so it is possible to lose a great deal of revenue in the course of a year where the load fluctuates so rapidly, and one revolution of the meter disk corresponds to so much energy, that one revolution or less represents the energy drawn from the mains during one peak period, and returned more or less completely during the succeeding trough period. The best method of overcoming the difficulty is to provide such fly-wheel inertia in the plant to be driven that the peak demand from the mains is reduced, and the private generating equipment is kept busy on the load itself or in bringing the fly-wheels up to speed. The circuit conditions are equalised without troublesome equalising currents flowing.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

"Mazda" Shade for Subdued Lighting.

The more stringent regulations lately enforced by the authorities as to the lessening of outward illumination from shops, offices and private residences have made it necessary for every individual lamp to be shaded. A neat and effective screen of attractive appearance is being issued by the BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, 77, Upper Thames Street, E.C., and any number in reason will be supplied to business firms, contractors, and retailers upon request. The shade is posted flat, and is made up of stout dark-coloured card, with stencil cut-out lettering backed by orange-tinted paper. The shade can be placed over any electric lamp without removing the latter, and if an ordinary fancy glass shade is used the "Mazda" shade will go over it. To place the screen in position, the two wings are locked together around the holder, this movement causing the shade itself to assume a curved form, thus shutting off the direct light rays from about one-third of the circumference of the lamp.

Timber-Piling Machine.

A portable electric machine for piling timber, patented by Mr. H. C. Hülke, is being made by the SEATTLE MACHINE WORKS, U.S.A. It consists of a lattice steel tower from 24 to 40 feet high, over which runs a continuous chain elevator, lifting planks on one side, carrying them over the top, and lowering them on the other side, where they are taken off at any desired height by the men building the pile. The chain is reversible, and the machine can equally well be used to unpile timber. It is stated that by use of this machine timber can be quickly piled at the lowest possible cost.

SUBSTITUTES FOR OIL IN HIGH-PRESSURE SWITCHGEAR.

THOUGH the risk of oil switch explosions may be practically eliminated by proper design and construction the use of inflammable liquid to quench a high-temperature flame can hardly be regarded as an ideal practice. There is a possibility also of fires which originate elsewhere than in the switch cases themselves being fed from oil in the latter. Provided nothing were sacrificed in electrical efficiency and safety, there would be a distinct field for a non-inflammable substitute for oil in high-pressure switch practice and about seven years ago E. Peyrussou (Paris) took out patents protecting the use of carbon tetrachloride in this connection. Nothing appears to have been done, however, till Voigt and Haeffner experimented with the use of that material in 1911, in ignorance it is said of Peyrussou's patent. The German experiments were revived in the summer of 1914, and conducted with special vigour after the outbreak of war, when there was a great scarcity of oil. The position is said to have been reversed a little later when oil became again available, and the raw materials for carbon tetrachloride, and the glycerine to protect it from evaporation, became scarce. Whatever the precise bearing of the matter on the question of Germany's supplies of material, the following notes from test data recently published in the *E.T.Z.* have an interest of their own.

Carbon-tetrachloride (CCl_4) or "benzoinform" is a colourless liquid of sp. gr. 1.6, which boils at 76°C . and freezes at -26.7°C . It evaporates as freely as benzine when exposed to the atmosphere, but it is incombustible and does not conduct electricity. The high sp. gr. of benzoinform (about 80 per cent. greater than that of switch oil) increases the difficulty of handling filled containers and necessitates heavier design of the latter. A more serious disadvantage is the great volatility of the tetrachloride. The level

of liquid in an ordinary enclosed switchbox, filled with this material, falls 1 mm. per day by evaporation, and even after packing the joints as thoroughly as possible, the loss amounts to 0.5 mm. daily fall in level. Consideration of possible pressure rises inside the casing precludes sealing the case hermetically, and also renders a liquid seal inadequate. The use of a flat is of little assistance, for though the exposed surface of the liquid is reduced, there is capillary creeping in the clearance between flat and container. Peyrussou's patent suggested the use of a layer of glycerine or glycerine and water to prevent evaporation; this is satisfactory in its primary function, but if the switch-box be lowered for inspection of the switch, the latter becomes covered with a film of glycerine, which soon forms verdigris. Other troubles introduced by the use of glycerine are mentioned below.

Copper is practically unaffected by benzoinform at atmospheric temperature, but after prolonged immersion in the liquid warmed to 45°C , the metal is deeply corroded and covered by a greasy white layer. Aluminium, silver, and lead are less attacked, and tin is particularly immune, so that tinning gives satisfactory protection against chemical attack by CCl_4 , except as regards hinges and contact surfaces, which cannot be permanently protected by a surface coating. Rubber, vulcanite, pertinax and micante cannot be used in CCl_4 , but fibre and mica are unaffected, and litharge cement, though blackened on the surface, does not lose its strength.

In respect of dielectric strength, the behaviour of benzoinform depends on whether the stress is momentary or sustained. The following data show the breakdown distance between pointed electrodes:—(A) For oil; (B) for CCl_4 , and momentary stress, lasting 2 secs. or so; (C) for CCl_4 stressed for 20 minutes without breakdown:—

Test pressure between points.	Distance between points (mm.).		
	(A) Oil.	(B) CCl_4 momentary.	(C) CCl_4 sustained.
10 KV.	6	—	9.5
30 "	12	—	20
50 "	20	—	33
60 "	26	12.5	42.5
80 "	41	36	66
100 "	62.5	50	—

The tests from which these data were obtained were made with CCl_4 which had already been used for short-circuit tests; though turned brown by this treatment the liquid had still good enough insulating properties to make it suitable for use in high-pressure switchgear. A switch designed on the basis of the figures in col. (C) above would obviously be able to withstand high surge pressures without breakdown. Probably the marked difference between the sustained and momentary dielectric strength of CCl_4 is due to the liquid being set into brisk motion by electrification; the movement is much more pronounced than in oil.

During the past 18 months various tests have been carried out on switches filled with CCl_4 , and operated under various conditions of load and pressure. Limitations attached to the use of the "new" insulating material were soon discovered. Benzoinform evaporates so rapidly that the presence of a small leak in the container is not betrayed by visible staining or oozing, yet the loss of liquid may be so serious, that flash-over occurs through the reduced head of dielectric to the conducting "earthed" layer of glycerine, which alone affords effective protection against surface evaporation. It is not permissible to draw the switch out through the glycerine for routine inspection purposes, because the film of glycerine thus collected forms verdigris on the copper, and a conducting covering on the insulators; leakage across the latter then causes quantities of CCl_4 vapour to be driven off. Benzoinform does not possess the lubricating value of oil, hence it may be necessary to employ more powerful operating springs and solenoids, and presumably wear will occur more rapidly than in standard switchgear. The lack of lubrication is particularly undesirable when the switch has to break a short circuit, and should act as quickly and freely as possible.

The best form of switch for use with CCl_4 is the closed pattern in which the leading-in insulators are taken through the bottom of the switch, and the moving part passing through the glycerine layer is limited to a round rod. Accessibility for easy inspection must be sacrificed.

A mixture of 25 per cent. benzoinform, with 75 per cent. ordinary switch oil (by volume) loses only 5 per cent. in weight during 3 hours' heating to 100°C , and is thus much less volatile than pure CCl_4 . The mixture is not incombustible, but is much less inflammable than oil. The small evaporation loss at 100°C is evidence of the intimacy of the mixture, for the boiling point of pure CCl_4 is 76.5°C . The fact that the incombustible CCl_4 would distill off first in case of a switch fire might prove a point of practical importance, but the ultimate fire risk is obviously only reduced and not entirely eliminated. It is suggested by Vogelsang that some of the "incombustible" switch oils placed on the market have been simply mixtures of oil and benzoinform: as such they are not truly incombustible, but the characteristics of benzoinform afford good grounds for hoping that chemistry may yet evolve incombustible liquid dielectrics of high insulating value.

Though they may form the basis of more fruitful research, the data and information given above afford no ground for prophesying or recommending the use of benzoinform alone, or even in admixture, as a substitute for oil in switchgear. That its possibilities have been investigated at such length, at such a time, is probably another indication of Germany's difficulties and exigencies. Whatever future developments may be—and this field of research is certainly worth exploring—benzoinform as a substitute for switch oil may fairly be classed with iron and zinc as a substitute for copper conductors and with linoleum as a substitute for leather soles!

INSULATING OILS FOR TRANSFORMERS.*

EARLY in 1913 the Research Committee of the INSTITUTION OF ELECTRICAL ENGINEERS appointed a sub-committee to consider the properties of and methods of testing switch and transformer oils. Letters were sent to a number of manufacturers and users of oils, and to Universities, and the replies received were reviewed in an interim report by Mr. W. Pollard Digby in January, 1915. The Sub-Committee has considered the suggestions received with regard to the proposed tests, which in the first place are being limited to transformer oils. A brief account of the tests, most of which have been in practical use for some time, is given below. The points that now require investigation are:—

1. How far are the results consistent when made by different observers on the same sample of oil?

2. Could the results of the tests be relied upon to indicate with certainty the behaviour of the oil under practical working conditions?

The Institution has received a grant from the Advisory Council for Industrial Research for this work, and the Sub-Committee proposes therefore to put the experiments in hand at once, especially in view of the delays caused by the war.

The Sub-Committee expresses its indebtedness to Mr. Pollard Digby for the services rendered by him in examining the information received and drafting the first report, and to the small committee consisting of Messrs. A. R. Everest, A. C. Michie, and T. O. Thomsen who prepared the draft of the tests.

In order to judge the suitability of an oil for use as a cooling insulating medium, it is necessary to know its characteristics in the following respects:—Tendency to sludge; loss by evaporation; flash point; viscosity at different temperatures; chemical reactions; density and coefficient of expansion; cold test (solidification); moisture absorption; dielectric strength; specific resistance; thermal transference; and specific heat.

Sludging.—The object of this test is to obtain an idea of the tendency of the different oils to form solid deposits when they are subjected to the action of heat and air. This action is considerably influenced by the presence of certain metals. The method recommended is a modification of that used by Dr. Michie. The oil contained in a flask is subjected to the action of heat and oxygen for a given time, a piece of the metal in question of given surface area being present in the oil during the test. It would be of interest to obtain comparative figures for copper, iron, lead, tin, zinc, and aluminium, and, in view of the importance of copper in electrical work, data should also be obtained for tinned copper, silver-plated copper, and copper covered by insulating material such as cotton.

Besides the formation of solid deposits in the oils after these have been subjected to the conditions of the test, note should be made of any corrosive effects on the metals, the formation of water and acids, and the extent to which the oils have darkened in colour.

Loss by Evaporation.—Two different methods of carrying out this test are described. A definite volume of oil is heated in a beaker at 100 deg. C. for 8 hours. In one method the body of the beaker is immersed in the heating bath, its open mouth being exposed to the air of the laboratory but shielded from draughts. In the second method the beaker is carried in a revolving tray in a hot-air oven. The result is expressed in terms of loss of volume and ratio of surface to volume of oil, the height of beaker wall above oil surface at the commencement of the test being stated.

Closed Flashpoint.—The temperature at which vapours accumulating above the oil in a closed vessel become inflammable is determined by means of either the Pensky-Martens or Gray's instrument. The oil is rapidly heated to about 25 deg. C. below its suspected flash point, the heating being continued beyond this at the rate of 24 to 3 deg. per minute. At each additional degree of temperature the cover is opened and a flame inserted. The lowest temperature at which flash occurs is thus determined.

Viscosity.—The standard method in Great Britain for this determination is that of Redwood, which notes the time in seconds required for a definite volume of oil to run through an aperture of fixed dimensions. Measurements are made at 15.5 deg. C., 50 deg. C., and 80 deg. C.

Chemical Reactions.—The oil is tested for acidity and alkalinity. An iodine test is also recommended, as it is believed that this test gives a good general indication of the tendency to sludge.

Density and Coefficient of Expansion.—The density is determined at the three temperatures 15.5 deg. C., 50 deg. C., and 80 deg. C., by means of specific gravity bottles or pycnometers, preferably of the Sprengel tube type. From these data the coefficient of expansion is obtained.

Cold Test.—This test determines the temperature at which the oil commences to congeal. A knowledge of this characteristic is of importance in connection with oil switches used in exposed situations and cold climates.

Moisture Absorption.—This test is made to determine the tendency of an oil to absorb moisture from the atmosphere, and is made by taking dielectric (breakdown) tests upon the originally dry oil after successive intervals of exposure.

* Abstracted from the *Journal* of the INSTITUTION OF ELECTRICAL ENGINEERS for April 1st, 1916.

Dielectric Strength and Specific Resistance.—These are familiar laboratory tests.

Thermal Transference.—A certain amount of information is available regarding the relative cooling effects in a transformer with oils of different viscosities, but it is felt that more exact information would be of value, and a method of investigation recommended by the National Physical Laboratory is described in detail.

Specific Heat.—The method of performing this test is left to the judgment of individual experimenters. Data should be obtained at 15.5 deg. C., 50 deg. C., and 80 deg. C. Reference is given to published data upon this subject. It is suggested that specific heat tests at 15.5 deg. C. might with advantage be made upon the oils both in their original condition and after drying, but for the test at higher temperatures dried oil should be employed.

Detailed methods of investigation for each characteristic recommended are given in the *Journal*.

AN ELECTROLYTIC OXYGEN AND HYDROGEN INSTALLATION.

A NEW electrolytic oxygen and hydrogen plant recently put into operation at the works of the Fore River Shipbuilding Corporation, Quincy, Mass., is run entirely automatically, requiring the attention of only one man to a shift, the plant being run continuously by three men in three eight-hour shifts.

The plant consists of a crude-oil engine, belt-connected to a 45-kw. D.C. generator, and one of the National Ox-Hydric Co.'s electrolyzers, as shown in the accompanying illustration, guaranteed to produce 3,500 cubic feet of oxygen per 24 hours and twice that amount of hydrogen.

The oxygen and hydrogen, after being produced from the electrolyzer, pass into steel gasholders of 2,000 cu. ft. capacity each. From there they pass through a suction line into suitable compressors, which boost the pressure in the pipe lines between the gasholders and point of consumption to the amount required at the blowpipes. Between compressors and blowpipes or operating stations, are suitable concussion tanks to take the pulsation of the compressors off the pipe lines.

The plant is also equipped with high-pressure compressors, for the purpose of compressing oxygen and hydrogen into cylinders where it is not advantageous to run pipe lines, such as on board ships and other extreme points of the company's shipbuilding yards.

The National electrolyzer is of the improved "filter-press" type. It consists mainly of a number of decomposition cham-

FILTER-PRESS ELECTROLYZER.

bers connected in series. These chambers are formed by clamping together a series of cast-iron electrodes, so recessed and grooved that each plate forms, with its neighbour, a chamber which holds the electrolyte, and in which the generation of the gases takes place.

The electrodes are carefully insulated one from the other by means of patented rubber-bound asbestos diaphragms. The electrodes and diaphragms are arranged alternately, and are supported by the insulated frame of the filter press. The required number of electrodes and diaphragms with the corresponding end plates are then pressed tightly together by means of a heavy screw standard, thus making the whole equipment form a hermetically sealed tank of the filter-press type, the diaphragms serving both as an insulation and gasket, and forming the sides of the cells, preventing any mixture of the two gases generated. The fact that the electrodes are thus separated by the diaphragm causes one side of the plate to act as the anode of the chamber and the other side as the cathode of the adjacent chamber.

The electrodes are composed of a special alloy, and are heavily coated with nickel, which makes them neutral to oxygen and alkali, and prevents the formation of deposits or the oxidation of the electrodes themselves.

The number of chambers required is, of course, dependent upon the production of gases required, as well as the voltage of the electric current. The electrolyses of the National Ox-

Hydric Co. are designed for any standard a.c. current, or, with the use of a motor-generator set, for any of the standard a.c. currents, thus doing away with the inefficient low voltage and high amperage necessary with the individual-cell type of installation. Furthermore, these electrolyzers occupy about one-fifth the floor space required by the individual cell type.

By the design of electrode the anode and cathode are brought close together, so as to reduce to a minimum the electric resistance, while, at the same time, the hydrogen gas is effectively kept separate from the oxygen gas without preventing the proper passage of the electrolytic solution between the anode and the cathode.

The electrodes themselves are made with corrugated surfaces, increasing the active electrode surface and forming a large number of very small vertical channels through which the gases rise freely to the upper part of the plates. At the top of each electrode and hermetically sealed together are substantial chambers in which the gases are separated from the electrolyte. From these chambers the gases pass off in a dry state into ducts extending through each plate, these ducts forming continuous conduits, owing to the manner in which the plates are assembled. The gases pass through these conduits into their respective receivers or storage tanks. One of the main features of the design is the way in which the conduits are kept free from electrolyte; this is accomplished by a device which is cast integral with each plate, thereby eliminating any possibility of a short circuit even should the conduits become filled with the solution.

The electrolyte is a 21 per cent. solution of pure caustic potash in distilled water. After the electrolyzers are once filled with this solution, distilled water is added from time to time to take the place of the water decomposed; the potash lasts many months. The distilled water is fed to the electrolyzer by an automatic device which maintains a constant level of the electrolyte throughout the machine.

Under normal load conditions, the voltage required per cell is two volts or less. Therefore, to operate on a 110-volt circuit an electrolyzer containing 55 cells is necessary; and on the same basis, 110 cells are necessary for a 220-volt circuit.

Assuming continuous operation and normal load conditions, the electrolyzers yield 4 cu. ft. of oxygen and 8 cu. ft. of hydrogen at atmospheric pressure per K.W.-hr. of energy consumed when the plant is operated at a temperature of 68 deg. F.

The gases produced are very pure, the oxygen being of 99.5 per cent. purity. The electrolyzer will stand an overload of 50 per cent. without any ill effects. This feature of being able to overload the plant and generate a proportionately greater amount of gas is of great advantage.

The water of which the electrolyte is formed has to be distilled in large commercial plants, but in the smaller individual plants the purchase of distilled water in quantities sufficient to operate the plant is advocated.

The electrodes are said to be practically indestructible. The asbestos diaphragms are very durable, and, being neutral to the elements with which they come in contact, have a life fully equal to that of the electrodes. All other parts of the equipment are practically not subject to any wear and tear.—*Metalurgical and Chemical Engineering.*

of the accident which his experience suggested. He had been able to satisfy himself that one cause of a rise in temperature in the L.P. purge pot was from a choking of the L.P. cooling coil, due to a carbon deposit taking place at the sharp gum-metal bend which coupled the L.P. delivery pipe to the cylinder. This might lead to the generation of an ignition pressure and temperature at this particular spot, and this pressure would not be recorded by a gauge on the L.P. purge pot. The precautionary measures taken as a result of the accident were as follows: A check valve was fitted on the H.P. delivery pipe as close as possible to the air compressor casing, pressure gauges were fitted to the L.P. and H.P. stages, so as to give timely warning when the valves needed attention; instructions were given for the valves to be cleaned at more frequent intervals, and it was recommended that this should be done every six weeks, but the experience gained by a study of the gauge pressures would be the best guide; the valves also should be renewed before any play or rounded seatings became accentuated.

Referring to Mr. P. H. Smith's recommendations in connection with the Smithfield accident, Mr. Lyle stated that his experience led him to suggest that the provision of anti-vibrators in connection with the gauges was better than throttle valves, as being more reliable in damping the oscillations and in providing freedom from choking. He considered that large relief valves provided no proper safeguard against explosions, though he quite agreed that valve wings choked the area. He thought that a non-return valve should certainly be fitted between the H.P. delivery and the blast bottle. With regard to Mr. P. H. Smith's statement that the L.P. purge pot was always the hotter when the machine was in good order, Mr. Lyle contended that this would depend on the type of the compressor, and that when fitted with the L.P. condenser type of cooler the reverse would be the case.

Mr. P. H. SMITH desired to make a correction in connection with the remark in recommendation (6) in his report by adding the words, "this remark applies only to compressors in which cooling coils are used, and not multitubular coolers." The next meeting of the Association will be held on Wednesday, May 10th.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

"Glow Lamps."

In the recent new wiring regulations of the Institution of Electrical Engineers, the Institution Committee adopts the term "glow lamps" to refer to incandescent electric lamps.

It is of interest to note that this term does not appear to be used at present by any of the electric lamp manufacturers in their lists as a descriptive term for the electric incandescent lamp. Examination of over 100 lamp catalogues issued by electric lamp manufacturers for a long period only traces the use of the expression "glow lamps" in one of them.

A. B. C.

DIESEL ENGINE USERS' ASSOCIATION.

At the April meeting of the Association, the accident to an air compressor attached to a Diesel engine at the Smithfield Markets was further discussed. Mr. W. FENXILL suggested that it might be advantageous to fit some suitable form of coil instead of the usual purge pot.

Mr. R. LYLE referred to an accident of a similar nature which had occurred on an air compressor attached to a 300-H.P. Diesel engine at the works of the Hoffmann Manufacturing Co., Ltd., in 1913. On that occasion, fortunately, no personal injuries resulted from the accident. The engine had been at work continuously for 24 hours before the accident occurred, whereas, in the Smithfield case, the accident occurred on starting the engine. It was found that the H.P. suction and delivery valves of the compressor were somewhat worn and fouled with carbon deposit. An exhaustive inquiry was held, but no very definite conclusion was arrived at. It was suggested that the bursting of the purge pot was caused either by the high pressure getting back from the blast vessel or being built up, or by high pressure due to the combustion or explosion of vapour. Mr. Lyle did not think that the first theory was tenable, as the calculated bursting pressure of the purge pot was over 2,000 lb. per sq. in., and the pressure in the blast vessel did not exceed 850 lb. at the time of the accident; the necessary pressure could not be built up, as a test by the makers, which consisted in blanking-off the delivery pipe and running the compressor up to full speed, showed that the relief valves dealt efficiently with the air. He considered that the trouble was undoubtedly caused by explosion, brought about by high terminal pressure and temperature in the intermediate-pressure cylinder, which might have been caused by the H.P. valves sticking in, as was suggested in the case of the Smithfield accident. There was, however, in the probable cause

Electricity in War Areas.

It is with great pleasure that one receives out here regularly a copy of the *ELECTRICAL REVIEW*, kindly sent by the editors and publishers, which enables one to keep in touch with what is happening in electrical spheres at home and abroad.

It may be of some interest to your readers to hear that electricity is playing an important part on this front; one finds where power is available from company mains that full advantage is taken of it in every possible way, and it is truly painful to see the thousands of pounds' worth of up-to-date electrical plant, i.e., large capacity sub-stations, transmission lines, transformers, &c., lying about in the "unhealthy area," rendered useless either by shell fire or exposure to the bad weather one has had to contend with in recent weeks.

One wonders if the orders after the war for reconstruction, new installations, &c., will be placed at home, as undoubtedly a huge volume of business is bound to be obtained out here.

One interesting application of electricity is, perhaps, worth mentioning. A certain mobile workshop near the line was equipped with a dynamo coupled to an internal-combustion set, but it was discovered that an old flour mill, dating back from 1787, possessed an overshot wheel, driven from a small stream near by, and shafting (incidentally, the drive was bevel wheel and pinion with wooden renewable teeth). This has now been utilised as prime mover, a countershaft obtained from a "shelled" thrashing machine fitted up, and the dynamo is now driven by water-power, an improvised transmission line being run to the workshop supplying power and lighting, and, consequently, saving valuable liquid fuel.

Previously, in another part of the front, the same dynamo was taken off its engine bed and coupled to a 3-phase motor that happened to have lost its owner, and connected to com-

pany mains, the insulators of the transmission lines in this case being the tops of champagne bottles, filled with plaster of Paris.

One wonders what will be the next vicissitude the dynamo will pass through.

The Resistance of a Cubic Frame of Wire.

The solution of this question has provoked considerable discussion, and Dr. Fleming has given the general form of solution for such mesh questions, involving a set of simultaneous equations, and their solution by determinants. This is, doubtless, the correct general method, but a good many engineers have little familiarity with determinants, and it may be worth while to show a very simple way of treating the particular case.

Fig. 1 shows the cube framework in perspective, with the 12 wires numbered. Fig. 2 shows these wires developed by following the three paths from one angle of the cube to that opposite. It is at once obvious that these paths form two terminal sections each of three wires in parallel, and a central section of six wires in parallel. The resistance of the three

FIG. 1.

FIG. 2.

sections in series is, therefore, $1/3 + 1/6 + 1/3 = 5/6$ of the resistance of one wire, assumed all equal as in the question. The vertical connections represent the junctions of the wires at the angles of the cube, and are of zero resistance. The method seems to be applicable to any mesh arrangement, but it may obviously involve complex arithmetic where the mesh sides are of different resistances and otherwise complicated.

Henry M. Sayers.

London, S.W., April 16th, 1916.

WAR ITEMS.

Exemption Applications.—At the Lambeth Tribunal an application for exemption was made by an electrician employed by the South Metropolitan Electric Supply Company, Ltd. As an outside worker it was a moot point as to whether he was in the revised list of reserved occupations. His grounds for exemption were that he was in a "reserved occupation, and that he was employed on public utility service." The case was adjourned for the appearance of the applicant's departmental manager, who later informed the tribunal that the man was exempt. He had that morning had a letter from the Minister of Munitions declaring that the men previously exempt as far as public electric lighting companies were concerned, were still exempt. The Mayor said they would adjourn the matter for inquiry. These exempt men ought to have badges and certificates, and the tribunal should not be burdened with their appeals.

At Stratford-on-Avon, on April 12th, the manager of the electricity works claimed exemption for Mr. H. L. Smith, electrician, on the ground that it was expedient in the national interest that he should remain in his present occupation of installation work. Two months were allowed to find a substitute.

In applying at the Sunderland Tribunal for the exemption of a journeyman electrician, a firm of electrical engineers said they considered him indispensable to the town because of his expert knowledge of X-ray and other surgical apparatus, and because he was often engaged in repair work at the Royal Infirmary and other hospitals in the district. There was no one else in the firm who could do such skilled work. Conditional exemption was granted.

At Richmond-on-Thames, on April 15th, the Richmond Electric Supply Co., Ltd., applied for exemption for an assistant in the showroom, it being claimed that the occupation was a reserved one. The tribunal decided otherwise, and refused the appeal.

At the Durham County Appeal Tribunal, last week, application was made by the Imperial Tramways Co., Ltd., for the exemption, on the ground of indispensability, of two fitters employed at Stockton-on-Tees. Both were single, and had been granted temporary exemptions. It was stated that the men were essential for the proper working of the company's system, which was the means of transit of munition workers. It was absolutely essential that the cars should be kept in perfect order. At the beginning of the war, the company had 16 fitters, and this number had been reduced to eight. It was stated further that a representa-

tive of the Ministry of Munitions had recently visited the works, and had had to admit that in his search there for men who could be spared, he had drawn blank. The elder man applied for was granted exemption until August, when, it was pointed out, it would be open to the firm to make a further application. The appeal in regard to the younger man failed.

Before the East Kent Appeal Court, on April 14th, Mr. Joseph Iggudden, electrical engineer, of Folkestone, appealed against refusal of exemption by the local tribunal. The Court decided that the latter body should grant three months' exemption.

Dartford Light Railway Co. have applied for exemption for 12 motor men, a driver, repairer and fitter, a driver and mechanic, a car and overhead equipment repairer, a driver and traffic inspector, and a brake fitter and overhaul repairer. All the rest of the employees are over military age. Conditional exemption was given to each, with a time limit of six months to those not married.

At Lewes, the Electric Supply Co. applied for absolute exemption for an engine fitter and cable joiner, and the request was complied with. Conditional exemption was also allowed the company's clerk.

The Surrey Appeal Court has refused an appeal for exemption made by Mr. E. B. Slaughter, electrical engineer, of Haslemere.

At Rugby, Mr. Hosking, assistant works manager to the British Thomson-Houston Co., Ltd., appealed for exemption for six engineers, two of whom completed their college course on March 31st, and the other four would do so on July 31st. The military recommended no exemption for two from a college in Scotland, who had finished their theoretical training, and exemption until July 31st to the four from English colleges, to enable them to complete their course of studies. Mr. Hosking said they were not pupils, but testers, who wished to come to Rugby to do practical work, and to be trained as electrical engineers. Before the war they had 94 testers, they had lost 55, and at present had 42 English testers and 12 of other nationalities. In testing it was absolutely impossible to dilute with female labour. The military recommendation was agreed to, and Mr. Hosking said he should appeal.

At Malmesbury, Mr. B. de Bertodano applied for temporary exemption for Richard Bishop, who runs an electric plant serving Cowbridge House. Exemption until July 15th was granted.

At Basingstoke, exemption was sought for an electrical wireman, engaged in the electrical installation at Park Preweth Asylum by Messrs. Hill, Upton & Co. The firm's manager said that their work was under the direction of the War Office, as the new asylum might be used as a military hospital. Exemption was allowed until May 15th for applicant to have his certificate as a voluntary munitions worker renewed.

At Bacup, last week, the secretary and manager of the Corporation electricity department appealed for the exemption of a fitter's labourer. It was submitted that this was a certified occupation, that there was pressing work in hand in connection with the sub-station for special purposes, and that it would take considerable time to train another man. The military representative said there was nothing in the lists or instructions which entitled the appeal to succeed. The appeal was disallowed.

The Austrian Electrical Industry in War Time.—A communication on this subject was recently published in the "E.T.Z." from E. Honigmann, of Vienna, who, after giving a survey of the situation from the time of the outbreak of the war, states that the electrical industry quickly recovered in the early months from the inevitable reactions which occurred at the beginning of the war, and accommodated itself to the new state of affairs. By way of illustration of this fact, it is mentioned that the companies which are liable to make a public return of their accounts, although not able to distribute such good dividends as in normal times, were yet able to divide acceptable profits for 1914, despite the large provision made for reserve funds and the exercise of great prudence in the preparation of the balance sheets. It is probable that the results for 1915 will show an improvement, as the turnover of those firms who produce articles for army requirements experienced a considerable increase, whilst at the same time yielding better results owing to the cessation of the keen competition which formerly took place. Other factors in the situation are that the old stocks, including those which had been partly or entirely written off long ago, were disposed of at good prices, that manufacturing has been simplified, that the production of munitions which caused many difficulties at first became profitable with the growing experience of the workmen and the increase in the output, and that a large portion of the working expenses declined.

The electricity works within whose scope of supply are situated works which are engaged on army contracts, also earned a larger income, not only on account of an expansion in the demand on the part of old customers, but also because of the addition of many new connections, as numerous owners of private installations preferred to obtain a supply from central stations, owing to the dearness, or difficulty of procuring, coal or liquid fuel for their own individual plant. Thus, for instance, the company owning the

great station at Rossitz was compelled to install a large new generating set in order to meet the greater demand for energy. After the re-conquest of the Galician oil yielding region provisionally occupied by the Russians the difficulties experienced by the owners of oil-engined installations were probably overcome, but the price of crude oil is still so high that it is more profitable to have a connection with a generating station. As to the question of a scarcity of raw materials, the author remarks that the Austrians helped themselves in the same way as the Germans by the adoption of substitutes, as, for instance, iron and zinc for conductors, paper insulation, &c.

It is submitted that an expressed dearth of raw materials has probably not yet been perceived. Nevertheless it is contended that precautions should now be taken, so that on the conclusion of peace the replacement of exhausted stocks should not be left to the action of individuals, as this would lead to the forcing up of prices by speculators and the causing of immeasurable damage to the industry. The work of acquiring raw materials should be carried out according to a scheme of centralisation under Government control, under which the materials would be grouped together.

American Engineers and Preparedness.—At a special meeting in New York on March 20th, attended by 3,000 engineers, the following resolutions were adopted:—

"The engineers assembled in public meeting on March 20th, 1916, under the auspices of the Engineers' Committee on Military Lectures, believe that it is unworthy a great nation like the United States, and that it is dangerous to the peace, safety and liberty of its people, to remain in our present position of inadequate military, naval and industrial preparedness.

"We believe that between pacifism and militarism there is a just, safe and proper ground, greatly in advance of our present position—a ground which involves large additions to both the navy and army, a large increase in our schools for training officers and a co-operation and mobilisation of the physical and industrial resources of the nation.

"We believe that this nation should never make war except to enforce peace; that when strongly supported by armed resources its influence in maintaining its own liberties and rights, and the liberties and rights of the weak and oppressed throughout the Americas, will be greatly strengthened.

"We believe that Congress should give due weight to the opinion of experts and should then appropriate sufficient money to put the nation in a position of defence against attack on either the Atlantic or the Pacific Coast.

"We demand that our representatives in Congress act in accordance with this expression."

Many prominent electrical engineers were among those subscribing to the resolutions.—"Electrical Review and Western Electrician."

Made in Holland.—The "Auckland Weekly News" refers to complaints that are being made by New Zealand importing firms that although direct trade with German factories is blocked by present conditions, a large amount of business that will ultimately accrue to the benefit of the German firms, is still being done in New Zealand, especially in electrical requisites. One dealer attributes the cause of the trouble to the fact that a large number of Anglo-German businesses, with works in England, are in the hands of supervisors, but their goods are going out to New Zealand in competition with the manufactures of Britain and her Allies and of neutral countries. He asks: "Why should enemy enterprises be allowed, under this thin disguise, to keep open the market in the Dominion, so that purely German business may step in at the close of the war and reap the benefit of this warming pan system, as if their trade had never suffered interruption?" The "News" later refers to the question of electric lamp manufacturing thus:—"As a striking illustration of the flimsy pretexts on which enemy trade is permitted, the trader produced a certificate covering a small consignment of a particular kind of electric lamp, manufactured in Holland. He had received a circular advertising the line and had sent a small order to see what he might discover. Sure enough, with the goods came a certificate from the British pro-Consul in Rotterdam to the effect that the Dutch company had satisfied him that the goods had not been manufactured in enemy territory, and that they 'did not contain materials or labour of enemy origin to a value exceeding 17 per cent.' So that, it was pointed out, £17 out of £100 of the value of the goods in Holland admittedly went to assist the enemy. The lamps in question, it is stated, are being sold in New Zealand by thousands."

Trade After the War.—Mr. Asquith was recently asked in the Commons whether any, and if so what, steps were being taken by the Government to formulate a trade policy after the war. In reply, according to the "Times," he said that a committee of the Cabinet was appointed some time ago to deal generally with all questions of reconstruction—including those relating to commercial and industrial policy—which were likely to arise at the close of the war. The detailed investigation of particular aspects of the problem would be carried on by sub-committees, as to the most important of which the Cabinet were in communication with the Dominions.

Dilution of Labour.—In reply to a Member of the House of Commons who asked the Minister of Munitions to what extent his demand for 80,000 skilled and 200,000 unskilled workers had been met, Dr. Addison said that the effect given to the policy of dilution, that was, the performance by women or unskilled men of work hitherto performed by skilled men, had enabled the demands for skilled men to be largely met. The demands for skilled men which could not be filled by the employment of women or unskilled men had been partly satisfied by the transfer of war munition volunteers from private work, the release of skilled men from the Colours, the introduction of labour from the Dominions, and from certain foreign countries, and by training semi-skilled persons or persons skilled in trades similar to these in which vacancies existed. There was still, however, a large demand for skilled men. This was especially important in shipyards, and the demand could only be met by the further progress of the methods referred to, and particularly by further dilution. The demand for unskilled workers had been largely reduced, mainly by the introduction of women.—"Morning Post."

Post Office Tube.—According to the "Daily Telegraph," the suggestion has been made by Colonel Norton-Griffiths that the work of the Post Office Tube Railway should be suspended so as to release the large number of men employed for pioneer battalions and other Royal Engineer units, where they are urgently wanted. Though the Postmaster-General stated that it would not be expedient to suspend such work, he was considering, in conjunction with the Ministry of Munitions, whether it would not be advisable to divert some of the men now employed on the tunnel.

Exports to China.—The "London Gazette" for April 18th and 21st contains further lists of firms and persons in China and Siam to whom exports may be consigned.

LEGAL.

ELECTRIC BATTERY CONTRACT.

AN action by Pritchett & Gold & Electrical Power Storage Co., Ltd., manufacturers of electrical batteries, against Humble, River, Luke and Co., Ltd., Hamble, Hampshire, was heard by Mr. Justice Sargant, in the Chancery Division, on April 17th.

Mrs. Hilda Beatrice Currie, of Upham House, Aldbourne, Wiltshire, was originally a defendant to the action, but, as counsel explained, she interpleaded, and an order was made whereby she paid into Court £255 odd, and withdrew from the action, her costs having to be provided for by the Judge. The action now came on between the plaintiff company and the defendant company.

MR. GRANT, K.C., who appeared for the plaintiffs with Mr. Merlin, said the claim was for payment of the price of a contract for the supply and erection of an electrical installation at Mrs. Currie's premises. The main contract was between her and the defendant company. The plaintiffs were sub-contractors to the defendant contractors. The contract was dated February 14th, 1914, and was for a general electrical installation for the purpose of lighting, pumping water in case of fire, and telephonic communication within the house, garage and engine room at Upham. The price for the whole of the work was £1,363. Defendants wanted to sub-contract for the battery—a 66-cell one—and the plaintiffs were to supply it and put it into working order, and start it off for £286. Plaintiffs delivered the material in a large number of cases ready for erection, but before the erection the defendant company went bankrupt. They, however, took the materials supplied by the plaintiffs, and did the erection, and now they said that the property in the goods passed to them when the plaintiffs delivered the materials, notwithstanding that the contract was not completed. They declined to pay the contract price, and said the plaintiffs would have to take whatever dividend the company could pay. Plaintiffs, on the other hand, said they had a contract for the supply of the materials for the battery, and they were to put it up and start it off, and until that contract was completed on the premises, no property passed in any portion of the goods. Counsel argued that this was one contract, not for the sale of goods at all, but for materials to be supplied and work to be done in the erection of the battery, coupled with the superintendence of the first charge.

HIS LORDSHIP: You say it was a contract for the supply of a battery in working order?

MR. GRANT: That is so.

MR. ROMER, K.C., who appeared with Mr. H. E. Wright for the defendants, said the plaintiffs made default to erect the battery, and the defendants did it.

The hearing was continued on April 18th.

MR. ROMER, K.C., who appeared with Mr. H. G. Wright for the defendants, argued that the plaintiffs had tendered for a battery, and had not incurred the responsibility of erecting it. This was not a case analogous to that of a man contracting to build a motor car on a buyer's premises; it was a contract to supply the component parts of a battery, and the moment the articles were delivered the property passed from the plaintiffs to the defendants.

MR. GRANT, K.C., said in reply that there was no completed contract until the battery was erected.

HIS LORDSHIP, giving judgment, said the real question was

when did the property in the goods pass. If the property in the materials for the battery passed to the defendants, as was alleged, at or about the time of the delivery of the materials, free on rail for the railway destination, then of course the plaintiff company were only entitled to prove in the liquidation for the amount due to them. If, on the other hand, the property in the materials did not pass, then the plaintiffs were entitled to the materials, and under the arrangement made by the order of the Master, to have paid out to them the sum paid into Court by Mrs. Currie. In his judgment all the difference was made by the special terms of the actual contract between the parties which seemed to him, on their true interpretation, to amount to a contract for the sale and purchase of a battery as one complete and entire whole *in situ* and in working order with its first charge included. The legal consequences were that the property still remained in their original owners, the plaintiff company, and they were entitled to have paid out to them the sum paid into Court and to have the costs of the action against the defendant company.

A stay was granted with a view to an appeal.

CEDES ELECTRIC TRACTION, LTD

UPON the petition of the Tudor Accumulators, Ltd., Mr. Justice Neville, on April 18th, made an order for the compulsory winding up of this company. The matter had been standing over for some time, and counsel for the respondent company said he could now no longer resist the order.

THE KINGSTOWN ELECTRIC LIGHTING SCHEME.

THE Irish Court of Appeal delivered a considered judgment in the appeal by the Dublin Southern District Electric Supply Co., Ltd., from the decision of Mr. Justice Barton in the matter of the arbitration between the company and the Kingstown Urban District Council, refusing an application made by the company for an order directing the Taring-Master to tax the costs of the company as against the Council, in the proceedings in connection with the scheme for the electric lighting of Kingstown, on the scale provided by the Acts for the taxation of Parliamentary costs, or, in the alternative, that the costs should be taxed as Chancery costs on the higher scale as between solicitor and client, or for such order as the Court might think reasonable. Their Lordships had previously dismissed the appeal.

The LORD CHANCELLOR now pointed out that, in making his award, the arbitrator, Mr. S. L. Brown, K.C., did not use the word "expenses," or refer to expenses by name. On looking at the schedule to ascertain what it was that was made a rule of Court, no submission in the ordinary sense could be found. The Arbitration Act of 1889 did not apply to Ireland, and if the matter had been amply dealt with by statutory provision, it did not apply to that country. They were confined to the provisions of the Common Law Procedure Act and the older statute of William III, dealing with arbitration. It did not appear that the immense difficulty raised by that simple consideration was brought before Mr. Justice Barton, and the trouble that he (the Lord Chancellor) found, was that the company, of necessity, having obtained the order which made the presumed submission a rule of Court, could not themselves argue or suggest that the proceedings were now irregular. Nor could the other side do it, because they were content to have the order made, so far as the award generally was concerned, which, he believed, had been obeyed. The award was afterwards confirmed. It was a very serious question whether, in view of what appeared to be a defect on the face of the proceedings, they should base their decision on that state of affairs. The whole point turned on whether there was any award on the word "expenses" in Sec. 28; this conclusion was that if that section was to apply, as he was willing to consider it, it covered something to be paid by one party to the other and was really only costs; that it included costs, and that where it was a larger thing than costs, and where the expression was interchangeable with costs, the arbitrator had jurisdiction to make the order which he did, giving costs simpliciter. It was impossible not to see that a grave and serious question arose as to whether the whole proceedings in the case were not outside jurisdiction. He thought, however, on the whole, as he found an order purporting to be regular, which might be within jurisdiction if there was a real submission, he might safely declare his opinion that Mr. Justice Barton's view was correct.

Lord Justice Molony and Lord Justice Roman concurred.

The LORD CHANCELLOR said Parliamentary costs would be, of course, indemnifying costs, his view being that the decision of the Court of Appeal in England in Peterson's case was conclusive on the subject. He also pointed out, with regard to the extension of the Arbitration Act to Ireland, that three lines would have cured what was a very manifest error.

MR. T. M. HEALY, K.C., M.P. (for the company) said it might interest the Court to know that when a clause was being drafted the Board of Trade ruled it out.

In reply to Mr. Clancy, K.C., M.P. (for the Council), the LORD CHANCELLOR said the ruling was that the appeal was dismissed, with costs.

S. T. BALDREY & SUN ELECTRICAL CO., LTD.

JUDGE PARRY, at the Lambeth County Court, on 20th inst., gave judgment in the application for compensation made by Samuel Theodore Baldrey, aged 14 years, who, through his father, Joseph William Baldrey, engineer, of 65, Kirkwood Road, Peckham, brought an action under the Workmen's Compensation Act against the lad's employers, the Sun Electrical Co., Ltd., of 118-120,

Charing Cross Road, W. The facts were reported in our issue of April 7th, page 391. A piece of metal thrown by another boy caught the applicant in the right eye, the sight of which he lost. His HONOUR, in giving a considered judgment, said a suggestion was made that the boys were larking, but their evidence convinced him that this was not so. They were taking an intelligent interest in their surroundings, and seeking information from each other, as human children of their age would do, and, according to modern educationalists, should be encouraged to do so. He had no doubt that this was an accident arising out of, and in course of, the applicant's employment, and made an award in his favour of half wages of 9s. 10d. a week since the date of the accident, with costs.

MORGAN JAMES & BEDWELLY DISTRICT COUNCIL.

MR. JUSTICE ASTBURY, in the Chancery Division, last week, gave judgment in the action of Morgan James, flannel manufacturer, Maerccymmer, against the Bedwelly District Council. The matter is reported in the *South Wales Echo*, which says that plaintiff sought damages for the pollution of the river Rhyney with sewage, which, it was alleged, clogged plaintiff's turbine to such an extent, that it would not work, and, as the consequence, plaintiff had to obtain electric power and light for his factory and house from the South Wales Electric Supply Co. at considerable expense. Defendants denied liability, and pleaded that the machinery could not work owing to its neglect and defective erection.

His LORDSHIP said there was only one fact not disputed, and that was that the Council poured their undiluted sewage into the river. Not unnaturally, perhaps, defendants sought to throw the blame on the other District Councils, particularly the Council of Gelliager. On the evidence, he thought there were three contributory causes to the loss of the power of the turbine. The first was that the plaintiff neglected to replace worn blocks; the second was that the vanes of the turbine were choked with solid sewage matter mixed with coal dust, and the third was that, owing to the presence of sewage, the screens to the turbine became unusable. The parties, and especially the defendants, had spared no expense in presenting the case. Balancing the evidence as best he could, and notwithstanding the expert views which were very positively given by the defendants' witnesses, he had come to the conclusion that solid sewage did find its way from defendants' pipes to plaintiff's factory, and that even if plaintiff had kept his turbine in proper repair, it could not have given satisfactory power. He awarded plaintiff damages for £150 and costs, and refused a stay of execution, remarking that he thought the Council had indulged themselves very freely in incurring expenses for expert evidence.

MUNITIONS CASES.

BEFORE the Oldham Munitions Tribunal two Belgians applied for leaving certificates to enable them to leave the service of an electrical manufacturing firm. They complained that they felt ill and said they desired to go to London for a rest and to undergo medical treatment. A doctor's certificate was produced showing that both men needed a rest. It now transpired that one of the men did not want to go to London, but wished to take up textile employment at Bradford, having been offered a wage of £4 per week. Spinning, according to the doctor, would suit him better than shell-work, which was too heavy for him. The men said they received 28s. and 32s. per week respectively, with 3s. war bonus in each case, but according to the statement of a representative of the firm their average earnings were 47s. per week and 37s. 8d. per week respectively. The applications were refused.

At a General Munitions Tribunal at Oldham, an electrical firm complained that the Gordon Spinning Co., of Hollinwood, had engaged a junior clerk from their office without consent or leaving certificate. Mr. Marland, of the electrical firm, described the youth's work and strongly complained about outside firms taking their clerks after they had trained them. At least a dozen boys from their place had been taken into cotton mills during the last few weeks. Mr. A. J. Ashton, K.C. (President), said they did not intend to allow textile companies to go on taking these boys as they had been doing. They were going to protect the munitions establishments as much as they could. There would be a fine of £2 in this case, but it must be clearly understood that if offenders came again, either in Oldham or in other towns, they would take a severe view of the matter. Mr. Pickford, manager of the Gordon Co., said he was sorry if he had acted wrongly, but he had done it in ignorance. The President said he was prepared to accept that statement. If he had thought the act had been committed other than in ignorance he would have imposed a fine of £10 or £15.

Trade with Australia.—H.M. Trade Commissioner for Australia (Mr. G. T. Milne) is about to visit those trade and industrial centres in the provinces which have been decided upon as most advantageous to visit in view of the applications that have been received from firms in or near those centres, and from Chambers of Commerce. The itinerary of H.M. Trade Commissioner's tour includes Bristol, Newport (Mon.), Cardiff, Birmingham, Wolverhampton, Walsall, Coventry, Leicester, Nottingham, Derby, Stoke-on-Trent, Dublin, Liverpool, Manchester, Sheffield, Huddersfield, Bradford, Leeds, Newcastle, Edinburgh, Dundee, Dunfermline and Glasgow in the order named.

BUSINESS NOTES.

Greece.—The French Consul-General at Athens gives the following particulars regarding the commercial situation in Greece as far as concerns imports. Price, owing to the competition of German and Austro-Hungarian products, is an essential factor, and should be fixed at the lowest level practicable, and should embrace freight, insurance and packing. Among wares which French exporters might offer with a good chance of sales are lighting apparatus, chemical products, machinery, dynamos, steam-engines, &c. The Greek merchant only rarely opens direct negotiations with overseas producers, and foreign exporters have more often to treat with commission agents whose standing in consequence becomes of first importance. To obtain all needful details regarding such firms' credit and reputation, French exporters have only to apply by letter to the French Chamber of Commerce at Athens-Piræus, or, in Paris, to the Office National du Commerce Extérieur (which bodies would, doubtless, extend their services to British exporters, in special cases). Additionally, the French Consul also advises a more extensive employment of travellers, if only to counterbalance the local activities of the numberless German travellers in Greece. Particular attention must likewise be given to the drafting of the terms of the agreements come to. The bills of lading drawn in duplicate and sent by two different routes, should be as much as possible made out in a way to lessen the risks of the misappropriation of this deed and the diversion of the goods to improper third parties. Packing should be light, but strong. Settlement is made through a bank, which hands the documents to the purchaser against payment forthwith or against an accepted bill. The French exporter is dissuaded from drawing directly on the purchaser. Credit varies from two to three and from six to 12 months, and as the renewal of bills is common throughout the Levant, exporters would commit a great error in showing themselves too strict on this head. In Greece commercial causes come before the civil courts; suits are decided by a Commission of Customs officials, which is attached to the Ministry of Finance, against whose decisions there is no appeal. The French Consul advises the making out and forwarding of invoices in the fullest detail, with gross and net weights of each article; to pack goods in solid cases, banded if possible; to insure against theft and other risks, and to indicate on the invoice the name of the representative in Greece of their insurance company to whom the goods-receiver should prefer his claim for damage or loss. It is to be observed that all commercial travellers are subject to special regulations, prescribed by Article 6 of the Commercial Code arranged between Germany and Greece, whereby among other things, they must be furnished with a letter of recommendation subscribed by a competent authority in their own country; samples which they bear are allowed duty free only on condition that they are re-exported unutilized within from six to 12 months, and subject to fulfilling certain Customs formalities. Commercial travellers are likewise exempt from the patent tax, if Greek commercial travellers are granted a like exemption. The office of the French Chamber of Commerce in Greece is available for use by French commercial travellers for the reception of their correspondence, and, on occasion, for the exhibitions of samples.—*La Revue Electrique*.

The Board of Trade C.I.B.—At a recent meeting of the Advisory Committee of the Board of Trade Commercial Intelligence Branch, it was reported that the number of written and personal inquiries received, exclusive of the foreign samples section, during 1915 was 50,400, as compared with 40,600 in 1914, and that in view of the success which had attended the British Industries Fair, the Board of Trade had decided to hold a similar Fair next year, to be opened on February 1st.—*Daily Telegraph*.

Aircraft Constructors.—The *Times* records the formation of the Society of British Aircraft Constructors, Ltd., to encourage, promote, and protect British aircraft industry. Among the firms who have signified their intention to join are:—Austin Motor Co. (1914), Ltd., Wm. Beardmore & Co., Ltd., Boulton and Paul, Ltd., Brush Electrical Engineering Co., Ltd., Mann, Egerton and Co., Ltd., Handley & Page, Ltd., Phoenix Dynamo Manufacturing Co., Ltd., Robey & Co., Ltd., Ruston, Proctor & Co., Ltd., Vickers, Ltd., and G. & J. Weir, Ltd.

Liquidations.—**ILKESTON MOTOR AND ELECTRICAL ENGINEERING CO., LTD.**—Creditors must send particulars of debts, &c., to the liquidator, Mr. A. Boaler, King Street, Nottingham, by May 16th.

TELERADIO ELECTRIC CO., LTD.—A meeting is to be held on May 22nd, at Balfour House, E.C., to hear an account of the winding up from the liquidator, Mr. E. H. R. Trenow.

ARDWICK ELECTRIC REGULATORS CO., LTD.—This company is winding up voluntarily with Mr. J. W. Shepherd, 78, King Street, Manchester, as liquidator. A meeting of creditors is called for May 5th.

BRITISH ACCUMULATOR CO., LTD.—Meeting of creditors, May 4th, at Tanfield Buildings, Bradford.

Trade Announcements.—In order to expedite delivery of telegrams to the EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., Ponder's End, Middlesex, customers are asked to address all telegrams: "Ediswan, Enfield," when communicating with the Ediswan Works.

The new works of MESSRS. ARSTIN WALTERS & SON are at Gaythorn Electric Works, Manchester. Their old address was inadvertently given in our paragraph of last week. The word

stores in the last line but one of that paragraph, of course, should have read *stores*.

THE GREENEY ADVERTISING SERVICE have issued a folder entitled "Preparedness," briefly explaining the service which they are prepared to render. Copies will be sent to manufacturers and merchants on receipts of an inquiry to 37 and 38, Strand, W.C.

THE GENERAL INSULATE CO., 1008-20, Atlantic Avenue, Brooklyn, N.Y., makers of "Insulate" and "Hi-Heat" moulding compound, are extending their works so as to more than double their present capacity.

Book Notices.—*The Relation of Imports to Exports.*

By J. Taylor Peddie. Second Edition. London: Longmans, Green & Co. 5s. net.—The author describes this book as a study of the basis of a new National and Imperial Policy. A series of essays, in which a number of leading authorities are quoted at length, has been written to induce the public to see that all questions relating to the welfare of the State should be judged from the national point of view, and not from the standpoint of political party or individual interest. In the introductory notes the author holds that the destiny of nations is now guided by the efficiency of their systems of national economics. He takes credit that another volume of his was "largely instrumental in bringing about the formation of a strong Industrial Research Committee, under the auspices of the Government," which has placed £30,000 at its disposal. We are inclined to think that some others also believe that they were "largely instrumental" in that connection. In the preface to the second edition, he asserts that a great many of the legislative measures approved of in recent years would have taken on a much different character if they had been based on a clearly defined national policy, and this volume is submitted with a view to making a beginning in this direction. The essays in which he unfolds the national policy are "The Relation of Imports to Exports; Foreign Exchange (the Bill of Exchange)"; "National Economics or Empiricism?" Part of the last of these, as he says, was read after luncheon to the Institute of Industry in January last. The four immediate objects which he considers the public should aim at establishing before the war concludes, or shortly thereafter, are Nos. 1, 2, 3 and 6, which were published in the *ELECTRICAL REVIEW* for January 21st, page 66—a Ministry of Industry, better representation in Parliament of national industry, finance, science and commerce, the establishment of industrial banks, and the standardisation of our educational system.

"Scientific Papers of the Bureau of Standards": No. 260, Centre of Gravity and Effective Wave Length of Transmission of Pyrometer Colour Screens, and the Extrapolation of the High Temperature Scale; No. 261, Studies of Instruments for Measuring Radiant Energy in Absolute Value: an Absolute Thermopile; No. 264, Photometry of the Gas-filled Lamp; No. 265, Life Testing of Incandescent Lamps at the Bureau of Standards; No. 269, Effect of Imperfect Dielectrics in the Field of a Radio-Telegraphic Antenna. "Technological Papers of the Bureau of Standards": No. 62, Modern Practice in the Construction and Maintenance of Rail Joints and Bonds in Electric Railways; No. 63, Leakage of Currents from Electric Railways; No. 68, Standardisation of Automobile Tire Fabric Testing.

"Journal of the Röntgen Society." No. 47. Vol. XII. April, 1916. London: Percy Lund, Humphries & Co., Ltd. Price 4s. net.

Bankruptcy Proceedings.—A. F. HAWDON, electrical engineer, Gosforth.—Application for discharge is to be heard at Newcastle-on-Tyne, on May 11th.

J. SWAINSON, electrical contractor, Chorlton-cum-Hardy and Manchester.—Trustee (Mr. A. Yearsley) released March 24th.

Catalogue.—BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—List No. 4,501 C, giving an illustrated description of, and price and dimensional information respecting, lightning arresters for C.C. circuits.

LIGHTING AND POWER NOTES.

Argentina.—A preliminary meeting of shareholders of the newly constituted co-operative association for the supply of electric light and energy in Mar del Plata has been held. The installation is expected to be working by next summer season. It is proposed to charge 40 cents per unit during the summer and 25 cents during the winter months.

After careful consideration of the request of the Compania Alemana Transatlantica de Electricidad for permission to supply electric current by means of aerial wires in certain of the less densely-populated districts of the Federal Capital, the request has been granted, similar permission, however, being accorded to all other electrical companies operating in the city.

Australia.—The *Commonwealth Engineer* recently summarised the position of the controversy regarding the departure from standard frequency and voltage in the case of the West Australian Government's power plant at Perth. The Federal Council of the Electrical Association of Australia has endeavoured to induce the W.A. Premier to conform to the existing standards, pointing out the disadvantages which will arise from the Perth

area having to be specially provided for, in view of the 40-cycle A.C. supply and 250-volt consumers' pressure which is being adopted, but has apparently been unsuccessful. It may be added that 50 cycles has been generally adopted for A.C. work on large Australian supply undertakings, while the voltage adopted for Perth consumers, 250 volts, adds to existing divergencies as follows:—Adelaide 200, Brisbane 220, Melbourne 200 and 230, and Sydney 240 volts.

Aylesbury.—**LOAN APPLICATION.**—The U.D.C. has applied to the L.G.B. for sanction to a loan of £550 for battery extensions at the electricity works. The Council has agreed that notice be given to the occupier of the Bull's Head Hotel to discontinue receiving current from the Aylesbury Electric Theatre, Ltd., or any company or person other than the Council.

Burton-on-Trent.—The T.C. has decided to carry on the cable extensions to cost about £600, including the provision of transformers and motors, and to meet the cost out of revenue. The extensions are needed for additional power customers.

Cardiff.—**RESTRICTED LIGHTING.**—The electrical engineer reported to the Tramways and E.L. Committee that the new lighting restrictions order, which came into force on the 14th inst., would mean a loss of £20,000 to the department. There have been no restrictions in lighting up to now.

Grimsby.—The Electric Lighting Committee has decided not to accept any new consumers of current for lighting purposes, the plant being already overloaded. The engineer, in his report, recommends that a scheme of extensions be prepared, so that orders can be placed immediately on the close of the war. The report was adopted. The Committee agreed, in the event of the war being over by next winter, to continue the existing restrictions as to private and public lighting.

Heywood.—Although the actual figures showing the result of the working of the electricity department during the past year have not yet been made public, the Electricity and Tramways Committee has decided to ask for a sum equal to the production of a 4d. rate for the reduction of the adverse balance; last year a 5d. rate was granted.

India.—**ELECTRIC POWER SCHEMES.**—In view of the growing demand for electric power in Mysore, Mr. S. G. Forbes, chief electrical engineer, has formulated two projects to supplement the present works at the Canvey Falls. They are known as the Shimsha and the Kodedatu schemes, estimated to cost 67 lakhs and 30 lakhs respectively. Power from these would be fed into the existing transmission cables. Increased production up to 40,000 H.P. is provided for, with a further possible increase up to 50,000. In discussing a paper on the subject before the Mysore Engineers' Conference, Mr. Forbes, besides forecasting a possible supply of 3,000 to 4,000 H.P. for Madras City, points out that the railway from Bangalore to Mysore can be electrified. He thinks the schedule of trains over this 87 miles' section could be so arranged that power consumption would be fairly uniform throughout the day at an average of 1,000 H.P.—*Indian Engineering.*

Ichen.—**PROV. ORDER.**—The B. of T. has informed the U.D.C. that it has no power to grant an extension of the E.L. order for three years after the war as requested by the Council, but under the existing circumstances it will defer the question of revoking the order for a year.

London.—**ST. PANCRAS.**—The Ministry of Munitions has agreed to the request of the B.C. that the contracts in connection with the King's Road station extension may be declared war contracts, so far as the two new boilers and the building portion of the work are concerned. The Ministry suggests, however, that the installation of the coal storage bunkers and coal and ash-handling plant should be left over, if possible, in order to economise in the use of steel. The Electricity Committee thinks it important that the whole of the portion of the station extension scheme now arranged for should be allowed to proceed without modification, and it has accordingly appointed a deputation to wait upon the Ministry to explain the urgent needs of the case.

WOOLWICH.—A supply of current is to be given to a large firm engaged on Government work, necessitating the purchase of apparatus, and at a total cost of £140. Having regard to the fact that the amount of coal to be handled at the Globes Lane Station has nearly quadrupled, and there is every possibility that it will further increase, the Electricity Committee's original proposal to purchase a grab to be fitted to the existing telfer is quite insufficient to meet present needs, and it is reported that other arrangements have been made in connection with the existing extensions now being completed. The B.C. has received sanction to the borrowing of £3,290 for mains, transformers and hire rentals.

Luton.—**NEW PLANT.**—The electrical engineer reports that two new boilers, an economiser and steel piping, and ash and soot-handling plant, will be required for next winter's load.

Lymington.—**PRICE INCREASE.**—The Electricity Co. has informed the T.C. that as from March its charges for current will be further increased by 5 per cent.

Manchester.—**RATE AID.**—At the meeting of the Electricity Committee to consider the estimates, it was stated that in order to provide the £30,000 for rate aid for the previous year £1,825 had to be taken from the reserve fund, the surplus available being £28,175, as against £34,426 the previous year. The number of units sold for the year ended March 31st, 1916, was 141½ millions, as against 127½ millions for 1915, and the income had risen from £530,740 to £605,652. For the current year the Committee estimates that the sales will increase by about 42 million units. Owing to the high price of fuel and other costs the estimated surplus on the year's working is £9,000. To provide the £30,000 for rate aid it will be necessary to withdraw the balance in the reserve fund and carry forward as a debit against the year 1917-18, £10,943.

Mexborough.—**PROPOSED LOAN.**—The U.D.C. has decided to apply to the L.G.B. for sanction to borrow £700 for the purchase of a new boiler, &c.

Rathkeale (Co. Limerick).—**WORKHOUSE LIGHTING.**—The average cost of gas lighting for the workhouse for the six years 1909-14 was £100 per annum, while the electric light bill for the year ended in March, 1916, showed a cost of only £65.

Rochdale.—**YEAR'S WORKING.**—The working of the electricity department during the past year shows a profit of £2,537, compared with £1,522 in the previous year, and a loss two years ago of £330. The income amounted to £51,307, compared with £53,553, an increase of £1,754. Working expenses amounted to £30,379, compared with £18,279, an increase of £12,100. The gross profit was £20,928, or £5,655 more than in the previous year. Interest and sinking fund charges, and allowances to employees on active service, amounted to £18,390, compared with £13,751 in the previous year. The depreciation fund amounts to £10,286, the sinking fund to about £35,000, and there is £4,857 in the reserve fund. The capital value of the undertaking is given as £227,673. Last year £1,500 was contributed to rate relief, but this year it is recommended that the profit of £2,537 shall be placed to reserve.

It is proposed to apply for L.G.B. sanction to the borrowing of about £60,000 for extensions to the electricity works building and plant in accordance with recommendations in the report of Mr. S. L. Pearce, Manchester city electrical engineer, who has recently been called in to prepare an expert report.

Southampton.—In the course of a report upon the condition of the machinery and mains, the electrical engineer reminds his Committee that last year English agents found it difficult, and finally impossible, to obtain brushes from Germany for the Willans turbo-generator. For some months this machine was run as little as possible, in order to eke out the stock, there being no English makers of these brushes. Sample brushes obtained from a French firm have now proved fairly satisfactory.

Stratford-on-Avon.—**PRICE INCREASE.**—The T.C. has consented to the Electricity Co. increasing the charge for energy for lighting from 5d. to 6d. per unit for the year or for the duration of the war.

Tasmania.—Owing to delay in the delivery of material, the Government's Great Lake hydro-electric scheme is not likely to be ready to supply light and power before May. The turbines at the power station were given a trial run recently when the machinery ran smoothly, and everything was in good order. All that remains to be done before power is available at Hobart is to carry the transmission line across the Derwent at Bridgewater.

Tynemouth.—**YEAR'S WORKING.**—The report of Mr. Turnbull, the borough electrical engineer, on the working of the electricity department for the year ended March 31st last, shows that the total units sold amounted to 4,809,341, as against 4,296,305 in 1914-15; of these, 2,844,860 were three-phase units supplied to large consumers not over the Council's mains, and only 1,964,481 units were purchased in bulk, and only 291,653 units were generated by the Council's plant. The total revenue for the year was £23,030, and the net surplus, after meeting all expenses, £738, as compared with £1,787 in the previous year.

Watford.—**LOAN SANCTION.**—The U.D.C. has received sanction to the borrowing of £1,625 for electricity purposes.

West Ham.—The electrical engineer reports having obtained quotations for further automatic protective devices to be used in connection with the three main generators, and that he proposes to put these on order immediately. When installed, these devices, the engineer submits, will bring the principal generators into line with the most modern practice in regard to automatic protection.

Weymouth.—**PRICE INCREASE.**—The T.C. has decided, in view of the loss of £1,500 on last year's working, that the charges for electricity be increased as from April 1st as follows:—15 per cent. on lighting and fixed price lighting, 20 per cent. on heating, cooking, power and contract supplies, and that the meter charges be reduced from 2s. 6d. to 1s. per quarter.

Wolverhampton.—**PRICE INCREASE.**—The T.C. has decided to advance the price of electricity by 10 per cent.

Application is being made to the L.G.B. for sanction to borrow £17,100 for the extension of the Corporation's electricity plant.

TRAMWAY and RAILWAY NOTES.

Australia.—The Minister of Victorian Railways (Mr. H. McKenzie), states that satisfactory progress has been made towards the inauguration of the suburban electrification scheme. Contingent upon the arrival of sufficient apparatus from the contractors, Messrs. Siemens Bros. Dynamo Works, Ltd., it would be practicable to commence the running of electric trains on the line between Essendon and Sandringham about the end of the year. The Agent-General and the consulting engineer, Mr. Merz, had waited on the Minister for Munitions to obtain his consent to the contractors proceeding with their work, but they were unable to obtain any definite promise. The Commissioners are in communication with Mr. Merz who has requested the contractors to submit any proposal they can make for the early completion of the contracts. The Minister stated that the present indications are that the determining factor in the matter will be the supply of switchgear.—*Melbourne Age.*

Birmingham.—TRAILER CARS, &c.—The Tramways Committee reports that no definite decision has been arrived at with reference to the running of trailer cars. A car was being prepared, and would be placed on the Handsworth route as an experiment; if successful, the question of introducing such cars upon the tramway routes of the city would be considered.

The scheme for constructing a branch tramway off the Edrington route, to open up communication with Tyburn, had been postponed until after the war; meanwhile motor-buses, of which several of the 12 ordered had been delivered, would be used to convey employees to the works in that district.—*Birmingham Daily Post.*

Blackburn.—YEAR'S WORKING.—The annual report of the Corporation tramway department for the year ended March 31st last, shows that the total revenue was £68,410; the working expenditure amounted to £46,964, and after meeting financial charges the net balance was £21,757 as against £1,572 in 1914-15. The figures mentioned scarcely vary from those of the previous year. An increase of about £1,200 in war grants has been met by savings in other directions. Less miles have been worked and more passengers carried, the totals for the year being 1,091,050 car miles and 12,216,151 passengers. The receipts per c.m. reached £17.17.

Blackpool.—YEAR'S WORKING.—The gross profit on the Corporation tramways for the last 12 months was £35,036, the total income being £80,070. After allowing for interest, sinking fund repayments, &c., there was £16,275 available for the relief of the rates, reserve funds, &c. The year was financially the third best in the history of the tramway undertaking, there being a disposable balance of £24,552 in 1913-14, and of £17,664 in 1912-13.

Bradford.—RAILLESS GOODS TRAFFIC.—Owing to the shortage of team labour and cartage facilities the question of utilising the tramway system for the conveyance of goods has been considered by Mr. C. J. Spencer, the tramways manager, with the result that a vehicle has been built by the tramway department as an experiment to run on the railless trolley principle, fitted with accumulators which will take in a supply of current from the overhead wires. It is considered that such a vehicle might be loaded with merchandise at a railway goods depot and follow the tramway system to almost any part of the city. It is calculated that one of these vehicles would do the work of 10 men and 10 horses and carts, and at considerably less cost. The matter has been placed before the B. of T. by Sir Wm. Priesley, M.P., and Ald. James Hill, M.P., and the authorities in London have granted every possible facility. It is proposed to erect a number of vehicles of the type in question, and the experiment at Bradford will, it is understood, be watched by the B. of T., with a view to its development in other centres.—*Leeds Mercury.*

The general manager (Mr. C. J. Spencer) presented a report to the Tramways Committee regarding the issue of free tramway tickets during the year ended March 31st last. During the 12 months 42,230 free tickets were issued to soldiers, Belgians, and visitors attached to the Lord Mayor's Relief Fund, the aggregate value of these being £2,770. The proportions were: 333,400 to soldiers (£2,084), 97,180 to Belgians (£607), and 12,650 to Lord Mayor's Relief Fund visitors (£79).

Bury.—YEAR'S WORKING.—The profit on the Bury sections of the Corporation tramways during the past year was £7,314, and it was decided to recommend that this should be apportioned as follows: insurance fund account, £1,000; reserve and depreciation fund, £1,314; and borough rates, £5,000. On the Radcliffe section a profit of £769 was made under the first agreement, and a loss of £368 under the second agreement; this is borne partly by Bury and partly by Radcliffe.

Croydon.—STRIKE.—At a meeting, on Tuesday, the employees of the South Metropolitan Tramway Co. decided to return to work at once, subject to certain guarantees; the Corporation employees, who also took a vote on the position, decided to remain out until the T.C. agrees to arbitrate or to have a meeting of both sides, with an independent chairman.

Darlington.—The Electricity and Light Railways Committee's report of the tramway revenue last year showed an increase of nearly £1,000. An increased demand for electricity was reported, by about 40 per cent. as compared with the previous year.

Female Tramway Drivers.—The Tramway and Vehicle Workers' Association has made representations to the B. of T. and the Ministry of Munitions against the suggested employment of women as tramway drivers, and the secretary of the Union, Ald. Jackson, of Salford, stated last week that requests had been made that the departments named should receive deputations on the subject. The Union contends that no case has been made out for the employment of women as car drivers, or for the assumption that men over military age cannot be obtained for the work.

Hyde.—FEMALE LABOUR.—At the local Trades Council on the 18th inst. a protest was made against the proposed introduction of women as tramway drivers in the district. It was stated that the local Joint Tramways Board had invited applications from males or females who wished to learn driving.

Heywood.—YEAR'S WORKING.—During the past year the loss on the tramway undertaking amounted to £518, compared with a loss in the preceding year of £1,042. The gross income amounted to £11,955, an increase of £358, and the gross expenditure to £12,503, a decrease of £165. It has been decided to ask the Corporation for a sum equal to the production of a penny rate for the reduction of the adverse balance.

Kingsbury.—The District Council is giving support to the application of the M.E.T. Co. for permission to use trailer cars.

Leeds.—YEAR'S WORKING.—The returns of the Tramway Department for the year ending March 31st 1916, show that the income was £475,505 (traffic receipts £467,197; haulage of minerals £2,620; and rents £5,054), representing an increase of £40,994 as compared with a year ago. The working expenses were £230,715, as against £228,134 in the previous year, which left a gross profit of £239,278 as compared with the previous year's £206,376. To this is added £10,302 in respect of bank interest and dividends, and redemption fund investments bring the net revenue to £249,589, £35,375 in advance of the previous year. From this has to be deducted interest on capital £49,474; income-tax £15,319; rent of lines £3,072; allowances to dependents of employees serving with the Colours £13,271; redemption fund contribution £64,789; permanent-way renewals and exhausted loan on power plant sold during the year £11,550; reserve fund for third party risks £2,044, leaving a net surplus of £86,822, representing an increase of £5,255 as compared with the figure for a year ago. Of this surplus £15,000 is placed to the reserve fund, and £71,822 is to be devoted to the relief of the rates.

L. & Y. Electrification.—A tabular statement which has been prepared in connection with the electric train service between Manchester and Bury (which was inaugurated last week) shows that the electric system cuts down the time of the journey substantially. By steam train the journey from Manchester to Bury, with stops, is shown as taking 32 minutes, as compared with 24 minutes on the electric service. From Bury to Manchester the time by steam train is 29 minutes, and 22 minutes by electric train.

Manchester.—ESTIMATES FOR 1916-17.—The Tramways Committee, after considering the annual estimates of receipts and expenditure for the year 1916-17, has agreed to contribute £100,000 to the relief of rates as it has done on two previous occasions, but to do this it is probable £10,865 will have to be taken from the reserve and renewals fund. This rate contribution was fixed by the City Council three years ago, and it is considered that it will have to be revised before the end of the year. For war service allowances the department paid £31,764 for the year ended March, 1915, last year the amount was £92,881, and for the current year it is estimated that £94,000 will be necessary, making a total in three years of £218,645. Last year's revenue was £939,416, an increase of £27,540 over the previous year and £14,106 higher than 1914 which was a record year; the car miles run were 18,486,440, and the passengers carried, 209,853,344, an increase of 7,084,924 over 1915. The revenue per car mile was £12.96d. as against 11'3d. in 1915. The estimated expenditure for 1916-17 is £950,365 based on an estimated car mileage of 18,500,000. After providing for the payment of £100,000 to the city fund and meeting the extraordinary expenditure arising out of the war, viz., war services allowances, £94,000 and £40,000 income-tax, the department will not only be unable to make any provision for renewals, but it is estimated that there will be a deficiency of £10,865.

Northampton.—Precautions which have been taken in case of Zeppelin raids, almost led to a strike of the Corporation tramway employees last week-end. The tramcars ceased to run a fortnight ago at 8 p.m. and this led to a reduction of the working hours and a consequent loss of wages to the drivers and conductors of the cars of from 7s. to 8s. per week. An offer by the Tramway Committee to pay half rates for the lost time was declined. After further consideration the Committee agreed to the demands.

Portrush and Giant's Causeway.—County Court Judge Orr, sitting at Ballymoney, Co. Antrim, decided that the Portrush and Giant's Causeway Electric Tramway was to be assessed as a tramway, not as a railway, and that the Portrush Urban Council was therefore entitled to recover £8 in its action against the tramway company for moieties of poor-rate and consolidated town rate.

Rochdale.—**YEAR'S WORKING.**—The net profit of the Corporation tramways for the year just ended amounts to £3,608, a decrease of £676 by comparison with that of the previous year, and it has been decided to ask the Council to approve the placing of the whole of the profit to the renewals fund, which will then stand at £22,149. The gross takings to March 31st last amounted to £87,908, an increase of £4,733. Working expenses amounted to £48,124, an increase of £1,283. Interest on loans, income-tax, sinking fund, rent of leased lines, and receipts due to Heywood, accounted for £34,780, as against £32,652 in the previous year; half wages to men on active service, and war bonus to employes remaining with the department, amounted to £2,262, as against £1,208 a year ago. The sinking fund has been increased from £108,033 a year ago to £120,868 at present.

Southampton.—**ELECTRIC VEHICLE.**—The Tramways Committee has decided to purchase an Edison battery automatic tip-wagon at a cost of £950, and to pay for the same out of the depreciation and renewals fund.

Southend-on-Sea.—According to a financial statement prepared by the borough accountant, the total loss incurred on the motor-bus undertaking, subject to loss on realisation of the assets still in hand, amounts approximately to £1,179. Edison Accumulators, Ltd., has offered to supply additional bus chassis at the price tendered in April, 1915—viz., £890 each—and also to replace the existing motor-bus chassis with a new model, less a sum in respect of depreciation. The Committee has adjourned consideration of the matter until after the war. The Committee has resolved to try, as a tentative measure, the services of suitable women and girls with a view to utilising them as temporary drivers.

Stalybridge.—In connection with the protest of the Trades Council against the contemplated employment of women as tramcar drivers, it was reported at a meeting of the Council last week that the commercial manager of the Joint Tramways Board had written stating that women drivers would only be put on in the last resort, and then only after thorough training and on level routes. No driver was allowed on hilly routes until after two years' service. It was decided to leave the matter where it was for the present.

West Ham.—The B. of T. has given its consent to the Corporation's proposal to substitute a double line of tramway track for the existing interlacing lines in Woodgrange Road. The Tramways Department proposes to purchase a second-hand motor-lorry for cartage purposes.

York.—**FEMALE LABOUR.**—The Tramways Committee proposes to instruct women as drivers of the Corporation cars, and the tramway manager has asked the drivers and conductors if they would be willing to work with women drivers, and would be prepared to stand by the Corporation in the event of disturbance with other employes. The matter has been referred by the men to the Tramways Trade Union, which has requested the Committee to receive a deputation before taking any action in the matter.

It was proposed at a meeting of the Tramways Committee that four women should forthwith be instructed as drivers: an amendment that no action should be taken until the Committee had received the deputation from the Union was carried on the casting vote of the chairman.—*Manchester Guardian.*

TELEGRAPH and TELEPHONE NOTES.

Constantinople.—A letter addressed to a German newspaper in March contains a reference to the situation of the telephone service in the Turkish capital. A few days previously the Turks celebrated the anniversary of the taking-over by the Government of the undertaking of the English Telephone Co. According to the well-known newspaper the *Tanin*, the sequestration of the undertaking was due, apart from the state of war with Great Britain, "to the defective fulfilment of the obligations and the conditions of the concession assumed by the English company." On the occasion of the celebration the present general manager of the telephone system sought to prove that the Turkish administration had turned out far superior to the former English management, and that the statement of the retiring Englishmen, who predicted that the telephone service would be suspended within two months, had come to naught. It was mentioned in this connection that, notwithstanding the scarcity of materials, the number of exchanges had increased during the year, simultaneously with a reduction in the number of telephone girls from 120 (1) to 94, some of whom are young Turkish girls. At the same time the daily conversations had risen from an average of 8,600 to 23,000. These figures were also quoted by the Turkish newspaper in question, which added that no single employe was now in the service who was not an Ottoman subject.

Glasgow.—The opposition of a number of subscribers to the increase in telephone rates for unlimited service has resulted in the formation in Glasgow of a Telephone Subscribers' Defence Association.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—May 24th. N.S.W. Government Railways and Tramways. 16 600-volt D.C. motors for tramway stores, Randwick.

MELBOURNE.—May 1st. City Council. Meters and maximum-demand indicators. See "Official Notices" April 7th.

May 31st. Victorian Government Railways. Transformers for five years. First order, 220 transformers in six months.

Birkenhead.—May 2nd. Electricity Department. Twelve months' supply rough slack, small coal and coke breeze. Electrical Engineer, Craven Street.

Glasgow.—May 4th. Electricity Department. Twelve months' supply of cables and meters. See "Official Notices" to-day.

New Zealand.—June 23rd. Oamaru Borough Council. Overhead mains and street-lighting equipment (Contract No. 2); power-station equipment (Pelton wheels, alternators, &c.) (Contract No. 3); service meters (Contract No. 4); line transformers and accessories (Contract No. 5).

Salford.—May 8th. Electricity Department. High-pressure steel steam pipes and separator, also cast-iron pipes and valves. See "Official Notices" April 21st.

West Hartlepool.—April 28th. Electricity Department. Two water-tube boilers with superheaters and mechanical stokers. See "Official Notices" April 14th.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Bray.—U.D.C. One year's supply of electricity meters: Electrical Apparatus Co., Ltd.

Burton-on-Trent.—T.C. Coal (4,000 tons) for the electricity works: Messrs. Jonathan Longbottom & Sons.

East Ham.—Accepted tenders for coal for the Electricity Department for 12 months:—

E. & A. Shadrack.—1,000 tons Nailstone best hand-picked hards, £1 4s. per ton; 2,000 tons Nailstone best 14-in. nutty slack, £1 1s. 10d.; 1,000 tons Swadincote 14-in. nutty slack, £1 2s. 11d.; 2,000 tons Cadley Hill 14-in. best nutty slack, £1 2s. 6d.
E. Foster & Co.—1,500 tons Bestwood washed peas, £1 1s. 8d. per ton; 1,000 tons Craigola Welsh large steam, £1 8s. 11d.; 1,500 tons Pooley 7-in. slack, 19s. 6d.; 1,000 tons Istock slack, 16s. 6d.

Copper wire.—T. Bolton & Sons, Ltd.; B.I. & Helsby Cables, Ltd.; Elliot's Metal Co., Ltd.; Johnson & Nephew, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co., Ltd. (incorporated in the London Electric Wire Co. and Smiths, Ltd.); Wilkes, Son & Mapplebeck, Ltd.

COMMISSIONERS OF PUBLIC WORKS, IRELAND.

New Public Offices, Dublin, South Block: electric wiring, bells, switch-board, &c.—V. G. Middleton.

High Wycombe.—T.C. Refuse destructor: Messrs. Goodrich & Hamlyn, £1,435.

Llandaff and Dinas Powis.—Rural District Council. One year's supply of A.C. meters: Electrical Apparatus Co., Ltd.

Leyton.—The quotation of Messrs. Edgar Allen & Co. has been accepted, at £480, for a new lay-out.

Mexborough.—U.D.C. Water-tube boiler, £615: Messrs. Babcock & Wilcox, Ltd.

Southampton.—The Electricity Committee, having received tenders for British-made meters, has decided to divide the contract between Messrs. Chamberlain & Hookham and Messrs. Ferranti, Ltd., and has authorised the engineer to obtain any additional meters from the British Thomson-Houston Co. at prices not exceeding those quoted by the other firms named.

The Tramways Committee proposes to accept the tender of Mr. G. P. Wilson for brake blocks and castings, at £5 12s. 6d. per ton, an increase of 8s. per ton compared with last year.

Southend-on-Sea.—Owing to the increase in the price of materials, the E.L. Committee has agreed to pay the contractors for the supply of joint-boxes an extra sum of 2½d. per box in respect of 250 boxes recently ordered by the electrical engineer. The Town Clerk reports that subsequent to the decision of the Council in January last, to pay £168 to Messrs. Callender's Cable and Construction Co., Ltd., for cable ordered in December, 1914, in connection with the proposed supply of current in the Leigh area (the payment for which had been delayed in consequence of the withholding by the L.G.B. of the sanction to the raising of the necessary money for the purchase thereof, and for the construction of the Leigh sub-station) a portion of the cable had been supplied to the Government, and that Messrs. Callender's had offered either to replace such cable now, undertake to replace it at the termination of the war at the original contract price, or credit the Corporation with the value (£480), plus £210, being the increased value of the copper at the existing market price, thus reducing the amount payable to the firm to £991. The Committee has decided to accept the last-named offer.

Corporation. B.I. & Helsby Cables, Ltd.: Six miles of overhead trolley cable, at 1s. 4½d. per lb.

West Ham.—The Council's contract with the Fuller Electrical and Manufacturing Co., Ltd., for the supply of motors for the Sales Department terminated at the end of March last. The engineer invited nine leading firms to send in quotations, but only four replied. Out of these that of the Fuller Co. was the only complete one; their prices, although much higher than last year, were slightly lower than those of any of the other three on most of the items, and slightly higher on two or three other items. The firm intimated, however, that they would not enter into a contract and reserved the right to increase prices at a month's notice. Under the circumstances the engineer proposes to continue to buy from the company until such time as it seems desirable to make another contract.

FORTHCOMING EVENTS.

Society of Engineers.—Monday, May 1st. At 5 p.m. At Caxton Hall, S.W. Conference on "Engineering and Scientific Research," to be opened by Dr. J. A. Fleming, M.A., F.R.S.

Institution of Electrical Engineers (Birmingham Local Section).—Wednesday, May 3rd. At 7 p.m. At the University, Edmund Street. Annual meeting.

Chemical Society.—Thursday, May 4th. At 8.30 p.m. At Burlington House. W. Ordinary scientific meeting.

Iron and Steel Institute.—Thursday, May 4th, at 10.30 a.m., and Friday, May 5th, at 10 a.m. At the Institution of Civil Engineers, Great George Street, S.W. Annual general meeting.

Royal Institution of Great Britain.—Friday, May 5th. At 5.30 p.m. At Albemarle Street, W. Lecture on "Electrical Methods in Surgical Advance," by Sir J. M. Davidson.

Saturday, May 6th. At 3 p.m. At Albemarle Street, W. Tyndall Lecture on "X-rays and Crystals: New Methods of Research," by Prof. W. H. Bragg, F.R.S.

NOTES.

Electric Light Switching Examinations.—The results of Messrs. Lundberg's recent examination are given elsewhere in this issue. The continued popularity of these competitions indicates that interest in them is sustained, and we have no doubt that really useful results accrue both to the competitors, who are thus induced to sharpen their wits and study the possibilities of the subject, and to the electrical trade, which will benefit by the increased knowledge thus acquired. A noticeable feature of the list of names is that we find there wiremen, students, Associate Members of the I.E.E., contractors, graduates, and apprentices, showing the width of the field from which the competitors are drawn.

Inquiry.—Makers of small seatate parts are asked for.

The Metric System.—In the paper on "Electric Power in Slate Quarries," of which an abstract appears elsewhere in this issue, there were included drawings which happened to be figured partly in inches as well as millimetres, and these afford interesting examples of the draughtsmen's failure to appreciate the meaning of "significant figures." For instance, the original dimension being 510 mm., he gives the English equivalent as 12'2049 in. The latter is an absurdity, for the dimension relates to the frame of a motor, on which an accuracy of one part in 100,000 as here given would be ridiculous. Even to figure to mils is superfluous; the proper equivalent here is 12'2 in. Other instances occurring on the same drawings are the following:—Distance between centres of holes, 440 mm., 17'323 in. (17'32 would suffice); 330 mm., 12'9924 in. (12'99 would suffice). Of course, there should be no occasion for conversion—all the dimensions should be in the same notation, and that metric; but when and whilst conversion is necessary it ought to be done with the aid of common sense. The dimensions of a bed-plate or motor frame are not gauged to the $\frac{1}{1000}$ th of an inch in commercial workshop practice. In most cases $\frac{1}{16}$ th in. and $\frac{1}{8}$ th in. are ample limits.

We welcome the decision of the Electric Vehicle Committee, reported on p. 485, to give the metric equivalents of all their standard dimensions (and trust that the error illustrated above will not be allowed to occur).

A report on the use of the metric system in export trade has been prepared by Director S. W. Stratton, of the United States Bureau of Standards. This report was considered so complete and of such a useful character that it has been issued as a Senate document, in the form of a booklet consisting of 80 pages. It will be found interesting by all manufacturers, especially those who are cultivating an export trade.

Institution and Lecture Notes.—**Tramways and Light Railways Association.**—At the annual Congress of this Association, which will take place on Friday, June 30th, there will be the annual general meeting at Westminster Palace Hotel, at 2.30 p.m., followed by a paper by Mr. W. Tuke Robson, general manager of the Southampton Corporation Tramways, and a discussion thereon. There will be a motor-bus visit to the L.G.O. Training School, at Millman Street, Chelsea, and after the exhibition of cinema films showing London traffic scenes, with special reference to Rules of the Road for tramcars, buses, and other traffic, methods of training, &c., tea will be served during which Mr. Blain will give a short address on "The Safety Movement." The members' dinner will be held in the evening at the Trocadero Restaurant.

Royal Institution.—The lecture arrangements for the coming months include the following:—

Friday, May 5th, at 5.30. Sir J. Mackenzie Davidson, on "Electrical Methods in Surgical Advance."

Friday, May 19th, at 5.30. Col. E. H. Hill, F.R.S., on "The Movements of the Earth's Pole."

Friday, May 26th, at 5.30. Prof. C. A. Barkla, F.R.S., on "X-rays."

Tuesday, May 30th, and June 6th, at 3 o'clock. Dr. T. Martin Lowry, F.R.S., on "Optical Research and Chemical Progress."

Saturdays, May 6th and 13th, at 3 o'clock. (Tyndall Lectures.) Prof. W. H. Bragg, F.R.S., on "X-rays and Crystals." (1) New Methods of Research. (2) First Results and their Applications. Saturdays, May 20th and 27th, at 3 o'clock. Prof. H. S. Foxwell, on "The Finances of the Great War—New Problems and New Solutions: How we Stand To-day and What Lies Ahead."

The Committee on Neglect of Science.—A meeting will be held at the invitation of this Committee, of which Sir Ray Lankester, K.C.B., F.R.S., is chairman, on Wednesday, May 3rd, in the rooms of the Linnean Society, Burlington House, Piccadilly, London. Lord Rayleigh, O.M., Past President of the Royal Society and Chancellor of the University of Cambridge, will take the chair at 3 p.m.

Resolutions will be submitted stating:—

That it is a matter of urgency, in order to promote national efficiency in the near future, that the natural sciences should be made an integral part of the educational course in all the great schools of this country, and should form part of the entrance examination of the Universities of Oxford and Cambridge, as well as of the newer universities.

That it is in the highest degree desirable that the Government should encourage the study of the natural sciences, and thereby increase the efficiency of our public servants, by assigning capital importance to the natural sciences in the competitive examinations for the Home and Indian Civil Service, and by requiring some knowledge of the natural sciences from all candidates for admission to Sandhurst; and

That the method indicated is the only one by which it is practicable to bring about the desired change in the attitude of the schools and colleges throughout the country towards the natural sciences and to make some knowledge and understanding of those sciences general. As the results of such changes will only develop in the course of years, it is urgent that the matter should be at once taken in hand by His Majesty's Government.

Many well-known public men have expressed their sympathy with the objects of the meeting, and several of them are expected to take part in the proceedings.

Those desiring admission to the meeting should apply to the Hon. Secretary of the Committee on the Neglect of Science, 28, Victoria Street, Westminster, S.W.

Industrial Fatigue.—In our leading article to-day we draw attention to a memorandum issued by the Ministry of Munitions on the subject of "Industrial Fatigue and its Causes" (Memo. No. 7, Cd. 8,213; Wyman & Sons, Ltd. Price 1½d.). The keynote of the report is the necessity for due alternation of work and rest if the maximum efficiency, in the most general sense, is to be attained, the respective durations of these periods depending upon the nature of the occupation. By way of illustration the case is quoted of two officers at the Front, who recently, for a friendly wager, competed in making equal lengths of a certain trench, each with an equal squad of men. One let his men work as they pleased, but as hard as possible. The other divided his men into three sets, to work in rotation, each set digging their hardest for five minutes and then resting for ten, till their spell of labour came again. The latter team won easily. In another instance, a group of five male voluntary Sunday workers in a certain munitions factory were able in eight hours (including one hour for meals), to exceed the average day's output of eight week-day men, who worked 14 hours (including 1½ hours for meals). Whilst the squad probably could not have kept up the pace daily, there could be little doubt that they could repeat their 8 hours' effort on, say, four days a week, and the startling result follows that in those four days they could do more than the whole week's work of an equal set of men working for the longer hours; yet they would have more time for recreation and sleep and three whole holidays in the week. The work was of a uniform "repetitive" kind, involving moderate physical exertion. The experienced manager of a large shell factory employing 1,200 men and 1,500 women states that the system of three 8-hour shifts gives better output and maintains better health than that of two 12-hour shifts, and that there is a period of slacking, often quite unconscious, during a 12-hour shift which is detrimental to output.

On the question of Sunday work by exhausted men, a foreman said that he did not believe in "a holiday on double pay." Another foreman said that Sunday work gave "six days' output for seven days' work on eight days' pay." At a large shell-making factory the men during the early months of war worked seven 12-hour day and seven 12-hour night shifts in the week. Recently Sunday work has been stopped, and the men work from 6 a.m. to 7.30 p.m., with 1½ hours for meals, tea being also brought to the men while the machinery is running. The factory now produces an increased number of shells with half the number of workers, and the manager attaches the greatest importance to the week-end rests. At another large munitions factory men engaged in the heavy work of moulding are required by the management to rest 15 minutes in every hour of work, the manager being satisfied that this arrangement was good for the men and for the output. The men objected because they were on piece-work, and they thought the production would be lessened, but the output per hour was found to be actually increased.

References are given in the Memorandum to a report by Prof. Stanley Kent to the Home Office on industrial fatigue (Od. 8,056, price 4½d.); "Fatigue and Efficiency," by J. Goldmark, New York, 1915; and the Interim Report to the British Association (Manchester, 1915) by the Committee on the Question of Fatigue from the Economic Standpoint. The following works also bear upon the subject: "Motion Study," by Frank B. Gilbreth; London, Constable & Co., Ltd. Price 4s. 6d. net. "Psychology and Industrial Efficiency," by Hugo Münsterberg; London, Constable and Co., Ltd. Price 6s. net.

Electrical Trade in Argentina.—Statistics which are based upon a census are generally of a belated character, and those which were published a few months ago by the Argentine General Administration of Trade and Industry, in regard to an industrial census which was undertaken in Buenos Aires for the year 1913, form no exception. The principle of the census was founded on the Trading-tax Register, and the firms concerned were requested to supply the desired information. It is considered possible that many of the figures returned may have been less than those which were actually the case, on account of the apprehension that the statistics might be utilised for the purposes of taxation. With this reservation a report recently issued shows that there were 45 electricity works in Buenos Aires in 1913, with a share capital of £7,900,000, which disposed of electrical energy for the sum of £2,050,000. The value of the native raw materials consumed by these works was £4,300, whilst that of the imported raw materials amounted to £498,000. The staff employed numbered 735 and the workmen 2,991, the salaries and wages averaging £193 5s. and £135 10s. per annum respectively. The works are for the greater part distributing stations of the German Transmarine Electricity Co., whose former monopolistic position is now threatened by the Italian-financed undertaking of the Cia. Italo-Argentine de Electricidad. It is mentioned that this company has already assured itself of contracts for the supply of energy for the harbour and the Palermo part of the city. Previous to the advent of this rival the price charged for lighting purposes was 5.17d. per kw.-hour, and that for power was 3.06d., but the competition has caused the prices to be reduced. The boilers which supply steam to the turbines in the generating stations are now fired with Mexican oil, and the Transmarine Co. is said to be financially interested in one of the oil-producing companies.

The report, proceeding to discuss the manufacturing side of the question, states that 121 firms produced electrotechnical goods in 1913, the combined capital being £218,000 and the value of the turnover £352,900. In manufacturing these products, inland raw materials of the value of £27,250 were used, whilst the imported materials totalled £68,300. The staff numbered 197

and the workmen 1,168, and the wages averaged £125 and £81 10s. per annum in the two cases respectively. Apart from these undertakings carbon brushes were produced by firms having a capital of £17,500, whose turnover, however, was comparatively insignificant. It is concluded from the figures that electrical work in Buenos Aires is very largely dependent upon other countries, especially as the imports of electrical machinery and plant in 1913 were of the approximate value of £2,000,000.

Appointments Vacant.—Engineer and manager (£400), for the Mexborough and Swinton Tramways Co. See advertisement pages to-day.

Electric Steel.—A South Australian company has in hand a project to establish in each of the capitals of the Commonwealth an electric steel furnace for making cast steel out of scrap iron. The furnace is a Swedish patent, and an English expert will superintend the works. —*Times*.

For Sale.—Greenock Corporation electricity department has for disposal one 500-H.P. Belliss & Morcom triple-expansion engine, coupled to a 6-pole Silvertown dynamo, with spare armature. See advertisement pages to-day.

Volunteer Notes.—ENGINEERING INSTITUTIONS' V.E.C.—Orders for week commencing May 1st, 1916.—By Lieut.-Col. Clay, V.D., Commanding.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, May 1st.—Sections 1 and 2, Technical; Sections 3 and 4, Squad and Platoon, Signalling Class.

Tuesday, May 2nd.—6 to 7 p.m. School of Arms; 7.15 to 8.15 p.m., Recruit Drill.

Thursday, May 4th.—Shooting for Sections 1 and 2, and Signalling Class; Roruits, 5.45 to 7.45 p.m.

Friday, May 5th.—Sections 3 and 4, Technical; 1 and 2, Squad and Platoon.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, April 27th, 1916.—

Work-End Parades.—Saturday.—The Battalion will Parade as strong as possible outside Baker Street Station, and proceed by train to Wembley Park for Ceremonial Drill, under the Commandant.

Sunday.—The Battalion will Parade as strong as possible at Liverpool Street Station (low level entrance, G.E.R.), at 9.30 a.m., and proceed by train for Entrenching duties. The Battalion will return to town about 6 p.m. This being the last day on these particular trenches, a large muster is required in order to finish them and leave them in a fit condition to hand over.

Fatigue Party.—A volunteer Fatigue Party is required on Monday, May 1st, at Wembley Park. Members volunteering for this duty should report themselves to the Camp Quartermaster at Wembley Park, at 11 a.m. and 2.30 p.m.

Musketry.—There will be shooting at Bisleigh on Saturday next, the 29th inst. Names must be sent in to the Musketry Staff, not later than Friday midday. Members proceeding to Bisleigh must report themselves, in Uniform, to Sergeant Cotter, at 12.45 p.m. No. 6 Platform, Waterloo Station.

A. G. JOINER, Major and Adjutant, O.B.C.

Electric Vehicle Committee.—A meeting of the Committee was held in London on April 14th, 1916. Mr. R. A. Chattock presiding. It was announced that all the Associations, with the exception of the Tramways and Light Railways Association, whose reply had not been received, had re-nominated their representatives on the Committee. The Committee re-elected the representatives of the provincial electricity supply companies, makers of electric vehicles, Edison Accumulators, Ltd., and Chelsea Electricity Supply Co., Ltd. It was decided to invite the Motor Manufacturers and Traders' Society to nominate a representative to sit upon the Committee. The present officers of the Committee were re-elected for the present year, except in the case of Mr. A. H. Seabrook, who, by reason of the work he is engaged upon in connection with munitions supply in London, is unable to devote any time to the work connected with the honorary editorship of the *Journal*. This work the hon. secretary (Mr. F. Ayton) is undertaking *pro tem*, until someone can be found who will accept the position. It was decided that, in future, dimensions for standards will be given in both metric and British measures, and that, in regard to the British measures, exact dimensions will be quoted in mills, while ordinary dimensions will be quoted in fractions. The secretary was instructed to bring this rule to bear in quoting dimensions of standards in the annual report of the Committee. Mr. E. W. Curtis, of the General Vehicle Co., was nominated as the Committee's representative upon the Tire and Road Wear Research Committee of the Society of Motor Manufacturers and Traders. The next meeting of the Committee was fixed for Friday, June 16th, at 2.45 p.m.

Fatalities.—At the resumed inquest held at Failsworth last week respecting the death of Ernest Capewell, who had been employed as a labourer at the works of Messrs. Ferranti, Ltd., and who had a mishap whilst lifting a carboy of nitric acid, the jury returned a verdict of "Death from misadventure."

Electrolytic Hypochlorite for Hospital Ships.—

A report to the Medical Research Committee on the use of sodium hypochlorite prepared by the electrolysis of sea-water, for disinfecting and antiseptic purposes on shipboard, especially in hospital ships, has been made by Dr. H. D. Dakin and H. G. Carlisle, and was abstracted in the *British Medical Journal* of March 26th.

The report contains a description of apparatus installed on H.M.I.S. *Aquitania*, and is illustrated by scale drawings which would make it possible for any combination of doctor and engineer to introduce the method into any ship in which its use seems advisable. The electrolyser consists of a rectangular box of oak or cedar bolted together, and divided into 20 or 25 cells by means of carbon plates placed parallel to one another. Great care must be taken in the selection of the carbon plates, and a particular kind of graphite is recommended. Two wires leading the ship's current (100 to 110 volts direct current) are suitably connected through a switch with the electrolyser, which, to ensure even distribution of current, is provided with a copper plate attached to four binding screws at each end. If the voltage be 200 to 220, two electrolysers can be placed in series. Thanks are expressed to Dr. Edward Hopkinson, of Meers, Mather & Platt, Manchester, for his assistance in constructing a practical and efficient apparatus, and apparently that firm is prepared to provide electrolysers.

When using ordinary sea-water, it is inadvisable to continue electrolysis for more than 10 minutes. In that time, with a current of 60 to 75 amperes at 110 volts, a solution will be obtained containing usually a little less than four parts per 1,000 of sodium hypochlorite or available chlorine. For most purposes it is advantageous to limit the electrolysis to five minutes, and at the end of that time the solution will contain from 2 to 2.7 parts per 1,000 of sodium hypochlorite or available chlorine. For swabbing floors, walls, latrines, &c., this may be diluted with an equal amount of water.

The results of the free use of hypochlorite in the wards were most gratifying. The general opinion, after the experience of two voyages to the Mediterranean, was strongly in favour of the hypochlorite as contrasted with phenolic disinfectants. In the typhoid and dysentery wards the results were particularly striking, and the absence of odour most marked. The most important effect, however, had been the large reduction in secondary infection occurring among the ship's staff.

The hypochlorite had also been used for the purification of the ship's drinking water. About 1 part in 1,000,000 was sufficient for all ordinary purposes, and the instability of electrolytic hypochlorite was so great that after three or four hours all traces of chlorine disappeared.

Electrolytic hypochlorite for surgical use should not be kept for more than 24 to 48 hours, but it can be so readily and cheaply prepared that this is not a matter of consequence.

The solution was also useful in the laundries and in the swimming bath on the *Aquitania*. No significant damage to ship structures was observed after two months' use.

The *Aquitania*, accommodating more than the seven largest London hospitals, gave Lieut.-Col. R. H. Fahr full opportunity for forming a considered opinion, particularly as large numbers of dysentery and paratyphoid cases had been carried. The confinement of approximately 4,000 patients in a limited space rendered essential most stringent sanitary precautions, and Col. Fahr states that he has satisfied himself that for efficiency, economy, and utility, electrolytic hypochlorite is very essential for hospital ships.

Engineering Equipment Required for Peking Government University.—With reference to the desire of the Chancellor of the Chinese Government University at Peking to obtain samples and models of engineering products of United Kingdom manufacture, it is notified that a well-known London firm of consulting engineers has been appointed to the office of honorary consulting engineers to the University, with a view to co-ordinating the equipment of the engineering school. The firm referred to (which holds a similar appointment with the Hong Kong University) has been instructed to prepare plans of the school of engineering, the equipment of which is to be proceeded with; a list of the apparatus required is being prepared, and the firm desires to get into communication with United Kingdom manufacturers who would be willing to present the necessary apparatus either free of charge or on specially favourable terms. The advantages which may be gained to British trade through Chinese students learning from samples and models of British make are obvious.

United Kingdom manufacturers who are prepared to assist in the manner indicated may obtain the name and address of the honorary consulting engineers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.—*Board of Trade Journal*.

Engineering and Scientific Research.—At the meeting of the SOCIETY OF ENGINEERS (INC.) on Monday next, a conference on the above-named subject will take place. It will be opened by Dr. J. A. Fleming, who has played a prominent and effective part during the war in directing attention to the nation's neglect of science, and to the handicap thereby imposed, not only upon our industries, but also upon our military efficiency. A large number of leading engineers and industrial authorities are expected to take part in the discussion.

In his paper, Dr. Fleming reviews the whole field indicated by the title, and indicates the nature of the reforms that are required in order to remedy the errors of the past.

The Board of Education has allocated £40,000 for scientific and industrial research, as compared with £25,000 last year.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Mr. EWART BIGGELL, who was installation superintendent at Sutton (Surrey), with the South Metropolitan Tramways Co., has resumed his duties after being invalided from the Army.

Workshop U.D.C. has appointed Mr. J. FLETCHER, station superintendent, to take charge of the electricity works during the absence, on active service, of the electrical engineer, Mr. Crowther. His salary is to be increased by £25 a year.

The Southampton Electricity Committee proposes to advance the salary of the assistant mains engineer, Mr. F. G. GILBERT.

The Oldham Tramways Committee has recommended the appointment of Mr. P. PRIESTLEY, general manager of the Mesborough and Swinton Tramways Co., as manager of the Oldham Corporation Tramways. There were 47 applications.

The West Ham Corporation has been recommended to grant some small increases in the salaries of certain employees in the electricity department. In the case of the assistant engineers-in-charge it is proposed to raise the maximum salary payable to £2 10s., and in the case of the junior engineers-in-charge to £1 15s.

Mr. J. F. CAMERON, manager of the Northampton Tramways, while attending to repair work at the generating station last week-end, stepped in the darkness into a 6-ft. inspection pit. Mr. J. COTTIER, who went to Mr. Cameron's assistance, fell into the pit on the top of the manager. He escaped with slight injuries, but Mr. Cameron had two ribs broken.

Having regard to the extra duties imposed upon the tramways manager consequent upon the Leyton District Council's resolution not to insure against third party risks, it is proposed to increase his salary from £400 to £425 per annum, rising by annual increments of £25 to a maximum of £500.

The Luton Town Council has been recommended to increase the salary of the assistant electrical engineer, Mr. H. A. KELL, from £200 to £215 per annum, and that of the chief technical assistant, Mr. A. H. GATES, from £182 to £200 per annum.

General.—The Executive Committee of the City and Guilds of London Institute have appointed Prof. GILBERT T. MORGAN, D.Sc., F.R.S., of the Royal College of Science, Dublin, to the Chair of Chemistry at the Institute's technical college, Finsbury, rendered vacant by the death of Prof. Meldola.

A correspondent says that Mr. WALTER PILLING, who has been a member of the Rochdale T.C. since 1903, and is an Alderman, has sent in his resignation. It is understood that his action is due to his dissatisfaction with the methods of the Electricity Department in connection with the supply of electricity to certain mills in which he is largely interested.

An agreement has been concluded with Mr. CLIFFORD C. PATERSON, M.I.E.E., A.M.I.C.E., principal assistant in charge of electro-technical and photometric buildings at the National Physical Laboratory, to join the Osram-Robertson Lamp Works, Ltd., as director of laboratories for research and technical manufacturing purposes. The arrangement will commence at the conclusion of the war, or before that date if possible.

Mr. H. P. GIBBS, consulting electrical engineer to the Mysore Government, and general manager of the Tata hydro-electric scheme in Bombay, is shortly returning to the United States on long leave, *via* Australia and Vancouver.—*Indian Engineering*.

The *Commonwealth Engineer* states that in consequence of a protest by the Professional Officers' Association of the Commonwealth Postmaster-General's Department against the appointment of imported officers over the heads of Australians, a competitive examination was recently held for the position of electrical engineer for the telephone branch at Adelaide. The salary is £528 per year. Mr. R. LAWSON, formerly assistant engineer on the staff of the chief electrical engineer, and who was one of the imported officers, was selected. Mr. P. KENNEDY, of Western Australia, gained second honours.

Mr. ERNEST HARDMAN was married at Blackpool, on April 19th, to Miss Ethel A. Service. An aneroid barometer was presented by the staff and employees of the Yorkshire Electric Power Co. Mr. Hardman is a charge engineer at the Barnsley power house of the Yorkshire Co. The barometer was presented on behalf of the entire staff by Mr. H. F. G. Woods, resident engineer. Mr. Geo. Sheppard, who acted as best man, is a colleague of Mr. Hardman's.

Roll of Honour.—At a meeting of the Salford Tramways Committee on April 18th, Ald. Worsley (Deputy-Mayor) presented to Sergeant W. E. SMETHURST, of the Royal Sussex Regiment, the D.C.M., which has been awarded to him for conspicuous gallantry in the field. Smethurst was for several years employed as a motor-man in the Salford tramways

department. He was also handed an illuminated copy of a resolution of congratulation on his distinction, which was passed by the Tramways Committee.

Lance-Corporal HERBERT HARVEY, of the Royal Fusiliers, formerly engaged at the West Ham electricity works, who has been missing in Flanders since October, 1914, is now officially reported killed in action.

Lieutenant H. A. CLIFTON, of the East Lancashire Regiment, who has fallen in action whilst serving with the Kilt relieving force in Mesopotamia, was, before the war, engaged as an electrical engineer at Woolwich, with Messrs. Siemens Bros.

The *Times* records that Second-Lieutenant JAMES CLEMENT SMITH, Royal Fusiliers, an electrical engineer, was killed at the Front on March 27th. He joined the Public Schools Battalion of the Middlesex Regiment shortly after war broke out.

Second-Lieutenant T. O. H. BYTES, A.M.I.E.E., of the 80th Punjabis, late chief electrical engineer to the Tata Steel & Iron Co., Bombay, died on April 12th of wounds received in action. Prior to his appointment in India, he held the position of engineer-in-charge at the Motley Corporation electricity works, and also that of electrical engineer at the Rotherham Main Collieries.

Lance-Corporal R. DAVID, formerly an assistant at the Bristol depot of the Edison & Swan Co., Ltd., has received a letter from the Divisional Officer on active service referring to his distinguished conduct in the field on March 19th and 20th, 1916.

Obituary.—MR. J. STOTT.—We regret to record the death of Mr. Jones Stott, for 12 years manager of the Heywood Corporation electricity works. He was 42 years of age, and three years ago resigned his appointment on account of failing health. Death was due to heart failure.

NEW COMPANIES REGISTERED.

N. E. C. T. A., Ltd. (143,669).—This company was registered on April 19th as a company limited by guarantee, but having a share capital of £4,000 in £1 shares (2,000 6 per cent. cumulative preferred). Each member undertakes to contribute not more than £1 in the event of winding-up. To enter into contracts (a) to obtain special trade discounts on the purchases or dealings of members or others, and (b) to indemnify clients of members or others against the supply of faulty workmanship or materials; to carry on, as principals or agents, the business of manufacturers, repairers, commission agents, contractors or dealers in electrical machinery, instruments, appliances, wires, cables, accessories, and apparatus, electricians, electrical gas, mechanical, or general engineers, &c. The subscribers (with one pref. share each) are: W. Cross, 7 & 9, Ribbles Place, Newcastle, electrical engineer; P. Callaghan, 3 & 5, Millergate, Bradford, electrical engineer; H. Murryat, 25, Hatton Garden, E.C.4, electrical engineer; J. Orringe, 23, Belvoir Street, Leicester, electrical engineer; W. R. Rawlings, 82, Gloucester Road, S.W., electrical engineer; W. A. Shaw, 107, Princes Street, Stockport, electrical engineer; S. H. Webb, 15, Caro Street, Leicester, electrical engineer. Minimum cash subscription, seven shares. The management is vested in a council, which shall consist of such persons who are existing members of the Central Board of the Electrical Contractors' Association (Incorporated) as shall consent to be members of the company, and act thereon. The first are W. Cross, P. Callaghan, H. Murryat, J. Orringe, W. R. Rawlings, W. A. Shaw, and S. H. Webb. Secretary: L. G. Tate. Registered office: 20, Bucklersbury, E.C.4.

Mitcham Rubber Co., Ltd. (143,592).—Registered April 13th, by Lumley & Lumley, 15, Old Jewry Chambers, E.C. Capital, £50,000 in £1 shares. Objects: To carry on the business of indiarubber, asbestos, gutta-percha, flax hose, flax and cotton belting, lawn tennis, and ship and engineers' core, manila, and dealers, electrical, telegraph, and electrical engineers and contractors, submarine and other cable and telegraph instrument manufacturers, wire drawers, wire rope makers, manufacturers of and dealers in pneumatic and other tires and wheels, vans, carriages, and vehicles of all kinds, &c. The subscribers (with one share each) are: R. M. Albery, Combe Hill Road, East Grinstead, Sussex, gentleman; E. W. Hopton, Furzedown, 74, Crowborough Road, Tooting Common, cashier; H. C. Routell, 3, Ermine Road, Lewisham, S.E., clerk; F. Hopkins, 12, Holmewood Road, South Norwood, Surrey, secretary; E. H. Taperell, 20, Chester Road, West Green, N.E., clerk; J. E. Anstey, 31, Barcombe Avenue, Streatham Hill, S.W., clerk; F. G. Mathews, 116, Penille Road, Streatham, S.W., clerk. Minimum cash subscription, 7 shares. The first directors (to number not less than three or more than seven) are to be appointed by the subscribers. The directors shall have the right to appoint "departmental directors." Qualification, 250 shares. Remuneration (except departmental directors), £100 each per annum, and the first two named are permanent joint managing directors, subject to holding 25,000 shares each, with £1,200 per annum respectively. Qualification of A. D. Simms, 500 shares. Registered office: 340, Woolwich Road, Charlton.

Troughton & Simms, Ltd. (143,586).—This company was registered on April 12th, with a capital of £21,200 in £1 shares, to take over the business of mathematical instrument makers carried on by W. Simms & J. Simms, at 135, Fleet Street, E.C.4, and 340, Woolwich Road, Charlton, as Troughton & Simms, and to carry on the same and the business of astronomical instrument makers, manufacturers of instruments connected with land survey, electrical, and other scientific apparatus. &c. The subscribers (with one share each) are: J. Simms, 132, Shooters Hill Road, Blackheath, mathematical instrument maker; J. Simms, Craighed, Abbey Wood, Kent, mathematical instrument maker. Private company. The number of directors is not to be less than two or more than five; the first are W. Simms, J. Simms, and A. D. Simms. The first two named are permanent joint managing directors, subject to holding 25,000 shares each, with £1,200 per annum respectively. Qualification of A. D. Simms, 500 shares. Registered office: 340, Woolwich Road, Charlton.

Precision Screw Co., Ltd. (143,612).—This company was registered on April 14th, with a capital of £3,000 in £1 shares (2,000 pref.), to carry on in the United Kingdom or elsewhere the business of manufacturers of screws, particularly screws and parts for electrical and scientific instruments, and of engineering and scientific apparatus, &c., and to adopt an agreement between H. Homberger and F. E. Collinson. The subscribers (with one share each) are: F. E. Collinson, 7, Hempstead Road, Walthamstow, N.E., instrument manufacturer; H. Homberger, 9, Hempstead Road, Walthamstow, N.E., engineer. Private company. The number of directors is not to be less than two or more than five; the first are H. Homberger and F. E. Collinson (both permanent, subject to holding £500 shares). Registered office: Provost Works, Macdonald Road, Walthamstow.

Anchor Electric Co., Ltd. (143,670).—This company was registered on April 20th, with a capital of £4,100 in £1 shares (1,700 10 per cent. cum. pref.), to take over the business of electrical engineers, manufacturers of electrical apparatus, fittings, and batteries, being a portion of the business carried on by A. Richmond and T. T. Rankin, E.C.4, E.Sc., M.I.M.E., M.I.M.E., at 81, Cannon Street, E.C.4, together with the benefit of the experiments made and secret processes used by the proprietors. The subscribers (with one preferred share each) are: A. Richmond, 81, Cannon Street, E.C.4, electrical engineer; T. T. Rankin, 81, Cannon Street, E.C.4, electrical engineer. Private company. The number of directors is not to be less than two or more than seven; the first are A. Richmond and T. T. Rankin (both permanent). Qualification (except first directors) £100 shares. Remuneration, £50 each per annum. Registered office: 81, Cannon Street, E.C.4.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Derby Lamp Works, Ltd.—Second mortgage debenture dated March 30th, 1916, to secure £2,000, charged on the company's undertaking and property, present and future, including unutilised and unpaid capital. Holder: W. L. T. Arkwright, Caxton House, Westminster.

Charing Cross, West End & City Electricity Supply Co., Ltd. (29,122).—Capital, £2,100,000 in 130,000 pref., 130,000 ord., 80,000 City Undertaking pref., and 80,000 City Undertaking ord. shares, all of £5 each. Return dated March 28th, 1916: £80,000 pref., 80,000 City Undertaking pref., and 70,000 City Undertaking ord. shares taken up, £1,200,000 paid on the pref. ord., and City Undertaking pref.; £330,000 considered as paid on the City Undertaking ord. Mortgages and charges: £1,087,175.

Clarke, Chapman & Co., Ltd. (39,045).—Capital, £250,000 in 15,000 ord. and 7,000 pref. shares of £10 each. Return dated March 7th, 1916: 15,281 ord. and 6,885 pref. shares taken up; £10 per share called up on 3,536 ord., £2 10s. on 200 ord., and £10 on 4,435 pref.; £80,210 paid; £152,450 considered as paid, being £10 per share on 11,445 ord., £7 10s. on 200 ord., and £10 on 2,550 pref. Mortgages and charges: £100,000.

Crossley Bros., Ltd. (51,970).—Return dated March 9th, 1916. Capital at date of return, £973,700 in 40,330 pref. and 57,031 ord. shares of £10 each. All shares taken up; £378,200 paid on 27,320 pref.; £695,000 considered as paid on 12,519 pref. and 57,031 ord. Mortgages and charges: Nil. On March 14th, a resolution was confirmed sub-dividing each £10 share into ten £1 shares.

Asbestos and General Paint Co., Ltd. (formerly Asbestos Fireproof Paint Co., Ltd.).—A notice of the appointment of H. Moore, of 41, Bedford Row, W.C., as receiver and manager by Order of Court dated April 12th, 1916, filed pursuant to Section 94 of the Companies (Consolidation) Act, 1908.

Newton & Wright, Ltd.—Land Registry Charge on certain land in Islington, dated March 27th, 1916, to secure all moneys due to or become due from company to Union of London & Smiths Bank, Ltd., 455, Oxford Street, W.

G. H. Turner & Co., Ltd.—A memorandum of satisfaction in full on April 14th, 1916, of second deb., dated April 21st and July 12th, 1915, securing £100, has been filed.

CITY NOTES.

MR. E. GARCKE presided at the annual meeting on April 18th. He said that, despite the many difficulties of the past year, they had maintained the improvement of recent years. In fact, the gross profits were a little larger, being £91,800, as against £90,800 in 1914, but general charges had been £1,200 higher, and £1,200 more had been spent on maintenance and plant and buildings; so that the net distributable profits for 1915, after paying debenture interest, were £17,300, compared with £19,100 in 1914. Out of this they proposed to write off for depreciation £8,000, to put £5,000 to reserve, to pay an extra 4 per cent. on the second prior lien debenture stock, which would require £2,000, and would make a return of 10 per cent. for the year on this stock, and then to increase the carry forward by £2,200, which would then stand at £9,321, equal to about 9 per cent. of the share capital. During the year they had spent £31,962 on capital account in connection with Government contracts on which they were engaged. This expenditure was anticipated and referred to last year, and it was then stated that they would have to issue the balance of the second funds. They had obtained the consent of the Treasury to make the issue. In view, however, of the fact that they were paying 10 per cent. per annum on this stock, and that the present was not a good time to make issues of capital on the most favourable terms, they were postponing this issue as long as possible. Meanwhile, they were utilising their profits and temporary loans to provide the cash for capital expenditure. That was obviously better finance than to raise capital at a high cost in order to pay dividends, and the directors were glad that the shareholders at the last meeting approved the course recommended not to commence the payment of dividends on share capital during the war. They might, however, have to issue some more debenture stock, although they would postpone doing so as long as possible. In addition to other things, they had turned out a large quantity of transport material as well as turbo-generators, motors, and transformers. Although the net profits had not been quite up to those of the previous year, due to the fact that they had to some extent had to bear the brunt of higher wages and a largely enhanced cost of materials, it was satisfactory to feel that their work had

Brush
Electrical
Engineering
Co., Ltd.

been of national importance. With regard to the Ljungström turbine, the performance of this machine continued to be highly satisfactory. Naturally, some of the directions in which they looked for orders for this class of plant were lessened for the time being, and development had to some extent been retarded, but during the year they had provided Ljungström sets to the Government and munition works, as well as to electricity supply stations and industrial undertakings, and in every case with gratifying results. Ljungström sets of larger size were now in course of installation. Orders were in course of execution for Japan and New Zealand. Whilst, as he had already said, the home market was at present necessarily restricted, the Swedish Ljungström Co. had made phenomenal progress, and found itself for the time being unable to cope with the demand which had arisen for turbines of this design. The figures representing the output of turbines by the parent company, as well as the Brush Co., were really very remarkable. It now amounted to 12,000 kw., thus showing that the Ljungström turbine had passed completely out of the experimental stage. Their own arrangements for the manufacture of this turbine, with its auxiliaries, on a more extended scale, were well forward, and would have been complete in normal circumstances long before this, but owing to the abnormal conditions prevailing, the delivery of some of the new machine tools on order had been unavoidably delayed. However, they were already reaping some of the benefit they hoped ultimately to enjoy by the installation of this new tool equipment, and he hoped that before long tools for the whole sequence of their manufacturing operations would be available.

Mr. B. S. BROWNE (vice-director) seconded the motion, and the report was adopted without discussion.

South Metropolitan Electric Light and Power Co., Ltd.

At a meeting of debenture stockholders held on April 19th, Mr. H. R. BARTON, president, a resolution was passed making certain modifications in the provisions of the trust deeds in order to more clearly define the obligations of the company thereunder with regard to setting aside sums to depreciation, &c., and, according to the *Financial Times*, to put an end to questions which have arisen. Mr. Barton said that his co-trustee and himself believed that the resolution would enhance the credit of the company and contribute to the prosperity which, he felt sure, they all agreed was now fully assured. The chairman of the company seconded the resolution.

Cuba Submarine Telegraph Co., Ltd.

The total receipts for 1915 were £45,312, and the expenses were £29,121, leaving £16,190, plus £7,891 brought forward. Several of the cables were seriously affected by earthquakes, cyclones, and other causes during the year, necessitating heavy expenditure both of cable and for steamer hire in repairing same, amounting to £13,655, which has been charged against revenue. £2,500 has been placed to pension fund, and after paying 10 per cent. on the preference shares, less income-tax, and 5 per cent. on the ordinary shares, free of income-tax, £7,581 is to be carried forward. Annual meeting: May 3rd.

Johnson and Phillips, Ltd.

The profit for 1915 on trading accounts, &c., after making provision for bad and doubtful debts, and after charging to revenue upwards of £9,000 for maintenance of buildings, plant, &c., was £69,084, plus £21,296 brought forward, less the dividend paid in April, 1915, £8,750. Remuneration of directors, &c., absorbs £1,358; debenture interest £5,727; debenture sinking reserve fund £7,182; second debenture interest £2,500; depreciation on machinery and plant, &c., £12,149; interest on loan £1,063; reserve account £20,000, to meet contingencies in connection with the war; leaving available £31,650. After paying 5 per cent. dividend on the ordinary shares, £8,750, £25,300 is to be carried forward. The business has been a "controlled establishment" since August last. Annual meeting: Yesterday.

Oriental Telephone and Electric Co., Ltd.

The gross earnings for the year 1915, including dividends and interest from subsidiary companies, amounted to £90,631, plus £15,181 for payments made under the deed of compromise dated June 9th, 1915, and the balance brought forward £56,135, making £162,248. Working expenses, maintenance, &c., absorbed £38,655; depreciation of securities £5,500; interim dividends, debenture interest, and redemption charges £18,368, leaving £29,726. After paying the final dividends of 3 per cent. on the preference and 6 per cent. (making 10 per cent.) on the ordinary shares, £70,000 is transferred to reserve account, £2,000 to staff pension fund, and £15,497 is to be carried forward. The exchanges worked by the company continue to expand and show improved revenues. Underground cabling extensions are in progress at Singapore and Madras, from the operation of which additional revenue will accrue to the company. The Indian local companies show considerably increased revenues for the past year. The Bengal Telephone Co., Ltd., has paid the same dividend as for 1914, viz., 7 per cent. In order to provide permanent quarters for increasing business, the directors of that company have decided to purchase a central site in Calcutta, and intend to erect a suitable building thereon, in which will be installed a new switchboard equipment. Additional share capital will be

issued to meet the necessary expenditure, and this company will take its proportion of the issue. The Bombay Co. has paid a dividend of 20 per cent., as against 16 per cent. for 1914. The amount of the dividend in both instances has been included in the accompanying revenue account. Both the Telephone Co. of Egypt, Ltd., and the China and Japan Telephone & Electric Co., Ltd., have had a satisfactory year: the former continues to pay the previous rate of dividend of 10 per cent., and the latter 10 per cent. against 5 per cent. for 1914, which have also been brought into the revenue account. The annual meeting was held on Wednesday.

Potteries Electric Traction Co., Ltd.

The capital expended during 1915 was £532. The revenue was £136,167, the traffic receipts at £119,872 showing an advance of £4,789. After deducting expenses, including £11,269 for debenture and other interest, the balance is £20,872, as against £35,825 for 1914. There is to be placed to reserve £8,065, and to renewals £10,000; preference dividend 5 per cent., requires £12,250; 3 per cent. dividend on the ordinary shares amounts to £7,550, and £1,965 is to be carried forward. The reserve now stands at £96,824, and the renewals account at £35,758. The tramway and omnibus receipts for the second half of the year showed satisfactory increases. Owing to labour shortage through the war, working conditions were exceedingly difficult. The negotiations with the Stokeson-Trent Corporation for the postponement by the Corporation for a definite period, of their rights to purchase certain portions of the company's undertaking, have not so far resulted in agreement. Annual meeting: May 1st.

Willans and Robinson, Ltd.

For the year 1915 there was a net profit of £16,726, after payment of debenture interest, provision for depreciation of plant and machinery and revaluation of stocks, allowances to employees on active service, as well as special provision on account of outlays and commitments arising from war conditions. The company was among the first to become a "controlled establishment" under the Munitions of War Act, 1915, i.e., from July 12th last. During the year the Queen's Ferry works were disposed of. In 1913 the majority of the ordinary shares were acquired on terms by interests when Mr. H. Barber represented. An opportunity has arisen by transfer of the greater part of such interests of introducing additional parties. The directors consider this will be advantageous to the company's interests, and a resolution confirming the conditional release of Mr. Barber from his covenant not to transfer the shares will be submitted to the shareholders for approval at the meeting to-day. Warrants will be issued covering the dividends on "A" and "B" preference stocks, and interest on the funding certificates. A dividend for the year of 10 per cent. on the ordinary shares is recommended, leaving a balance of £8,776. Of this, it is proposed to carry £7,000 to the reserve fund, and to distribute £1,677 among the holders of "B" stock and ordinary shares in manner provided by the Articles.

Urban Electric Supply Co., Ltd.

Mr. P. D. TREKERT, presiding at the annual meeting on April 12th, referred to the effect of the drastic lighting restrictions and of consumers' economy on the lighting revenue, also to the heavy increase in cost of materials, especially coal, which was up by £8,888, or about 30 per cent., while the quality was often inferior to that of similar class coal prior to the war. They had been deprived of the services of many of their most experienced and highly-trained men at a time when they could least afford to lose them. Over 150 men had enlisted, and allowances had been made. Considering all these adverse circumstances, it was fortunate that they had so little less profit than a year ago. Both the profits earned at the various works and the net profit balance were less than £500 below the 1914 figures. They had placed £9,589 to reserve for depreciation, as against £10,904 in 1914. The item investments now stood at £178,531, as a large part of their advance to the Cornwall Co. had been converted into shares of that company. They had connected the equivalent of an additional 83,286 lamps, a 10 per cent. increase, of which 83 per cent. represented power, a much larger proportion than in previous years. These additional connections had entailed a capital expenditure of £31,846, which was largely met from the proceeds of the Cornwall Co.'s debenture issue made last May. This year new connections and capital expenditure would be materially reduced, as they were not in a position to finance any large developments in these difficult times. In regard to their different undertakings, Hawick and Grantham had largely saved the situation, the former owing to the activity of its mills, and the latter owing to its military camp. Glossop and Twickenham showed useful increases of £700 and £800. He very much hoped that Twickenham, with its largely increased power load, to provide for which the greater part of last year's capital expenditure was incurred, would show a further large increase of profit during the year, for he feared that it might be the only undertaking from which they would receive any considerable increase, most of the others being likely to be increasingly affected by the adverse conditions already mentioned, and particularly by the increase in the price of coal, which was now substantially higher than last year's figure; indeed, the difficulty had been to get coal at all. The whole situation was a most anxious one for all large coal-users, and he doubted whether there was much prospect

of any material relief whilst the war lasted. They had been reluctantly compelled in a good many instances to make some increase in their rates of charge, but how far it would compensate them it was impossible to forecast, for it was one of the peculiar characteristics of the business that, owing to the altogether disproportionate ratio which capital and standing charges bore to running costs, a rising or falling revenue was not accompanied by a corresponding increase or decrease in the costs of production. In other words, loss of revenue largely represented loss of profit, just as an expanding revenue largely represented increased profit. It was a most satisfactory feature in normal times, and a correspondingly unsatisfactory one in abnormal times. It had been a great disappointment that the Cornwall Co.'s extremely gratifying progress should have been interrupted so unfortunately, but it was directly attributable to the war conditions, and particularly to the fact that half the active mining population had gone to the Front, where their expert knowledge was no doubt of the utmost value in trench warfare. The increased demand for power, which the various war activities had brought about, and which had been a marked feature of the year, had materially contributed to prevent the results shown by several of the towns being worse than they were, whilst Stamford and Twickenham's improved results were almost entirely due to increased power load. Amongst the many uses to which the supply of power was being directly put for the purposes of the war were the manufacture of shells, grenades, fuses, stretchers, motors, motor cycles, motor lorries, and propellers, whilst wolfram from the mines supplied by this company in Cornwall constituted a most important element in the manufacture of high-class steel. With their street and shop lighting practically gone for the time being, and with lighting consumers generally economising, the lighting revenue, in spite of additional connections, was in many cases substantially reduced; and when they combined with this an abnormal war expenditure of some £11,000 or £12,000 it was not at all surprising that some of the towns showed worse results than for the previous year. Speaking broadly, the towns which had suffered most had been those which were most largely dependent on a lighting load, such as Weybridge, whilst the towns which had benefited most were those with an industrial population and a power load like Hawick. Glossop's improved profit was almost entirely due to the improved earnings of its tramway, which had greatly benefited by the prosperity of the industrial population it served.

River Plate Electricity Co., Ltd.

The report for 1915 states that the net revenue, after providing for administration expenses, bad debts, and all necessary depreciations, amounts to £98,713, plus £20,513 brought forward, making £59,226.

The board proposes a dividend of 7 per cent. for the year on the ordinary stock, to set aside as special provision for bad debts £5,000, income-tax £5,000, and to carry forward £18,387. The persistence of unfavourable trading conditions in the Argentine, aggravated by the prolongation of the European war and the great rise in freights and cost of materials, has, as in the previous year, adversely affected the net results. The continuance of hostilities has also prevented the payment of interest upon the 5 per cent. obligations of the German Trans-Oceanic Electric Co., of Berlin. It has likewise prevented the eighth annual payment of £2,300 due upon April 1st, 1916, on account of the amortisation of the 5 per cent. obligations being made. No dividend is included in the year's receipts upon the 21,000 £1 shares of the Argentine Electricity Co., received in connection with the sale of Tucuman, but upon the issue of that company's report, due shortly, it is expected that a small dividend will be declared. The important capital improvements and extensions at Ensenada and La Plata in progress during the last two or three years are now satisfactorily completed. No further capital expenditure of any moment is in contemplation. The further 25,000 £1 preference shares and 25,000 £1 ordinary shares issued in 1914 are now fully paid and have been converted into preference stock and ordinary stock.—*Financial Times*.

Calcutta Tramways Co., Ltd.—The revenue, including interest on investments and deposits, less interest on loans, and the balance brought forward of £7,566, amounts to £116,736. A final dividend of 6s. 6d. per share is proposed, making 9½ per cent. for the year, transferring to reserve for depreciation, &c., £15,000, contribution to staff provident fund £1,309, leaving to be carried forward £6,812.

Colombo Electric Tramways and Lighting Co., Ltd.—The directors announce a dividend of 10 per cent., free of tax, for 1915; £15,000 is put to general reserve and renewal fund, which has been dealt with by writing off £3,000 from the special renewal fund, and £8,165 is carried forward.

Bath Electric Tramways, Ltd.—The accounts for 1915, after providing for the preference dividend and sinking fund instalment, show an available balance of £8,486, which the directors recommend (says the *Financial Times*) should be carried forward to augment the reserves available for the purposes of depreciation and renewals.

Rees Rotobro Manufacturing Co., Ltd.—The available profit for 1915 is £30,419, of which £8,000 is put to depreciation and £12,000 to reserve, £10,419 being carried forward.

An Austrian Cable Works.—The Felten & Guillaume A.G., of Vienna, reports gross profits of £145,000 for 1915, as contrasted with £106,000 in the preceding year. After defraying general expenses and making provision for depreciation, the accounts show net profits of £105,000, as against £57,000, and a dividend is proposed at the rate of 12 per cent., as compared with 10 per cent. in 1914. The prospects for the current year are declared to be favourable, as work is on hand for a long time forward, both in the electrical works at Vienna and the iron and steel works in Styria.

Capital Reduction.—*British Uralite Co. (1908), Ltd.*—A petition for confirming the reduction of capital from £142,500 to £91,875 is to be heard on May 9th.

Montreal Light, Heat and Power Co.—A dividend of 2½ per cent. is announced for the quarter ended April 30th.

Kaministiquia Power Co.—A dividend of 1½ per cent. has been declared for the quarter ended April 30th.

STOCKS AND SHARES.

TUESDAY EVENING.

The Stock Exchange has scarcely got back into its full swing of business, and the influence of the Easter holidays remains apparent in most of the markets. The political crisis of last week had no effect upon quotations, and the only effect which such matters are having upon the world of finance is to be seen in New York, where prices came down sharply upon the innocent statements as to another last Note to Germany. In the electrical sections, the principal feature is the further progress of telegraph stocks and shares. It is extremely difficult to get the offer of any reasonable amount, and other groups outside the Eastern have begun to share in the strength initiated by the dividends recently declared by the latter.

The good prices reached by the Underground Electric stocks have barely been maintained, though the market in them as a whole is not a bad one. There is considerable curiosity felt as to the reason for the still-unexplained rise in Metropolitan Consolidated stock, which gained another point just before the holidays. Districts keep steady, but Underground Electric income bonds eased off a trifle.

Many people are asking whether they are entitled to claim income-tax in respect of the Electric Underground income coupons, seeing that these are paid free of tax, which is deducted by the company before it distributes the dividend. Those people, however, who are entitled to relief should apply to the bank for an income-tax certificate when they are presenting their coupons for payment; and the bank will hand them a certificate somewhat similar to that which is given in cases where dividends are paid less tax, this certificate being accepted as a voucher by the Inland Revenue authorities, as entitling the holder of it to claim what may be due to him.

We believe that some little question arose between the bankers, the Underground Electric Railways Co., and the Inland Revenue authorities as to the proper procedure to be employed in this case; but the points of difference have now been adjusted satisfactorily, and, as we have already said, bondholders who are entitled to return of tax should ask for a voucher at the time they present their coupons.

Eastern ordinary has followed up its 9 points rise of last week with a further advance of 2½, and the improvements in "China" and Western Telegraph shares have been carried further. Indo-Europeans are good at 52, on the declaration of the usual dividend of £2 12s. 6d. per share, making 7½s. for the year, the announcement being couched in an unusual way. Instead of this dividend being declared as the final for the year, the company calls it an interim dividend, which naturally gave rise to some hope that there might be a little extra to come when the year's accounts could be made up and properly adjusted. Apparently, the company has not yet received its final accounts for the year from the various outlying parts of the world which it serves; and it may be, of course, that the present interim dividend may also prove to be the final in respect of 1915.

Electricity supply shares are distinctly better, there being rises in nearly half-a-score of the leading issues. It would appear as though this department, the Cinderella of the industrial market, were at last to receive a little attention from investors, and that the attractions held out by good yields were not to be entirely overlooked, after all. For improvement to come in the shares of illumination companies just when the days are growing long is a novelty. We have mentioned from time to time recently that shrewd people have been trying to get the offer of shares, but without meeting any noticeable success; evidently some of the inquiries have crystallised into transactions, for the supply of stock now on offer in the market is more than usually limited. At the same time, it has to be borne in mind that the market is at all times a narrow one, and that it takes comparatively little either of demand or supply to cause prices to move.

Some of the manufacturing shares are better, too. Edison and Swan (£3 paid) have risen a florin. Electric Constructions are 6d. up, and General Electrics gained ½. India-Rubber shares, still called "Silvers" in the Stock Exchange,

are 10s. better at their par value of £10. Cable manufacturing shares, as a whole, have followed the lead set by the cable market; and Henleys at 14½ are ex the dividend of 17s. 6d., therefore showing a net gain of 2 on the week. The only exception to the strength of this section is a fall of 1/16 in British Westinghouse preference. Most of the chemical shares are good; Castner-Kellners, for instance, at 3½ are 2s. 6d. up.

Brazil Tractions are quoted ex a dollar dividend this week, allowing for which the price is 2½ higher. The Stock Exchange calculates that the company may now be regarded as upon a 4 per cent. basis, so far as the common shares are concerned; so that at the present price the return works out to about 7½ per cent. on the money. The Colonial and foreign shares as a whole are steady. Mexicans once more having sunk into suspended stagnation. The movements of the American troops on the frontier, and in Mexico itself, are watched with a languid interest; and President Wilson, deep in the throes of another Note to Germany, cannot be expected to find time to deal with such a trifle as Mexican settlement.

The rubber market keeps firm, and the steady outpouring of excellent Spring dividends and reports is sufficient to command the attention, interest, and money of a wide circle of speculative investors. The price of the commodity does little to help values, but nowadays this is treated with comparative indifference, seeing that were rubber to drop to half-a-crown per lb., most of the producing concerns would still make large profits. In the metal markets, copper shares are mostly strong, but there is not much doing in these; while the armament division is disposed to be a trifle heavy.

Canadian General Electric Co.—The accounts for 1915 show a profit of \$1,219,514, and after deducting interest and \$46,222 for depreciation, there remained a net profit of \$764,378. Dividends of 7 per cent. have been paid on both the preference and ordinary shares, leaving a surplus of \$66,356, increasing the undivided profit brought down to \$1,067,119, out of which \$300,000 goes to reserve, raising that fund to \$3,000,000, and \$767,119 remains to be carried over. —Financial Times.

Stock Exchange Notice. The Committee has ordered the undermentioned to be quoted in the Official List.

Thos. Bolton & Sons, Ltd. & Power Co., Ltd. London scrip, fully paid, for £496,700 7 p.c. conv. 30 years prior to "A" bonds.

British Coalite Co., Ltd.—A financial audit states that the sale of the company's land at Barking has now been completed, and that out of the price received the first mortgage debentures are being paid off.

American Telephone and Telegraph Co.—The net earnings for 1915 were \$41,117,487, an increase of \$559,510. The interest charges were \$6,498,849, and dividends at the regular rate of 8 per cent. per annum, \$29,100,591. Of the resulting balance there was carried to reserves \$2,500,000 and to surplus \$3,018,046. The indebtedness of the company was reduced during the year by \$50,963,560.

Direct United States Cable Co., Ltd.—The accounts for the year ended at March, 1916, show that the reserve fund account balance is £187,705, an increase of £10,719. A fourth and final dividend of 2s. per share (less tax) is announced, making a total of 4 per cent. for the year. Annual meeting: May 2nd.

Calcutta Electric Supply Corporation, Ltd.—The directors recommend a final dividend on the ordinary shares at the rate of 11 per cent. per annum for the half-year ended December, 1915, making, with the interim dividend, 9 per cent. for the year. £52,000 is placed to the credit of the depreciation and renewals fund, and £10,000 to reserve, the same as in the previous year.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING MARCH, 1916.

THE returns of electrical exports and imports for the month of March show increased values in nearly all sections of the table.

The exports reached the respectable total of £133,396, as compared with £396,453 in February; the imports were valued at £196,251, as against £182,222 in the previous month, while the re-exports, at £17,383, were also considerably in advance of the February figures. Generally speaking, all the sections of the exports, except machinery exports, were at a higher level than in the previous month, the most noteworthy figures being, however, for cable exports, which were valued at £111,031 for the month, an exceptionally high value.

Tel-graphic and telephonic exports were also considerably in advance of the February figures.

Electrical machinery imports remained practically stationary and cable imports declined, while telegraphic, telephonic and glow lamp imports (from Holland) advanced considerably in value, as compared with February.

Our best customer during the month was India, followed by France, while, as usual, Australian purchases reached a considerable value.

The total value of electrical material received from the United States during the month showed an advance on the previous month.

Registered Exports of British and Irish Electrical Goods from the United Kingdom.

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

SOME LEGAL HINTS TO THOSE WHO SELL MACHINERY.

[FROM A LEGAL CONTRIBUTOR.]

ALTHOUGH a very considerable proportion of judicial time is occupied with the decision of cases relating to the sale and purchase of machinery, but few reports of such trials appear in the papers. They are either too technical for the average reporter to record with accuracy, or too complicated or dull for the reader of the newspaper. An action for breach of promise affords better "copy" than an action for breach of warranty on the sale of a "booster"!

In these circumstances a few hints to the vendors of machinery, derived from experience in cases which have either actually been decided or have at least got into the lawyers' hands, may be found useful to engineers.

In many of the disputes arising out of the sale of machinery which occur in practice, the first question at issue is this: What was the contract between the parties?

In his natural anxiety to secure the business, the manufacturer is sometimes careless about the guarantees to which he stands committed. On the other hand, to obtain machinery of which he is in urgent need for the fulfilment of an important order, the purchaser sometimes closes a bargain without making his requirements absolutely plain, and without securing specific guarantees that the machine in question will do what is demanded of it.

Selling a complicated piece of machinery is not like selling a top hat. In this latter case the customer comes to the premises of the vendor, pays his money, buys the goods "on the view" and takes delivery on the spot. No question of guaranty arises. The customer does not—cannot—come back in six months' time and say: "This hat will not do the work required of it," and then bring suit for damages.

Where, on the other hand, machinery is sold a number of considerations may arise. It has to correspond with a long and complicated specification. It is generally guaranteed to do certain work under certain conditions which must be precisely explained. Let there be any departure from those conditions and the machinery will not do its work. Finally, it may have to work in conjunction with machinery supplied by another manufacturer or by the purchaser himself. It is of the utmost importance that the rights and liabilities of the parties in relation to all these matters shall be borne in mind when the contract is framed.

It often appears to be thought unnecessary to draw up a special contract when the parties are negotiating about a mere piece of machinery. A conversation, or a ring-up on the 'phone—confirmed (or not) by a brief letter—is sometimes considered sufficient.

Again, when a dispute arises, it frequently happens that the lawyers have to determine the real contract from (a) the evidence given of conversations at various interviews; (b) telephone conversations; (c) telegrams; and (d) letters. Small wonder, if the component parts of the contract are thus disseminated, that disputes arise as to what those terms really are.

The first principle, then, is to put the contract into writing. *Vox emissa volat sed res scripta manet* is a maxim which should be writ up in every office.

In cases where an arrangement is made orally, it should always be confirmed by letter, unless it is considered that to so confirm it would be regarded with suspicion by the purchaser. In that event a memorandum of the transaction should be made by the manufacturer in his own handwriting in his own diary on the same day, and when the facts are fresh in his memory. In 99 cases out of 100 he may never have to refer to the entry again; but if a dispute occurs, and he has to state his recollection of what took place at the interview, he can refresh his memory by looking up the entry.

These are more or less general observations appertaining to all contracts; but there are certain specific things to be remembered when selling machinery. Assume the agreement is to be in writing, what should that writing contain?

In the normal case there will be an inquiry from the customer for a particular machine capable of doing so much work. The manufacturer replies sending a specification in

which the machine is described. He also makes a tender to supply it at a particular price. It is in the conditions annexed to the tender that he should take particular care to make plain the circumstances in which the machine which he supplies will carry out his guarantees.

The following points should be made in the general conditions to accompany a specification and tender:—

1. *Continuous Working.*—Assuming the machinery is guaranteed for a certain period, the question whether it is to work continuously should be borne in mind. A machine guaranteed for six months' working continuously might be guaranteed for 12 months if only working by day. Again, continuous working may be an essential requirement—as, for instance, in the case of a condenser for a sugar refinery—and the manufacturer must be careful not to make himself responsible for continuous working unless he knows the machine will stand it.

2. *Indirect or Consequential Damage.*—It is sometimes prudent to say in the conditions: "The manufacturer undertakes no liability for indirect or consequential damage of any nature or due to any cause." This has effect, at any rate, to compel the purchaser to reveal the purposes to which the machine is to be put. But such a disclaimer will not release the manufacturer from the consequences of a breach of warranty. For instance, if an engine be sold as being of 10 H.P., and it turns out to be only 7 H.P., with the result that the purchaser suffers damage, this clause will not relieve the manufacturer.

3. *Machinery of Other Manufacturers.*—A composite machine or piece of apparatus may include the workmanship of other manufacturers. As to this it is well to say: "Any machinery not of our own manufacture included in this tender is sold under the warranty given to us by the makers, and which we are able to enforce, but it is not guaranteed by us in any respect."

4. *Drawings.*—It should be pointed out that drawings, &c., submitted with the tender and contained in illustrated catalogues which may form the basis of the contract are approximate only, and that after acceptance of the tender accurate outline drawings will be supplied.

The foregoing are some general conditions which will be found applicable in most cases where machinery is to be supplied.

Some particular cases remain to be considered. The manufacturer is often asked to furnish something which is to be worked in conjunction with an old machine already installed on the premises of the purchaser. In that case he should be careful to limit his guarantee by saying that what he is selling will do so much "provided the efficiency of the existing plant is as stated." A case occurred a year or two ago where an atmospheric condenser was supplied with a guarantee that it would maintain a constant vacuum of 25 in. to 26 in., with the barometer at 30 in., in the vacuum pans at a sugar factory. When installed, the condenser appeared to be unable to maintain the vacuum. In the course of a long inquiry it was found that while the condenser itself was free from leaks there was immense and abnormal leakage of air into the sugar pans which was quite sufficient to explain the drop in vacuum. In supplying a condenser, therefore, the manufacturer should be careful to point out the conditions under which he guarantees that the vacuum will be maintained.

One or two other instances come to mind. Where a gas engine is supplied and is stated to be of a certain horsepower, care should be taken to specify the quality of the gas which must be used if the full power is to be attained. For example, coke-oven gas and producer gas may vary very considerably in calorific value. In such cases the specification should state that the gas to be used must be able to produce so many B.T.U. per cb. foot.

As a last example, mention may be made of a specification for refrigerating machinery. Here again, in the nature of things, something that is essential for the proper working of the machine may have to be supplied by the purchaser himself. The writer calls to mind a case in which a carbonic anhydride refrigerating machine was guaranteed to be able to produce a certain number of tons of ice *per diem*. The specification was very complete, but it made no reference to cooling water. There was nothing to show whether that water was to be supplied from the mains, or

whether it was to be circulated from some kind of re-cooling device. This is clearly a matter which should be provided for in the conditions attached to the tender. The purchaser should be told either that the refrigerator will require so much water from the mains (the amount depending to some extent on the season of the year) or that a re-cooling device of a certain capacity must be installed.

But a few examples have been given above to show the necessity of disclaiming responsibility for the vagaries of apparatus supplied by the purchaser. It would, doubtless, be possible to multiply instances in the case of more complicated machines.

THE USE OF CONTINUOUS CURRENT FOR TERMINAL AND TRUNK LINE ELECTRIFICATION.

ON March 21st the paper on this subject by Mr. N. W. STORER, which was read before the INSTITUTION OF ELECTRICAL ENGINEERS, was discussed by the MANCHESTER LOCAL SECTION.

The CHAIRMAN (Mr. B. WELBOURN) endorsed the plea which the author made for some attempt to be made, before it was too late, to secure the standardisation of voltage and collector systems in this country. It was to be hoped that in connection with railway electrification work they would not have a repetition of what had happened in the electricity supply industry.

Mr. W. A. BARNES, referring to standardisation, pointed out that direct-current traction was competing very strongly with alternating-current traction in the only advantage the latter possessed, namely, high-voltage transmission, and on this account it would not be policy at the present time to standardise 1,200 or even 2,400 volts. Another point against standardisation at the present time was that such a course would tend to stop progress. The question of the location of the third rail had been brought before a meeting of railway engineers as long ago as 1903, when it was decided that the most advantageous position for the third rail was such that the contact surface be 3 in. above the track rail, and that the horizontal distance between the centre of the track and the centre of the third rail be 3 ft. 11½ in. This was adopted for an overrunning shoe, and it was thought that 600 volts would not be exceeded for direct-current electric traction. The above recommendation had been adopted by railway companies who electrified since 1903, but during the past two years the direct-current traction motor had been greatly improved, so much so that the 1,200-volt motor was probably more reliable than the 600-volt motor of ten years ago. The 600-volt third rail was not sufficiently well protected to be used at 1,200 volts, and on the Manchester-Bury section of the L. & Y. Railway, where 1,200 volts was in operation, this had led to the adoption of the side-contact rail adequately protected along its entire length, thus departing from the earlier standard. The gear required to operate at various voltages would have to be accommodated inside the car, and together with the equipment for regenerative control and the apparatus for changing the position of the shoe would seriously limit the passenger-carrying capacity of the car, and would cost more for maintenance and running charges. It was probable that in trunk line electrification any one railway company would adhere to one system, and only inter-running trains would be affected; he suggested that such trains be ordinary stock worked by electric locomotives which would be changed at the junction of two systems, and where through coaches were involved, trailer coaches should be used in conjunction with motor coaches in the usual way. The choice of motors depended on the relative importance of efficiency of working and efficiency of service.

Mr. FERGUSON considered that the first step should be to standardise line voltage. The inter-running of trains over systems employing different voltages had been shown to require a relatively large number of switches; in maintaining equipments of this kind, however, it was well to remember that so far as the main control was concerned it was only necessary to deal with a number of similar contactors or reverse-type switches, all of which were fairly well-known pieces of apparatus, hence the maintenance was only increased in proportion to the number of similar pieces. The case of auxiliaries for high voltages and various voltages was very different, necessitating, as a rule, new types of apparatus more or less exploited and undeveloped. In the case of equipments having to run at comparatively high speed on the suburban parts of a railway, say, 2 to 4 miles between stops, and also on city lines with only half-mile stops, the field control was the proper thing, but required extra switches and extra cables, involving additional capital cost and maintenance, and there were cases where it would be advisable to put the money and material into building a large motor having a non-saturated field.

Dr. WM. CRAMP said that emphasis was laid upon what were called saturated and non-saturated fields, and no indication was given as to the point at which distinction between

saturated and non-saturated was drawn. A case had been made out against the rating of railway motors on the one-hour basis; it was to be hoped that the Institution of Electrical Engineers or the Engineering Standards Committee would go into this question with the object of sanctioning a more rational basis for specifications. Such a basis had already been suggested by Dr. Pohl. The second part of the paper was a most eloquent plea for standardisation, and showed into what confusion railway equipment would be thrown if some control was not quickly exercised. The adoption of the single-phase system would obviate many of the difficulties mentioned; in fact, the paper might be turned into a demand for the single-phase system, so long as there was no co-ordination between the railway companies as regarded voltage. In the single-phase system only frequency needed to be standardised, and that only within certain limits, which should not be difficult to decide upon. Series-parallel operation of transformer or motor windings would meet all other variations. It was ridiculous to construct trains on such short lengths of line as existed in this country, with so much complicated apparatus to change from one railway company's system to another. If it were necessary to have voltages varying over the range suggested by the paper, the continuous-current system should not be adopted at all. The only solution seemed to be some form of control which would prevent a company adopting a system different from that adopted by another company, without showing good cause for the difference, and the method to be adopted to secure interchangeability.

Prof. E. W. MARCHANT said that one of the main advantages of series-parallel control lay in the greater efficiency on starting. The maximum possible efficiency in starting with series-parallel control and two motors was 67 per cent., whereas, starting with ordinary rheostatic control, the loss was 50 per cent. Taking the ordinary limit accepted in this country of from 150 to 200 amperes from the trolley, it was clear that very high voltage would be required on the trolley wire in order to obtain the power required to drive a railway train. Regarding the question of the D.C. voltage possible on a dynamo or motor, Mr. Catterton-Smith had experimented some four or five years ago, using a motor designed to work under compressed air at 200 lb. per square inch. The armature was designed for 3,000 volts, and he succeeded in getting an output of about 3 kw. from the machine, which was 2-pole and had a commutator only 4 in. in diameter. The design of the bearings was a most difficult matter, on account of the air pressure on one side, and the mechanical difficulties involved were too serious to warrant much hope of final success.

Mr. A. P. M. FLEMING expected a great deal of trouble with high voltages, particularly in view of the extremely arduous conditions under which railway services operated in regard to moisture, dust, and oil.

Mr. C. H. WORDINGHAM most strongly deprecated the nationalisation of railways; every country which had nationalised its railways had done so to its own detriment. Once the feeling of competition was removed, bad as railways might be in certain respects at present, they could be infinitely worse if nationalised, and it might be said without doubt that a Government department was not in a good position to conduct trading operations successfully or with advantage to the public. It was essential to confine standardisation chiefly to questions of interchangeability, and not to attempt to standardise design. By adopting a rigid standardisation, mechanical or electrical, there was a grave danger of stifling progress.

Mr. J. S. PECK said that whilst it was not possible to standardise completely, as by so doing progress might be seriously hampered, if certain provisional standards were adopted—say, 600, 1,200, 1,800, and 2,400 volts—it would prevent one railway company from adopting, say, 1,200 volts and an adjacent company 1,800 volts, 1,500, or other odd voltage which seemed at the moment to possess some special advantage. Unless some effort was made to standardise very soon, there would be the same multiplicity of voltages that existed in the States, where they had 500, 600, 750, 1,200, 1,500, 2,400, 3,000, and 5,000 volts. Mr. Barnes's suggestion of using electric locomotives operating only on their own systems seemed a very important solution of the problem. If the railways were ever amalgamated, one of the first things would be to adopt a standard voltage, which would necessitate scrapping a large amount of expensive equipment. Why should not standard voltages be adopted, as would be the case if all the railways in this country were under one management? The question of the shunt motor being more sensitive to fluctuations in line voltage was explained by the self-induction of the shunt motor field, due to many turns of fine wire, being much, very much, higher than that of the series motor with a few turns of large wire. If the line voltage went off and was suddenly thrown on again, or whenever there were large fluctuations in line voltage, there was a tendency for very large rushes of current to occur. The field of the shunt motor was sluggish in building up, and the very heavy armature current distorted the field and was apt to produce flashing. The maximum current which could be collected from a trolley wire was dependent a good deal upon the type of trolley and size of wire, but 250 to 200 amperes could be collected without much difficulty, even at high speeds. An advertisement some time ago showed a double pantograph trolley which would collect 4,000 amperes at 40 M.P.H. Compressed air was a very excellent insulator, and it had been proposed in connection with transformers in order to stop static discharge. The author

had written to Mr. Beck to say that the only difficulties they had experienced so far with the 5,000-volt control equipment were due to earths on the resistance, due to running through sleet and snow; that, however, was very easily remedied.

ELECTRIC POWER IN SLATE QUARRIES.

By G. K. PATON, A.M.I.E.E.

(Abstract of paper read before the LIVERPOOL ELECTRICAL SOCIETY, April 12th, 1916.)

It is only within the last ten years that electric power has been introduced to any extent in the slate quarries of North Wales, some of which have been in active operation for a century or more. Under the terms of the North Wales Electric Power Act of 1904, the company is authorised to supply power in bulk to power consumers with an equivalent amount for lighting purposes.

The transmission lines of the Power Co. now extend to the principal quarrying districts in an area of nearly 400 square miles, supplying slate and granite quarries, aluminium works, and also the New Carnarvon transmitting station of Marconi's Wireless Telegraph Co., Ltd.

The generating station is situated at Cwm Dyli, near Pen-y-gwryd, in the Gwynant Valley.* Water power is the prime mover at an effective head of 1,150 ft.

Four Pelton wheels, each of 1,600 H.P., are installed, coupled to 5,000-K.V.A. alternators with direct-coupled exciters,

should it fall. Both designs are based on the fact that the insulator is the weak point of a line, and should it fail the wire may fuse or break at this point. The second insulator and anchor wires then prevent the conductor from falling.

A continuous earth wire should be run throughout, and all ironwork, motor frames, switch ironwork, and the neutral point of the secondary, efficiently connected thereto.

In Blaenau Ffestiniog the workings are all underground, and consequently the slate blocks and most of the debris require to be hauled to the surface, electric power being used in the larger quarries. Power is required in operating inclines, slate saw sheds, air-compressors for rock drills, ventilating, and also for pumping. In the Nantlle district the quarries are of the open pit type. Hoisting in these quarries is done by aerial suspension cableways and inclined hoists.

Slate saw sheds should be erected as near as possible to the part of the quarry from which the blocks are obtained. Advantage should be taken of the electrical supply to install units of 15 to 20 H.P., driving 12 to 15 saw tables, instead of the older method of concentrating all the saw tables in one large shed. When conversion is made to electric drive in these large sheds it is better to sub-divide into groups of 12 to 15 tables, each group being driven by a separate motor.

A convenient arrangement, recently laid down in Penrhyn quarry, is a shed 162 ft. by 58 ft., containing 12 saw tables, each driven by a belt from a main shaft, 1 in. diameter at the centre and tapering to 3 in. at the extreme ends, driven from the centre by means of a squirrel-cage, 3-phase induction motor of 20 H.P., coupled to a worm gear with a speed ratio of 900:45 R.P.M., the secondary shaft being direct coupled to the main shaft. An outline of this type of motor and worm gear is given in fig. 2. The slate tables are arranged six on each side of the motor equipment.

So far, artificial lighting has not been a success in saw

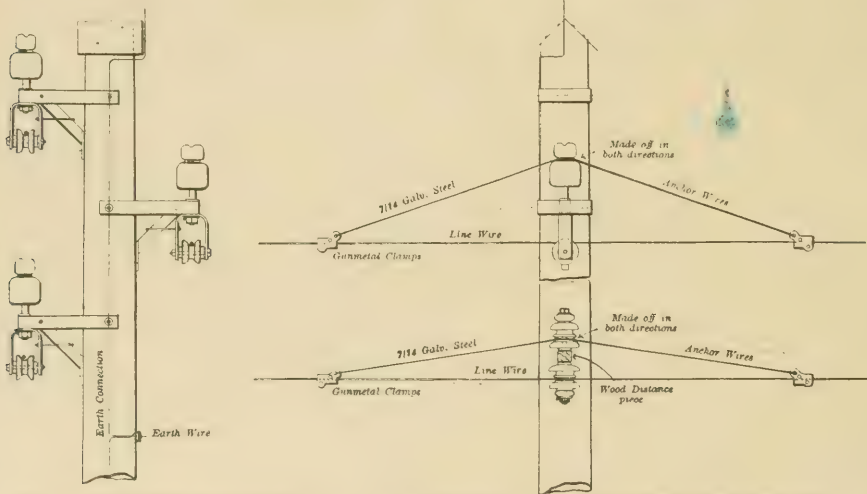

FIG. 1. OVERHEAD LINE CONSTRUCTION IN QUARRIES, CROSSING RAILS AND FOOTPATHS, AT 5,000-10,000 VOLTS.

generating 3-phase current at 10,000 volts 50 periods when running at a speed of 500 revolutions per minute.

Power is transmitted to the various consumers by overhead transmission lines, and each consumer has one or more substations, equipped with two 3-phase oil-insulated transformers, varying in size from 100 to 750 K.V.A. capacity according to requirements.

The neutral of the E.L.T. system is earthed at the power station, and it is advisable that the neutral on the L.T. side should also be earthed. The earthing system in a slate quarry is important on account of the slate debris, which gives a poor "earth"; an earth wire should be run beyond the debris to obtain satisfactory results.

In slate mines bitumen-insulated armoured cables are the most suitable for voltages up to 550 volts. The moisture underground causes rubber to perish quickly. All cables should be armoured, the armoring being used as an earth conductor.

Overhead lines have to cross innumerable rails and footpaths, and it is often necessary to guard the lines throughout their whole length, owing to the extreme weather conditions, guarding with earthed cradles is impossible.

A simple and effective design for a 1,000-volt single circuit line is given in fig. 1, which is self-explanatory. Double circuit lines with channel arms are arranged with two insulators per conductor, to one of which the line wire is bound, and to the other is attached the anchor wires. An earth bar is fixed as an additional protection to earth the live wire effectively

sheds, owing to the habit of quarrymen to work only in daylight. In winter the working hours are thus reduced to eight hours per diem, but even then there are periods when artificial lighting is necessary indoors; the cost is so little that it is surprising that more use has not been made of electric lighting in sheds—to the author's knowledge, only one quarry has installed it.

In changing over an existing shed to electric drive, a belt drive is employed from the secondary shaft on the motor, running at about 240 R.P.M., to the main shaft at 45 or 60 R.P.M. Slate dust causes considerable wear on paper or hide pulleys, and it is nearly impossible to prevent dust getting about, as it is carried by the belt, even when the motor is fixed in a different compartment. A helical cut gear gives good results.

It is always preferable to use a belt drive, but when a speed reduction to 45-60 revolutions is required, this is only possible by means of a slow-speed motor. The "Cascade" motor is suitable for this purpose, a 15-H.P. motor running at 320 R.P.M., synchronous speed 333 R.P.M. The pulley ratio is about 7 to 1, and consequently the motor pulley is small in diameter.

From the Power Co.'s point of view, it is better to use high-speed motors, giving a higher power factor at half to three-quarter load, which is about the average over the running periods of the day.

The cost of power in slate saw sheds may be taken at 5d. to 7d. per ton of output, depending on the quality of rock, hard or soft, at one penny per unit. The running load factor varies from 45 per cent. to 55 per cent. over 93 working hours per diem. The actual power required per table (8 ft. by 4 ft.) is on an average 1.1 K.W. From tests taken, the actual cutting

* A full description of the plant has appeared in the ELECTRICAL REVIEW.

power per ton is approximately 1 H.P., giving an overall efficiency of 68 per cent.

Where the quarries are of the open pit type, the slate blocks and debris require to be lifted out of the pit: aerial suspension cableways and inclined ropeway hoists are used for this work.

In the case of the inclined ropeway hoists, two heaving ropes are employed on one drum, one paying out as the other is pulled in, and the wagon and rope weight is balanced during most of the travel. In practice, however, it is found that the empty wagon descending is actually landed before the full wagon reaches the top of the mast at the upper landing stage. Consequently, the power required at the end of the lift is that required for the gross weight of wagon and load. The single hoist, with two main ropes, lifts a gross weight of 50 to 60 cwt., one empty wagon descending while the other load is lifted. The double hoist is arranged with four main ropes and is used to lift one or two full loads at a time, as may be required. The single hoist is driven by a 70-B.H.P. motor and the double hoist by a 150-B.H.P. motor.

The total net weight lifted with 1,135 loads during tests was 2,380 tons, and the corresponding units registered were 1,140 units, which gives per net ton lifted 0.48 unit and approximately 1 unit per journey or load.

The overall efficiency is 75 per cent. with unbalanced load, and about 85 per cent. with the wagon weight balanced, a result which may well be considered satisfactory. The time taken for each complete operation is about 14 minutes, so that it is not impossible to do one journey every 25 minutes, equal to about 200 loads per day, or, approximately, 400 tons net. Under these conditions, the motor would take 200 units per diem, although actually about 100 units per diem would be a good average under normal conditions.

100 units per diem represents a load factor of 18.5 per cent. over nine working hours per diem, but taken over longer periods when other conditions, weather, &c., interfere with outdoor work, the load factor averages from 12 to 15 per cent. only. In other words, to the Power Co., a winding motor taking a maximum demand of 60 kw. intermittently, consumes in a day from 60 to 100 units, representing from 0.9 to 1.43 units per H.P. per diem, which at 1d. per unit brings in a revenue of from 5s. to 8s. 4d. per diem.

FIG. 2.—WORM GEAR AND MOTOR.

In the case of aerial suspension cableways, two winding drums, one for heaving rope, and the other for the endless travelling rope, are employed. The drums are independent of each other, and each drum has a separate band brake with foot control. The endless rope serves to hold the load carriage in position when hoisting and lowering. For travelling horizontally, the hoisting rope is drawn in and the endless rope is paid out at the same speed, the drum diameters being equal. The load may be hoisted or lowered at any point under the line of cable, and the horizontal motion may be given to the load at any height to which it may be raised. The direct lifting speed is one-third of the rope speed. Compared with the inclined hoist, which has fixed positions for picking up, it will be seen that the aerial cableway can pick up and lower at any point across the main cable.

The following particulars relate to three such cableways in operation at Penrhyn Quarry, with spans of 965, 1,010, and 1,015 ft.:—Gross load, each 60 cwt.; hoisting speed, 300 ft. per min.; travelling speed, 900 ft. per min.

Winding drums, 5 ft. diameter, giving maximum rope speed of 900 ft. per min.

Motor, 70 B.H.P. 3-phase, 50-period, 500 volts, 570 R.P.M. Slip ring, reversing, enclosed ventilated type, with extended shaft and third bearing.

Controller, Westinghouse F. 12A drum-type reversing controller, with 11 steps forward and reverse, arc shields, five-minute rated open-type, cast-grid resistance.

Switch panel, totally enclosed, oil-break automatic circuit-breaker with no-volt and overload releases, fitted with adjustable time lags.

As the driver is not in full view of the landing points in the bottom of the quarry, an electric signalling system is used, with luminous signal receiver fitted in the driver's room. The signals are given from a signal box in full view of the workings under the cableway.

The main cable suspended across a span of 1,000 ft. forms a catenary, and the power required in traversing varies according to the direction and slope of the cable.

Over a definite period 423 complete journeys were made (in and out), when the net tonnage lifted amounted to 887

tons. During this period the energy used amounted to 423 units, equal to 0.733 unit per ton, or 1.54 units per load of 12 cwt.

In another cableway the tonnage noted in 255 journeys was 574 tons, when the energy consumed amounted to 516 units, giving 0.9 unit per ton lifted, or 1.89 units per load of 42 cwt. net. These figures include journeys made with empty wagons.

The time of a complete cycle of operations is six minutes, equal to 10 journeys per hour, as a maximum. In a 10-hour working day this would give at most 100 journeys, or about 200 tons per diem, which probably has not yet been attained in ordinary working.

Taking 200 tons per diem as a maximum, the consumption of energy at an average of 8 unit per ton would be 160 units.

The average load requires a maximum power of 60 kw. or 70 B.H.P., which gives an average of 2.28 units per H.P. per diem. Over a longer period the average would amount to only about 50 units per diem, equal to only .715 unit per H.P. per diem. This is equivalent to a load factor of, say, 9 per cent. to a possible maximum of 28 per cent. over a 10-hour day, and under normal working conditions 10 to 15 per cent. would be a fair average.

The costs and tonnage handled by each type of haulage are given below:—

Type of cableway.	Cost of equipment.	Tonnage per diem.		Kw.	Units per ton.	Load factor.		Overall efficiency.
		Max.	Aver.			Max.	Aver.	
Single incline hoist*	£600	400	130	200	60	0.48	35% 12 18%	76%
Aerial suspension cableway†	£900	200	50	100	60	0.733	12-28% 10-15%	65 70%

* Diagonal lift, 300 ft. Travel 100 ft.

† Vertical lift, 165 ft. Travel 900 ft.

The approximate cost given in column 2 includes complete electrical equipment, ropes, masts, buildings, foundations and anchorages. The electrical equipment of the single hoist and aerial cableway is similar, with 70-B.H.P. motors and controllers.

From the figures given it will be noted that the actual tonnage handled by the inclined hoist is practically double that of the aerial suspension cableway.

Both types are used in Penrhyn Quarry, the cableways spanning the open workings, and landing the wagons on rails on which they are taken under the inclined hoist. The hoist then lifts the wagons another 300 ft. to the level of the debris tips. One hoist deals comfortably with the tonnage handled by two aerial cableways. In this way, 200 to 300 tons of debris per diem are removed from one part of the quarry workings, lifted a height of 400 to 500 ft. and a distance of over 1,500 ft., at a power cost of about 1d. per ton.

Rock drilling in slate quarries is usually carried out by compressed air operating hammer drills: there is a big field for electric drills if they can be proved satisfactory.

A typical installation consists of an Ingersoll-Rand two-stage belt-driven compressor, driven by a 150-B.H.P. 3-phase, 50-period, 500-volt, 575-R.P.M., slip-ring, 3-bearing induction motor. Regulation of the air pressure is maintained within any desired range, usually between 80 and 100 lb., by a mechanical unloader, which operates by entirely closing the air intake, the power on the motor dropping immediately the intake pipe closes.

If a compressor is too large for its work, it is a good method to have a smaller pulley fitted to the motor and run the compressor at a reduced speed. This is done in one large quarry with good results, three different sizes of pulleys being used according to the number of drills in use.

The power consumption is dependent upon the number of drills in use, and the number of hours the plant is working. On an average, the daily load factor over a 10-hour working day is from 50 to 60 per cent., equal to 4 or 5 units per H.P. per diem.

A considerable amount of pumping is required in some quarries, and turbine pumps direct coupled to high-speed electric motors are in use. The sizes in use vary from 15 to 200 B.H.P., with a discharge up to 1,200 gallons per minute against a head up to 400 ft. The larger pumps are usually controlled from switchgear near the motor, but with smaller pumps it is possible to control them from a higher level. This is of great benefit in open quarries, as at night-time it is unnecessary for the attendant to go down to the pump, which is a more or less risky proceeding even in daytime.

It is sometimes necessary for pumping to be continued night and day, it is therefore necessary for power to be available at all times, and a bulk supply is of great benefit.

The winding or haulage load accounts for 58 per cent. of the total demand, with a poor load factor.

Air compressors and slate sawing machinery tend to balance matters with their increased load factor, but the result is a demand on the Power Co.'s system is not ideal.

The plant diversity factor equals 2. In other words, a demand of 250 kw. on the power plant will supply a quarry plant totalling 500 kw. Totalling the individual quarry H.P. connected against the actual maximum demand on the power station gives a diversity factor of about 3.

While the present state of the slate trade may not warrant further capital expenditure, and each particular quarry must be estimated by itself, the actual working costs with modern machinery are so small compared with the additional revenue from increased output and reduced working costs, that no quarry manager should be content to work under the conditions which prevailed in the past.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

AUSTRALIA.—By a Proclamation, dated December 15th last, the importation or exportation is prohibited of any goods packed in a bag or sack when the combined weight exceeds 200 lb.

SWEDEN.—The exportation of antimony, unmanufactured platinum, and platinum wares other than those with precious stones or pearls inset, has been prohibited recently.

ITALY.—By a Decree dated February 17th certain Customs privileges are granted in favour of new industries. For a period of five years from March 1st exemption from Customs and Octroi duties will be granted in respect of machinery and building materials destined (1) for the establishment of factories for producing articles not already manufactured in Italy, or the products of new industrial processes; and (2) for factories existing in the Kingdom, in order to enable them to undertake industrial processes not hitherto applied, or to obtain products supplementing those already manufactured in such establishments. Regulations for the application of these privileges are to be laid down by Decree.

GUATEMALA.—A Decree, dated September 9th, 1915, provides that, as from October 1st, 1915, Guatemalan Consular Officers were to collect the undermentioned fees:—

For the legalisation of invoices, 2 per cent. of the value of the merchandise.

American gold.

For the legalisation of ships' manifests 10 dollars.

For the "visa" of each bill of lading in quadruplicate 1 dollar.

For each additional copy 1 dollar.

For the "visa" of bills of health 2 dollars.

For the legalisation of signatures to documents to be used in the Republic 3 dollars.

RUSSIA.—Information has been received at the Board of Trade to the effect that the competent Russian authorities have decided that the differential rates of duty which are leviable on goods falling under certain sections of the Russian Customs Tariff, when imported over the Western land frontier, are not to be levied on such goods when they are imported *via* the Swedish-Finnish land frontier.

[NOTE.—The differential duties referred to consist of the rates for goods imported by sea, increased by 20 per cent., and are leviable under Sections 140-2, 149-61, &c., of the Russian Tariff, which has been published as a Parliamentary Return (Cd. 7,854, price 7d., ex postage). The sections in question relate, *inter alia*, to certain iron and steel manufactures, and wire and wire manufactures (including electrical cable of all kinds).]

SWEDEN.—The exportation of molybdenite has been prohibited as from March 17th, and of calcium carbide and nitrogen carbide (calcium cyanamide) as from April 1st.

NETHERLANDS.—The exportation of asbestos has been prohibited as from March 27th, and of zinc ore and zinc oxide as from April 1st.

SOUTHERN RHODESIA.—The following Customs decision has recently been announced:—

Washing machines driven by electrical power are dutiable under No. 193 of the Tariff at the general rate of 20 per cent. *ad val.*, the rebate allowed on goods manufactured in the United Kingdom or British Possessions (whether reciprocating or not) being 9 per cent. *ad val.*

NEW ZEALAND.—A revised decision has recently been issued by the Customs Department regarding the tariff classification of accessories for motor vehicles, cycles, and motor cycles. Certain articles, among which are included electric batteries and switchboards, will only when accompanying the motor vehicle, &c., to which they belong, be classed as parts of same. When imported separately they will be classed under appropriate tariff headings.

BRITISH SOLOMON ISLANDS.—A Proclamation has been issued under the "Solomons (Customs) Regulations, 1907," embodying new schedules of goods dutiable and free, respectively, on importation, with effect from January 19th. Among the articles exempt from duty are machinery (including electrical) and component parts thereof which the High Commissioner may from time to time specify. The schedule of goods dutiable mentions fuse, the duty on which is 10 per cent. *ad val.*, and this rate is also payable on all goods not specifically tariffed or not included in the list of exempted articles.

NEW PATENTS APPLIED FOR, 1916.

(NOT YET PUBLISHED).

THE DEARNESS OF THE LOWEST TENDER.

It is a common saying, and one that is full of sound wisdom, the fruit of long experience, that "the best is the cheapest in the end." Unfortunately, in purchasing plant, the buyer too often ignores this maxim, and appears to believe that the best is that which is cheapest in the beginning; that is to say, he accepts the lowest tender, on the faith of the assurances that he receives that the plant is "just as good" as its more costly rivals, or a bit better, and is "guaranteed" to have high efficiency, long life, and all the other virtues of high-class productions. The lowest tender is not always unworthy of consideration; when, made by a firm of high standing, whose reputation is an asset that it cannot afford to depreciate, it may be, and often is, both safe and wise to accept an attractive offer. But in general the lowest tender should be most carefully scrutinised, and considered in all its bearings, before it is preferred to a somewhat higher-priced tender of unquestionable merit.

Private purchasers, of course, are able to exercise their discretion with absolutely unfettered freedom, but municipalities in this country have always before them the fear on the one hand of the Local Government Board, which is apt to give little heed to explanations justifying the payment of a higher price than the very lowest terms, and on the other of the intelligent ratepayer, who sees in any departure from the minimum price basis either an opportunity for making political capital out of the transaction, or evidence of corrupt practices which he is not slow to denounce. It is sometimes the duty of the conscientious engineer to advise his committee to brave these dangers and pass over the lowest tender, but occasions arise when even he can see no adequate reason for such a recommendation, and price must rule the choice; yet the risk remains that the bargain may turn out to be a bad one.

Such a case is recorded in the annual report of Mr. T. H. U. Aldridge, engineer-in-chief to the Municipal Council of Shanghai, which has just come to hand. Mr. Aldridge states that, in view of the price and guaranteed efficiencies of the German turbo-alternators which were installed two years ago at the Riverside generating station, the German tenders were "theoretically" the best offers received, and could not easily have been passed over. In practice, however, they proved to be most disappointing, for a crop of troubles has been experienced since they were put to work. It cannot be too widely made known in neutral and Allied markets that serious breakdowns of the German-built machines took place, and at one critical period two-thirds of the turbine plant was unavailable for service, owing to serious defects. The trouble was traced to the employment of unsuitable material for the turbine blading, but other mechanical defects were discovered later, and a serious electrical burn-out also took place, almost simultaneously with the blade troubles. The consequence has been that while the average cost of repair of six British turbo-alternators at Shanghai, aggregating 4,200 kw., which have been running for five to nine years, was under £40 each per annum, the two 2,000-kw. turbo-alternators supplied by the A.E.G., of Berlin, which have been running less than two years, have cost respectively £318 and £267 per annum, an

average of £293 each. In addition there was a serious loss of revenue whilst the A.E.G. machines were under repair. Mr. Aldridge adds: "Since those turbines were installed, troubles with machines of similar make have come to light in connection with machines in Australia and England. Not only have the German turbines proved defective in Shanghai, but several transformers have also shown marked inferiority to either British or American ones in service." Whilst we condole with Mr. Aldridge on his unfortunate experience with German generating sets, we must, in passing, once more congratulate him on the splendid progress that his undertaking has again recorded. A 52 per cent. increase in units sold, following on successive increases of 46, 80, and 50 per cent., and a load factor of 40.8 per cent., are achievements to be proud of; the units sold now exceed 50 millions per annum, and the installation of generating plant of 25,000 kw. capacity is in hand.

Probably one of the Australian breakdowns to which reference is made above is that of the Sydney City Council, which in 1913 bought an A.E.G. turbo-alternator for £20,233, the lowest tender by £2,077. This set was supplied through the Australian Metal Co., and broke down in 1914. It would be interesting to know whether the resulting loss to the Council had swallowed up the difference between the price quoted and that of a set of reliable make. We know that certain large A.E.G. turbines installed in this country have turned out so defective that they have had to be rebuilt.

From the foregoing data we deduce the obvious moral which forms the subject of this article—that the cheapest may be far from the best, and may be found the dearest in the long run. The danger of too readily accepting the lowest tender was emphasised by Dr. Ferranti at one of the Beama conferences last winter, and is particularly to be feared in connection with German plant, even though it be made by the greatest of the German companies. In the course of a discussion at the Royal Society of Arts not long ago, Mr. J. Swinburne said that the more the Germans dumped goods into this country, the more we should get in the way of an indemnity; dumping was a splendid thing for the countries that received the goods, and very bad for the countries sending them. But if the dumped goods prove to be more costly in maintenance than higher-priced goods made in this country, even Mr. Swinburne will surely admit that dumping is a bad thing for both parties. In this country we want neither Germans nor German machines; it has been proved that British machines are the better and the cheaper in the end, hence there is nothing to be gained by importing the inferior article.

It would seem, therefore, that the State gets the best of the bargain, and would be acting wisely if it were to offer rewards to the originators of successful ideas, in addition to the monopoly of which so few are in a position to take advantage. But on the contrary, far from recognising its indebtedness to the inventor, the State demands that he shall pay an annual tribute for the privilege of owning letters patent—a tribute increasing from year to year, just as the public benefits derived in other ways from successful inventions increase as time goes on. Surely this is an unjust and unwise policy. At the very least, the State should grant the patents free of charge.

Are we exaggerating the position in favour of the inventor? By no means. The truth of our contention is recognised, confirmed, and published abroad to all the world by the State Government, which has organised several departments for the express purposes of inviting the submission of ideas of all sorts, good and bad—of sifting out the former from the latter with the aid of experts of the highest standing and ability—and of carrying into effect those which afford any prospect of advantage to the nation, at the same time offering rewards to the inventors. Our readers are familiar with the constitution of these departments, which were organised first for the specific purpose of increasing our military efficiency, and afterwards to develop our industrial interests.

Yet side by side with this admittedly revolutionary innovation, the Patent Office pursues its normal course, demanding fees from inventors for the maintenance of their privileges—whilst, moreover, other departments of the Government commandeer factories and workshops, and thus render it impossible for the inventor, during the continuance of the war, to utilise the scanty term of his patent to secure his just reward.

The manufacture of munitions must proceed with the utmost energy, and must take precedence of all private interests; but, at the very least, steps should be taken to suspend the payment of fees for the renewal of patents which are thus hung up, and to prolong the lives of the patents to a corresponding extent.

Our attention has been called to this matter by a letter which appears in our "Correspondence" column to-day; we cordially sympathise with the views of our correspondent, and should be glad to see a movement set on foot to secure justice for the inventor.

Electrical Propulsion of Ships.

ELSEWHERE in this issue we commence an abstract of a paper by Mr. R. S. Portham, which at the same time adds to our information with regard to the Ljungström steam turbine—one of the most interesting and admirable engineering achievements of the age—and bears witness to the growing attention that is being given to the electrical propulsion of ships. This is one of the most important fields that still await conquest by the electrical engineer, hardly second in importance even to the railway field, and the excellent results attained by the s.s. *Mjölner*, in comparison with her sister ship *Mimer*, inspire the confident hope that in no long time marine engineers, for their own advantage, will be compelled to adopt the electrical method of transmission of power from the prime mover to the propeller. The small electrical losses in transit are completely swamped by the gain due to the possibility of adopting the most economical turbines, running at their most efficient speeds, and taking advantage of the latest developments of high steam pressures and high superheat; reversing turbines are dispensed with, and the control is reduced to its simplest terms, while all auxiliaries throughout the vessel, as well as lighting,

Patents in War-time.

THE primary object of the law of letters patent is to secure to the public the benefit of new inventions, by inducing inventors to disclose the details of their processes and apparatus, instead of endeavouring to surround them with a veil of secrecy. The inducement offered to the inventor is the privilege of monopoly, guaranteed by the State, for a term of years. Incidentally, by retaining inventors and their discoveries in this country, the public derive advantage not only after the lapse of the term of monopoly, but also during the life of the patent, for employment is given to a number of persons in working the processes, in distributing the products, and in other ways, extending over a wide and complex range; the importance attached to this aspect of the subject by the State is well exemplified by the provisions introduced into the Patent Law a few years ago for the purpose of compelling British patents, not only of native but also of foreign origin, to be substantially worked in this country as a condition of the maintenance of the monopoly.

heating, and cooking, can be efficiently and cheaply operated by electrical means. We understand that already the application of the system to very large merchant vessels—which, running almost all the time at constant speed, are able to derive the greatest advantage from turbo-electric drive—is in hand, and when the shipbuilding boom which is certain to follow the war commences, we hope that the opportunity will be taken to increase the splendid lead which our merchant marine already possesses over all its rivals, by this means.

THE recent setback in the price of Rubber. crude rubber has proceeded to an extent which has certainly tended to keep the trade demand going at a pretty satisfactory rate considering the rather drastic restrictions imposed by the authorities on the exports to the United States. The reason for this policy is rather obscure, especially in view of the fact that unsold stocks have been accumulating for some time past, while it is understood that proper regulations are in force on the other side under the co-operation of the Consular agents in order to preclude the possibility of leakages in the way of contraband trading with the enemy. However this may be, it is generally inferred that the present restrictions as to permits are merely ephemeral, and must therefore soon or later be modified, or otherwise trade will suffer to some extent. Meanwhile, there is no denying the fact that this adverse feature has had something to do with the recent weakness of the market. Not only have export buyers had to resort to a more conservative policy in the placing of new orders so as to avoid unnecessary additional charges in the way of storage or interest, but the attitude of home consumers has been of a more discriminating character, all of which, including quite large arrivals, have contributed to the depression. Prices, nevertheless, now appear to arouse more interest on the part of consumers, and it is not really surprising that the market is now exhibiting a little more backbone, although there is as yet no robust confidence as to its stability. It is, however, worth noting that the rubber estates are not anxious sellers, and that quotations for forward deliveries covering the remainder of this year have been remarkably well held, mostly at a trifling premium over spot rubber. For the present, dealers are disinclined to carry stock, but it is probable that as soon as the issuance of permits is restored to the normal, a stronger feeling will assert itself and have a stimulating effect upon the general demand. The lower qualities of crepe rubber are now comparatively cheap, and once again attracting a little more attention. The inevitable result of the recent break in the price of plantation descriptions has been an adjustment in values for wild rubber, in which there has not been much activity. The price of fine hard Para has dropped to below 3s. per lb. in the absence of any notable demand, but supplies are fairly well concentrated, and the chances are that, given a revival of buying, the market will readily respond alongside of a change of feeling in plantation rubber. Having regard to the progress of general consumption, the outlook is satisfactory enough, prospects across the Atlantic being quite good, and pointing to the probability of the importations being maintained on a big scale for an indefinite period. American manufacturers have doubtless still good stocks to go on with, so that a temporary falling off in the imports can hardly impair the progress of their operations. As regards the home manufacturing trades, things are now quieter, the pressure of Government work having relaxed, which is enabling the works to make up somewhat for their arrears of deliveries against export orders. The outlet for ordinary cycle tires is, for the time being at any rate, not so large as it used to be.

An Important Detail

It seems that American traders are not so alert as their hustling reputation might lead some people to expect. One of their own Consuls (at Pernambuco) has been writing home emphasising the importance of stating one's telegraphic address and the names of codes used, on letterheads, in catalogues, &c. A case is mentioned of a firm for whom a cable order was waiting, but neither the firm's letterhead nor any available directories gave the information required. Needless messages were in consequence sent, and valuable time was lost, and the business eventually had to be abandoned. This order was not one for electrical machinery or supplies—it was for candies, but the lesson it teaches is the same whatever the article of trade. We need not give the Consul's figures showing the American trader's remissness in the above matter except to state that out of 144 letters examined only 26 gave cable addresses, 50 the address and code, and 68 gave *nothing*. In our opinion the left-hand side of business notepaper can be most profitably occupied by giving essential information of this kind, especially when dealing with buyers abroad. We believe that most of our leading electrical export firms are alive to the importance of such matters. In some cases their catalogues are models of what an export trade publication should be, but the matter wants attention, not only on correspondence paper and in catalogues and trade circulars; it should be especially attended to in advertisements appearing in trade organs. For example, a copy of the ELECTRICAL REVIEW lies on the table of a given Consular office abroad—it is to be found on many of them—the Consul receives an inquiry; he turns over our advertising pages and "spots" just the thing the inquirer wants, but the inquiry is an urgent one and the cost of cabling is so many shillings per word. The advertisement gives neither cable address nor code, and the name of the concern is Brown and Johnson's Electrical Accessories Manufacturing Company, Limited, of Little Huddlesdon Works, Partingchester, near Manton—is the inquirer not likely to be discouraged to the point of exasperation if, as is as likely as not, he have no directory of British manufacturers at hand? The illustration may seem an extreme one, but we use it as the simplest way of getting home the need for placing before the buyer essential export trade particulars. Whether the inquirer be a trader in a big business centre, or a caller at the Consulate, or a buyer in an out-of-the-way corner of the globe, when he gets the ELECTRICAL REVIEW with the complete trade advertisement in it, he will find it a time-saver and the advertiser will get business which might otherwise pass him by. We have no first-hand figures available concerning the practice followed in British export papers as a whole, but the American Consul gives some interesting information that he has compiled as the result of a survey of the advertisements in a number of publications. He does not say whether these journals are all American; we should judge that they are not so, for the weakness is certainly not peculiar to the States. He says:—

One of the best-known export journals circulating in Brazil and South America contained in a recent issue 127 advertisements, and of these 9 had address and code, 4 had address only, and 122 no telegraphic information. The same is true of other announcements in other export magazines. Of 100 advertisements examined, 10 gave address and code, and 90 gave address only, 4 gave private code only, having no public address and other codes used; 96 gave no telegraphic information.

ELECTRICAL EQUIPMENT OF THE PHOENIX ASSURANCE CO.'S BUILDING.

ONE of the finest of the recently-completed modern London office buildings is that erected for the Phoenix Assurance Co., in King William Street, E.C., which houses not only the

supply at 100 volts being obtained from two independent sources, viz., the Charing Cross and City of London Electric Supply Cos., and this division of service is carried out wherever practicable throughout the whole building, approximately half the lighting in all large or important rooms and on each floor being supplied by each company, and the well pump, ventilating, lift and pneumatic tube

motors being served by both companies as a precaution against total interruption of the supply. The switchroom is a departure from usual practice, the main switchboards being built up of ironclad gear attached to the glazed brick walls, with the interconnecting cables carried in heavy-gauge screwed gas barrel, with rectangular cast-iron junction boxes.

On entering the switchroom, each company's service—the neutral being divided—is led to two two-way terminal boards (positive and negative) through a 350-amp. D.P. switch and fuses.

From each terminal board a 200-amp. service is led through a D.P. switch and fuses to a 200-volt main distribution board for

FIG. 1.—LARGE CENTRAL FITTING, PHOENIX ASSURANCE BUILDING; ALSO INDIRECT OFFICE LIGHTING.

company's own staff, but also the Bank of Egypt and certain other tenants. The building, which is in the classical Renaissance style, covers an area of 12,000 sq. ft., and is eight storeys in height, the two lower storeys being basements.

The consulting engineer for the whole of the electrical work in connection with the building was Mr. S. G. Castle Russell, M.I.E.E., who has courteously allowed us to place on record the principal features of interest in the installation.

Although the services to, and installations in the Phoenix Company's premises, and those of the Bank and east and west ends (tenants' portions), &c., are kept distinct, the general type of installation is uniform throughout and can be gathered from the description of the work carried out at the Phoenix Co.'s premises, which follows.

The electric supply for the whole of these premises is controlled from a switchroom in the sub-basement, this

FIG. 2.—PHOENIX ASSURANCE CO.'S OFFICES, SHOWING "HALF-WATT" INDIRECT LIGHTING.

lighting, fitted with D.P. switches and fuses for controlling individual services to the various floors and basement and sub-basement; a 100-amp. heating service is also taken off, similarly controlled in each case by a D.P. switch and fuses—these services running in the case of one company to

the ground and fifth floors, and in the case of the other to the first and second floors.

From the outers of each pair of terminal boards a 200-amp. power service is taken to a main power distribution board, fitted with D.P. switches and fuses, which controls the various motor circuits in the building; each of these

FIG. 3.—VIEW IN BOARD ROOM, SHOWING SPECIAL LIGHTING FITTINGS.

boards is also controlled by a D.P. switch and fuses in the switchroom.

The pair of lighting distribution boards on each company's service are on facing walls, but all the heating and power circuits are in close proximity.

As previously mentioned, the switchgear is of the iron-clad pattern throughout, the D.P. switches being mounted on marble bases, two inches clear of the case all round for the main switches which are lined with Uralite, and three inches clear in the case of the main distribution boards which are also Uralite lined and have plate glass fronts and front bus-bars.

The whole of the switchgear is white enamelled and clearly labelled; its general appearance is shown in figs. 4 and 7.

To provide for the services to the various floors, four chases are provided running from bottom to top of the building; and adjacent to the chase on each floor are provided sub-distribution fuseboards and D.P. switches of the iron-clad type, as shown in fig. 8.

The whole of the wiring, as far as possible, is carried out on the looping-in system, special cast-iron looping boxes with porcelain interiors being provided where necessary. This wiring, consisting of 2,500 meg. braided V.R. cable, is run throughout in heavy gauge-screwed galvanised gas barrel, which was erected complete, with the plaster in position, before any wire was drawn in.

Cast-iron junction boxes with screwed lids are provided where necessary and similar boxes are used in place of tee-pieces and elbows throughout.

All the lamp-fittings, switches, &c., are screwed direct on

to the iron junction boxes connected to the tubing, and the ends of all tubes throughout the installation were fitted with brass bushes, screwed on before the wire was drawn in.

The method of illumination adopted is of particular interest owing to the extent to which semi-indirect lighting is being used.

The imposing ground floor office depends entirely on the light provided by twenty-two 100-watt half-watt lamps in diffusing bowl reflectors suspended from the ceiling, as shown in fig. 2. In addition, a large central bowl-fitting is provided on a level with the gallery under the dome, which is a feature of the ground floor office; this fitting contains a 150-watt half-watt lamp in the bowl, with 60-C.P. lamps in spherical globes round the periphery, as shown in fig. 1, which also shows the semi-indirect lighting in part of the actuarial department. The illumination of the counters of the ground floor office is from 3 to 4 ft.-candles, while that of the desks behind varies from 4 to 6 ft.-candles.

The suspended bowl type semi-indirect lighting fitting has been generally adopted throughout the building, having been specially designed by the makers in bronze and in Georgian style, to harmonise with the principal apartments.

In all, we understand that some 1,200 lamps of from 20 to 100 watts each have been installed in the building.

Turning to the other matters of electrical interest, an extensive mechanical ventilating plant has been provided, which includes a 25-in. motor-driven fan for forcing fresh air into the basement and sub-basement, the incoming air being passed through the heating chamber in order to slightly warm it in the winter; a 15-in. motor-driven fan for extracting used air from parts of the basements; two 25-in. motor-driven fans for extracting air from the upper floors and several smaller extractor fans in various positions.

The general heating of the building depends on hot water radiators, fed from boilers in the basement, but this is supplemented by a number of 1,500 watt electric radiators, each controlled by D.P. iron-clad switch and fuse and plug.

The water supply for the building is obtained from two artesian wells, bored to a depth of 150 ft. below the lower basement level. Each well is provided with its own electrically-driven pump and each of the latter will supply about 12,000 gallons, or the estimated requirements for one day, with eight hours' running. The water is raised in two lifts to storage tanks on the roof of the building.

The Phoenix premises proper are equipped with two Weygood-Otis electric passenger lifts placed centrally; three other lifts of a similar type are also provided to

FIG. 4.—VIEW IN SWITCH ROOM, SHOWING MAIN DISTRIBUTION BOARDS, &c.

serve the Banking and other tenants in other parts of the building.

A small electric cooking installation, comprising some 35 kw. of Jackson equipment, is installed on the fifth floor.

This apparatus, shown in fig. 6, includes a double oven with hot-cupboard between, and a boiling plate with six rings over it; a grill with hot-cupboard over it; stock pot, fish

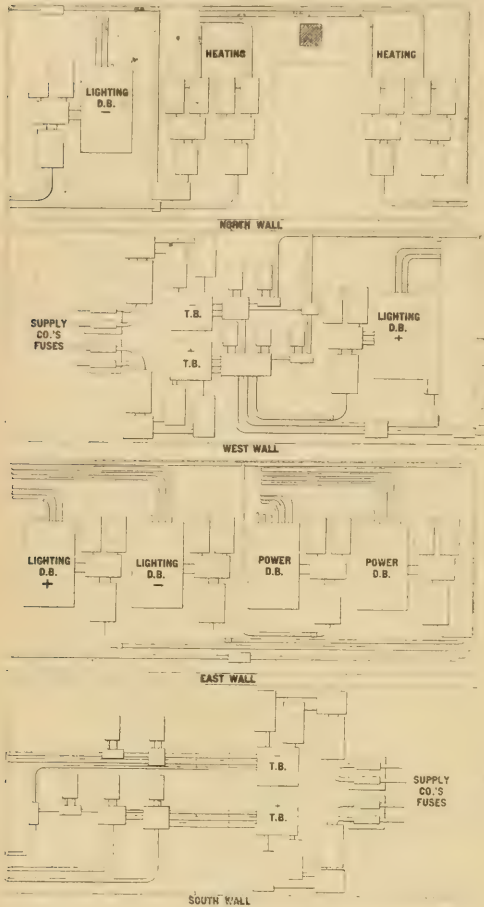

FIG. 5.—DIAGRAMMATIC ARRANGEMENT OF IRONCLAD SWITCHGEAR IN SWITCH ROOM.

FIG. 6.—ELECTRIC COOKING APPARATUS IN KITCHEN.

fryer, tea and coffee urns, &c., the average week-day requirement being from 17 to 34 dinners and 70 teas.

A private telephone exchange is also provided in the building, this consisting of two 50-line P.O. boards and a 120-line private internal board. There is also a very complete electric-bell installation for the inter-departmental use of the Phoenix Co.'s staff.

The principal contractors in connection with the carrying out of the work for light and power wiring were: Phoenix Co.'s offices, Messrs. Balshaw & Co.; tenancies and Bank of Egypt, Messrs. Finch & Wheeler, which firm also carried out the internal telephones and electric bells. The special electric light fittings were designed and supplied by Messrs.

FIG. 7.—VIEW IN SWITCH ROOM.

Verity, Ltd., who also were responsible for all the ironclad switchgear and motors. The ventilating plant was supplied by Messrs. Strode & Co.; and Messrs. A. Williams & Co. were responsible for the artesian-well work, under the supervision of Mr. Albion T. Snell.

As previously mentioned, the whole of the electrical work was carried out under the direction and supervision of Mr. S. G. Castle Russell, M.I.E.E., who was also responsible for the electric lifts, low-pressure hot water and ventilating systems; and Mr. C. W. Catt acted as clerk of works for the whole installation.

THE ELECTRIC COOKER IN INDIA.

By CHARLES S. JEFFREY, A.M.I.E.E.,
A. Amer. I.E.E.

In reviewing the possible applications of electricity for domestic cooking and heating in India, we may leave out of consideration the greater part of the population. There can be no question whether the poorer classes will ever use electricity in their homes, because these people live in a state of poverty unknown in colder climes. Perhaps "poverty," which suggests distress, is not the best word to use; although the majority of Indian natives have the absolute minimum of worldly possessions, they are usually happy and contented. "A state of simplicity" better describes their circumstances. One does not expect to find electric fittings in a bamboo hut, or in a shed made of old kerosene tins, where the entire furnishings consist of a mat on the floor

and one or two cooking pots, and, perhaps, a few treasures in the shape of empty cigarette tins or the illustrated calendars of bygone years.

It is only necessary, therefore, to consider the classes who use or are likely to use electricity for lighting. In one of the largest towns in India, where there is no gas supply, the number of consumers on the supply company's mains is only 1 per cent. of the total population. This number includes all business premises. Of course, in India the number in each household is usually greater than in England, but the total number of users of electricity is not likely to exceed 10 per cent. of the population in the large towns.

It is the custom in all European and the better-class native households, in which may be included all those wherein electricity is used, to keep a cook. In most self-contained residences the kitchen is situated a short distance from the main part of the house, with a covered way between the two. The advantages of this arrangement in a hot country are obvious, but it has the effect of isolating not only the kitchen, but also the cook from the rest of the household. The kitchen becomes not so much a

in his kitchen, had the greatest difficulty in persuading the cooks to use it, and whenever a dish was spoiled the cook invariably blamed the fireplace. A letter received from one of our cooks may be of interest. The errors in spelling are omitted:—

highly respected memsahib with due respect and humble submission this petition humbly sheweth that your petitioner is a poor man and humbly requests you to forgive the trouble your ladyship is my father and my mother and my children and their children look to you for bread I good cook man and my father good cook man and pray that your ladyship will have pity on my hard case my father cook with charcoal and his father cook with charcoal madras cookman cook with charcoal bombay cookman cook with charcoal memsahib say cook with coal fire not can do I giving notice leaving at end of month by your favourness have pity on my hard case my children will have no bread for which act of kindness shall ever pray for your ladyship's long life and happiness please I waiting your ladyships reply your most obedient servant cook dorosawmey.

It should be remembered that native servants spend all their spare time, of which they have much, gossiping about their mistresses and the doings in the households to which they belong. Should the electric cooker one day develop a fault and reveal the thousand devils of which it is possessed, the news would go round to every cook in the town, and no eloquence would prevail on one of them to touch it again. Everyone connected with the business of electric supply in India knows that if a native receives an electric shock he vanishes "like the snowfall on a river" and the place thereof knows him no more.

In support of cooking by electricity, much has been written about the saving in weight effected by roasting joints in an electric oven, but the opinion seems to be gaining ground that this saving is really due to cooking at a lower temperature, and the only advantage attributable to the electric cooker is the closer regulation that can be effected. A study of Indian methods of cooking supports this theory, as one cannot fail to observe that the apparatus used appears to be of comparatively little importance. A good cook will prepare the most elaborate meal with the most primitive utensils. The cooking place in a typical Indian kitchen consists of a square of brickwork in which are made several small charcoal fireplaces, about 6 in. square and 4 in. deep. That is the whole permanent equipment of the kitchen. There is no oven provided. If the cook wishes to be disagreeable, he may insist on having a portable cast-iron oven which he can place over one of these fireplaces, but usually all the baking and roasting is done in an old kerosene tin. Most cooks will bake excellent cakes in a stewpan only a little larger than the cakes themselves.

She who presides over the writer's household informs him that to cook well, one must cook slowly. Undoubtedly herein lies the secret of the Indian cook's success. He is superlatively slow. To his credit, it must be said that he also has infinite patience. For example, when baking a cake he will surround his kerosene tin or stewpan with glowing charcoal, and will stand over it from the moment the cake is put in until it is taken out, carefully fanning the fire and readjusting his charcoal, piece by piece, in order to concentrate the heat just where it is required. So long as the cooks stick to these methods, and that is probably as long as the present generation of them survives, it is unlikely that much progress can be made in the adoption of electric cookers for general purposes.

In India, another very important drawback from

FIG. 8.—TYPICAL SET OF SUB-DISTRIBUTION BOARDS AND SWITCHES. PHOENIX ASSURANCE CO.'S INSTALLATION (see page 500).

FIG. 9.—VENTILATING PLANT IN BASEMENT.

part of the house as the abiding place of the cook; its usually gloomy fastness is seldom invaded by the mistress of the house, and, except on a punitive expedition, by the master, never. To the careful housewife in England it may seem incredible, but very few Mem Sahibs visit their kitchens more than once per day, and many not once per week. And perhaps it is better so.

Be as enthusiastic as they may, it is not possible for white women in the East to do much work in the house if they take proper care of their health. It is evident, therefore, that no matter what appliances are used, the greater part of the cooking must be done by the native cook.

The writer may be unduly pessimistic, but he fears that the task of educating Mr. Dorosawmey in the economical use of an electric cooker is an insuperable obstacle. If one could be certain of keeping one's cook, it might be done, but it is likely that the knowledge that he alone could operate the cooker would give the cook courage to become more and more extortionate in his daily bazaar accounts. It is seldom that one keeps a servant for more than a year in India, and good cooks are usually the most difficult to retain.

In Rangoon the cooking is usually done on a charcoal fire. The writer, who had a coal fireplace

the supply company's point of view is that the principal meal of the day in all European and better-class native houses is served between seven and nine o'clock in the evening, and since, in India, even in the northern provinces, there are no long evenings such as we are accustomed to in the summer months at home, it is invariably served after dark. This means that the peak cooking load would almost coincide with the peak lighting load, and with a poor diversity factor it is, of course, impossible to offer very attractive rates.

So far this article is so pessimistic that it is, perhaps, more suited to the pages of the *Journal of Gas Lighting* than those of the *ELECTRICAL REVIEW*, but the writer hastens to add that there is a brighter side to the picture. Although there is not much likelihood of electric cookers being adopted for general purposes, their cleanliness and freedom from external radiation make them valuable auxiliaries for domestic purposes. Apart from the attitude of the cook, the isolation of the kitchen and its uncomfortable environment are sufficient to deter most Memsahibs from practising the culinary art; but if the home is equipped with a small electric cooker which can be fitted in the dining room or verandah, there is no reason why the husband domiciled in India should any longer be free from the danger which is reputed to lurk in his young wife's first cake. There are many people who cannot enjoy food prepared by the native cook, because they know too much about his methods, and electric cookers make it possible for them to prepare an occasional meal for themselves.

Once an electric kettle has been used in any household it becomes indispensable, not only because of its convenience at the tea table, but because it provides a means of obtaining hot water after the cook has departed from the kitchen. Electric toasters also are in great demand. Even those of us who accept all that comes from the kitchen, provided it passes the test of smell and taste, without permitting our imaginations to dwell on disagreeable possibilities, enjoy our toast better when we have positive knowledge that the hands which prepare it are clean.

When we leave the kitchen for the laundry, we find another invaluable article to be the electric iron, because by its use it is possible to save many delicate fabrics from that ruthless destroyer, the dhoty or washerman. The dhoty's method of washing is to dip the article to be cleaned into a bucket of soap and water, swing it round his head, and bring it down with a smack on a block of wood or a flat stone. If the wood has a nail in it, what cares he? Mark Twain described him as the man he saw "breaking stones with a shirt."

When ironing, in order to impart to the clothes the moisture which we are told is necessary to obtain a good surface, he uses his mouth as a reservoir and ejects water upon the garment with an accuracy of expectoration that no Englishman and few Americans could equal. Fortunately for their peace of mind, many Memsahibs are in ignorance of this little practice of the dhoty's, because the ironing is usually done in his own quarters. When an electric iron is part of the household equipment, it is possible to have the more delicate articles washed and ironed under the eye of the Memsahib. Even if the dhoty will not do the work in this way, there are few women who will grudge the time it takes to do a little laundry work for themselves, when by so doing they are spared the distress of witnessing the rapid disintegration of their most cherished "chiffons."

In the rainy season small electric heaters are very useful for drying out wardrobes, cupboards, &c., and thereby preventing much destruction by mould and mildew. In many pianofortes a carbon lamp or small heater is permanently fitted for this purpose. Obviously, in a hot country it is essential for comfort that the heat should be localised to the articles

to be dried, and the advantage of the electric heater in that connection is at once apparent, since it can be used in situations where any form of combustion heater would be out of the question.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

"Doing His Bit."

We sing of Tommy Atkins, the "man behind the gun,"
Of workers in the factories, making bullets by the ton;
But think of the man in the power-house, amid the turbines' roar,
For there he's doing his duty, they'll let him do no more.

He cannot join the Army, they say he can't be spared;
They won't put him in khaki, for then he'd not have cared.
He's trying to do his little bit, it isn't much, I know,
It's one of those silent, unknown jobs that doesn't get much show.

Men from munition factories pour out each day in streams,
But they would be no good at all if they weren't supplied
with means
To turn their massive turret lathes and make the motors run,
But they get the extra cash, while the other chap gets none.

The man who runs the power house works seven days a week,
He gets no overtime, but has to pay more for his keep;
And when "Take air-raid action" comes he has to do his bit
For the safety of the public, and the chance of getting hit.

So when you pass a power house and hear the turbines hum,
Give a thought to the man inside, whose work is so hum-drum.
He isn't a khaki hero or a sailor boy in blue,
But his King and Country need him, and he'll see his duty through.

P. Gordon Hicatt.

York.

Justice to Inventors.

Whilst to many in this country the war has brought increased work and remuneration, there are others who have been very hardly hit, and none, I venture to say, more than inventors and patentees.

Before an invention reaches the stage when it begins to bring in a return, a large amount of work, trouble, time, and money has, as a rule, been expended on it.

When the war broke out, there must have been large numbers of engineers, and others, owning patents which had just reached the stage at which it might reasonably be expected that the income to be derived from royalties or sales would begin to repay the time and money expended in development.

In the majority of cases, alas! the inventors soon found that, owing to the works being required for munition purposes, it was no longer possible to manufacture their patented articles, and their royalties fell off very considerably, or in many cases ceased altogether.

Under these circumstances, it seemed a natural step to ask the Patent Office to postpone payment of the renewal fees and to prolong the life of the patent by a period corresponding to the duration of the war, or to the time during which the pressure of Government work rendered it impossible to manufacture the patented article.

The reply of the Patent Office is, however, that they have no power to grant either request, and that, as far as the Office knows, no fresh legislation is contemplated.

It is, of course, always open to any patentee at the expiration of the life of his patent to apply for an extension, but what assurance has he that his application will be favourably received? Meantime, he must either drop payment of the renewal fee, and thus forfeit his rights, or pay the fees in the hope that after the war is over his application for an extension of his patent may receive favourable consideration.

Now, Sir, this is neither justice, nor in the public interest. It is, surely, not just that the Patent Office should take fees from inventors when, owing to the needs of the nation, it is impossible to get the patented articles made; nor can it be in the public interest to discourage inventors in this way.

In the industrial war to which the nation is committed we shall need to utilise to the very utmost all the inventive skill of our people, and we cannot afford to risk the loss of useful inventions simply because inventors, owing to want of proper support, cannot afford to nurse their ideas through to fruition.

Even if the inventor does receive any royalties, the authorities show their appreciation of his work by demanding the payment of income-tax at the full unearned-income rate without allowing any deduction for development expenses.

May I beg, Sir, the hospitality of your columns to ventilate the matter, in the hope that a body of public opinion will be formed sympathetic to securing fair play and encouragement to our inventors.

Fair Play.

[We refer to this matter in our leading columns to-day.—*Elec. Elec. Rev.*]

WAR ITEMS.

German Goods in New Zealand.—The "Auckland Weekly News" publishes the following:—"A trade catalogue has been shown to a Dunedin reporter which states explicitly of a certain magneto that it is manufactured in America. The old German-looking title of the company is replaced by a word that is characteristically American, and the catalogue expressly states that the concern is purely of American make. So one would also gather from the lettering on the cover of this magneto 'Made in the United States of America.' It is this lettering that the customer reads, probably he looks no further, but the repairer, in remedying defects, looks inside. It was in the course of such an examination that a repairer found a betraying brand on the magneto 'made in Germany.' The outer lettering, in small type and newly cut, declares that the magneto is made in America, the inner and bolder and older inscription inside states that the make is German. Information placed at the disposal of the reporter leads to the belief that such magnetos are still being imported into the Dominion, via America."

Controlled Works.—The number of establishments controlled by the Ministry of Munitions has been increased by 156 to 3,493.

Exports to Liberia.—In the "London Gazette" for April 28th there is published a list of persons authorised as consignees of articles exported to Liberia.

To be Wound Up.—Under the Trading with the Enemy Amendment Act, the Board of Trade has ordered the following to be wound up:—Alphons Custodis Chimney Construction Co., Ltd., 119, Victoria Street, London, S.W.; constructors of chimneys, &c.; controller, D. H. Allan, 20, Copthall Avenue, London, E.C. The Phonotas Co., Ltd., 125, High Holborn, W.C.; sanitary system for cleaning telephones; controller, Alfd. Hartley, 9, Ironmonger Lane, E.C.

Trade After the War.—A Reuter dispatch from Sydney states that the annual conference of the New South Wales Chamber of Commerce has unanimously passed a resolution in favour of the encouragement of trade within the Empire, recommending among other things the imposition of a surtax on enemy goods, and also that enemy goods after the war shall be indelibly marked with the name of the country of origin.

The Chairman of the General Steam Navigation Co. says that in considering the question of new tonnage, a great factor must necessarily be how far and how long the bitter feelings engendered by the war would be extended after its close to commercial intercourse between the belligerent nations. As reported by the "Evening News," he added: "I think that trade between this country and Germany will be vastly reduced in volume—for sentimental reasons because the British will not easily forget the many acts of ruthlessness of which the Germans have been guilty, and for economic reasons because the spending power of this country and the Central Powers must be restricted for years. It is clear that additional revenue to meet our indebtedness must be sought from other sources than direct taxation, and those will be found in the imposition of duties on all imported manufactured goods. It is not to be assumed that a complete commercial boycott of the Central Powers will be effected, as, in my opinion, international business is too interlaced to make this either possible or desirable."

At the close of the International Inter-Parliamentary Commercial Conference in Paris (says a Reuter dispatch in the "Morning Post") the meeting unanimously adopted resolutions regarding the following:—(1) The establishment of preferential postal, telegraphic, and telephone rates between the Allied nations. (2) The constitution of a permanent body charged with determining the conditions of the transport of merchandise and the introduction of a tariff on enemy goods so as to avoid delays in the transport of goods from Allied States. (3) Reduction of freight rates, with recourse if necessary to general requisition of merchant vessels with indemnification in order to assure victory by the economic solidarity of the Allies.

Exemption Applications.—At Maidstone, on April 25th, the manager of the Corporation tramways renewed an appeal for exemption for three car-drivers. A month ago the matter was deferred to see if ineligible men could be found, and Mr. Lambert now said that he had engaged a discharged naval man and a discharged military man, but two other drivers had left, and he was in the same position

as he was a month ago. Next month, however, he expected two discharged army men formerly in the service of the Corporation. One man, who has been on the tramways since the opening, was conditionally exempted; the cases of the others were put back until May 25th.

Before the West Kent Appeal Court, on April 27th, an appeal by Mr. J. Vince, electrician at the Turkey Paper Mills, Maidstone, for exemption, was refused.

At Ryde (Isle of Wight), the Isle of Wight Electric Light Co. applied for exemption for a shift engineer and fitter in sole charge of the engines and electrical plant while running, and claimed to be indispensable. The tribunal granted conditional exemption.

The Rugby tribunal has granted conditional exemption to an employee of Messrs. Willans & Robinson, who wished to go to Nigeria to erect machinery at tin mines there.

Before the Devon Appeal Court, on April 26th, an appeal was made for an electrical engineer and wireman employed by Messrs. Garnish, Lemon & Co. The local tribunal had refused exemption, considering that the appellant was not indispensable to the business. The tribunal granted adjournment until applicant's group was called up.

At Wallasey, on Monday, Colonel Greene, tramways manager, applied for further exemption for 28 married car drivers. The tribunal decided to defer consideration of all married men's cases until single men "combed out" of reserved occupations had been dealt with, and granted conditional exemption for one month to all the married tram drivers. An appeal was also made for the exemption of a motor controller, single, aged 36, who was stated to have taken the place of a skilled man, and who was essential for the maintenance of the tramway service. It was remarked that the man came under the head of those engaged on the maintenance and repair of plant and machinery, but a member of the tribunal said that the skilled man had been allowed to go and the handyman had taken his place, whereas the handyman ought to have been allowed to go at the onset, and not the skilled man. The appeal was disallowed.

Trading with the Enemy.—The "London Gazette" for May 2nd contains further additions and amendments to the lists of persons or bodies with whom trading is prohibited in Argentina, Brazil, Chile, Netherlands East Indies, Norway, Philippine Islands, Portuguese East Africa, Spain, Sweden, &c.

Exports to China.—The "London Gazette" for May 2nd contains further lists of persons and bodies in China and Siam to whom exports may be consigned.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

ANNUAL REPORT, &c.

THE report of the Council for the past year is published in the issue of the *Journal* for May 1st. It states that the membership at April 1st was 6,676, showing a net decrease of 141; additions during the year numbered 212 (including 142 Students), and deductions 353 (79 deceased, 96 resigned, and 178 lapsed). Members numbered 1,500, Associate Members 3,466, Associates 520, Graduates 382, and Students 801, the remaining 7 being Honorary Members. During the year 49 candidates for Associate Membership, of whom 27 were non-members, were approved by the Council subject to complying with the examination regulations. The Council elected M. Maurice Leblanc an Hon. Member, and the King conferred a baronetcy on Sir H. Norman, M.P., K.C.B. upon Lord Moulton, and knighthoods upon Sir W. Slingo and Sir G. Franklin. Numerous military distinctions were awarded to members, including the Victoria Cross to Lieut.-Com. E. G. Robinson, R.N., and 34 members lost their lives in the war. Other members deceased included Mr. C. E. Spagnoletti, Prof. E. Gerard, Mr. Robt. Hammond, Lord Alverstone, Mr. E. Danvers, Mr. H. A. Mavor, Sir A. Rücker, Capt. E. G. Tidd, Mr. F. H. Varley, and Mr. Thos. Parker.

On account of the war, the annual dinner and conversazione will not be held this year.

Premiums for papers have been awarded to Messrs. J. R. Beard, H. H. Harrison, N. W. Storer, A. Campbell and D. W. Dye, A. E. Clayton, and Professors A. B. Field and G. W. O. Howe. No Students' premiums have been awarded, and the David Hughes and Salomons Scholarships will not be awarded this year.

Twenty-two societies have held meetings at the Institution. The Wiring Rules have been revised, 24 meetings of the Committee having been held and over 500 amendments considered; no fewer than 13,500 copies of the 1911 edition were issued, and the seventh edition has been adopted by the whole of the fire insurance companies of the United Kingdom.

The Council applied to the Committee of the Privy Council for grants for research, and has received £340 for a year's

work on the heating of buried wires, and £250 for research on the properties of insulating oils; Mr. J. S. Highfield has been appointed representative of the Institution on the Engineering Committee of the Advisory Council for Research.

The number of members that are or have been serving in the Navy or Army since the outbreak of war is over 1,300. The Council has taken steps towards facilitating the employment of disabled soldiers and sailors in electrical undertakings, and arrangements are in progress to that end; a guarantee fund of over £300 has been established for the purpose by past and present members of Council.

The accounts show a surplus of income over expenditure of £1,847, compared with £1,623 in 1914. The assets amount to £116,718, against liabilities £13,013, leaving a balance to the good of £73,735, an improvement of £2,165; the building fund amounts to £43,946, and the general fund to £23,619.

At the end of 1915 the capital account of the Benevolent Fund stood at £4,642; donations and subscriptions amounted to £777, and seven grants were made, amounting to £126.

The same issue of the *Journal* contains a further list of promotions, transfers, &c., of members on military service, and the result of the "voting" on the proposals adopted by the informal meeting of Corporate Members on March 8th. The number of cards issued was 3,244, and of these 1,470 were returned. The proposals were as follows:—

	For.	Against.
(a) To expel members who are subjects of enemy countries or States	1,320	88
(b) To expel members who being naturalised British subjects have retained enemy nationality	1,307	79
(c) Not to expel members who are naturalised British subjects and were formerly subjects of a country or State now at war with Great Britain and Ireland but who have under the laws of such country or State definitely lost their alien nationality, provided they are able to prove this to the complete satisfaction of the Council	1,081	264
(d) That no person shall after the ... day of 19... be eligible for election as a member of the Institution who is a subject of any country or State with which the United Kingdom of Great Britain and Ireland is or shall have been at war on or after the date mentioned	1,120	200

A resolution has been drafted to carry out the objects proposed, and in due course the necessary meetings of Corporate Members will be called to consider it.

The ballot paper for the election of Council has been issued; the list of names is identical with that published in our issue of March 31st, with the exception that the name of Mr. C. H. Wordingham has been added to those of Messrs. R. A. Chattock and J. S. Highfield as candidates for election as Vice-President, on the nomination of 17 members, whose names are given, in accordance with the Articles of Association.

The annual general meeting will be held on Thursday, May 11th, at 8 p.m.

SHANGHAI ELECTRICITY REPORT.

THE annual report of Mr. T. H. U. Aldridge, engineer-in-chief of the Shanghai municipal electrical undertaking, for the year 1915, shows that continuous progress is being made, and that the forecasts of previous years are in process of realisation.

During 1915, 49,787,397 units were sold, including, roughly, 14 millions for private lighting; 1 million for public lighting, 680,000 for heating, 30,633,455 for power, and 3,395,813 units for traction; the total represents an increase of 52 per cent. on the 32,633,671 units sold in 1914, and the power units included show an increase of 101 per cent.

The public lighting output showed a slight decrease, although over 100 additional lamps were connected, this being due to the general use of the nitrogen-filled metal lamp.

The maximum load on the feeders, 14,000 k.w., was under the amount estimated at the beginning of the year, due to the temporary suspension of running of some large mills, and to a number of small consumers shutting down owing to trade depression. The load factor improved from 33·6 per cent. in 1914 to 40·8 per cent. in 1915. The total H.P. of motors on the mains now amounts to 14,547, representing a net increase of 2,365 H.P. during the year. The report points out that 6,210 H.P. of motors in 10 different oil, flour, and cotton mills have been negotiated for in the coming year.

As to heating and cooking, 1,216 radiators, of 2,432 k.w. capacity, are now connected, practically all hired out by the department at 1s. 3d. per month.

This form of heating has become popular amongst foreigners and Chinese alike, but electric cooking has been held back because the cooking ranges ordered could not be procured. It is found that 2 k.w. is the minimum satisfactory size of heater in Shanghai.

At the end of the year there were 44 arc and 1,422 metal lamps in use for street lighting and practically all the latter are of the nitrogen-filled type, in 60-C.P. to 400 C.P. sizes. During the typhoon last summer, in several cases the street lighting was interrupted by branches of trees falling upon or among the wires forming the street lighting circuits; the typhoon was, however, of exceptional severity, and Mr. Aldridge points out that failures are rare and the price paid for the lighting service is very low. There were 16,992 meters and 1,092 current limiters in use at the end of the year, and 18,104 connections to the mains.

The generating plant capacity in use at the two stations (Fearon Road and Riverside) was 19,600 k.w.; 62,291,413 units were generated, the modern Riverside plant providing 54,845,415 units.

The works cost per unit fell to '534d.

The net increase of transformer capacity for the year was 5,394 k.w., bringing the total transformer capacity in use to 18,284 k.w. A new sub-station in Tonquin Road has been completed and partly equipped; it will ultimately be supplied with 6,300 and 22,000-volt current and have a capacity of 15,000 k.w. Seven three-phase sub-stations for an ultimate capacity of 10,000 k.w. are under construction.

Financially, the undertaking made a net profit of £32,363, after providing £27,877 for loan interest and £38,087 for depreciation. The profit represented 8·91 per cent. on capital outlay, having increased from 6·98 per cent. in 1914. The profit for 1916 is estimated at £39,567, and £44,573 will be set aside for depreciation.

The report contains a short description of the new Riverside extensions, to which reference has already been made in our pages.

The present type of steel frame building with corrugated iron walls will be adopted, with a turbine room 90 ft. long by 60 ft. wide, and a boiler house 130 ft. long by 90 ft. wide. Coal bunkers will provide accommodation for 1,000 tons of coal, and will be supplied by coal-handling plant with a capacity of 60 tons an hour, either direct from an 11,000-ton coal store or from river barges.

A 20-ft. bay containing pumps, fans, &c., will separate the turbine and boiler rooms, and a separate reinforced-concrete switch and transformer house will be provided.

Two 10,000-k.w. turbines (by Parsons and the G.E.C. of America) and a 5,000-k.w. turbine set (Fraser & Chalmers-Vickers) comprise the first installation, and these will operate on 180-lb steam superheated 200°. The alternators are to generate at 6,600 volts, three-phase, and by means of step-up transformers direct-connected to the generators, the pressure will be raised to 22,000 volts.

The transformers are designed with 5 per cent. internal reactance, and the use of external reactance will be avoided.

The 5,000-k.w. turbine set will run at 3,000 R.P.M., and have a full-load steam consumption of 13 lb. per unit, while the 10,000-k.w. Parsons turbine unit (1,500 R.P.M.) will operate on full load with 11·9 lb. per unit, the American turbine of the same size and speed, but of the impulse type, being rated at 12·85 lb. steam per unit; the latter machine was adopted on account of the short time of delivery.

For the 22,000-volt switchgear, the tender of the B.T.H. Co. was recommended, and for the transformers that of the Westinghouse Co.

Eight new Babcock marine type boilers, each of 40,000 lb. normal steaming capacity, are to be installed; six of the boilers will have Babcock chain-grates and two Taylor underfeed stokers. All the boilers will operate with mechanical draught.

To connect the Riverside and Fearon Road plants, four 0·15 sq. in. 22,000-volt underground cables, of the split-conductor type, will be provided, and the necessary step-down transformers and switchgear at Fearon Road, and, as previously mentioned, at the Tonquin Road sub-station.

The B.I. & Helsby Co.'s tender for 22,000-volt cable was recommended.

The Copper Position.—At the meeting of the Namaqua Copper Co., according to a *Times* report, Mr. T. V. Anthony, a director, stated that the world's production of copper in 1915 was estimated to have been a little in excess of 1,000,000 tons—of which the United States were responsible for some 635,000 tons—and a recent estimate put the present rate of the world's output at 100,000 tons a month. To-day they were face to face with a position for which no parallel could be found in the history of the metal—on the one hand a production far in excess of anything ever hinted at hitherto, and, on the other hand, a price which had not been reached within the memory of any of those present, and, what was still more phenomenal, no visible limit to either. He would, indeed, be a bold man who would venture to predict the point to which prices might yet be taken, in view of the undoubted fact that, huge as the production had become, consumption was keeping pace with it and could hardly be relaxed so long as the war endured—a comforting reflection for producers like themselves, however much it was to be regretted that the result had not been attained by other means.

A ROTARY CONVERTER INSTALLATION.

By E. P. AUSTIN, A.M.I.E.E.

AMONGST the various ways of linking up two individual generating systems that employ different periodicities, and are also generating direct current, the following example possesses several interesting features.

A certain generating station supplies energy for public supply and traction, the former being on the three-wire system. The same generators are available for each system, and are used as shunt machines for the lighting supply, and compound for the traction work, two distinct switch-boards being used for the purpose.

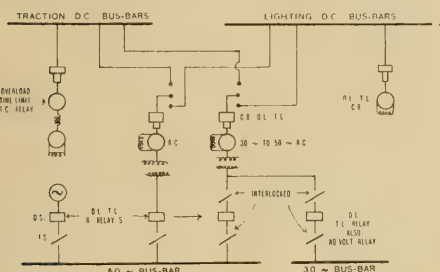

FIG. 1.

A booster rotary converter is installed, capable of running inverted off either D.C. system, and supplying three-phase energy at 50 periods, 6,600 volts, through a step-up transformer. It will also, when required, convert A.C. to D.C. in parallel with either D.C. system.

It became necessary to take a bulk supply from a neighbouring system at 30 cycles, and receive it in such a manner that either D.C. system could be supplied. It was also desirable that the machine installed for the purpose could be run inverted at 30 or 50 cycles off either D.C. bars, and thus form a complete stand-by unit for all conditions of running. The several conditions were met by installing a booster converter capable of running at two different speeds on shunt field adjustment, and giving its rated output at each speed.

A 50-cycle, 6,600-volt alternator has been added to the system to synchronise with the rotaries at 50 periods. This machine is controlled by a voltage regulator acting on the field of the exciter, which is chain-driven off the alternator shaft.

From this description it will be seen that considerable complication has been introduced in order to obtain maximum flexibility. A schematic diagram of the system is shown in fig. 1, and a detailed wiring diagram of the 50-cycle to 30-cycle rotary is given in fig. 2. There are two distinct control panels and cubicles for this machine, all the switches being mechanically interlocked to prevent mistakes in switching and synchronising. Each rotary is fitted with interpoles and is compound-wound, the shunt excitation being obtained normally from the exciter mounted on the rotary shaft. A separate compounded booster is also mounted on the same shaft and connected on the A.C. side, and provided with a potentiometer and rheostat to give a wide range of voltage regulation.

From the diagrams it will be seen that the compound windings of main and booster fields are connected in series, and that it is necessary to change these windings, or short-circuit them as required in accordance with the direction of power supply and the bus-bar to which they are connected. The switching arrangements on the D.C. side provide, therefore, for the following changes:—

Lighting bus-bars, D.C. to A.C. ... Compound machine with compounding reversed.
A.C. to D.C. ... Shunt machine.

Traction bus-bars, D.C. to A.C. ... Compound machine with compounding reversed.
A.C. to D.C. ... Compound machine with equaliser in circuit.

The interpole winding reverses its polarity with the direction of armature current, and therefore requires no switch control.

The rotaries are started up from the D.C. end and synchronised in the usual manner.

The operation of No. 2 rotary is somewhat different. It is usually started from the traction bus-bars as a compound motor, synchronised at 30 cycles, and immediately tripped off the D.C. bars. The compounding is then reversed and the machine is paralleled with the D.C. bars.

The various combinations possible for reliability of supply and efficient running have made the effective protection of all generators a complicated matter, and the relay gear, therefore, deserves a special description. The nature of the load demands short-time overload capacity on the traction and A.C. systems, which sometimes reach 100 per cent. overload for several seconds.

Time-limit overload relays have, therefore, been fitted on all circuit-breakers, and are capable of adjustment on both elements to suit running conditions. As the rotaries can run direct or inverted, the D.C. overload trips are operated off shunts on the main circuit or through change-over switches. On the A.C. side of the rotaries and also on the alternator, inverse time-limit overload relays are used, connected to a D.C. trip circuit, and also three-phase reverse power relays actuate the same tripping element of the oil switches. The latter are necessary to prevent complications when rotaries and alternator are supplying power in parallel, and they will also prevent undue disturbance of the D.C.

FIG. 2.

supply in the case of bad synchronising. A snap switch is used to cut the reverse power relay out of action when the rotaries run direct.

The protection of No. 2 rotary when taking 30-cycle energy in bulk is still further complicated. Normally, No. 2 runs on the D.C. traction bars in parallel with a steam-driven generator. When the bulk supply temporarily fails, the

rotary A.C. switch must be instantly tripped to prevent the supply from being restored out of phase. A simple no-volt coil is not sufficient, since the rotary will continue running off the D.C. bars and maintain voltage on the A.C. line.

To overcome the difficulty a sensitive D.C. reverse-current relay is used to trip the oil switch immediately energy flows from the D.C. bars. It was also found necessary to install a very sensitive A.C. no-volt relay coil to open the no-volt coil circuit if the supply fails when the rotary is not in parallel with other machines. The situations of all these devices are indicated in the diagram fig. 1, and fig. 3 shows the detail connections of the no-volt protection gear for No. 2 rotary. The general working of this system is quite satisfactory, due in large measure to the careful study of the conditions and the design of the rotary converters to meet them. The A.C. voltage and frequency is maintained very effectively on varying loads. Frequent

is described as "a straight talk with British working men," and it is written by one who, from birth and experience, is able to understand the position of Labour. The author touches in an interesting way upon many matters. In the main, he tries to show the worker that the Home producer and his work should be protected against the foreign manufacturer and the importer, and that in the councils of the nation business men should have a larger influence. Working men are urged to ask Parliamentary candidates whether they stand for the Protection of British industry, and whether they are in favour of State Insurance of Labour, and to vote against them unless they are sound on these matters. Mr. Glas looks forward to industrial peace and national prosperity being secured, but while we have no desire to throw cold water upon so well-meaning an effort to deal with what threatens to be a somewhat serious situation, we have to recognise that there are still mountainous difficulties in the reformer's path, and that, notwithstanding the war, the defects of our human nature are still very present with us. The pamphlet has been prepared for distribution by employers among their workpeople, and if the latter can be induced to seriously read it, and weigh up its arguments, some good may be done in paving the way for a better understanding between Capital and Labour.

Bankruptcy Proceedings.—STEEL BROS., 206, East India Dock Road, E.—The first meeting of creditors was held last week at the London Bankruptcy Court, under a receiving order. Mr. Egerton S. Grey, Official Receiver, reported that no one had surrendered under the proceedings. A representative of the petitioning creditor stated that an appearance to their writ was entered by "Sidney Steel, trading as Steel Bros." When the writ was issued the name outside the premises was "The Steel Electrical Engineering Co., Ltd.," but the word "Limited" was subsequently struck out. The same heading appeared on the note paper of the firm. The chairman added that from inquiries made by his inspector, it appeared that the debtor, Sidney Steel, joined the Army in November last, and that a cousin of his had stated that the business now belonged to the company. The case was left with the Official Receiver to be wound up in bankruptcy.

J. W. & T. W. TATTESELL, electrical engineers, London.—Second and final dividend of 1½d. in the £, payable at Carey Street, W.C.

Russia.—The French Commercial Attaché in Russia calls attention to the importance of certificates of origin for French and other imports into Russia. This document should bear the *visa* of the Russian Consul in the circumscription where the certification has been made, for this *visa*, which is the simple legalisation of the signature of the Chamber of Commerce which issues the certificate, is absolutely needful to avoid claims by the Russian Customs for dues 100 per cent. increased, notwithstanding the production of a certificate of French origin. French merchants and manufacturers, says the Attaché, do not appear to attach that importance to this *visa* which it really possesses. In short, to have full effect abroad, the certificate should bear the *visa* of the country whither the goods are destined.

Traders' Demands.—At the National Chamber of Trade Conference, on Monday, at Cardiff, resolutions were passed calling for improved technical and business education, for the declaration of a Government policy of trade with enemy countries after the war, and the appointment of a Ministry of Commerce consisting of business men.—*Daily Telegraph*.

A Strike at Pittsburg.—A Central News dispatch from Pittsburg, dated April 26th, says:—"The Westinghouse air-brake plant has been closed down on account of labour trouble. The dispute also involves the Westinghouse electric plant. The total number on strike is 20,000."

Consular Reform?—It is stated in the *Times* that Lord Robert Cecil has informed the Associated Chambers of Commerce that the Foreign Office is prepared to enter into consultation with a Committee of business men in regard to the changes which may be necessary in the Consular Service. Before doing so, however, the Foreign Office find it necessary to discuss the matter with the Board of Trade, but as soon as that preliminary inquiry is concluded the Foreign Office will be happy to receive the views of the Committee of business men and if possible to invite their co-operation.

Patents and Alien Enemies.—Application has been made to the Board of Trade for the avoidance or suspension of patents Nos. 9,499/12, and 13,903/12, issued to Siemens & Halske A.-G., for radiographs and Röntgen-ray tubes, by Messrs. Watson and Sons (Electro-medical) Ltd. Licences have been granted by the Board of Trade to the British Thermit Co., Ltd., in respect of patents Nos. 26,297/04, 21,750/09, 24,389/10, 19,473/11, 16,165/12, 218/13, 1,179/13, and 25,180/13, issued to Th. Goldschmidt A.-G.

The application of Messrs. Belliss & Morcom, Ltd., with respect to Patents Nos. 8,487/06 and 30,101/10, granted to Rogler, for licences has been granted by the Board of Trade.

FIG. 3.

adjustment of the compound and interpole windings by means of diverters was necessary, to obtain the best results, in conjunction with the characteristics of the prime generators and engine governors.

Some difficulty was experienced in the parallel running of the rotaries and alternator, owing to the practically flat characteristic of the former combination and the drooping characteristic of the latter. Sudden fluctuations caused uneven divisions of load, and curious divisions of power factor. The use of the previously-mentioned voltage regulator, and the experimentally-determined value of the rotary exciting current, which has been proved to be best at some 20 per cent. lower value than that necessary for running alone, has resulted in very satisfactory operation up to 60 per cent. overload on the combined machines.

BUSINESS NOTES.

Electrochemical Industries in South Africa.—We recently summarised an important report issued by the Development of Resources Committee of the South African Institute of Electrical Engineers, on the possibilities of establishing in South Africa, on a commercial basis, certain electrochemical industries. The *Board of Trade Journal* states that a factory has been established at Vryheid (Natal) for the production of ammonium sulphate. Plant, stated to be capable of producing 5,000 tons annually, has been laid down at a cost of £350,000.

Book Notices.—"Journal of the Institution of Electrical Engineers." Vol. 54. No. 259. May 1st, 1916. This issue contains the following papers:—"The Use of Continuous Current for Terminal and Trunk Line Electrification," by Mr. N. W. Storer; "Hire and Maintenance of Continuous Current Motors," by Mr. H. Joseph. Also the Report of the Council and the Statement of Accounts for the past year.

"The B.E.A.M.A. Journal." April (Quarterly). 1s. London: The British Electrical and Allied Manufacturers' Association.

"Better Times for Working People." By James Glass. London: British Manufacturers' Association 1916. 16s. 8d. per 100.—This

Catalogues and Lists.—**BRITISH INSULATED AND HELSBY CABLES, LTD., Prescot.**—Illustrated leaflet, showing their Helsby pattern zinc rods for Leclanché cells.

SIEMENS BROS. & CO., LTD., Woolwich, S.E.—Priced circular respecting "Woolwich" tape of improved type.

ELECTRICAL SUPPLIES CO., 233, Tottenham Court Road, London, W.—Twenty-page price list of electrical accessories. Copies will be sent on application.

Maximum Iron and Steel Prices.—A detailed list of maximum prices fixed, until June 30th, by the Ministry of Munitions, after conference with trade associations, for materials used and produced in the iron and steel industries, is published in the *London Gazette* for May 2nd.

Patent Restoration.—An order has been made restoring Letters Patent No. 10,774, of 1910, granted to Nathaniel Baldwin for "Improvements in sound reproducing devices of the telephone receiver type."

Liquidations.—**EXCELSIOR ALUMINIUM SOLDER CO., LTD.**—This company is winding up voluntarily, with Mr. J. R. Atkins, 14, St. Ann's Square, Manchester, as liquidator. Meeting of creditors, May 12th.

STOLZ ELECTROPHONE CO. (1913) LTD., London, E.C.—First and final dividend, 7d. in the £, payable at 33, Carey Street, W.C.

Trade Announcements.—**MESSRS. J. H. WOOLLISS-CROFT & CO.**—Mr. J. H. Woollicroft, A.M.I.E.E., who is well-known to many of our readers, and has for some years been general manager of Messrs. H. T. Boothroyd, Ltd., has commenced business for himself under the style given above, at Queen's Buildings, 20, New Quay, Liverpool (telegrams, "Energy") Liverpool; telephone, Central 2341), as manufacturers and suppliers of A.C. and D.C. machinery, switchgear, &c., specialists in repair work, contractors for power plants, factory and ship-lighting installations, &c. Mr. Woollicroft, who was the inventor of the rotary liquid starter, intends to put on the market the improved patented pattern which we described in our issue of March 3rd; he will be pleased to receive lists and catalogues from supply firms. We wish him all success in his new venture, to which his genial personality will contribute in no small measure.

MESSRS. F. RYMAN & CO., are extending their works at 116, Livery Street, Birmingham, and are carrying a larger stock of general electrical accessories. They wish to inform the trade in Glasgow that their agreement entered into in 1912 with Messrs. Paterson & Service for the sale of fuseboards in Glasgow, is not now in force, and orders can be sent direct to Birmingham.

LIGHTING AND POWER NOTES.

Aberdeen.—A report in connection with the supply of electricity to the Caledonian and Great North of Scotland Railways has been submitted to the Electricity Committee, and approved. The report recommends an increase of 20 per cent. on the present charges. It was reported that the output generated in March was 1,423,730 units, an increase of 304,260 units over the same month last year.

Australia.—The Melbourne City Council has decided to establish a depot for the storage of coal, with a view to placing the electricity undertaking in a more secure position in regard to its coal supply. A site is to be utilised in Arden Street, North Melbourne, to hold 10,000 tons. The capital cost of establishing the depot, including machinery, is estimated at £8,785, and the annual cost of operation, including interest and depreciation, at £2,242.—*Melbourne Age*.

The Sydney (N.S.W.) City Council has offered to supply the proposed electric steel plant of the Australian Electric Steel Co., at a special rate of 3d. per unit, for not less than 500,000 units per annum, provided the load is restricted to certain hours; a further reduction in price will be made later if the company agrees to increase its load.

The N.S.W. Public Works Department, which proposes to install a generating plant at Port Kembla to supply Wollongong, has offered to extend the line to Bowral, Moss Vale and Mittagong, for pumping and lighting purposes, the local authorities to undertake distribution.

The Inverell (N.S.W.) Municipal electricity works extensions have been formally opened. During the past five years the enterprise has contributed £1,400 to the relief of the rates.

NORTH SYDNEY ELECTRIFICATION.—The Sydney City Council has informed the Council of North Sydney that the delay in supplying electricity to the district was due to the extraordinary conditions affecting the manufacture of electrical apparatus and the transportation of materials. No definite date could be fixed for this supply until the required materials reached Sydney, which would probably be in the course of a few weeks.

A large quantity of lead-covered insulated cable which was to be used for one portion of the North Sydney supply had been delivered in Sydney, but the Federal authorities declared it supplied by an enemy firm, and they had been unable to obtain its release from bond.—*Sydney Evening News*.

The Kilmore (Vic.) Shire Council has decided to take over the undertaking of the Kilmore Electric Supply Co. for £2,500, providing the money can be borrowed at 6½ per cent. The value of the plant has been put at over £3,000. The Council pays £160 per annum for street lighting. The present charge for private lighting is 7d. per unit.

According to *Melbourne Age*, proposals have been made for using the Hobart, Tasmania, hydroelectric power scheme for providing current to operate an electrolytic plant for manufacturing spelter from zinc concentrates. In the event of the negotiations now in progress coming to a head the first unit of a big plant will be erected.

Carlisle.—The County Property Committee has decided in consequence of the saving in the number of lights used and the improved efficiency in the lighting by the partial introduction of electric lighting in the county offices, court houses and committee rooms, to continue the installation throughout the whole of both buildings.

Chelmsford.—**E.L. CHARGES.**—The T.C. having protested against the minimum charge for E.L. to private consumers introduced by the Electric Supply Corporation, the latter has replied that it sees no reason to alter its decision, the charge being based on a clause introduced into practically every prov. order.

Darwen.—There was a loss of £900 on the working of the Council's electricity undertaking for the past year.

Edinburgh.—There is a considerable deficit in the revenue of the Corporation electric supply department, caused by the lighting restrictions, and the Electric Lighting Committee has decided to increase the rate for current for lighting by 1d. per unit, raising the charge to 3½d.; also to charge 5 per cent. in addition to the present power rate where there is no contract.

Greenock.—**PROPOSED LOAN.**—The Corporation has decided to apply to the Scottish office for sanction to borrow £45,000 additional capital. It was stated that the Corporation had been unsuccessful in its endeavour to get the Admiralty to agree to pay any share of the money required.

Halifax.—The Electricity Committee proposes to extend the high-tension mains to Messrs. Goodall's premises, *via* Lower Shaw Hill, &c., at an estimated cost of £1,123, subject to certain guarantees.

Haslingden.—During the year ended March last, the total units sold were 892,495, compared with 677,017 units in the previous year, an increase of 215,478 units. The maximum demand was 398 kw. last year, compared with 339 kw. two years ago.

Arrangements have been made for obtaining a supply of electricity from Rawtenstall, and application is to be made to the L.G.B. for sanction to borrow money to cover the cost of the necessary cable and switchgear.

Heston and Isleworth.—The District Council is to apply for sanction to borrow £787, the extra cost of laying feeder cables over and above the sum of £3,569 sanctioned before the war. Sanction has been received to the borrowing of £175 for extending cables.

London.—The B. of T. was to hold a conference on Wednesday to consider the proposal of the Charing Cross Co. to increase for the period of the war its statutory charges for electric current; this proposal, as mentioned in this column, has aroused considerable opposition amongst the company's consumers.

Manchester.—**WAGES.**—The Workmen Special Committee of the Corporation has considered an application by workmen (other than tradesmen) at Stuart Street generating station, for a special war bonus of 3s. per week. A motion recommending the Electricity Committee to grant the war bonus asked for, was negatived. With regard to another request from another Union on behalf of workmen in the electricity, tramway and other municipal departments that a minimum wage of 30s. per week be instituted without war bonus, in place of the 26s. rate for labourers, the Committee has decided that it cannot see its way to accede to the request.

Nelson.—**YEAR'S WORKING.**—Mr. G. F. Naylor, the borough electrical engineer, reports that, instead of a small estimated profit on the year's working, there is a deficit of £298.

The Electricity Committee has decided to recommend increases in the price of electricity per unit, of one-eighth of a 1d. in the case of power, and 1d. in the case of lighting.

Nova Scotia.—The proposal to harness the tides of the Bay of Fundy, at Cape Split, Nova Scotia, by means of a current motor, which would pump the water into huge reservoirs on the cliffs above, the descending water furnishing the power, has been followed by a suggestion to utilise the Reversing Falls at St. John. New Brunswick, in a like manner. The suggestion has come from the acting resident engineer of the Public Works Department, who says that a stronger current is available at the Falls than at Cape Split, and that there would be a longer period between tides for a motor pump to operate. All attempts to utilise their tremendous energy have, so far, failed, but by the application of a current motor such as has been suggested at Cape Split, and by the erection of reservoirs on the height above, it is thought that, at last, a way has been found by which the Falls may be harnessed.

Rawtenstall.—**YEAR'S WORKING.**—The electricity undertaking has made a surplus during the past year of £1,762, compared with a surplus of £2,005 in the previous year. The result is regarded as satisfactory, having regard to the increased cost of coal (over £1,100), and the increased rates and taxes.

Salford.—During the past month the Electricity Committee has authorised agreements to be entered into for supplying electricity to the premises of the General Electric Co., Ltd., the Broughton Copper Co., Ltd., and Messrs. Richard Haworth & Co., Ltd.

Sevenoaks.—The Electricity Co. has applied to the U.D.C. for permission to use overhead cables in part of the town for the supply of current to consumers.

Stalybridge.—At a meeting of the Joint Tramways and Electricity Board on April 27th, the seal was affixed to the precept on the four Corporations (Stalybridge, Hyde, Moseley and Dukinfield) for the amount of the deficiency in the net revenue for the past year, £7,000, which is to be apportioned in equal shares.

Stoke-on-Trent.—**PUBLIC LIGHTING.**—The Electricity Supply Committee of the Corporation has decided, owing to restricted lighting, to allow a reduction at the rate of £1,000 per annum on the public lighting account for the current year.

Wimbledon.—The Council has been informed that the Fixed Price Light Co. has paid the amount due in respect of transformer losses in connection with its supply from the Corporation.

TRAMWAY and RAILWAY NOTES.

Australia.—It was recently announced that Messrs. Norton, Griffiths, Ltd., had commenced tunnelling operations in Macquarie Street in connection with the Sydney City Electric Railway scheme.

At a recent meeting of the ratepayers of Port Adelaide it was decided to approve of the Council borrowing £12,000 for electric tramways, as set out in the specifications approved by the Council.

Argentina.—The Government has authorised the Buenos Aires Western Railway to construct in its own workshops, with the assistance of the Great Southern Railway, the coaches required for the company's electric service between the stations of Once and Moreno. The Western Railway had originally contracted for these coaches in Germany, but the war naturally involved the rescission of this contract. British firms were then approached but had to decline the business owing to pressure of war orders. *Review of the River Plate.*

Belfast.—**YEAR'S WORKING.**—The annual report of the general manager of the City tramways, just published, is considered very satisfactory under the present exceptional circumstances. The total revenue for the year ending March 31st, 1916, was £280,641, and the working expenses were £159,800, showing a trading profit of £120,840. After interest and other charges are met, there remains a net profit of £56,735. The sinking fund and depreciation fund absorb £32,434 and £17,000 respectively, £5,000 goes to the general purposes fund for 1915-16, and the balance to the same fund on account of the £15,000 promised for the current financial year. War pay and bonuses amounted to £10,081, and therefore, if it had not been for this special expenditure, it would have been possible to make a large contribution in relief of the rates. For the present year the net revenue is estimated at £69,180, and deducting £52,000 for appropriation charges, a surplus will remain of £17,180.

Bolton.—**WAGES.**—Application has been made for an advance of one halfpenny per hour for motormen, conductors, overhaulers, cleaners and day labourers, and on the standard rate for men working on machines, and the Tramways Committee, while holding the belief that an understanding was arrived at when the last advance was given that there should be no further application before July, 1916, has decided to receive a deputation from the workers' Union.

Certain lengths of track are to be relaid, in accordance with recommendations of the borough engineer.

Bournemouth.—**YEAR'S WORKING.**—The report of the working of the Corporation tramways for the past year shows a profit of £14,132, as against £9,083 in the previous year.

British Columbia.—According to the *Electric Railway Journal*, an exceptional record of snowfall was shown during January and February this year, amounting to 76 in. in the city of Victoria and about 60 in. in the city of Vancouver. Despite these severe conditions, the B.C. Electric Railway Co. maintained its city and interurban services on the mainland; in Victoria, however, the service was tied up for two days, due to the breaking of one of the transmission lines under the heavy snowfall. Power was only interrupted for one hour, but the cars were snowed up in that time. It appears that the "jitney" competition shows a great reduction, compared with a year ago, in Vancouver city.

Continental.—**SPAIN.**—It is intended to electrify the tramway running from Iran to Fuentarrabia, at present worked by horses.

SWEDEN.—With a view to electrifying the Eastern and Midland Railway lines of Sweden, the question of utilising the falls at

Mjölarp on the Swartan River has been for some time under consideration. The question has been taken up again recently, and guarantees have been given that the station shall be in working order by 1920. The electrification of the Lund-Bjarröd Railway is also well advanced, although it has been delayed by the Telegraph Administration owing to arrangements connected with the telephones.

Dublin.—**TRAMWAY STOPPAGE.**—In connection with the recent Sinn Féin Rebellion, brief reports to hand show that the tramway system was seriously damaged by the rebels, who obtained possession of the power station, and destroyed portions of the overhead system. It also appears that the electric lighting of the north side of the city has been shut down, owing to damage done, and there has been no gas supply since the commencement of the outbreak.

Haslingden.—**YEAR'S WORKING.**—The traffic receipts for the Council's tramway undertaking amounted to £8,105 for the past year, against £7,804 for the year ended March 31st, 1915, with a reduction in mileage of 18,569 and an increase in the number of passengers of 54,692. The average receipts per car-mile were 13'18d., as against 11'30d. for the previous year.

Hull.—**YEAR'S RECEIPTS.**—The receipts on the Corporation tramways for the year ended March 31st last were £161,945, an increase on the previous year of £195. The total receipts this year to April 22nd were £9,687, a decrease of £1,038 as compared with the corresponding period of 1915.

Manchester.—**THROUGH CARS.**—Arrangements have been made with the Stockport Corporation Tramway department for the temporary through running of Manchester cars to Reddish in the mornings and evenings to meet the requirements of factory workers employed in the Reddish district.

Nelson.—**YEAR'S WORKING.**—The Corporation Light Railways department has made a net profit during the past year of £1,124; the receipts amounted to £10,151, compared with £9,299 in the previous year. The tramway manager reports that the popularity of the discount tickets has been marked. During the coming year it is hoped to add another top-covered car to the rolling stock.

Newcastle-on-Tyne.—**PROPOSED FARE INCREASE.**—The Tramways Committee has been considering the question of increasing the revenue of the City tramways, and has decided to recommend the revision of some of the fares, including the minimum of one halfpenny for soldiers, which is suggested should be raised to one penny. The workmen, it is stated, will have to pay more for their books of coupons. *Newcastle Journal.*

New Zealand.—The directors of the Takapuna Tramways and Ferry Co. have decided to grant to Mr. P. Hansen an option over the rights to raise the requisite capital for the electrification of the Bayswater-Takapuna tramways. *Auckland Weekly News.*

Rawtenstall.—Speaking at a meeting of the T.C., Councillor Taylor said that, with the rate-in-aid of £2,000, the tramway undertaking had a surplus of £2,380, the whole of which was to be placed to the credit of the renewals fund. The financial result was very satisfactory, but the amount to the credit of the renewals fund was not sufficient to meet the expected expenditure in the near future.

Rotherham.—**YEAR'S WORKING.**—The total receipts from the Corporation tramways during the past year were £52,243, and the total number of passengers carried 11,705,735. There was a gross profit for the year of £19,155, an increase of £4,759 on the previous year.

Salford.—**FEMALE LABOUR.**—At this week's meeting of the Council a resolution was to be moved by Ald. Jackson to the effect that the Tramways Committee be instructed to pay all females employed on the cars and in the sheds a war bonus equal to that paid to men performing similar duties.

Sheffield.—**ELECTRIC VEHICLES.**—The Midland Railway Co. has placed in service three electric delivery vans of 2 to 3½ tons capacity, for serving the outer areas of the city.

Stalybridge.—**FEMALE DRIVERS.**—*Aprópos* the recent protests of local Trade Councils against the suggestion that women should be employed as tramway drivers in the district, Councillor Fowden stated at a meeting of the Joint Board, on April 27th, that women should only be employed in the last resort, and that no women should be put to the work without the matter having been brought first before the General Purposes Committee. Ald. R. Wood replied that if the G.P.C. was to take charge of the matter, that should be stated at once, because it was no use the Tramways Committee training women as car drivers if the Board was not going to approve them in the end. There was no idea of dispensing with male labour now or in future, and women drivers would only be employed if male drivers could not be obtained, and then only on safe routes and after thorough training. The discussion dropped.

U.S.A.—The report of the Pennsylvania Railway for the year ended December 31st last mentions that the electrification of the main line suburban zone from Broad Street Station to Paoli was completed, and that multiple-unit electric trains started running on September, 1915.

Pending the obtaining of further experience in the handling by electric traction of heavy freight trains, the proposed electrification of the main line across the Alleghany Mountains between Altoona and Conemaugh, has been deferred.

Walthamstow.—A new formula has been adopted by the District Council for the calculation of the amount to be charged by the electricity undertaking to the light railway undertaking for energy for the year ending March 31st last. In succeeding years monthly payments will be made on the basis of the last annual charge, such payments to be subject to adjustment on the issue of the accountant's certificate after the making up of the annual accounts.

TELEGRAPH and TELEPHONE NOTES.

A U.S. Story.—According to the *Telephone and Telephone Age*, Mr. Thomas D. Lockwood, general patent attorney of the American Telephone and Telegraph Co., and an old time telegrapher, is responsible for the following anecdote:—

An Irishman who had returned from a visit to the old country was telling a friend of the sights that had impressed him. "The funniest of all," he said, "is the telephone. It's a queer little instrument that you put up to your ear, and one to your mouth, and then you say, 'Are you there?' And the fellow at the other end answers 'Yes' or 'No,' as the case may be."

Cable Censorship.—An agreement has been made between the Danish Merchants' Guild and the British Government, according to which telegrams to America and England concerning business transacted in accordance with the Anglo-Danish Agreement are allowed to pass through the British Censor's Office without delay.

Norway.—A new wireless station is to be erected at Corser, with masts 100 m. in height, to communicate with other long-range stations in Europe; it will be constructed on the same scale as that of Nauzen, near Berlin, and will be ready for operation next autumn. A contract has just been made with a Berlin company for the execution of the work. A smaller station near it will be provided for communication with ships.—*La Lumière Electrique*.

Portsmouth.—An automatic telephone exchange was brought into operation on Saturday last at Portsmouth; it is said to be the largest of its kind in the country.

The Telegraph Service.—The Postmaster-General has issued an important announcement to the effect that, on account of the depletion of the Post Office staff by the withdrawal of men for service with the Colours, the hours of public telegraph business at many post offices have been curtailed. Some of the larger telegraph offices, and a number of the smaller offices, both in town and country, now open at 9 a.m. and close at 7 p.m. for the reception and delivery of telegrams; and senders are warned that telegrams handed in after 6 p.m. may not reach their destination until the following morning.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—May 24th. N.S.W. Government Railways and Tramways. 16 600-volt D.C. motors for tramway stores, Randwick.*

June 20th. Sydney Municipal Council. Supply of a two-ton electric lorry. City Surveyor, Town Hall.

MELBOURNE.—May 31st. Victorian Government Railways. Transformers for five years. First order, 220 transformers in six months.*

June 14th. Victorian Railways. Electric lamps and lampholders for signal system.*

Canada.—May 15th. Ten knots of single-conductor submarine telegraph cable (107 lb. copper, and 150 lb. gutta-percha per knot) with iron wire sheathing, for Canadian Government Telegraph Service Department of Public Works, Ottawa.*

Ingleton (Yorks.).—Electric light installation at St. Mary's Church. Rev. J. Llewellyn, Vicar.

Manchester.—May 10th. Coal slack for 12 months. Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall. May 17th. Electricity Committee. Automatic coal-handling plant at Stuart Street station. See "Official Notices" to-day.

New Zealand.—June 23rd. Oamaru Borough Council. Overhead mains and street-lighting equipment (Contract No. 2); power-station equipment (Pelton wheels, alternators, &c.) (Contract No. 3); service meters (Contract No. 4); line transformers and accessories (Contract No. 5).*

Salford.—May 8th. Electricity Department. High-pressure steel steam pipes and separator, also cast-iron pipes and valves. See "Official Notices" April 21st.

Spain.—May 15th. Municipal authorities of Belcaire (Province of Gerona). Tenders for the concession for the electric lighting of the town during ten years.

May 18th.—Municipal authorities of Villalbarbe (Province of Valladolid), for the concession for the electric lighting of the town.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Australia.—Sydney City Council has accepted the tender of Messrs. Noyes Bros. for insulated wires and cables, at £7,181, the basis price of copper being taken at £110 per ton.

Bolton.—Electricity Committee. Accepted tenders:—J. & N. Dickinson, Ltd., construction of a sub-station near McIlrose Mill in connection with the supply of current to Lostock Mills. D.C. motors for 12 months: McClure & Whitfield.

Manchester.—The Tramways Committee has reconsidered the question of the tenders for the supply of electric lamps, referred back at the last meeting of the City Council, and has decided to accept the following tenders:—

Drake & Gorham, Ltd.—Half-watt lamps and drawn-wire filament traction lamps, manufactured by B.T.H. and Edison & Swan. General Electric Co., Ltd.—Carbon-filament lamps, half-watt lamps, and drawn-wire filament lamps, manufactured by the Osram-Robertson Lamp Works, Ltd.

The Electricity Committee has accepted the following tenders:—Cable—Callender's Cable & Construction Co., Ltd.; Pirelli General Cable Works, Ltd.; Guss, Macintosh & Co., Ltd.; Western Electric Co., Ltd.; B.I. & Helsby Cables, Ltd.; Liverpool Electric Cable Co., Ltd. Crane for sub-station—Vaughan Crane Co., Ltd. Low-pressure water and exhaust steam pipes, &c.—Staveley Coal & Iron Co., Ltd.

Salford.—Electricity Committee. Accepted tenders:—J. Gerrard & Sons, Ltd.—Alterations and additions to buildings and foundations for one 5,000-kw. turbo-alternator, £1,660; extensions to H.T. switch house, &c., £1,660. British Westinghouse Co., Ltd.—Transformers, £1,088. Albion Motor Car Co., Ltd.—Four-ton Albion petrol motor-wagon, £896. Underfeed Stoker Co., Ltd.—Two underfeed mechanical stokers, £1,836, for two water-tube boilers.

Walthamstow.—U.D.C. Recommended tenders:—

W. T. Henley's Telegraph Works Co., Ltd.—Cables during the period ending March, 1917. P. R. Jackson & Co.—24 commutators, at £5 5s. each.

FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Friday, May 5th. At 5.30 p.m. At Albemarle Street, Piccadilly, W. Lecture on "Electrical Methods in Surgical Advances," by Sir J. M. Davidson.

Saturdays, May 6th and 13th. At 8 p.m. "Tyndall Lectures on" "X-rays and Crystals": I, "New Methods of Research"; II, "First Results and their Applications," by Prof. W. H. Bragg, F.R.S.

Royal Society of Arts.—Monday, May 8th. At 4.30 p.m. At John Street, Adelphi, W. Cantor Lecture II, on "Vibrations, Waves, and Resonance," by Mr. J. E. Keirsey-Murray.

Faraday Society.—Tuesday, May 9th. At 8 p.m. At the Institution of Electrical Engineers, Victoria Embankment, W. Ordinary meeting.

Illuminating Engineering Society.—Tuesday, May 9th. At 5 p.m. At the Royal Society of Arts, John Street, Adelphi. Discussion on "A Report to be presented by the Research Committee of the Society." Annual meeting.

Institution of Electrical Engineers.—Thursday, May 11th. At 8 p.m. At Victoria Embankment, W.C. Annual general meeting. (Yorkshire Local Section).—Wednesday, May 10th. At 7 p.m. At the Philosophical Hall, Leeds. Paper on "The Economical Production of Power from Waste Gases," by Mr. G. Dearnle.

Chemical Society.—Thursday, May 11th. At 8 p.m. At Burlington House, Piccadilly, W. Ordinary scientific meeting.

Physical Society of London.—Friday, May 12th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Papers on "The Latent Heats of Fusion of Metals and the Quantum Theory," by Mr. H. S. Allen; "Lenses for Light Distribution," by Mr. T. Smith; "The Choice of Glass for Cemented Objectives," by Mr. T. Smith.

NOTES.

Bribery Prevention.—A letter has been issued by the secretary of the Bribery and Secret Commissions Prevention League (Ino.), 9, Queen Street Place, London, E.C., appealing for members and associates from the various branches of the engineering profession. The letter reads:—

It is expected, judging by past experience, that when the war is over, and there is eager competition for new business and the general dislocation of trade, the utmost vigilance will have to be maintained to guard against bribery. Now, and in the near future, there seems to be special need for the work of the League in eradicating corruption in official, commercial, and private life. It is recognised, however, that the demands of the war, directly or indirectly, are such that many persons may be unable to become members of the League at the present time. It has been decided, therefore, as a temporary measure, due to the war, to consider those who give not less than 5s. as associates, for 12 months. Similarly, trade organisations which wish to help the League but lack the funds for affiliation, or shrink from the responsibilities involved, will be grouped as associated organisations, on making an annual payment of one guinea.

The Business Languages of South America.—There are two business languages used in South America, the language of Brazil, with about 20,000,000 people, is Portuguese: the language of the rest of South America, comprehending an equal number of people, is Spanish. Portuguese and Spanish—these are the business languages of South America. The business man must use in his correspondence and through those who represent him the language of the people he wishes to reach.

Under no conditions should a letter addressed to South America be written in English, unless the writer is positive that the person to whom it is addressed reads and speaks English fluently. If the writer does not know that the person he is addressing possesses this qualification, the letter must be in Portuguese if sent to Brazil and in Spanish if sent to any other South American country. On the other hand, it is always safe to answer a letter from South America in the language in which it is written.

The racial traits of courtesy possessed by all South Americans tend to make them lenient of errors in language, provided the attempt to make oneself understood is genuine. Thus, a letter written in poor Portuguese or poor Spanish is far better than one written in good English. The English letter would probably reach the waste basket without an attempt being made to read it. On the other hand, the letter in understandable, though inelegant, Portuguese or Spanish would be read and its contents grasped.

All business letters written by South Americans are most courteous in style. They are cordial and even gracious. To us, both the salutation and the closing greetings are effusive. Scattered through the body of the letter are frequent phrases of direct address to the one who is to receive the letter, worded in the most polite terms. When reading such expressions, one can almost imagine the courtly raising of the hat that accompanies the meeting and parting of business men in South America.

Three examples of common salutations in Spanish business letters are herewith given, each being followed by a rather literal translation into English: *Muy Señor mío*—My dear Sir; *Distinguido Señor*—Distinguished Sir; *Ilustrísimo Señor*—Most Illustrious Sir. Three endings for letters, similarly translated, are also given: *Quedo de Vd. atto. y S. S.*—I remain to your Grace your attentive and obedient servant; *Me repito de Vd. atto. y S. S.*—I repeat to your Grace that I am your attentive and obedient servant; *Esperando sus ordenes S. S.*—Awaiting your orders, I am your obedient servant.

From these few phrases it is easily imagined how offensive our brusque North American style of letter writing must be to anyone who naturally, and by association and training, uses most courteous forms in addressing others.

The importance of using the language of the country in dealing with South America has been realised and acted upon by both the British and the Germans. The German has acted from his usual disposition to take advantage of everything that might count; the Englishman has accommodated himself to necessity. The final result is that the salesmen representing German and British houses are well equipped with a knowledge of the language of the countries with which they are doing business, the customs of the people, and the niceties and refinements of business intercourse. These qualifications give them a decided advantage over North Americans who have failed to appreciate and learn these important things. In the case of the British, however, it must be confessed that this acquirement is a veneer, for when Englishman meets Englishman, or Englishman meets American, the brusque Anglo-Saxon ways again come to the surface.

This subject of business languages in South America is so important that everyone who is exporting to that continent should see to it that only Portuguese and Spanish are used, and that the courteous forms of expression which enter into the daily business intercourse of the peoples of those countries are scrupulously observed.—*American Mechanist*.

Electric Winding in South Africa.—In a paper read by Mr. J. Norman Bulkeley, before the American Institute of Mining Engineers, on the application of electric power to mining work in the Witwatersrand area, some particulars are given of electric winding plants in South Africa. The area contains 113 electrically-driven hoisting engines, exclusive of winches. The combined continuous rating of these hoists amounts to 74,000 H.P., or an average of 517 H.P. Although exact comparisons of costs with steam winding plants are not possible, investigation favours the use of electric winding, especially in deep shafts. One result is a marked decrease in the cost of maintenance of shaft guides, owing to the steadier turning moment of the electric winder, while greater safety and reliability are also found with the electric hoist.

A comparison of the efficiency of two winding plants operating under similar conditions, but one equipped with a geared three-phase rheostatic winder, and the other with a Ward-Leonard winder, shows that where the latter has been kept working steadily, its efficiency exceeds that of the rheostatic set by about 5 per cent., but where the shaft H.P. hours have dropped, the efficiency of the Ward-Leonard set has dropped with them, showing the bad effect of intermittent winding due to the practically constant losses of the motor-generator set, while with rheostatic control the only loss, when the hoist is standing, is that due to the controller pump motor, which is negligible.

In the case of a mine under Mr. Bulkeley's charge, a complete change from steam to electric drive was made, and, at the same time, the milling capacity was increased from 15,000 to 17,000 tons a month, and the air-compressor plant by one-third.

A comparison of the last two years of steam operation and first year of electric service showed a saving in favour of electric drive of \$12,000 per annum, without making any allowance for the increased capacity of the plant.

American Electrical Exports in January.—The electrical exports for January were surpassed in recent months only by the record shipments in November. In the four electrical classes for which the numbers of articles exported are given in the Government Report, there were shipped in January the following:—Electric fans, 1,433; arc lamps, 164; carbon-filament lamps, 128,522; metal-filament lamps, 507,527. The detailed figures for last January and for the corresponding month in 1915 are given below:—

	Jan., 1916.	Jan., 1915.
Batteries	\$115,354	\$100,946
Dynamo or generators	56,983	309,868
Fans	16,010	17,221
Insulated wire and cable... ..	265,622	83,728
Interior wiring supplies, &c. (including fixtures)	87,611	72,104
Arc lamps... ..	1,203	759
Carbon-filament lamps	14,667	5,802
Metal-filament lamps	109,720	38,504
Meters and other measuring instruments	75,352	40,556
Motors	389,380	205,140
Telegraph instruments (including wireless apparatus)	5,802	17,326
Telephones	69,050	184,556
Transformers	55,708	57,122
All other	1,058,360	640,306
Total	\$2,320,822	\$1,773,938

Electric locomotives are separately listed in the report. In January eight of these, valued at \$151,245, were exported.—*American Electrical Review*.

Society for Electrical Development, U.S.A.—To effect closer co-operation between the Jovian Order and the Society for Electrical Development, reigning Jupiter Thomas A. Wynne has appointed James M. Wakeman, General Manager, Harry W. Alexander, Director of Publicity, and George W. Hill, of the Field Co-operation staff, as Statesmen-at-Large in the Jovian Order. The Jovian Order, with its nearly 20,000 members, has substantially the same object as the Society for Electrical Development, but its functions are different. The recent appointments will effect better co-operation which will consistently complement the work of both organisations, such as the founding and fostering of local Jovian Leagues, and the harmonising of relations between local electrical interests. During the "America's Electrical Week" campaign next autumn, it is expected that the Jovians will exert great force in the handling of local sales, committee work, and celebrations. The Society will, however, conduct the national campaign as it did the Electrical Prosperity Week.

Electrical Rain-making in Australia.—Upon the recommendation of the committee of investigation into Mr. Balcillie's proposals for rain-making, the Premier of New South Wales is communicating with Dr. G. C. Simpson, of Simla, India, and also with Prof. Bragg, through the Agent-General. Dr. Simpson has been selected on the ground that he has carried out the most recent and the most comprehensive investigations into the scientific principles involved in water precipitation from vapor, which have come under the notice of the Committee. One or two English scientific men at times have investigated the subject to some extent in its relation to rain-making; and Prof. Bragg, who is in a position to get reliable advice at once, will be invited to assist the Committee. The Premier has altered the title of the Committee, on its own recommendation, to the "Rain Precipitation Investigation Committee."

Cheap Power.—In a letter to *Mel. and Chem. Engineering*, Mr. W. E. Herring, of the Puget Sound Traction, Light and Power Co., Seattle, states that his company has water-power plant of 71,000 H.P., supplemented by steam plant of 34,000 H.P., and the regular commercial power rate for loads above 101 H.P. for continuous use is 1d. per K.W.-hour. Still lower terms are offered to concerns that use large powers continuously, and the company is about to develop from 75,000 to 150,000 additional H.P.

Daylight Saving.—It is reported that the Government will probably accept a motion put forward by Sir Henry Norman, on the lines advocated by the late Mr. W. Willett, to advance the public clocktime by one hour during the summer months, with a view to effecting economy in the use of fuel. The French Chamber of Deputies has already passed a Bill giving the Government power "until the end of the year when the treaty of peace is signed" to vary the legal time; whether the Senate will agree to it remains to be seen. It is estimated by the supporters of the Bill in France that a saving of two millions sterling will result. Similar measures have been adopted by Germany, Austria, and Holland as from May 1st.

American Reconstruction Work in Belgium.—We read in the *American Electrical Review* that Mr. Nevil Monroe Hopkins, as chairman of the Belgian Scholarship Committee, Washington, is making an appeal to the professional and scientific men of the United States for assistance in providing a fund for the reconstruction of Belgian educational facilities and opportunities for development in arts and science. The Committee includes among its members the Presidents or Chancellors of the following Universities:—Johns Hopkins, Princeton, Michigan, Missouri, Leland Stanford, Pennsylvania, George Washington, State of New York, Nebraska, Rice Institute, Western Reserve, and many other leading men of the country. It is proposed to establish a fellow-

ship upon the basis of \$1,000 a year for the duration of the war and two years thereafter, a sustaining membership of \$100 and an associate membership of \$10 each year under the same circumstances.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' V.E.C.**—Orders for week commencing May 8th, 1916.—By Lieut. Col. C. B. Clay, V.D., Commanding.

Drills, 6.25 to 7.25; 7.25 to 8.25.

Monday, May 8th.—Sections 1 and 2, Technical; Sections 3 and 4, Squad and Platoon, Signalling Class and Recruits.

Tuesday, May 9th.—School of Arms, 6 to 7 p.m.; Recruits' Drill, 7.15 to 8.15 p.m.

Thursday, May 11th.—Shooting for Sections 3 and 4; Recruits, 5.45 to 7.45 p.m.

Friday, May 12th.—Sections 3 and 4, Technical; Sections 1 and 2, Squad and Platoon; Signalling Class and Recruits.

Saturday, May 13th.—Adjutant's Instruction Class at 2.30 p.m.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, May 4th, 1916:—

Week-End Parades.—**Saturday.**—The Battalion will Parade at Baker Street Station, at 2.30 p.m., and proceed by train to Wembley Park for Battalion Drill, under the Adjutant.

Sunday.—The Battalion will Parade at Victoria Station, Wilton Road entrance at 10.20 a.m., and proceed by train to Orpington, for Field Operations with the 3rd Batt. West Kent Volunteer Fencibles. The Battalion will leave Orpington on the return journey at 5.12, reaching Town at 6.4 p.m.

Musketry.—Inter-Battalion Cup Competition. There will be practice at Bisleigh for above Competition on Saturday, May 6th. The range will also be open to other members. Names to be sent in to the Musketry Staff by Friday midday. Members to report themselves in Uniform, at 12.45 p.m., to Sergeant Cotter, No. 6 Platform, Waterloo Station.

A. G. JOINER, Major and Adjutant, O.B.C.

Appointments Vacant.—Junior engineers-in-charge (15s.), for the Borough of Newport (Mon.) electricity department; assistant engineer (£150); joiner (£2), for the Borough of Gillingham (Kent) electric light and power department. See advertisement pages to-day.

Institution and Lecture Notes.—**University of London, University College.**—The following, among other, public lectures are announced:—**Tuesday, May 9th at 5 p.m.**—"The School of Chemistry at University College; Turner, Graham, Williamson, Ramsay," by Prof. J. Norman Collie, F.R.S. **Monday, May 15th, at 8.30 p.m.**—"The Manufacture of Nitrates from Air by Electric Power," by E. Kilburn Scott, M.I.E.E. **Tuesday, May 16th, at 5 p.m.**—"The Role of Chemical Science in Civilisation," by Prof. F. G. Donnan, F.R.S.

Institution of Electrical Engineers.—The annual general meeting of the contributors to the Benevolent Fund will be held at the Institution on Thursday, May 11th, at 9 p.m., to receive the report of the Committee of Management and the statement of accounts and balance-sheet to December 31st, 1915. At this meeting the names of the Committee of Management for 1916-17 will be declared. A general meeting of the contributors to the Fund will be held as soon as the business of the annual general meeting is concluded, for the purpose of considering alterations to Rules 9 and 10 of the Fund.

Society of Engineers (Inc.).—On Monday a conference of engineers, convened by the Society, was held to discuss the subject of "Engineering and Scientific Research." Dr. J. A. Fleming, F.R.S., who opened the discussion, showed that there were three main divisions of such researches:—

1. Those bearing on the determination of physical constants or specific qualities of materials required as an aid to design.
2. Researches which provide new methods of testing materials or structures.
3. Researches which involve new appliances or processes of manufacture.

He said that there were no cut-and-dried methods by which we could engender originality, but it was of the utmost importance to foster it in anyone who gave evidence of its possession. A totally changed attitude in the public mind towards scientific research was required. Until we produced more men who could do new things, and not merely know about old ones, it was futile for Great Britain to hope to gain pre-eminence over Germany in scientific industries. The advantages which we had in greater originality of mind and better workmanship were neutralised to a large extent by the want of a sufficiently thorough and broad scientific education to enable us to see the practical value of, and work out exhaustively, especially with reference to trade purposes, the openings given by scientific discoveries. Our post-war policy could not be simply defensive. No tariff wall could be built so high, no boycott of German goods could be so thorough, as to defend our position in the absence of a positive and vigorous policy of attack.

Röntgen Society.—It is proposed to conclude the Session in June with an exhibition of apparatus employed in radiography, radiotherapy including radium technique, electromedical appliances, and photographic apparatus to illustrate technique as applied to medical science.

Royal Institution.—At the annual meeting of members held on Monday afternoon the report of the Davy Faraday Research Laboratory Committee was read. Fifteen new members were elected in 1915. Sixty-two lectures and 19 evening discourses were delivered in 1915. The following officers were elected for the ensuing year:—President, the Duke of Northumberland; treasurer, Sir James Crichton-Browne; secretary, Col. Edmond H. Hills; managers, Sir Thomas Barlow, Bart., Sir W. P. Beale, Bart., Dr. H. T. Brown, Sir J. Mackenzie Davidson, Lord Grenfell, Charles Hawkey, Col. Sir F. Nathan, the Hon. R. C. Parsons, Sir J. Reid, Bart., Sir Napier Shaw, Alexander Siemens, Dr. S. P. Thompson, Lord Wrenbury, Sir A. F. Yarrow, Bart., Sir Robert Younger, Visitors, H. Ballantyne, S. G. Brown, J. F. W. Deacon, W. Duddell, Lieut.-Col. H. E. Gaultier, Dr. J. Dundas Grant, J. W. Jarvis, H. R. Kempe, F. Legge, E. R. Moon, H. G. Plimmer, Sir W. Wyndham Portal, Bart., A. W. Porter, H. Munro Ross, Joseph Shaw.

Institution of Civil Engineers.—The Council has awarded a George Stephenson Gold Medal to Mr. F. W. Carter, M.A. (Rugby), for his paper on "Electric Locomotives."

West Ham Municipal Technical Institute.—A special course of seven lectures on "Some Industrial Applications of Electricity," with practical work, will be given in the Institute, Romford Road, West Ham, on Monday evenings, from 7 to 9 p.m., commencing May 15th. Fee for the course, 2s. 6d. Particulars are given in our advertisement pages to-day.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—The following members of the staff of the Leicester electricity department have received advances in salaries:—Mr. W. E. Burton, superintendent of the Aylestone station, from £300 to £325 per annum; Mr. G. Morris, car shed superintendent, from £250 to £285; Mr. E. J. Riley, chief clerk, from £200 to £215; Mr. H. E. Rogers, mains superintendent, from £190 to £225; and Mr. G. E. Purdy, draughtsman, from 40s. 6d. to 50s. per week.

General.—Mr. WARE, Accrington Fire Brigade and lighting superintendent, is to have his salary increased from £160 to £200 per annum, and is to take charge in future of the whole of the public electric lighting of the town, and not, as at present, of the Blackburn Road section only.

Mr. P. J. PRINGLE, M.I.E.E., M.I.M.E., has been appointed consulting engineer and assessor to the Melbourne Tramway Board, recently formed, and will act in connection with the transfer of the Melbourne Tramway & Omnibus Co.'s undertaking to the Tramway Board. Mr. Pringle is general manager and chief engineer of the Electric Supply Co., of Victoria, Ltd., and will continue to discharge these duties.

Mr. LEONARD FREDK. ALDAY, who was married at St. Clement's Church, Boscombe, on April 21th, to Miss I. H. Sanbrook, was presented by his colleagues in the electrical department of Devonport Dockyard with an oak-cased chiming clock.

Official notice from the *London Gazette*.—Territorial Force. Royal Engineers, London Electrical Engineers, Temporary Second-Lieutenant T. S. WALLIS, from R.E., to be Second-Lieutenant.

Mr. C. F. BUTLER, A.M.I.E.E., late acting manager and engineer of the Gravesend and Northfleet Tramways, has taken up an appointment under the War Office as station engineer to the group of electric generating stations at Fovant, Salisbury.

Roll of Honour.—SERGEANT NORMAN GREEN, of the Durham Light Infantry, who has died in hospital at Boulogne of wounds received in action, was, prior to the war, engaged with Messrs. W. E. Dove & Co., Ltd., electrical engineers, of Darlington.

Obituary.—MR. FREDERICK WALKER.—The death of Mr. Frederick Walker, at Cheltenham, at the comparatively early age of 62, will recall to many of those with whom he was associated in the early eighties, and since, a personality almost unique in the engineering and electrical world. In his profession he was a genius, and on the subject of aerostatics his judgment and versatility were pronounced. In the book published by him in 1910, *Aerial Navigation*, his remarks, read in the light of recent events, may be considered almost prophetic. In the preface to his last book, Mr. Walker said:—

"The advent of the aeroplane is a medium for short flights, the new era of trade, and the exigencies of the preparation of foreign Powers for aerial war apparatus needs must stimulate our own Government to action in the same direction."

But whatever is done in the matter of aerial navigation in the next decade and inventive genius, should be done by the British people themselves. I cannot believe that the race has deteriorated to such a degree that we should depend upon foreign invention and manufacture for what we need at home. There is no need, for ages to come, to fear a social revolution or the destruction of civilisation by the advance of aerial navigation. This can only be effected by the discovery and application of the neutralisation and regulation of the force of gravity. Given this as a secret under the control of a peaceful and highly-civilised Power, and war and its concomitant horrors would be a story of the past.

Another extract from this book goes on to say:—

There is a great future before the aeroplane, and also before the airship, which is built as a rigid combination between the aeroplane and the airship. It is certain that with such an airship, having controllable vertical movement, with fuel and provision for eight men for one month, no spot upon our planet may remain unexplored and uncharted.

It must be conceded, however, by the most pacific of teachers, that it is well for every nation to prepare for defence, and, without going so far as to entertain or encourage a possible "war in the air," a fleet of properly constructed airships is a necessary adjunct to a navy, more especially for that of a nation like Great Britain, with an insular centre, so dependent upon the command of the elements surrounding it.

Born at Charlton, Kent, in 1853, he served an early apprenticeship of seven years as a millwright. His workshop training at Bryan, Donkins, Easton & Anderson's, &c., and a ripened world-wide experience gained as a sea-going engineer in the P. & O. service, peculiarly fitted him in later years for the profession of a consulting engineer and patent agent. He was employed, among other things, in first installing the electric light on the Suez Canal, the designing of the Volta (the first electric launch to cross the Channel) in conjunction with the late Anthony Reckenzaun, and was the patentee of the first dry battery in 1881, and closely identified with the "Jarman" electric road cars in 1880. He was also associated with the early beginnings of many well-known engineering and allied firms, and in particular with the late Gustav Binswanger in the inception of the G.E.C. Mr. Walker was a well-known contributor to the technical Press, and author of many works, including *Practical Dynamo Building*, *Tables and Memoranda for Electrical Engineers*, *Electricity in the Engine Room*, *Design and Equipment of Launches*, &c. In his later days Mr. Walker for many years practised the profession of a consulting engineer and patent agent, until, through failing health, he retired into the country, near Cheltenham, where he was much sought after by those who valued his mature knowledge, gained by his practical experience and naturally scientific mind.

Wills.—The late Lady KELVIN left £5,000, to be applied for promoting research and the teaching of physical science in connection with a natural philosophy chair, and all the decorations and medals conferred upon Lord Kelvin, to Glasgow University.

The late Sir C. RIVERS WILSON left unsettled estate £10,091 and net personalty £8,528.

REVIEWS.

Atmospheric Circulation and Radiation. By F. H. BIGELOW, M.A. London: Chapman & Hall. Price 2ls. net.

This is a meteorological treatise on the circulation and radiation in the atmospheres of the earth and of the sun, by a member of the Argentine Meteorological Office, who was for many years Professor of Meteorology in the U.S. Weather Bureau, and, therefore, is exceptionally well equipped for the task which he has set himself of adjusting the thermodynamic equations employed in meteorology to a uniform basis in accordance with the non-adiabatic system prevailing in the atmospheres above-named. Obviously this is not the place to discuss the author's work at length; we are mainly concerned with those chapters in which he deals with the electrical and magnetic phenomena connected with the atmosphere. Numerous references to authorities are given, and the author does not go into particulars with regard to instruments and methods of measurement, but briefly states the formulae employed, with their significations and some examples of their applications. The cause of the wide discrepancy between the values obtained by different methods for the conductivity of the atmosphere is discussed, with the aid of numerous observations, and the difference is ascribed to a difference in the conditions of experiment; it is stated that the absolute values of the dissipation coefficients must be obtained by ion-counters, the Elster and Geitel apparatus being suitable for giving relative, but not absolute, values. The characteristics of the atmospheric electric potential are ascribed to ionisation of aqueous vapour by the incoming radiation, producing a normal charge of 150,000 volts at a height of 5,000 metres. A chapter is devoted to terrestrial and solar relations, in connection with the diurnal phenomena, especially the variations of the electrical and magnetic elements; these are influenced by the convective movements of the atmosphere, and react upon one another also. The author remarks that the evidence is very strong that the magnetic variations depend upon ionisation currents in the lower strata, and not upon any system of ionisation currents in the upper strata. The aperiodic variations are also studied, and the author infers that there is a marked tendency to correspondence with the rotation of the sun in 26.68 days; there is also a semi-annual change in the phenomena, and the author remarks that the problem of the solar radiation and its effects throughout the earth's atmosphere is an exceedingly complex phenomenon. He is not without hope that the development of meteorology and solar physics will eventually enable us to predict the seasonal climatic conditions likely to prevail during the coming year in the great agricultural regions of the earth. While his work is mainly of use as a reference book, it is highly original in character and aim, and should be found of great value to meteorologists.

Handbook of Instruction for Wireless Telegraphists. By J. C. HAWKHEAD and H. M. DOWSETT. London: The Wireless Press, Ltd. Price 3s. 6d.

This is a second edition of Mr. Hawkhead's book, which has been taken in hand by Mr. Dowsett for revision and enlargement. A very marked improvement in the appearance, quality, and illustrations has been effected. With the exception of amplification in a number of places, and a much more complete description of the Marconi portable sets, the text remains of the same general standard. In Part II, covering the theory of waves, the faulty illustrations have been replaced and considerable revision has been effected in the text. Of the two or three additional illustrations, one gives an original conception of the shape of electric strain lines as they are stated to exist in the waves thrown off by an antenna. The object of this departure from the Hertz diagrams is not clear, and it is hardly a success. The sharply-pointed waves shown do not, of course, exist in reality.

While the information given is generally sound, it is hardly of the standard suited to high-class instruction, but will undoubtedly be valuable to operators using the Marconi apparatus. The latter appears to be the object of the work.

Examples in Alternating Currents. Vol. I. By Prof. F. E. AUSTIN. From the Author, 11, South Park, Hanover, N.H., U.S.A. Price \$2.40 (in America).

The first thing which strikes one about this book is that it is printed in green ink. Possibly some readers may like this; personally, we do not like it, and we find that it makes indices, subscripts, and small lettering on figures difficult to decipher. The next thing to strike one is the high price, but the cost of setting up mathematical matter is notoriously high, and the setting is done well in this instance, so we are prepared to forgive the rather high price, especially as the author is honest enough to say in his opening sentence that "one object of the book is to make money"! So many authors pretend to be philanthropists.

These initial prejudices vanish rapidly on a closer examination of the work, the scope of which is, perhaps, best explained to British engineers and students by saying that it gives a "pocket-book treatment" of alternating-current problems, the electrical principles involved by the latter, and the mathematical methods required for their solution. The treatment is sufficiently detailed to make the book readable and of value to students, as well as a work of reference for those wishing to refresh their memories on a particular point. Though there is, naturally, no particular "plot" in the book, its sections are arranged so that a student could start at the beginning and follow it right through intelligently. Previous knowledge of fundamental electrical matters and mathematical methods is, however, necessary unless the book is to be used as a class manual and supplemented by oral explanation. In this connection it should be particularly valuable.

The preliminary sections include a well-arranged collection of trigonometric formulae, geometrical relationships, and clear rules for differentiation and integration. Good definitions of A.C. quantities are given, and there is a good treatment of the fundamental formulae bearing on the generation of E.M.F. and of the constants and properties of sine curves. Instructive examples are given and supplemented by sufficient hints to make them really useful. A good deal of space is devoted to methods of determining the area under various curves, particularly as applied to A.C. problems, to addition and multiplication of sine forms, and so on. The student should be enabled by these pages to deal confidently with any problem concerned with wave form.

Inductance in straight conductors and in coils, impedances in series and in parallel, pure capacity, the properties of various arrangements of condensers, and the characteristics of A.C. circuits containing various mixtures of resistance, inductance, and capacity are all dealt with very clearly, frequent use being made of vector diagrams to supplement analytical results and methods. The author adopts different types of arrow heads to distinguish between pressure, current, admittance, and impedance; this device is successful where the vector diagrams are reasonably large. A series of tables at the end of the book gives values of $2\pi f$ for frequencies from 1 to 151 cycles, and corresponding values of $1/(2\pi f)$, $(2\pi f)^2$, and $1/(2\pi f)^3$. Here are also tables showing the capacities in farads necessary to neutralise inductance from 0.1 to 0.99 henry, and from 1 to 25 henries, and produce resonance at frequencies of 15, 25, 60, and 100 cycles. These and other special tables form a valuable feature, and it is a pity they are blemished by as many as 10 or 11 figures being given without any spaces to facilitate transcriptions.

The illustrations in the book are good, save that the lettering is generally much too small and is, consequently, illegible in some cases. On the other hand, there is an excellent index, and the arrangement of the text and mathematical matter is exceptionally clear. All the resources of the printer have been called upon to discriminate between main essentials and amplifications and examples. Revision seems to have been done very carefully, and we notice no misprints, though we cannot claim to have checked every calculation. One soon grows accustomed to the green ink, and the book is one which must be more appreciated the longer one has it in use. It should circulate freely amongst students, teachers, and practising engineers.

Directions for Designing, Making, and Operating High-pressure Transformers. By Prof. F. E. AUSTIN. From the Author, 11, South Park, Hanover, N.H., U.S.A. Price 60 cents (in America).

This book gives quite a good treatment of the fundamental principles of transformer action and construction. The figures given after the introductory section are intended primarily to assist those who wish to build a step-up transformer, but the data are useful in helping those who study the subject without going in for practical work, to a better understanding of the principles of transformer design and operation. Transformer losses are dealt with at some length, data being given to enable the reader to calculate the losses in any particular case. Sections are devoted to power factor and transformation ratio, and the author then works through the chief steps in designing a 1-kw. transformer operating at 110/20,000 volts on 60-cycle supply; this is done fully so far as concerns the losses, weights of material, iron and copper sections, &c. Directions and data are then given for building a 3-kw., 110/20,000-volt, 60-cycle transformer; the instructions are so complete that the reader should have no difficulty in building any other small transformer of the same order of magnitude, and for about the same working pressures. The cost of materials for the transformer described is about £6 10s. A short section is devoted to oil-immersed transformers, and attention is, very properly, drawn to the precautions to be observed in working with step-up transformers. The author's statement that the transformer he describes will pass "enough (current) to kill a person several times," contains a little unintentional humour, but the warning is none the less convincing.

In the concluding sections of the book there are data relating to a 4,000-volt transformer, a discussion of the use of transformers as frequency changers, notes on obtaining unity power factor by the use of condensers, and notes on connecting primary coils to produce different secondary pressures. The book is interesting and instructive.

The Practical Design of Steel-framed Sheds. By ALBERT SPENCER. London: Constable & Co., Ltd. Price 10s. 6d. net.

The war has caused the springing up of an unprecedented demand for steel-framed sheds, such structures being needed all over the country in connection with the production of munitions. According to Mr. Spencer's calculations, it would seem likely that in many cases such sheds are unskillfully designed. In fact, his complaint is that owing to the designing of sheds being left almost entirely to the manufacturers of such structures, who are often working on a severely competitive basis, many designs are open to serious objection on the score of capability to withstand all stresses with a good factor of safety. The trouble, the author is convinced, lies mainly in the fact that in most treatises on this subject, and also in the instruction provided at our technical colleges, too much attention is devoted to the design of the various units without proper regard to the structure as a whole. He, therefore, presents, in a clear and coherent manner, methods which, if adopted, should greatly facilitate the practical design of trustworthy shed framework and foundations. An intimate knowledge of the theory of structures and of practical designing is assumed to be already in the possession of the reader, and, given this, a student on the subject should find much food for thought in Mr. Spencer's calculations.—G. S. S.

NEW COMPANIES REGISTERED.

Harlesden Lamp Co., Ltd. (143,701).—This company was registered on April 26th, with a share capital of £10,000 in 9,900 pref. shares of 1s. each and 4,000 ord. shares of 1s. each, to acquire and turn to account any invention relating to electric and other lamps, or any lenses, reflectors, or other component parts or accessories for use in connection therewith, to carry on the business of manufacturers and repairers of, and dealers in, electric lamps, reflectors, lenses, or other articles, electricians, opticians, glass-blowers, &c., and to adopt an agreement with C. B. Leake. The subscribers (with one pref. share each) are: C. B. Leake, Red House, Harefield, Middlesex, gentleman; J. M. Longe, St. Margaret's, Hollowell Road, Northwood, Middlesex, gentleman. Private company. The number of directors is not to be less than two or more than five; the first are C. B. Leake and J. M. Longe. Qualification (except first directors), 500 shares. Remuneration, £200 per annum, divisible. Solicitor: W. E. Craigie, Cromwell House, Fulwood Place, Holborn, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

W. E. Dove & Co., Ltd. (72,630).—Capital, £3,500 in £10 shares. Return dated March 31st, 1916. 320 shares taken up; £3,000 paid; £1,200 considered as paid. Mortgages and charges: £1,100.

Carville Site & Power Co., Ltd.—Issue on April 20th, 1916, of £10,000 debts., part of a series of which particulars have already been filed.

CITY NOTES.

German Electrical Companies.

The *Deutsch-Atlantische Telegraphen Gesellschaft* proposes to pay a dividend of 6 per cent. for 1915, as contrasted with 6½ per cent. in the previous year.

The *Osteuropäische Telegraphen Gesellschaft*, of Cologne, which owns the cable between Constantza and Constantinople, records net profits of £15,600 for 1915, as contrasted with £12,300 in the preceding year, when a dividend of 7 per cent. was paid on the share capital of £50,000. The method of disposing of the profits available for 1915 is not disclosed.

The report for 1915 of the *Welter Elektrizitäts und Heberzeug Werke*, of Cologne, states that activity became greater and more uniform on the completion of the changes in working for the execution of Army contracts, and the company was also well occupied on the construction of lifting plant. The net profits of £3,300 permit of the payment of a dividend of 5 per cent., this result contrasting with a loss in the previous year.

The report of *Gebr. Korting A.G.*, of Linden, states that the company was able to deal with the increasing requirements for electrical machinery in 1915. No information was forthcoming in regard to the subsidiary companies in enemy countries, but the turnover in Austria-Hungary expanded considerably. The gross profits advanced from £147,000 in 1914 to £255,000 last year, and the net profits from £37,000 to £112,000 in the two years respectively. It is intended to pay a dividend of 10 per cent. on ordinary share capital of £950,000, as compared with no distribution in 1914 and 8 per cent. in 1913.

The *Elektrochemische Werke*, of Bitterfeld, most of whose installations and plant at Rheinfelden and Bitterfeld are leased to the Griesheim-Elektron Chemical Works, of Frankfurt-on-Main, report gross profits amounting to £87,000 for 1915, as compared with £86,000 in 1914. Including the balance brought forward, the net profits are returned at £62,500, as against £62,100, and the dividend on the share capital of £275,000 is 10 per cent., as in the previous year. The share capital has been increased to £350,000, and is held entirely by the Zurich Bank for Electrical Undertakings.

The *Gesellschaft für Elektrische Unternehmungen*, of Berlin, which is an investment company having a share capital of £3,000,000, and loans amounting to £1,997,000, states that the considerable interests held in enemy countries resulted in a reduction of £90,000 in the profits realised from dividends and interest in 1915, which was only partly equalised by profits of £40,000 resulting from sales of securities. The net profits and balance forward declined from £266,000 in 1914 to £216,000 last year, although the dividend is maintained at 6 per cent. for 1915, as in the previous year, whereas the rate in 1913 was 10 per cent.

The directors of the *Hamburg Hochbahn A.G.* report that the branch line to Rotenburgsort was handed over to the company by the Hamburg State on May 21st, 1915, and on that day the 40 years' concession commenced for the working of the circle line and the three branches to Eimsbützel, Ohlsdorf, and Rotenburgsort. The electrical equipment of the last-mentioned line was accelerated, and the service started about the end of July. During the first four months of 1915 troops comprising 2,200,000 were carried free of charge, whilst the paying passengers transported numbered 35,800,000 in the whole year, as compared with 36,480,000 and 39,000,000 in the two previous years respectively. After meeting interest charges and placing £27,000 to the renewal fund, as against £28,000 in 1914, the accounts show a loss of £900, as contrasted with net profits of £32,000, and a dividend of 4 per cent. in 1914 and 5½ per cent. in 1913.

The report of *Voigt & Haefner A.G.*, of Frankfurt-on-Main, states that the company was engaged during the whole of 1915 on the manufacture of parts of munitions, although the production of the customary peace articles was maintained to a satisfactory extent. Neutral countries were much larger purchasers than in former years, partly influenced by the favourable rate of exchange. It was possible to find substitutes for the requisitioned metals in materials produced in the country in the case of many classes of manufactures turned out, and the delivery of these materials was so much facilitated that the company was able to secure a satisfactory turnover towards the end of the year, particularly in products made in bulk. The net profits were £97,000, as against £49,000 in 1914, and a dividend of 12 per cent. has been declared on share capital of £250,000, as contrasted with 8 per cent. in 1914.

West London & Provincial Electric Supply Co., Ltd.—The credit balance for 1915 is £3,038, and after paying 6 per cent. on the cum. pref. shares the balance is to be carried forward.

Chiswick Electricity Supply Co., Ltd.—After paying debenture stock interest, a dividend of 5 per cent. for 1915 is to be paid, carrying £435 to depreciation reserve fund account.

Calcutta Electric Supply Corporation, Ltd.—The units sold during the five weeks ended March 31st were 2,122,507, compared with 1,579,169 units in 1915.

Austrian Electrical Companies.

The Elektricitäts A.G. (Date Kolben), of Prague, has decided to pay a dividend of 9 per cent. out of net profits of £52,000 in 1915, as compared with 7 per cent. and £38,000 respectively in 1914.

The Kabelfabrik und Draht Industrie A.G., of Vienna, reports gross profits of £121,000 for 1915, and net profits of £56,000, as compared with £13,000 in the preceding year. It is proposed to pay a dividend of 12 per cent., as against 10 per cent. in 1914.

The accounts of the *Kabelfabrik A.G., of Pressburg*, which has a community of interests with the before-mentioned Kabelfabrik, of Vienna, show net profits amounting to £31,000 for 1915, as contrasted with £24,000 in the previous year. The rate of dividend is 12 per cent., being an increase of 2 per cent. over 1914.

The accounts of *Fellen & Guillaume, of Pesth*, show net profits amounting to £29,000 for 1915, as compared with £17,300 in the preceding year. It is intended to distribute 12 per cent., as against 10 per cent. in 1914. The directors' report states that the works are satisfactorily employed, chiefly on orders for the Army and Navy.

Swiss Electrical Companies.

The Elektrizitäts Gesellschaft Althof, of Basle, which two years ago transferred its manufacturing departments to another company, and then became purely an investment undertaking, reports gross profits of £17,000 for 1915, as against £14,000 in 1914, and net profits of £13,000 and £11,000 in the two years respectively. It is proposed to pay a dividend of 5 per cent. on the ordinary share capital of £240,000, as contrasted with 4 per cent. in 1914.

The Société Franco-Suisse pour l'Industrie Electrique, of Geneva, which is in close association with the group of the Banque de Paris, is unable to pay any dividend for 1915, as also was the case for the previous year, on the ordinary share capital of £1,000,000. The company is interested in railways and tramways, hydro-electric works, and electro-metallurgical undertakings, all of which are situated outside the war area. After meeting the interest service on the loans, amounting to £38,000, the accounts show net profits of £16,000, as against £4,600 in 1914. Most of the profit has been carried forward.

Johnson and Phillips, Ltd.

MR. R. W. BLACKWELL, presiding on April 27th at the annual meeting, referred to the improvement in the accounts, which showed a trading profit of £69,077. In regard to the dividend of 5 per cent., free of tax, on the ordinary shares, he said that the conditions under which the business must be carried on for a considerable period to come did not admit of a larger distribution. They must carry very heavy stocks of material to meet the requirements of the Government. The position of the company was thoroughly sound and steadily improving. During 1915 they had spent on additions to buildings and plant £8,414. They had good reason, under existing conditions, to be satisfied with both the present position and the future prospects of the concern. So long as the war endured, it was more than probable that a large part of their plant would run at full pressure, but a considerable proportion of their machinery and plant which was not susceptible of adaptation to the present requirements might have to lie idle until normal conditions were again reached. He did not believe that their company had been either advantaged or injured financially by the war to any special extent. Their turnover might be somewhat higher than they might reasonably have expected, but the difficulties of doing business, prices and costs of all kinds, had greatly increased, and their margin of net profit decreased. A part of the new machinery that they had built would be of real utility to them when the demand for war material no longer existed. They proposed to continue in their endeavour to bring every part of the works and plant up to the best modern standard. Their stocks, though large, as they must necessarily be in these days, when there were great difficulties in securing material, had been well bought, and stood in the accounts at a safe figure. The chairman laid stress upon the fact that in the present abnormal state of all business the command of ready money was a first essential to the business of the concern. However quickly they might be paid for their goods when finished and delivered, the fact remained that they must buy their material well ahead, and on practically cash terms, and must carry its cost, plus labour charges, for the period of manufacture—say, an average of at least three months on every order received. The comparatively small dividend and the substantial carry-forward that they recommended were most advisable in view of the conditions under which their business must necessarily be carried on for an indefinite, but certainly a considerable, period.

Bath Electric Tramways, Ltd.

SIR J. SWEWRIGHT presided on April 27th at the annual meeting. He said that 1915 could not fairly be compared with any other year. The traffic and other receipts showed a decrease of £5,588. The decrease, however, was largely attributable to the reduction of the company's meters in the latter part of 1914, when a large number of them were transferred to the Government for military service. Economies in operation and in the expenses

of the company more than offset the diminution in receipts, so that they had actually a greater net revenue for 1915 than they had in 1914. The foundry belonging to the company had been engaged on most useful work, and continued to give capital results. Operating, as they had been, for the whole of the year 1915 without a large part of their torpedo fleet, the results compared most favourably with those of the previous twelve months, for nine months of which they were working the whole of their torpedo cars. In 1915 the weather during the spring and summer was very unfavourable, but there was a decided improvement in the autumn, and of this the company felt the benefit. A lot of money had again been spent in repairs and renewals, and everything had been kept in good order. He did not refer merely to replacements or repairs such as were done annually; what had been carried out would last for many years. The company was in a position not only to pay its debenture interest and preference dividend, as well as to redeem debentures, but also to pay something off the loan from the Union of London & Smiths Bank, which had been very substantially reduced. Originally it was £28,000, and it had now been brought down to £16,000, and, although the shareholders had had to forego that £12,000, the value of their shares was improved to that extent. There was a promising future before the company, and if they pursued their present policy they would have an improved fleet and their foundry would be extended. Mr. A. A. C. SWINSON seconded the adoption of the report, which was carried.

Western Electric Co., U.S.A.

The annual report of the Western Electric Co., Inc., which is in effect a re-organization of the Western Electric Co., of Illinois, covers the operations of both the Illinois and the New York companies during the year 1915, thus giving the results of the continuing business without attempting to segregate that part which pertains only to the operations of the new company. The sales for 1915, the report states, were \$63,852,000, as compared with \$66,408,000 for 1914 and \$77,533,000 for 1913. "During the latter part of the year, however," says President H. B. THAYER, "there was an increasing demand for our products, and the present prospects indicate a fair volume of business in 1916, following the general business activity of the country. The costs of our raw material have been very much inflated by the demand for similar material by manufacturers of war munitions or by interrupted supplies of such as usually come from abroad, which continually reminds us that the general business activity is largely founded upon the abnormal conditions abroad. These higher costs materially affect the costs of our manufactures, and when the return to normal conditions comes we may expect a considerable shrinkage in the value of such materials as we may have in stock at that time." The orders on hand, the report goes on to say, on January 1st, 1916, were \$2,111,000 in value more than on January 1st, 1915. The average value of an order filled during 1915 was \$55, as compared with \$56 for 1914. The number of employes on January 1st, 1916, was 17,135, as compared with 15,650 on January 1st, 1915.—*Electrical World*.

North of Scotland Electric Light and Power Co., Ltd.

Considering the conditions, satisfactory progress was made in 1915. Lamp connections in Montrose increased from 1,114 k.w. to 1,163 k.w.; in Brechin from 738 k.w. to 776 k.w.; and in Inverness from 1,286 k.w. to 1,452 k.w., making a total of 3,391 k.w. connected in the three towns. The gross profit, including £2,420 brought forward, is £9,458, and after meeting interest on debentures and loans amounting to £2,856, and writing off £57 from suspense account, a net profit of £6,546 remains. A dividend at the rate of 3 per cent. for 1915 is recommended, absorbing £1,500, £2,000 is to be placed to renewal reserve, £1,000 to general reserve, and £2,046 carried forward.

Babcock and Wilcox, Ltd.

The net profit for 1915 was £396,551, plus £69,492 brought forward. After paying dividends of 6 per cent. on the preference and 5 per cent. on the second preference shares for the year, 9 per cent. is to be paid on the ordinary for the past half-year, in addition to the interim dividend of 6 per cent. already paid; £150,000 is to be placed to reserve, and £10,000 to the staff pension fund, leaving £42,125 to be carried forward. The business has been a controlled establishment since August last. Additional premises were acquired during the year adjoining the Renfrew works, and other extensions have also been carried out. The company is, and has been, short of men, and is now introducing female labour in some departments. A large proportion of the staff joined the Forces, but the extra demands made on those remaining have been met with a spirit of enthusiasm. The company continued to contribute to the maintenance of dependents of the staff with the Forces. Annual meeting: May 9th.

Calcutta Electric Supply Corporation, Ltd.

During last year 21,081,923 units were sold, compared with 15,387,471 in 1914. The number of houses connected was 8,768, an increase of 588. The gross revenue was £224,206, as against £202,455 for 1914. The net revenue was £162,922 (as against £140,609 for 1914), calculating the exchange at 1s. 4d. per rupee. Adding the balance brought forward and interest received on money at deposit, the total is £176,602. After paying the interim dividend of 34 per cent., actual, paid on the ordinary shares in November, 1915, the dividends paid and accrued on the preference shares, and the other

items in the net revenue account, the available balance is £122,177. £52,000 is to be placed to the credit of the depreciation and renewals account, £10,000 to the reserve fund, and a final dividend at the rate of $\frac{5}{2}$ per cent. actual is recommended, making 9 per cent. for the year, leaving £30,000 to be carried forward after providing for the directors' extra remuneration of £2,500, and a bonus of £1,629 payable to the staff in India. The reserve for depreciation and renewals will thus be increased to £229,444, and the reserve fund, with the addition of £2,184 from dividends on investments, will stand at £126,704. The expenditure on capital account during the year amounted to £122,344, making the total outlay £1,380,827. The demand for electrical energy continues to increase steadily, and the result of the working for the year must be considered satisfactory. Units generated, 27,573,446; public lamps units sold, 476,373; sold by special contract, 613,271; lighting units by meter, 4,371,865; power units by meter, 15,620,419; used on works, 5,295,156; not accounted for, 1,196,362. Annual meeting: May 10th.

Consolidated Diesel Engine Manufacturers, Ltd.

The *Financial Times* states that another half-yearly statement by the liquidator has just been issued, bringing the record of the accounts up to January 6th last. In the interval the whole of the unsecured creditors have been paid off, leaving a balance of £52,800 in hand, so that the contributors are likely to receive a small portion of their capital back, but it would appear that there are still some uncompleted contracts in hand, and the rest of these may have to be set against the value of the remaining assets. "The liquidation has now reached the unprofitable stage, and the sooner that it is really closed the better." For the six months the costs and charges amounted to £32,200, while the total receipts were only £1,700, so that there was a loss of £1,500. The collection of book debts has been particularly disappointing, only £10,400 having been yet got in out of £28,100 marked "good" in the secretary's original statement, to say nothing of £69,900 scheduled as "doubtful." How far the war is responsible for this it is impossible to say, but we are afraid that not much value can now be attached to the company's Belgian interests."

Puebla Tramway, Light, and Power Co., Ltd.

The report for 1914 states (says the *Financial Times*) that the net profit in Mexico amounted to \$692,499 Mex., as compared with \$736,952 for 1913. Reckoning the earnings at the parity of exchange there is a debit balance—after charging all expenses, bond interest and first mortgage bond sinking fund—of £17,154, but owing to the heavy loss on exchange, which amounted to £42,996, the final result is a debit balance of £60,150. The average exchange was 13.78d., as against 24.5841d. par value and 21d. in 1913. At the date of this report the value of the peso is about 2d. The transmission line to Vera Cruz was completed and power delivered to that city at the end of the year, and commencing with January, 1915, a regular supply of power has been given to the Vera Cruz Electric Light, Power & Traction under contract. Except for a small amount of damage done by bandits from time to time and considerable thefts of copper, the company's properties remain intact. Owing, however, to the difficulty of operating the plants at Portezuelo and San Agustín, in face of continued interferences, these were closed in August, 1914, and the Tuxpango plant has since borne the entire load of the company's output. The business has suffered during the year on account of a large number of factories having been destroyed or closed down. Owing to the disturbed conditions of trade and the heavy fall in the exchange value of the Mexican dollar a meeting of the first mortgage bondholders was convened and duly held on July 30th last, when a resolution was passed sanctioning a modification of the rights of the bondholders.

Oriental Telephone and Electric Co., Ltd.

SIR GEO. FRANKLIN presided at the annual meeting on April 26th. He said that one of their colleagues, Capt. Akers, was in France on military service. After explaining the sources from which the company derived its income, he said that the gross revenue from subscriptions, rentals, and sales was \$55,336, an increase of £3,605, which was due mainly to development in Madras, Mauritius, and Singapore. Dividends and interest from subsidiary companies, £33,429, showed an increase of £1,696, due to larger dividends from the Bombay and China and Japan companies. The Bombay Co. now paid 20 per cent., and the China & Japan Co. 10 per cent. The working expenses amounted to £28,870, plus £9,656 for London expenses, which had been largely increased by heavier income-tax and excess profits duty. In regard to the charge of £5,500 against revenue for depreciation of securities, it was necessary to write off that amount in order to bring their War Loan and Cape stock well within the market prices on December 31st last. The balance to the credit of net revenue account was £61,957. With reference to the transfer to reserve, it should be borne in mind that telephone plant in tropical or semi-tropical countries was peculiarly liable to depreciation, not merely from ordinary wear and tear, but from other causes, such as the substitution of underground for overhead construction, developments in the art, typhoon storms, and many other contingencies of that kind. With regard to the Telephone Co. of Egypt, controlled by the Oriental Co., they had recently sent their consulting engineers to make a very care-

ful investigation, and to report as to the state of the plant, &c., and its value. They hoped, also, to get much useful advice for the carrying on of the business. With the figures and the information which they hoped to get in that way they would have conclusive evidence as to the value of their plant and property, which they conceived to be very necessary at this time. Having done that with regard to Egypt, it might be necessary to extend it a little further, and to consider how far it was desirable to gain similar information as to the value of their plant, and the best means of developing other parts of the company's systems. While he did not want to commit the board to anything more than that, then, the shareholders would see the bearing that this had upon several questions which might arise out of what he was going to say. With regard to the Oriental Co., they were proposing to earmark, for the first time, £40,000 to the reserve fund for depreciation, and whereas last year they had a carry-forward of some £56,000, they were only proposing to-day to carry forward £15,000. But they were transferring £70,000 to a reserve fund account. The question as to how much, if any, of the £70,000 was profit, depended upon the investigation they were proposing to make. That investigation would enable them, first of all, to see whether their assets were worth the balance-sheet figures—the capital which had been expended on lines, exchange equipment, and telephone plant. He need hardly explain the absolute necessity of keeping the company strong and safe. One of the first things, and the last, which a telephone company wanted was new capital. It was the breath of life to it. Without new capital they were unable to take advantage of opportunities of development which were of vital importance. These were not times when they could get Treasury sanction to increases of capital. The first thing, then, was to see that the value of the assets was sound. Secondly, it would be for them to consider how far, if at all, there might be any probable distribution from this source. He referred to the difficulty which would be created if they were to deplete themselves of cash in order to make any distribution of that kind. The stores on hand and in transit had increased to £45,512 during the past year, largely due to £17,000 which was in cables for Singapore and Madras in transit on December 31st last. They had learned since that the cabling work in those two places was proceeding satisfactorily and would enable the company to meet the development from time to time. With regard to their subsidiary companies, the figures in each case showed good progress. The Telephone Co. of Egypt grew in strength and continued to pay its 10 per cent. dividend. The circumstances of the war had cast upon the company considerable responsibilities in the construction of lines for the service of the military. In Hong-Kong and Kowloon the China and Japan Co. had made good progress, the gross revenue being increased by £3,400. The Bengal and Bombay companies had each shown satisfactory development, though their figures were also somewhat affected by the war.

Anglo-American Telegraph Co., Ltd.—The three quarterly dividends on the ordinary and preference stocks paid in May, July, and November, 1915, absorbed £157,500, and including the final dividends paid in February, absorbed £262,500, being the rent paid by the Western Union Telegraph Co. for the year, equal to $\frac{3}{4}$ per cent. on the ordinary stock, 6 per cent. on the preferred stock, and $\frac{1}{2}$ per cent. on the deferred stock. A bonus of 1s. 9d. per cent. on the ordinary and 3s. 6d. on the deferred stock was paid on February 1st, 1916. The balance at credit of revenue account, £97,153, includes £1,328 interest received, and the balance of £65,625 is available for dividends for the quarter to March 31st. Annual meeting: May 5th.

City Electric Light Co., Ltd. (Brisbane).—For the year ended January 31st, 1916, the credit balance is £20,133, after making additions to the franchise and purchase sinking fund, and renewal, replacement and contingencies account, and allowing for depreciation. An interim dividend was paid last September absorbing £8,987, and a further 3 per cent. has been paid on the preference shares, 5 per cent. on the ordinary, and 5 per cent. on the contributing shares; these payments, together with the dividend duty and an allowance for Federal income-tax, will absorb £10,892, leaving £1,569 to be carried forward.

A. Reyrolle & Co., Ltd.—The accounts for 1915 show a profit, after providing for depreciation, &c., of £11,853, there being an available sum, including £2,813 brought forward, of £14,696. Dividends of 12 $\frac{1}{2}$ per cent. on the preference shares and 12 $\frac{1}{2}$ per cent. on the ordinary shares have been declared. £5,000 being placed to reserve for general purposes and £3,996 carried forward.—*Financial Times*.

Alderley & Wilmslow Electric Supply, Ltd.—During 1915 the total lamp connections increased from 1,036 kw. to 1,092 kw. There is a profit of £3,094, plus £1,042 brought forward, and after paying £1,055 interest on debentures and loans, £2,442 remains, of which £1,200 is to be put to reserve fund and £1,242 carried forward.

Metropolitan Electric Supply Co., Ltd.—The ordinary general meeting which was adjourned until May 2nd or such later date as the committee might agree, will be held at a later date.

Indian Electric Supply & Traction Co., Ltd.—The surplus on working in Cawnpore during 1915, including £141 for interest accrued, was £15,932 (against £12,724 in 1914), and including further interest in England and transfer fees, the credit side of net revenue account shows a total of £15,992. London expenditure was £1,688 (against £1,537 in 1914), and after providing £3,900 for debenture interest a net profit of £10,264 is shown, plus £717 brought forward. Out of this, £2,000 has been placed to general reserve, £3,000 to reserve for depreciation and renewals, and £500 against expenses of the debenture issue. A final dividend of 3½ per cent., making 6 per cent. for the year, is recommended, absorbing £4,681, and £800 is to be carried forward. Annual meeting: May 5th.

Tramways & General Works Co., Ltd.—Including the balance brought forward, the amount now standing to the credit of the profit and loss account is £540, out of which the directors recommend the payment of a dividend at the rate of 4d. per share (less income tax), absorbing £333, and leaving £206 to be carried forward.

City of Buenos Aires Tramways (1904), Ltd.—A dividend of 1s. 3d. per share (at the rate of 5 per cent. per annum), less tax, for the three months ended March 31st is announced.

STOCKS AND SHARES.

TUESDAY EVENING.

Collapse of the Irish "rebellion" has done something to help the sentiment in the Stock Exchange, and with no more holidays in sight until Whitsun, markets should be able to settle down in earnest to such work as they can find. Business in securities may be affected to no small extent by that call to the Derby Groups which comes into operation at the end of the present month, but the Stock Exchange is not meeting difficulties half-way, and the future is left to look after itself.

Meanwhile, the pronounced strength of all issues connected with the cable industry is still the outstanding feature of the markets dealt with here, and to this must be added a readiness on the part of the public to buy most of the "chemical" shares. These last are being taken principally by Liverpool and certain of the manufacturing towns in the North, where the investor is eager for the offer of shares in companies of which Castner-Kellner may be taken as a fair example.

Continued strength is shown by the electricity supply shares. City preference and County preference are both ½ better at 10½, though City "Lights" are ½ easier at 11½. There is still a demand for other good-class shares in this market, and, as we have pointed out before, comparatively little supply. A somewhat sensational rise is one of 12s. 6d. in Edison & Swan fully-paid shares, the price jumping to 1½ upon persistent buying—or demand, rather, inasmuch as there have been few on offer and holders are by no means anxious to sell. The partly-paid rose 3s. to 12s. in sympathy. The market seems rather puzzled to account for advances so violent as these, but the buying proceeds from sources which should certainly know what they are about.

Babcock & Wilcox are firm at 2½ bid, on the issue of the report. The raising of the dividend by 1 per cent. to 15 per cent. does not look a particularly brilliant achievement, but it has to be remembered that the distribution is made free of tax, and consequently the yield is higher than it appears. The company's net profit was actually £6,000 smaller than that for the previous year, the whole of this, and more, being due to increase in income-tax, for the gross profit showed an advance of £13,300. Castner-Kellners are better, in company with most of the chemical shares; and British Westinghouse preference hardened to 2½. There is no quotable change amongst cable manufacturing shares, but the market is a good one.

Eastern Telegraph ordinary gained 1½, and small rises are shown by several of the other principal shares in this section. Marconis are dull, the recent bout of buying coming to an end somewhat abruptly. American Marconis are quiet at about 15s., while Canadians are 8s. 3d.

Latin-Canadian companies are doing well. The last published accounts show that satisfactory increases in earnings over the corresponding months in 1915 were secured by the Brazilian Traction, the Consolidated Gas and Electric Light, of Baltimore, and the Power companies of the Mississippi River, the Shawinigan and the Pennsylvania. From the market point of view, however, April was quiet, but there was a slight appreciation in prices on balance.

Within the past few business days has come a faint improvement in some of the Mexican prices, marked more in the railway departments than amongst utilities. The bonds of the Mexican Light & Power, and the Mexico Tramways are still all but unsaleable, though railway stocks have hardened in consequence of a jump in the price of silver that has taken it higher than it has stood for about a quarter of a century. The political situation in Mexico is little or no better, but if this were to take one of its unexpected turns—it could hardly be for the worse—Mexican utilities might make a vivid recovery. Seeing that the leading issues have suffered losses

ranging from 20 to 45 points since the outbreak of war, there is at least scope for reaction, even when the succession of blows at the companies is remembered and appreciated. The period for deposit of the bonds in the Mexico Tramways Group of Companies has just been extended until the end of June.

Brazil Traction are a point higher on the week at 5½. Other Latin-Canadians are good. New York has got over its recent fit of apprehension with reference to the diplomatic situation between the States and Germany, and, furthermore, manages to extract some degree of confidence from the reported refusal of Washington to withdraw the American troops from Mexico at the instance of the Carranzist party.

Home Railway stocks dropped back into lethargy, for which the Irish situation was held to be responsible. Unfortunately, the market made no particular recovery upon the surrender of the rioters. It is jocularly suggested that the sudden inrush of summer weather may have something to do with the cessation of buying orders in Underground Railway stocks. These issues are all easier, Metropolitan being the principal losers. Business in the group as a whole is quiet.

Rubber shares, moreover, are much less active. The price of the raw stuff has gone back to the near neighbourhood of 3s. per lb., and while such a factor would have weighed but little in an active market, it assumes importance when the upward movement shows signs of slackening. Armament shares hold their positions fairly steadily. Coppers are somewhat erratic, and in most of the other base-metal shares—silver alone excepted—the prevailing tendency leans towards dulness and rather lower values.

Fluctuations in April.

THE LJUNGSTRÖM TURBINE AND ITS APPLICATION TO MARINE PROPULSION.

By ROLAND S. PORTHAM.

(Abstract of paper read before the INSTITUTION OF ENGINEERS AND SHIPBUILDERS IN SCOTLAND.)

EARLY in 1913, the favourable results achieved by the turbine associated with his name led Mr. Birger Ljungström, of Stockholm, in conjunction with his brother—Mr. Frederick Ljungström—to consider the question of electrical propulsion for commercial vessels. The pioneer ship, the *Mjölner*, of 900 S.H.P., with two generating units, each of 450 S.H.P., has been running since December, 1914, and the fuel consumption under the same conditions of deadweight, speed, and coal has averaged 38.6 per cent. less than that of her sister ship, the *Mimer*, fitted with triple-expansion reciprocating engines.

Messrs. Ljungström recognised that an important feature in marine propulsion was that the generating plant should be subdivided into at least two entirely independent units, so that either set could drive the ship at about three-quarters speed, running under relatively economical conditions. Natur-

FIG. 1.—CONSTRUCTION OF BLADE RING.

ally, this subdivision of power, though conducing to maximum reliability at sea, necessitates an efficient, light, and accessible turbine.

In 1907, Messrs. Ljungström came to the conclusion that the pure reaction principle offered certain advantages over the impulse type, more especially for turbines of larger output. The drawback, however, in the reaction system was the large number of rings and blades, involving a correspondingly long rotor to ensure a reasonable efficiency, and the

FIG. 2.—SECTION OF BLADE RING.

attendant tendency to distortion of casing with varying temperatures, necessitating considerable tip clearances and corresponding leakages.

With a view to reducing such excessive length, Messrs. Ljungström experimented on various widths of blades, and found that these could be reduced to 5 mm. in the high-pressure end and to 17 mm. in the low-pressure end without affecting the efficiency. They realised, however, that shortening the turbine axially did not solve the problem of adjusting the passage of steam through the blading as to allow it to follow its natural curve of expansion from a stop-valve volume of about 2½ cu. ft. per lb. up to a volume of over 300 cu. ft. per lb., at a vacuum of from 28 to 28½ in. They, therefore, conceived the idea of turning the plane of the blade area through an angle of 90 deg., thus converting the direction of steam from axial to radial flow, and were thus enabled to proportion the areas of the successive blade rings so as to follow the true expansion curve of steam from turbine inlet to condenser. Simultaneously the great advantages were realised which would accrue were the guide blades in the ordinary turbine designed so as to revolve at the same speed as the moving blades, thus doubling the relative speed of the blade rings, and therefore necessitating only one-quarter the total number of rings for the same efficiency. Messrs. Ljungström concluded that the only satisfactory method of double rotation would be on the pure reaction principle of alternate concentric blade-rings, the steam reacting from the first blade ring to the next ring surrounding and concentric thereto.

As it was important that the clearance between the revolving rings should be as small as possible, the next step was

The Metric System.—The secretary of the Decimal Association is informed by correspondents in the U.S.A. that at the opening of the present session of Congress, a Bill was introduced by Mr. C. H. Dillon, making the metric system of weights and measures permissive till July, 1920, after which date it is to be compulsory and exclusive. This Bill is being considered in Committee, and the members are reported to be much impressed with the facts that domestic business would be greatly facilitated by the more scientific system, and that commerce with all parts of the world, and especially with South America, would be sensibly promoted if a metric basis were accepted. It is evident, therefore, that the advantages to be gained from the adoption of the metric weights and measures are being fully considered in the U.S.A., and that we shall have to face serious competition and be more severely handicapped than ever if we remain the only civilised nation which has not adopted metric weights and measures and a decimal system of coinage. The change in the U.S.A. should be made more easily than in this country, as the people there are already accustomed to think in decimals.

Judging from the editorial comments of the *American Machinist*, many manufacturers object to the proposed reform, which carries with it punishment by fine or imprisonment for the use of weights and measures other than metric after July 1st, 1924.

to hold them in their supporting disks that any distortion consequent on the variation in temperature between the blade ring and the framework should be eliminated. The original idea was, therefore, conceived of carrying each blade ring on its own expansion ring, and embodying a series of expansion or breathing rings throughout all parts of the turbine subject to temperature differences.

The period between 1907 and 1909 was spent by Messrs. Ljungström in preparing the designs of all the essential details, and the results of their careful work were embodied, in 1910, in the first turbine constructed by them of 750 B.H.P., running at 3,500 R.P.M., which gave a trial steam consump-

tion of 8.9 lb. per B.H.P. per hour, total temperature of steam 626 deg. F., vacuum 28.6 in., and 171 lb. per sq. in. absolute pressure on the turbine inlet-valve.

Since that date an aggregate of about 200,000 B.H.P., of a design practically identical with their first turbine, has been put in operation or under construction. Fig. 3 shows a 1,500-B.H.P. turbo-alternator, 16 ft. long overall, and 4 ft. 2 in. in diameter.* Two 3-phase alternators, each of half the capacity of the turbine, are coupled to opposite ends of the turbine, and run in opposite directions, at 3,000 R.P.M., the relative speed of the blades being 6,000 R.P.M. The running

FIG. 3.—LJUNGSTRÖM TURBO-ALTERNATOR.

FIG. 5.—SET OF 21 RINGS.

so that the fluctuations of temperature in shaft and hub follow one another, and thus avoid play between the hub and the shaft.

A general inspection of the half longitudinal section shows a number of small dumb-bell-shaped sections. These are not links, but cross-sections of circular rings made of nickel steel. They are the expansion or breathing rings previously referred to, which form one of the essential features of the turbine, and are interposed between any two parts which would be otherwise liable to distortion due to variation of temperature. These expansion rings are interposed between the blade rings

and supporting disks, between the component parts of the disks themselves, and between the steam chests and their supporting frames.

Figs. 1 and 2 show the method of construction of the blade rings. The blades are made of 5 per cent. nickel steel. Counting from the centre line, x y, fig. 4, the first 33 rows are 5 mm. wide, the next five are 7 mm., and the last two 12 mm. and 20 mm. respectively. The blades are milled from solid rough-turned bars and polished to a mirror-like surface both inside and out. They are then cut into lengths (11), fig. 1, and are notched on the ends for insertion into

FIG. 4.—HALF LONGITUDINAL SECTION OF LJUNGSTRÖM TURBINE OF 1,500 B.H.P.

speed is half the critical speed, and there is no vibration in running up to full speed. The set weighs 15½ tons. Fig. 4 shows a half longitudinal section of the turbine, the axis of which is x y. Steam enters by the vertical pipes a a, and passes through the holes b b milled in the hub of each supporting disk to the innermost blade ring No. 1, then radially

* An illustrated description of the Ljungström 1,000-h.p. turbo-alternator as made by the Brush Electrical Engineering Co., Ltd., appeared in the *ELECTRICAL REVIEW* of October 10th, 1913.

mild steel retaining frames (15). A side view of such retaining frames is shown with registers or slots to receive the blades (19). The turbine blades are retained in their positions by means of thin sheet-iron strips (20), in which are punched holes of the same cross-section as the blades, and at a distance corresponding to the pitch or spacing of the blades. These strips are applied in their places simultaneously with the assembling of the blades in the retaining frames, the angles of the blades being thus properly set, and the blades prevented from shifting during the welding operation. The blade ends are welded up solid in their frames by melting iron wire under the oxy-acetylene blow-pipe, thus filling up

revolves with it; whilst E is fixed to the stationary part of the steam chest. Steam is admitted between these dummies from the centre of the turbine. The inner labyrinthic packings receive the full steam pressure, the pressure gradually decreasing from the centre until it finally drops to that of the condenser outside of the outermost labyrinth. Each rib of the fixed dummies has a small groove on its outer face, into which a folded strip of thin nickel is lightly driven.

These labyrinthic dummy packings form a very accurate method of balancing the axial thrust. Should the load increase in the turbine, the receding labyrinthic face D approaches the fixed face E, thereby increasing the space between the nickel

FIG. 6.—HALF LONGITUDINAL SECTION OF LUNGSTROM TURBINE OF 10,000 H.P.

the channels (18). The blade ring thus obtained is then turned up in a lathe, giving the dovetail shape (10), fig. 2, and the sheet iron strips are cut away. Strengthening rings (9), fig. 2, made of the finest grade spring-steel are then dovetailed into the blade ring, and the edges squeezed in so as to grip the dovetail tightly, by means of hinged rollers carried on the lathe tool rest. A groove is formed in one of the strengthening rings (9), to receive the dumb-bell-shaped expansion ring (4), the other end of the dumb-bell being rolled into the seating ring (2), which is subsequently fixed to the supporting disk, to which it is secured by a caulking strip (3), fig. 2. Each blade ring is now complete, with the exception

strips, and causing high-pressure steam to enter between A and D, forcing D in the opposite direction, and automatically closing the labyrinthic openings. A small dashpot is fixed to the end of each rotor shaft for the purpose of damping any oscillatory movement which would otherwise occur. The

FIG. 7.—ROTOR OF 1,500-H.P. TURBINE.

of two pure nickel fins (7), fig. 2, which are caulked into the top surface of the strengthening rings by two pieces of soft iron wire (8). The function of the nickel fin is to prevent side leakage from any pair of counter-rotating blade rings. Fig. 5 shows the completed series of 21 rings ready for insertion in the supporting disk.

Referring again to fig. 4, it will be obvious that the steam entering the centre and flowing through the series of turbine disks to the condenser, will displace each rotating half axially outwards relatively to the other, unless this is counteracted by a corresponding reverse pressure. This is effected by a series of labyrinthic dummies E D, of which D is attached to its respective rotating disk through three expansion rings, and

FIG. 8.—TURBINE, WITH STEAM CHESTS.

shaft packings F, fig. 4, which reduce shaft leakage to a minimum, are of nickel steel, designed to expand freely in all directions without distortion. Packing for a 1,500-h.p. turbine occupies a length of less than 3½ in. of the shaft, but contains no fewer than 158 constricting surfaces. The actual leakage through these glands is less than 1 per cent. of the maximum output of the turbine, but this is not wasted, as a separate pipe leads it to the feed-water heater, where it is economically utilised.

L.M., fig. 4, shows the overload by-pass, which introduces high-pressure steam direct into the outer blade rings through a series of 60 holes drilled circumferentially in the supporting disk.

The shaft bearings of the turbine are provided with delicate methods of adjustment by four adjusting screws fitted with hemispherical heads (fig. 9). Each adjusting screw is provided with a pair of locking washers on which are 12 and 11 holes respectively, thus giving 132 different positions for each turn of the adjusting screw, corresponding to a thread with a very fine pitch. An eccentric ball admits of axial adjustment by turning its corresponding screw.

All bearings are automatically lubricated by oil under forced pressure. It is impossible to start the turbine unless the bearings are lubricated at their normal oil pressure, as should for any reason the oil supply fail, the turbine will automatically shut down.

The oil pump is of the ordinary geared type, driven directly by the governor spindle, and maintains a pressure of 35 lb. per sq. in., which is lowered to about 15 lb. for the bearing lubrication by means of a reducing valve. The throttle valve is normally pressed to its seat by means of a powerful spiral spring acting vertically downward. On the lower side of the valve spindle is attached a double-beat piston. The oil pressure acts on the bottom side of this piston, and consequently has to work against the spiral spring in order to open the throttle valve. Thus any variation in oil pressure varies the position of the throttle valve, which, through a floating lever and side shaft, maintains a constant relationship between the position of the stop valve and that of the governor, fig. 9, which is of the Horton Medlock type.

FIG. 9.—SECTION OF GOVERNOR AND SHAFT BEARING.

An emergency release device is supplied by a steel cable which, so long as it is in tension, holds shut an oil relief-valve in the relay controlling the stop-valve; in the event of the turbine attaining an excessive speed or the bearings becoming unduly heated, the cable slackens, thus releasing a lever at the side of the stop-valve; this releases the oil pressure, the tension spring operates, and the turbine stops.

To start the turbine, the handle at the top is unscrewed a couple of turns, so as to admit sufficient steam to raise the disk valve from its seat, allowing steam to leak past the double-beat piston-valve, which is quite sufficient to warm up the turbine in a few minutes. A few strokes of the hand pump raise the oil pressure sufficiently to lift the piston on the valve spindle against the downward pressure of its spring, so that the turbine starts, and when once it has attained its normal speed the regulation becomes automatic.

The enclosures are of very substantial construction, the whole machine forming a rigid cylindrical structure, which is adequately supported on the condenser inlet, thus forming a direct path without the necessity of intermediate points. As the turbine casing, itself part of the condenser chamber, it requires no external lagging.

A ventilator is attached to the rotor of each generator draws in air through a special inlet and propels it through slots in the stator, and thence the airgap between stator and rotor, to an outlet, whence it can be conveniently led through ducts to the exhaust duct or preheater in the boiler, dispensing with a separate fan engine. Fig. 7 illustrates the 1,500-B.H.P. turbine, the steam chests being removed, coupled to one rotor.

The relative lightness of the rotating parts of the Ljungström turbine, coupled with their mechanical construction,

should dispel any criticism respecting the overhang. In the case of the 1,500-B.H.P. machine, the weight of each revolving part, that is, turbine rings, supporting disk, and attached labyrinth packing, is only 265 lb. and 303 lb. respectively, while the maximum overhang to the outside of the bearing is 10½ in.

Fig. 8 shows the 1,500-B.H.P. turbine complete with its steam chests being lifted out of the casing, and separated from its generator rotors. The total weight of turbine and steam chests is about 1,300 lb. The complete turbine can be removed for inspection, and opened up in two hours. The overall diameter is 29 in. and overall length across the steam chests 27½ in.

No insulating jackets need be removed to make bolts and nuts accessible. The internal parts of the turbine are made accessible by lifting off the upper part of the turbine casing. The couplings between the generator shafts and the turbine wheels are then unscrewed, and a clamp is applied to the steam chests. By the aid of this clamp the whole turbine and its steam chests are lifted together.

Fig. 6 shows a longitudinal half cross-section of the largest Ljungström turbine actually completed, the maximum output being 10,000 B.H.P., and speed 3,000 R.P.M. The diameter of the outer blading is 34 in. The width of the outer rings necessary to give the required blade area is here obtained by building up a series of six independent blade rings, thus giving a sufficient stiffness to the drum as a whole. Each ring is connected with its neighbour through an expansion ring dovetailed and rolled together.

(To be concluded.)

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Lightning Arresters.

A recent list issued by the BRITISH THOMSON-HOUSTON CO., LTD., Rugby, describes the type M form D₂ lightning arrester for direct-current circuits. It consists of a single spark gap with a non-inductive resistance in series constituting the discharge path to earth: the spark gap is protected by a magnetic blow-out coil connected in parallel to part of the resistance, and should any arc form from the supply system follow the lightning discharge and tend to maintain the arc, a portion of such current will pass through the blow-out coil, producing a magnetic field tending to blow out the arc. The spark-gap terminals are threaded, allowing of adjustment; the box and cover are made of brown glazed porcelain, and the exterior view is shown in fig. 1.

Easy Clip Shade Carrier.

MISSRS. SIEMENS BROS. DYNAMO WORKS, LTD., of 38, Upper Thames Street, E.C., have placed on the market a new shade-carrier of neat design, which simplifies shade fixing. This carrier is shown in figs. 2 and 3; it consists of two sets of claw grips, the inner ones to engage the screwed part of the lampholder and the outer ones to grip the shade. The clip is compressed by hand and forced into

FIG. 1.—B.T.H. LIGHTNING ARRESTER

FIG. 2.—EASY CLIP SHADE CARRIER.

FIG. 3.—EASY CLIP SHADE CARRIER IN POSITION.

the top of the shade, where it holds in position: the shade and clip together are then forced over the lampholder, when the inner grips engage with the thread on the holder. The shade is removed by unscrewing, and it is not possible to remove it otherwise, as the grips act in opposite directions.

This clip renders the fixing of deep shades an easy matter, and when in position it presents but little difference in appearance from the ordinary shade ring.

Helsby Zinc Rods.

THE BRITISH INSULATED & HELSBY CABLES, LTD., of Prescott, have sent us particulars of their special zinc rods for Leclanché cells. The ordinary rods of uniform section are usually eaten away chiefly at a point one-third of their length from the bottom, and consequently much zinc is wasted, especially in the stump which remains at the top. The Helsby zincs are therefore made thinner at the top and thicker over the lower half of their length, so that the material is more efficiently used, and an equal life is attained at reduced cost.

HYDRO-ELECTRIC DEVELOPMENT IN AMERICA.

THE following notes are extracted from an address by Mr. Maurice Deutsch, delivered at the recent Pan-American Scientific Congress, and abstracted in *Power*:—

At present the total hydro-electric development of Niagara Falls is only 455,000 H.P. by five power companies. The average flow of the Niagara River is estimated at 222,400 cu. ft. per second, or about 25,000,000 tons per hour. Considering the total fall in the river from half a mile above the Falls to the Pool below as being 216 ft., there is, theoretically, available a total of 5,700,000 H.P. Assuming a turbine efficiency of 87 per cent. (this has recently been carried to about 93 per cent) and a generator efficiency of 92 per cent., the average available power would be about 4,500,000 H.P. This may be reduced by reason of friction losses, &c., to a net 4,300,000 H.P.

Three of the most interesting waterfalls in the world are to be found in South America—the Iguazu, Naounday, and La Guayra. The Iguazu is probably the most important, its height and the volume of water being greater than those of Niagara Falls. It enters the upper Paraná River about 1,500 miles from the Atlantic Coast, at the junction of Argentine, Brazil, and Paraguay, and lies in the midst of a primeval forest. It is estimated that about 28,000,000 cu. ft. per minute bursts through a series of thickly wooded islands, and makes a clear leap at this point of 210 ft. into the gorge below.

About 200 ft. above the entrance of the Iguazu, on the Paraná River, are the Falls of La Guayra, 310 ft. high, with an estimated flow of over 13,000,000 cu. ft. per minute. The physical conditions around this fall make it in every way a natural water power requiring only the installation of power-houses and penstocks. Although the journey from the Atlantic Coast to this falls takes about 12 days, the straight-line distance to the Atlantic Coast markets is not more than 400 miles. This entire country is wealthy in timber and other natural resources, awaiting only the assistance of capital for its exploitation.

In the United States the most remarkable development in recent years is that of the Big Creek, a tributary of the San Joaquin River, on one of the most inaccessible sites in the Sierra National Forest Reserve, 250 miles north-east of Los Angeles, California, and at an elevation of 7,000 ft. above sea level. The snow water from mountains 10,000 ft. high is stored and fed to two power plants, utilising in turn heads of nearly 2,000 ft. in horizontal distances of 2 miles to the first station, and 4 miles to the second. Power is transmitted 241 miles to Los Angeles at 150,000 volts, for industrial, lighting, and street-railway uses. The present plant has a capacity of about 80,000 H.P., but it is ultimately to be developed for 400,000 H.P.

The Coosa River project is the first of a number of hydro-electric developments by the Alabama Power Co. in Central Alabama, about 40 miles from Birmingham. The maximum distance of transmission is 150 miles. This company is largely financed by English capitalists. The present power house will provide for the installation of six 12,500-H.P. units operating under a 68-ft. head and at a voltage of 110,000. The ultimate capacity will be 400,000 H.P.

In power output, and especially in physical magnitude, by far the largest hydro-electric power plant in the world is that at Keokuk, Iowa, on the Mississippi River. The ultimate installation contemplates 30 turbines, each having a rated capacity of 10,000 H.P. at the normal head of 32 ft. At the maximum head of 39 ft. the output of each of these will be about 14,000 H.P., and at the minimum operating head of 20 ft., approximately, 6,000 H.P. The operating voltage is 110,000.

One of the largest water powers in the United States will be the Mount Shasta Power Co.'s development now in progress on the Pitt River, at the head of the Sacramento Valley. Its position will enable it to furnish power to the mining interests and mountain railroads of Northern California and to all towns and cities as far south as San Francisco and Oakland at a maximum transmission distance of 224 miles. Interesting features are the largest water-power tunnels in the world—16 × 19 ft. and 36.753 ft. long. The distance from the intake portal of the tunnel to the power house will be not quite 9 miles.

An important hydro-electric development in Brazil is the Pirahy plant of the Rio de Janeiro Light and Power Co. on the Lages River. The original plant had six vertical impulse wheels of 9,000 H.P. each, the maximum distance of transmission being 51 miles. As a result of the rapid growth of the cities served, the demand has exceeded the original capacity of 54,000 H.P. and the power house has been enlarged so as to make room for the

two largest impulse turbines built to date, each capable of producing 20,000 H.P. at a speed of 300 R.P.M. under a net head of 900 ft.

In 1914 the Sao Paulo Electric Co. started its plant at Sao Paulo, Brazil. The present capacity is 40,000 H.P., and current is transmitted 56 miles at 88,000 volts, to Sorocaba and vicinity. Ultimately, it will have a capacity of 67,000 H.P. One of the units in this plant has a capacity of 14,500 H.P. under a head of 600 ft.

While formerly gravity waterwheels were used to a greater extent than reaction or impulse wheels, the practical water prime movers to-day have been reduced to two—the Francis turbine and the impulse wheel. These have been applied to a range of head from 6 to over 5,000 ft. With the marked advance in the workable speed of these machines, it is now possible to develop water power under heads heretofore considered impracticable. A single-runner high specific speed mixed-flow Francis wheel has recently shown an efficiency of 93.7 per cent.

The largest single units so far constructed are the 17,000-H.P. vertical Francis turbines installed at Tallulah Falls. These operate under a head of 600 ft. Manufacturers now declare that 40,000-H.P. units are quite practical if the demand arises.

Niagara Falls power is transmitted to Syracuse and to Oswego at 60,000 volts. The Southern Sierra Power Co. transmits power from Bishop, California, to San Bernardino, California, 238 miles, at 150,000 volts. The Province of Ontario has been delivering Niagara power 130 miles and has continued its line to Windsor, a distance of 235 miles, at 110,000 volts. Already improvements are at hand permitting a still larger transmission at a voltage of 150,000. The standard generating voltages are 2,300, 3,600 and 11,000, the choice being governed by the speed and capacity of the plant. Standard transmission voltages are 11,000, 33,000, 66,000, 110,000 and above, depending on the amount of power and distance transmitted.

A few years ago the greatest trouble was had with high-tension transformers, but American manufacturers have now entirely overcome this. In some of the biggest foreign plants the engineers have found it desirable to come to the American manufacturers for transformers even when the rest of their plant was of home manufacture.

Thirty-one plants operate at or above 100,000 volts. One-half of these are on the American continent and most of them in the United States; all but one are three-phase plants. About 40 per cent. of the total number are operated at 60 cycles, 30 per cent. at 50 cycles and the rest at other periodicities, mostly 35 cycles. There seems to be a strong tendency to use single-phase units in the transformers, although a few plants use the three-phase type.

Lamps by Post.—According to the *Central Station*, the Rochester Railway & Light Co., of N.Y., has for some months been using the U.S. mails for the delivery of incandescent lamps, and has found a reduction in cost over the old method of electric auto-delivery. Pre-cancelled stamps are used to avoid handling. During four months, 26,000 incandescent lamps—70 per cent. Mazda—have been delivered by parcel post and about 20 lamps were broken in the first month, owing to careless packing.

Colliery Worker Fined.—A rope lad at Manton Pit, Worksop, named Tom Brailsford (17), held up the mine for over half-an-hour by making an electrical connection with a piece of wire, which set the alarm bell ringing and stopped the haulage engine. At the Worksop Court, Mr. E. G. Warburton, who prosecuted the lad on behalf of the Wigan Coal & Iron Co., said his action had held up over 40 tons of coal, and stopped 80 men for the period named. Defendant's excuse was that he had headache and did not know what he was doing. It was shown that although only 17, defendant could earn over 35s. a week and a fine of £2 was imposed.—*Sheffield Telegraph*.

Rheinfelden Power Transmission Works.—The report for 1915 of the Kraftübertragungs Werke, of Rheinfelden, on the Baden-Swiss frontier, is of interest, inasmuch as it would appear that nearly the whole of the undertaking situated on Swiss territory has been disposed of to the Canton of Aargau. A special law, which was passed by this State some time ago, ordained that the supply of electrical energy to the inhabitants must be vested in the State by the creation of a special department for this purpose, which was to be brought into operation on January 1st, 1916. The report of the Transmission Co. shows that an agreement was reached with the Canton during last year, whereby the State took over the former's contracts and concessions in Aargau which apply to the supply of energy in Switzerland, whilst on its part the company agreed to supply current to the Canton in bulk at a low price for a period of 20 years. In addition to the primary and secondary network of mains, the transfer to the State includes 26 transformer stations and apparatus, as well as the large direct-current converter station which was established for the town of Rheinfelden, together with a battery of accumulators. Most of the purchase price was paid last August, the balance becoming due early this year. The portion of the company's Swiss undertaking which has not been acquired by the State of Aargau, which served for supply in the district of Basle and to Laufenburg, has been disposed of in another manner. The company's accounts show net profits of £52,000 for 1915, as against £54,000 in 1914, and the dividend is 8 per cent., as in the previous year.

INDIAN NOTES.

[FROM OUR INDIAN CORRESPONDENT.]

Mysore Electric Power Scheme.—The Associated Press of India reports that in view of the growing demand for electric power in Mysore, the chief electrical engineer, Mr. S. G. Forbes, has formulated two projects to supplement the present works at the Chivvay Falls. They are known as the Shushwari and the Kodedathu Schemes, estimated to cost 67 lacs and 70 lacs respectively. Power from these would feed the existing transmission cables. Increased production up to 10,000 h.p. is provided for with a further possible increase up to 50,000 h.p. In discussing a paper on the subject before the Mysore Engineers' Conference, Mr. Forbes, besides forecasting a possible supply of 3,000 to 4,000 h.p. to Madras City, points out that the railway from Bangalore to Mysore can be electrified. He thinks the schedule of trains over this 87 miles' run could be so arranged that the consumption would be fairly uniform at an average of 1,000 h.p. throughout the day.

Amritsar City Lighting Scheme.—His Honour the Governor of the Punjab performed the opening ceremony of this electric power and lighting scheme on March 15th. Originally, this was intended to be a canal fall scheme, but subsequently it was decided to have it a self-contained one, using Diesel engines. The contracts were signed with Messrs. Siemens Bros. in September, 1914; considerable delays were caused by the war, and it is considered that excellent work has been done in finishing the principal contract even within eighteen months. The total capacity of the plant at present is 360 kW., consisting of three units of 120 kW. each, with room for extensions later. The Municipality has borrowed the capital, 4½ lacs of rupees, from Government at 4 per cent. interest. It is hoped that when the scheme is fully working, in addition to repaying the loan and its interest, the undertaking will pay a good dividend to the Municipality, and that at the end of 20 years the scheme will be the Municipality's own.

A great measure of popularity has already been attained, and if the demand goes on increasing at its present rate, it will soon be necessary to add more generators.

The scheme was initiated by Mr. Miller Brownlie, municipal engineer; the supervision and technical details were carried out by Mr. Greenwood, the electrical engineer, who has been mainly instrumental in bringing about a speedy completion of the useful project.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

SWITZERLAND.—By a Decree of the Swiss Federal Council, the exportation has been prohibited as from March 8th of manganese, chrome, molybdenum, titanium, uranium, vanadium, and tungsten, in so far as exportation is not already prohibited.

NORWAY.—A Customs Circular (No. 9 of 1916) states that the prohibition of the exportation of zinc applies also to (1) zinc ashes, (2) zinc scoriae, (3) zinc powder, (4) "sinkgröt," and (5) hard zinc.

SPAIN.—A Royal Decree, dated March 18th, authorises the Government to permit the establishment, by Spanish companies constituted in conformity with the Commercial Code, and at such ports as may be convenient, of bonded commercial warehouses. Goods may not remain within these warehouses longer than four years, after which period they must be exported abroad or entered for consumption in Spain. Certain operations may be performed within these warehouses (under supervision), including all those (with certain specified exceptions) which increase the value of the warehoused goods without essentially altering their nature.

Goods which enter these warehouses are to be exempted from transport duties, port duties, &c., as also are foreign goods re-exported from warehouse. Spanish goods which are exported to foreign countries through these warehouses shall be liable to transport duties and port dues, and also to export duties if such duties are leviable on the class of merchandise concerned. Goods from these warehouses which are passed into Spain are to pay import, transport, and other duties as if they had been imported direct from abroad.

BRITISH DOMINIONS AND POSSESSIONS.—A Supplement to the *Board of Trade Journal* of April 8th contains complete lists of articles which, according to the latest information received by the Board of Trade, are prohibited to be exported to various destinations from British India, Canada, New Zealand, South Africa, Egypt, Malta, Cyprus, Mauritius, Ceylon, Straits Settlements, Hong-Kong, Nigeria, Gold Coast, Jamaica, Barbadoes, Trinidad and Tobago, and British Guiana. The information in the present Supplement supersedes that given in the Supplement published on January 15th last. Copies of the Supplement may be obtained, at the price of 3d. per copy (post free), from the usual sale agents for Government publications.

PERU.—Two Laws have recently been promulgated establishing export duties on copper and other mineral products.

The duties are payable in 90 days' bills on New York or, at the option of the shipper, in the equivalent thereof in bills on London. The duties may be paid in sterling when the sum payable does not exceed £40. Producers and exporters are required to declare the nature and grade of their products.

It is gratifying, especially to those who for years have advocated a closer alliance between science and industry, to observe that the tide of public opinion continues to set strongly in that direction, and that a flood of exhortation in the Press and on the platform is being poured forth by men who occupy foremost positions in the ranks of both these parties; we earnestly hope that the movement will not end in words, but will develop into vigorous and whole-hearted action. The current month has already seen a conference held by the Society of Engineers to promote the application of scientific research to engineering needs, at which Prof. Fleming once more laid bare the deficiencies of our existing system—or lack of system—and pointed out the remedies; a meeting of the Iron and Steel Institute, at which Sir Wm. Beardmore dwelt upon the application of science to industry; a meeting of the Textile Institute, at which Dr. Garnett urged the need of reform in our educational methods in order to attain a higher standard of efficiency in industry and commerce; and a meeting of the Institute of Metals, at which Prof. Bragg showed how the properties of the Röntgen rays could be utilised in the study of the structure of metals. Here is activity, indeed.

Both Prof. Fleming and Dr. Garnett referred to the advantages derived by our enemies from their more practical system of education, as compared with our own, which is so largely devoted to cramming with knowledge (largely academic and remote from every-day life) instead of the development of the faculties of reasoning and observation.

The late Prof. Ayrton continually impressed upon his staff the principle that the purpose of a scientific training was to teach the students to *think*; for this purpose, a knowledge of fundamental principles was essential, but there was no need to memorise a mass of facts. In the same way, Prof. Fleming insists upon the importance of producing "men who can do new things, and not merely know about old ones." He draws attention again to the inadequacy of the instruction in the public schools, which results in the loss of valuable time at college which has to be spent in making up arrears; this is also referred to by Dr. Garnett, in connection with the education of the worker, and he points out that reform must commence in the training school, with the future teachers themselves. Years must necessarily elapse before the effects of such reform can become operative in the technical schools and colleges, and, consequently, it is imperatively necessary that this question should be taken up at the earliest possible moment. It is a matter of the utmost urgency.

The demand for compulsory attendance at secondary schools, while in harmony with the spirit of the times, would probably be superfluous if employers would recognise the value of the certificates obtained by evening-class students, which, as a rule, are brushed aside with the disdain that is born of ignorance; if superior attainments could be sure of a due reward, they would be voluntarily sought after.

Dr. Fleming laid great stress upon the importance of cultivating and encouraging originality of thought. Led by men who are deficient in scientific and engineering knowledge, we have been handicapped in the past; we need only cite the examples of the motor-car industry, the manufacture of air-

craft, and the development of submersible ships. The theory of our political incompetents has been: "Let us wait and see what other nations are doing; when they have made this thing a success, at their own expense, we will reap the benefit of their experience." No more disastrous policy could be conceived; to follow in the steps of others is to commit industrial suicide, and we hope that not the least of the benefits to be derived from the war will be the abandonment of this theory for ever.

We have space only to refer to one other feature of Dr. Fleming's address—his contention that the Government ought not to appoint committees of experts, but should work through the medium of the technical and scientific associations which already exist. Is the Government policy wrong? Have not these societies existed for decades, without directly exerting any appreciable influence upon the course of industry and commerce—subjects which they regard with supercilious contempt? With few exceptions they are, as Dr. Fleming himself admits, mere paper-reading societies, distinguished mainly by their stilted ideas of propriety and their narrow-minded attitude towards mundane affairs. It is the Committees—such as the Engineering Standards Committee, the Electric Vehicle Committee, and a few others—and never the Councils that get things done that are worth doing.

Daylight "Saving."

SIR HENRY NORMAN's resolution in favour of the adoption of the late Mr. Willett's scheme for "saving daylight" came before the House of Commons on Monday last, and was adopted with the minimum of opposition. The House of Commons has thrice rejected or dropped the measure, which was first introduced eight years ago, but it is now brought forward under most exceptional circumstances, for the patriotic purpose of economising coal, and though we regard it somewhat in the light of a wolf in sheep's clothing, we cannot but acknowledge the powerful aid with which it seeks adoption.

In our issue of April 28th, 1911, we set forth at some length the grounds for our opposition to the original proposal; in brief, these were as follows:—the Bill was *optional*, and its partial adoption would have resulted in chaos: a change of time on our part would have thrown our foreign communications by sea and by telegraph out of phase with the rest of the world, especially our European neighbours; tide tables and other standard publications prepared long in advance would have been thrown out of gear; the change was sought by men who thought they would derive advantage from it, but not by the vast bulk of the population; and there was grave doubt whether the alleged advantages would be realised.

The situation has changed, for the measure will now be made compulsory, thus avoiding confusion; we have no dealings with the Central Powers, Holland has already changed the time, and France, Denmark, Norway, and Sweden are likely to follow suit, so that the communication difficulty is largely removed; many of our works are in operation day and night, and will therefore be unaffected by the change; and the compelling argument advanced in favour of the change is national economy. Our case is, therefore, greatly weakened, but by no means destroyed.

To begin with, a new factor has come into existence in our favour: the Ministry of Munitions wants benzol and toluol, derived from the distillation of coal, agriculture wants sulphate of ammonia, the textile industry wants tar for dyes, and Diesel engine users want tar oil: we have, therefore, been urged to use gas freely—how does this square with the economy advocated by the Home Office, which has cordially welcomed the proposal? The Board of Trade is also pressing for a 10 per cent. reduction

in the consumption of coal for lighting purposes, apart from the daylight saving scheme, and this, again, will hit the Munitions Department, which, on the other hand, is calling upon electricity works to increase their output for power supply. What does the Government really want?

It is curious to read in *The Times* that gas and electricity undertakings, which would be directly hit by the scheme, "*regard its adoption with equanimity.*" The reduction in street lighting and the general lighting restrictions "have already had their effect"—and what follows? Surely, it is obvious that if the suppliers of light are indifferent to the measure, because its effect has been anticipated by other causes, the economy of coal that is hoped for cannot be realised; the Bill is already discounted. As for the street lighting, that goes by the sun, if it is not in fact wholly cut off, and no economy will be effected there; there is little shop lighting to save, and therefore the bulk of the economy must come from domestic consumption. Now, as mentioned above, the Board of Trade is urging the public to reduce their lighting by 10 per cent.; it is important that this fact be kept in view, for it overlaps the daylight scheme, and in all probability the advocates of the latter will claim for it, unjustly, the whole of the joint economy, thus producing a false impression of its benefits.

It is well known that agriculture has no use for the measure; the workpeople must be guided by the sun. As for the many workers who have to rise at five, in order to start work at six o'clock, these will rise with the sun until the middle of July, but throughout August and September they will get up in the dark; during a great part of September they will have to work by artificial light for the first hour, thus losing at one end what is gained at the other. In many cases the change will have no effect at all upon the lighting hours until the middle of August.

We feel that, with other European countries, we are about to take part in the perpetration of a trick upon ourselves, a voluntary self-deception, which is revolting to our intelligence and a slur upon our moral strength. Let it be granted that in the summer months it is desirable to rise earlier—could not that end be attained by other means, less suggestive of the child's "make-believe"? We see one ray of sanity in the speech of Mr. Herbert Samuel on Monday last—he said the Government would not think of favouring the proposed change unless they had reason to believe that it would be advantageous for war purposes. It is consoling to know that the proposal is now put forward for adoption purely as a war measure, and not on its own merits.

Copper.

DEVELOPMENTS in the position of copper have been of a rather startling character, as testified by the

further huge rise recorded in prices within the last few weeks, and there is as yet no sign of a halt in the upward movement, for it is increasingly difficult to secure spot or near copper of almost any description, even at the extreme prices now current. Reports from across the Atlantic are as strong as ever, consumers in all directions being anxious to have deliveries against current contracts in order to keep pace with their heavy requirements. The uncertainty regarding the tension between the United States and the Central Powers, and the fears of Labour disturbances, do not appear to have had the least effect on the temper of the market. Speculation on this side remains absolutely barred by the Government prohibition, which is to be regretted, for it was undoubtedly speculation or the operations conducted by large dealers which were instrumental in keeping down the price of standard copper, prior to the enforcement of the new regulation, at a much heavier discount than at present is the case. In the middle of last month the price of standard copper was in the neighbourhood of £125, and has

now reached about £140, while electrolytic, of which the bulk of the American output consists, has risen during the same period from about £137 to £150. The premium on spot and near copper for weeks past has been constantly on the increase, owing not only to the fact that American producers have very little actually available for sale to meet urgent needs, but also to the virtual extinction of the stocks in home warehouses. With America producing at the rate of about 80,000 tons a month, and consuming as much as 75 per cent. of that amount, or something like 60,000 tons a month, it is at once realised that the exportable surplus is comparatively small, in fact, rather inadequate, in order to cope with the huge European war requirements. Within the last few weeks the additional orders placed by the Allies are stated on pretty good authority to have been as much as 150,000 tons, or representing but little less than a two months' American production, this to say nothing of the orders given out by American consumers. The world's output in 1912 was, roughly, quite one million tons, to which the United States contributed about 70 per cent., or fully 700,000 tons. The world's output for the current year has been estimated by a fairly reliable authority as 1,202,000 tons, to which America will contribute about 79 per cent., or 936,000 tons. The present position is absolutely unique, both output and consumption being a long way in excess of all previous records, with unsold stocks practically non-existent and a rise in price not seen within living memory. The course of the market, of course, depends largely on the duration of the war, or developments in the political situation calculated to hasten the conclusion of peace. Anything happening in the latter respect would probably have an important bearing on the demand, but the speculative market having been killed by Government action, the tendency of warrant copper cannot be expected to be immediately very materially affected unless some selling pressure makes itself felt.

Commission Agents and Remuneration.

Most commercial men have received or have paid commissions in their time. Some business houses, indeed, appear to rely entirely upon the efforts of the "men on the road" to bring grist to the mill in the form of orders; but while this method of bringing buyer and seller together is well recognised, the principles by which the question "Has this commission been earned?" must be answered are not always clearly understood. A recent case in the King's Bench Division shows that the person employing an agent may be liable to pay commission although he derives no benefit for the services rendered. In that case by a contract between the plaintiffs and the defendants it was provided that if the plaintiffs procured for the defendants a contract to supply certain motor-lorries to the French Government, the defendants were to pay the plaintiffs a commission immediately after the defendants had received payment from the French Government. The lorries were to be supplied from Turin, the defendants not being the makers. The contract was procured by the plaintiffs for the defendants, but the latter were unable to get the lorries, and the French Government cancelled the contract and paid the defendants nothing. In an action to recover the commission, it was held that as the defendants had put themselves forward as being able to supply the lorries, the non-receipt of the money was caused by the default of the defendants, and the commission was payable.

The principle underlying this decision was that when it is a term that the commission is payable on the receipt of the money by the other party, it is payable even though the money is not received if the non-receipt is caused by the default of the per-

son employing the commission agent. It is to be observed that the application of this principle will not be avoided merely by inserting in the agreement a term to the effect that commission will only be payable "on orders accepted." A man may very well accept an order, only to find, on trying to carry it out, that it is commercially impossible to do so. For instance, suppose an agent has obtained an order for certain electrical machines, and the order has been accepted by the firm employing him. Subsequently it is found that to carry it out will involve such an expenditure on capital account that there will be a loss. If, in these circumstances, the firm decline to go on with the business, they will be liable to pay the commission due to the agent. The difficulty can be got over in one of three ways: (a) by the exercise of great care in the acceptance of an order; (b) by strictly limiting the classes of goods or orders which the agent may obtain; or (c) by drawing the commission note in such a way as to prevent the agent making any claim unless the order is not only accepted but carried out. We have heard recently of a case in which a firm engaged before the war in the manufacture of electrical fittings and apparatus had a claim made against them by an agent who had secured an order for munitions from the War Office. The firm accepted the order, only to find that with the plant at their disposal it could not be carried out except at a serious loss. Eventually, owing to delay, the War Office authorities cancelled the order. The claim of the agent was eventually compromised; but it is plain that the firm were in danger of having to pay the commission. These notes may suggest to those engaged in the electrical industry the advisability of revising or paying rather more attention to the terms of commission notes.

A CASE which decided a point of interest to all those who use water for driving turbines was reported in our issue for April 28th. The action

was brought by one James against the Bedwelty Urban District Council for a declaration that the defendants were liable to pay and make good to him the amount of the damage caused to him by nuisance arising from the pollution of the River Rhymney by sewage matter, which clogged the vanes of his turbine. Mr. Justice Astbury came to the conclusion that, while the clogging was partly due to grit and coal dust in the water, it was largely and mainly caused by sewage matter which could only have been kept out by the plaintiff enlarging his screens at very considerable expense; he awarded the plaintiff £150 damages and the costs of the action. This case is an illustration of the fact that a riparian owner has a right to have the water flowing past his land pure and unpolluted. In the days of the old watermill a little pollution by sewage would possibly have made no substantial difference to the working of the mill, but with a turbine it is otherwise; any impurities in the water appear to have a deleterious effect. While it is possible that a turbine would stand a certain amount of impure water at intervals, the constant flow of sticky matter would tend to clog, or of fluidy matter would gradually wear away, the blades of a turbine. It is important to notice that the right of a riparian owner to have his water unpolluted is an absolute right; so that it would be no answer to an action for the authority running sewage into the river to say: "You knew the sewage was there when you installed your turbine," unless, indeed, a right to pollute has been acquired by Act of Parliament, or by prescription; that is to say, by uninterrupted user for a period of years.

SURFACE MINING ELECTRICAL PLANT.

THERE is practically no class of machinery employed in connection with mining work which has not been adapted for electric driving, the size of plant ranging from the small ventilating fan to the largest main winder equipment.

¶ The advantageous use of electricity in underground mines is fully appreciated by all engineers, but its possibilities for shallow and surface mining work have not been developed in the same degree as for underground work. With surface mining, the area and position of operations may be

necessary that the electrical equipment should permit of the maximum output being obtained throughout the 24 hours.

In view of the extended nature of the workings and the necessity of carefully supervising native labour, the illumination at night was carried out principally by searchlight projectors, each fitted with lenses giving a widely diverging beam of light.

The electrical installation consists of three steam alternators, each having a normal three-phase output of 600 k.w. at 550 volts, 50 cycles, with a 0.8 power factor; a view of one of these sets is shown in fig. 1. The alternators are of Messrs. Crompton & Co.'s standard construction, and are designed to operate continuously at their full rated output with a temperature rise not exceeding 70° F.

The revolving field coils are of copper strip wound on edge, hydraulic pressure being employed in winding to force the turns into position. The stationary armature is provided with open parallel slots and former wound coils, the latter

being dried in a vacuum and impregnated under a pressure of about 50 to 60 lb. per sq. in., with special insulating and waterproof varnish, without breaking the vacuum. The armature and field coils of the exciters are treated in a similar manner.

In fig. 2 is shown the main switchboard, designed to control three alternators and feeder circuits. The alternators are paralleled by means of a synchroscope mounted on a swing bracket at one end of the board. The alternators are protected by circuit-breakers with no-volt and reverse-current trips, as well as overload trips on the circuit-breakers on the

feeder panels. A complete installation of lightning arresters is also provided.

All the feeders are of bare copper, carried overhead on porcelain insulators fixed to cross arms attached to wooden poles.

As most of the mining machinery is adjacent to the generating station, a pressure of 550 volts was adopted, but for the outlying district static transformers mounted on the transmission poles increase the pressure to 2,000 volts.

A general view is shown in fig. 4 of the hydraulic plant

FIG. 1.—600-KW. STEAM ALTERNATOR.

altered within very short periods, depending upon the locality and conditions of working.

¶ For various reasons, such as the difficulty of illumination and supervision of native labour, night working has not been adopted by many of the principal mining companies owning surface workings in different parts of the world.

¶ The following illustrations of plant supplied by Messrs. Crompton & Co., Ltd., of London and Chelmsford, will,

FIG. 2—MAIN SWITCHBOARD.

therefore, be of interest in showing the possibility of continuing the operations day and night, even when the workings are extended over considerable areas.

Two well-known mining companies some time ago decided to adopt electric driving throughout their surface mines. The material in the workings was principally washed from the cliffs and headings by hydraulic pressure, and it was

FIG. 3.—THREE-PHASE MOTOR DRIVING HYDRAULIC PUMP.

in operation, washing soil from the cliffs so as to expose the metallic strata and ore, thereby facilitating the collection of the ore.

In fig. 3 is shown a high-pressure three-throw ram pump driven by a "Crompton" three-phase induction motor, which supplies water power to various nozzles for washing the cliffs. The rotor is of the slip-ring type, and is fitted

with brush-lifting and short-circuiting gear, which eliminates all friction losses of the brushes and rings, as well as the losses in the rotor leads, after the machine has attained full speed.

No special mention is necessary in connection with the motors driving the usual mining machinery, such as main and tail haulages, auxiliary pumps, concentration plant, crushers, puddlers, agitators, &c.

FIG. 4.—HYDRAULIC MINING PLANT IN OPERATION.

To ensure the maximum efficiency of the illuminating plant for night operations, it was necessary to employ searchlight projectors working with continuous current obtained from rotary converters, one of which is illustrated in fig. 5. These rotary converters are self-starting from the three-phase side, the pressure being reduced by static transformers to about 65 or 70 volts, in order to obtain approximately 100 volts on the D.C. side.

The switchgear mounted on the side of the rotary is for starting purposes, and also for reversing the field windings,

FIG. 5.—ROTARY CONVERTER WITH STARTING GEAR.

so as to ensure the correct polarity being obtained on the D.C. side when starting up.

For this class of work the converting plant should be designed with a view to portability.

The continuous current from the rotaries supplies various 36-in. searchlight projectors. One of the projectors is

illustrated in fig. 6, and is designed for controlling the training and elevating motions by hand, through gearing, or electrically from a distance, the motors for the two motions being fitted in the base of the projector. The projector lamps operate automatically, and run with a small steadying resistance in each lamp circuit.

The projectors have parabolic glass mirrors and dispersion lenses mounted in special frames, which can be rapidly attached to the front of the projector, either by hooks or hinges, and which give a beam of light diverging either vertically or horizontally, as desired.

It is possible that considerable economy in operation might be obtained by electrically controlling a number of projectors from a distance, by a single operator situated at a central position in full view of the operations, or in communication with the workings by telephone.

The disposition and number of projectors employed would naturally influence the D.C. voltage and type of converting plant. It is quite probable that the most satisfactory arrangement would be to provide a motor-generator with each projector, consisting of a three-phase induction motor operating direct from the overhead lines, and coupled to a D.C. generator and small exciter so as to obtain a drooping voltage characteristic. This would enable the projector to operate automatically, thereby avoiding the necessity of a steadying resistance in the lamp circuit.

In fig. 7 a view is given of one of the workings taken at night. The workmen can be clearly discerned conveying the ore in trucks from the workings to the haulage gear station.

A general view of the mining area and generating station, &c., is shown in fig. 8. This view was also taken at night under ordinary working conditions, and clearly shows the arc lamps on the main road from the mine buildings to the principal workings.

There are numerous instances of surface mines extending over considerable areas, which are often of a temporary

FIG. 6.—MOTOR-CONTROLLED 36-IN. PROJECTOR.

nature, and where it is not practicable or convenient to erect overhead lines for a power supply for night operations. In these circumstances, the many advantages of a portable projector equipment cannot be over-estimated. It consists

of a petrol-driven chassis, the engine being arranged to drive the car or the generator for supplying the projector, when stationary. The projector burns with a normal current of 120 amperes at about 65 volts at the arc, and has a mirror of 36-in. diameter. It is shown mounted on a light trolley, so as to be capable of being easily moved in any direction. The supply cable from the chassis equip-

scientific and industrial research as described in a scheme outlined in a White Paper.

Since any such Government control over scientific research is bound to have a great influence in time on the direction of scientific work and its applications, it appears most desirable to gather views upon this scheme, even after its inception, from those who are concerned with one of the most scientific of these industries, viz., engineering in all its branches.

Important industries have died out or never thriven in this country in consequence of our neglect of scientific education and research. We cannot undo the effect of this neglect by a wave of the wand; reforms to be useful must be very deep and very thorough, and begin at the top and at the bottom in our systems of national education.

It is unquestionable that the success of the Germans in the commercial field is in part due to their system of national education, which prepares every man for some vocation and does it thoroughly. We are by no means desirous of copying it in its entirety, as it possesses grave defects on its ethical side and in its extreme cultivation of materialism in its worst aspects; nevertheless, we can usefully draw some lessons from it.

Our own educational systems are too bookish, too much devoted to the cultivation of memory and words, and not sufficiently leavened by a real knowledge of the facts of nature and power to draw true inferences from observations. One barrier in the way of our industrial progress has been the imperfect scientific training of foremen, managers and young heads of departments in many engineering works. The young men who are brought in to fill directing positions have generally received the usual public or middle-class school education, with its entirely insufficient attention to scientific subjects. Even when this has been supplemented by a course at a technical college, the time at the latter has been so much taken up with learning things which ought to have been learnt at school that the opportunity of acquiring advanced scientific knowledge or real power of independent investigation has been very much curtailed. Hence, when once immersed in business it has been impossible for them to keep up with scientific advances, and they can at most copy what

FIG. 7.—VIEW OF ONE OF THE WORKINGS AT NIGHT.

FIG. 8.—GENERAL VIEW OF THE MINE AREA AT NIGHT.

ment to the projector is carried on a drum at the rear of the car.

A similar equipment could also be usefully employed with other classes of outdoor work at night, such as the illumination of docks, shipyards, and all kinds of erection and excavation work, where the conditions of working require a high degree of illumination.

ENGINEERING AND SCIENTIFIC RESEARCH.

By J. A. FLEMING, F.R.S.

Abstract of paper read before the SOCIETY OF ENGINEERS (Inst.), May 1st, 1916.

THERE seems to be a very complete agreement that one result of the great war in which we are engaged will be to render absolutely necessary certain reforms in our national systems of education, and especially in the attention given to scientific knowledge. An important step was taken by the Government through the Board of Education last July in the establishment of a Committee of the Privy Council and the appointment of an Advisory Council to deal with the question of

they see others do. We have to produce more men who can do new things, and not merely know about old ones.

Until this state of affairs is remedied it is perfectly futile for Great Britain to hope to gain pre-eminence over Germany in scientific industries. The advantages which we have in greater originality of mind and better workmanship are neutralised to a large extent by the want of a sufficiently thorough and broad scientific education to enable us to see the practical value of, and work out exhaustively, and especially with reference to trade purposes, the openings given by scientific discoveries. It is the want of this sufficiently thorough scientific education which accounts for the limited faith of many employers and capitalists in scientific research, and also for the inability of the practical worker to take advantage of, or see the meaning of, facts which present themselves to him in his every-day work.

One of the educational reforms which seems most necessary is the compulsory attendance of lads after leaving the board school at a technical continuation school. Assuming he leaves at 14 or 15 and is taken on at an engineering works, it should not be optional whether he attends a continuation technical school. He should be compelled to do it until he is 17 or 18 years old, as in Germany. This continued education should not be merely a handicraft training, but should be a careful instruction by practical engineers in mechanical drawing, graphics, mechanics, physics, chemistry, metallurgy, electro-technics, and machine construction. The attendance should not be allowed to become irregular, and the certificates of proficiency should have an immediate effect on the lad's prospects of advancement.

In the case of young men of higher social rank who have been to public schools, the practical experience in the shops and drawing office should not be deferred entirely until after the college course. The school education should have provided them with a thorough grounding in the elements of chemistry, physics, and mathematics, pure and applied, and a speaking acquaintance with at least one modern language. One year at a university or technical college should then prepare them to take advantage of some shop experience, and after that they should return to the college for a year or, perhaps, two for the advanced laboratory and design work.

The degree or diploma examinations should be made to depend more than at present on the results of practical laboratory and drawing-office work. My experience is that students who come straight from school to college for three years without break are less serious workers than those who have had some experience in an engineer's shop and then returned to the college.

In order to compress into this time the necessary training, our methods and means of instruction must be much improved. It is essential now for every engineer to have a good working acquaintance with certain branches of mathematics. If he has no knowledge whatever of the calculus or trigonometry he finds it impossible to read many original papers in the technical journals. In teaching electrotechnics to young engineers, I find I have to give much time to imparting elementary mathematical knowledge which ought to have been gained elsewhere. It should, however, be taught by engineers to engineers.

The great thing to guard against on the part of the student is premature specialisation. He should broaden as much as possible his knowledge of the principles of chemistry, mechanics, physics, mathematics, and metallurgy, and he will then be able, later on, to build up on this foundation. Unless he does lay this foundation he will not be able to follow or assist in improvements. As an illustration of this, we may take subjects such as telephony or wireless telegraphy. It is impossible now for anyone to make any really important addition to these subjects who has not a very competent knowledge of physics and some parts of mathematics. The easier problems are worked out and the design of telephonic systems or radiotelegraphic stations has become a matter in which advanced scientific knowledge is an important factor. Then, again, to make any advance in metallurgy requires a very intimate acquaintance with the chemistry of metals. A lucky accident might give a clue to an improvement, but an observer not sufficiently acquainted with modern chemical principles could not take advantage of it or follow it up.

In the third and fourth year the student will, of course, have given time to learning as much as possible of the methods of testing—both mechanical and electrical—required in engineering work, the especial object of which is to enable him to deal with the kind of problems which will present themselves in practice.

It is of extreme importance that he should acquire sympathy with and confidence in scientific research to give the data for engineering work.

We then turn to the subject which it is our purpose more particularly to discuss, viz., the relation of scientific research to engineering practice.

There are first the laboratory researches, which aim at determining various physical constants of the materials used in engineering which are requisite to give data for design. This knowledge can never be made too accurate or too complete; but the moment one goes to any of the well-known pocket-books or tables of engineering data it is astonishing to find the wide gaps in our knowledge. Hence, we require abundant provision for re-determining these values for particular samples of new materials to be used in bulk for various purposes.

In the second place, there are those researches which aid engineering by providing new methods of examination and test of materials or structures. An instance of this, consider the invaluable aid rendered by what is now called metallography, or the study of the internal structure of metals and alloys by the aid of the microscope. Every engineering student is now familiar with the processes applied and with the immensely important knowledge that has been gathered as to the composition of steels and other alloys by this method.

The great development of pyrometry and high temperature thermometry by the invention and improvement of the thermo-junction and radiation pyrometer and the electrical resistance thermometer have provided the engineer with implements of great accuracy for the measurement of high temperatures and made it, in fact, an exact science.

The improvement in the means of testing the mechanical or elastic properties of engineering materials by testing machines is another instance of the same class of research. Of late years, the appliances for testing the mechanical properties of materials under repeated stresses, vibrations or blows have become important in giving the dynamic as contrasted with the static stress properties.

In the third place, we have a type of research which calls for special aptitude and insight, viz., those which lead to the discovery of some new process, material, or machine.

An excellent example of this is the discovery which rendered the production of metallic aluminium in bulk a commercial possibility; further examples of the same important class of researches are given in the production of the various alloy steels with extremely valuable properties.

This originitive power is partly due to natural gifts, partly to effective training, and partly to the possession of sufficient appliances and means.

Originality stimulates originality; a really great investigator not only discovers himself, but imparts something of his powers to his associates. Hence we require to establish and strengthen those research institutions such as the Cavendish Laboratory, Cambridge, or the Royal Institution, London, where notable scientific investigators have established schools of research and imparted some of their great powers to students and colleagues.

In providing a large mass of accurate scientific data for use in engineering, the National Physical Laboratory has given most valuable service for the last twenty years. Nevertheless, there are matters requiring assistance for which even its present resources are insufficient.

In Germany much of the technical research work is carried out by private associations of the trades concerned. In Great Britain manufacturers in the same trade are far too prone to regard one another as rivals, whereas in the future they will have to stand shoulder to shoulder much more against their common and German antagonists, who will be united against them. In many matters it would pay British firms in the same business to promote scientific research in common on certain problems of manufacture, subscribing together the funds to undertake it either at a National Technical Laboratory or at some Technical College or University which may be provided with the proper equipment. Such information when obtained would then only be communicated to the members of the association or union.

The same principle of common action might be brought to bear upon the collection of information as to what is being done in certain branches of manufacture; the establishment, in fact, of an information bureau common to certain firms or manufacturers. Trade associations such as the British Electrical & Allied Manufacturers' Association are doing and could extend this work with great effect.

As a rule, British technical firms do not expend anything like the same labour or money over their intelligence departments as German firms. The latter gather in from all countries every scrap of information which can assist them, both from scientific and technical papers and patent specifications. The first direction in which our advances should be made is in improving the means for obtaining this early information on possible improvements and advances.

Many important problems which need attention are very large ones and will require the assistance of many experienced men. Such problems are the conservation and more economical use of our national coal supply, the universal adoption of gas or of electric heating in place of the wasteful combustion of raw coal in domestic fireplaces, and the electrical transmission of power from coalfields to great cities. Hence, it is to be hoped that the principal engineering institutions will unite in a strong request to the Government, if they have not already done so, to place representative engineers upon the Advisory Council, and also that in the disbursement of funds allocated to the assistance of industrial research, these institutions, as bodies, shall be to a considerable extent the avenues through which it is dispensed.

The present policy of the Government and of the Board of Education seems to be the creation of fresh committees and boards, whilst setting on one side the existing learned and technical institutions, which include in their membership all those who have special knowledge and eminence in their various subjects.

Mr. Runciman has recently appointed certain committees to report on measures to safeguard the commercial interests of the iron, steel and engineering trades, and on shipping and shipbuilding. The Advisory Council for Scientific and Industrial Research is also appointing standing committees to deal with mining and metallurgy, and an engineering committee is promised as well. Furthermore, the Royal Society recently called a conference of about 25 of the chief scientific and technical societies, and it was decided to form a board to advise the Government on any branch of scientific inquiry which may be brought before it. The result of all this must be to diminish rather than increase the very organisation and co-ordination required.

The existing scientific and professional societies, if properly organised, would supply all that is required. These engineering institutions and societies should take a leading part in guiding the fortunes of the industries they represent, and not be reduced to the level of mere paper-reading or discussion societies.

At present, the Government prefer to ignore the existing societies and create fresh bodies of their own selection. The result will be to weaken these existing institutions and societies.

It is essential to guard against the bureaucratisation of science, and the safest and most simple method of avoiding this would be to make the great technical and professional institutions the means of advising upon the most important steps to be taken in aiding technology.

We have first to create a great change in the attitude of the public mind towards scientific knowledge and research and develop the conviction that until it is regarded as a most serious pursuit we shall fail to make any firm advances towards victory in industrial war.

No one who has studied German methods can fail to admit they have realised fully in commercial matters the truth that union is strength. Our ideal has been largely individualism

and competition, theirs has been organisation and co-operation. The German commercial system is essentially militant in nature and organisation. It is all part and parcel of the plan to achieve world conquest at any cost and by every means. Our post-war policy cannot, therefore, be simply defensive. No tariff wall can be built so high, no boycott of German goods so thorough, as to defend our position in the absence of a positive and vigorous policy of attack. Hence, the first condition of success must be association and combination, and the second the scientific method in all things.

The first principle of scientific investigation is to collect the facts and to draw deductions only by the light of full knowledge. The inference is that our information about foreign markets must be greatly increased. This means that our Consular reports must be improved, that foreign agencies must be staffed with men who have the necessary linguistic and scientific accomplishments, and that the study of foreign markets and of the nature of the foreign demand for goods shall be made a scientific study.

In the main, however, we have to rely on bringing to bear scientific knowledge of all kinds upon the manufacture and distribution of goods and obtaining foreign markets for the same.

The importance of a true education in science is that it leads to love of accuracy as to facts, loyalty to scientific truth, unwearying labour in obtaining it, and care in the inferences derived from it. We have to cut ourselves adrift from all the past, its easy, self-satisfied mediocrity, dislike of trouble, and contempt for knowledge.

CORRESPONDENCE.

Letters received by us after 5 P.M. on TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Electricity in War Areas.

My thanks are due to you for the copy of the ELECTRICAL REVIEW which reaches me here regularly. Even though one is not actually filling one's corner in the work at home, it is very gratifying to read of what others are doing, and of what is happening in the wide circles of electrical science and engineering.

Your correspondent's description of the utilisation of derelict machinery in the war area is very interesting. I have seen many instances where otherwise wasted energy could be made use of with advantage—ancient flour mills with over-shot wheels offer very good scope in this direction. By the way, the condition of the wooden-teeth pinions in some of these old mills is really surprising—they have a wonderfully long life.

Perhaps it is not looking too far ahead when we express the hope that we shall soon see some examples of German engineering ingenuity "behind the line," an article on which appeared in the REVIEW some little time ago.

J. H. Pembrey,
A.S.C., M.T.

British Expeditionary Force, April 30th, 1916.

The I.E.E. Election.

I have just returned my ballot paper to the Secretary of the Institution of Electrical Engineers, and I regret to say that I consider myself justified in having erased the name of Mr. Sparks, who has apparently been nominated by the Council as President of the Institution for another year.

My action has been prompted through no hostile feeling on my part towards Mr. Sparks, because, as a matter of fact, I very much admire the way in which he has carried out his duties during the past year, but I entirely disagreed with the practice of electing presidents for two successive years. There are any number of eminent gentlemen who could quite well fill the position satisfactorily.

I believe there are any number of people who agree with the above sentiment, although they probably do not take the trouble to express their opinions in writing.

I am in entire agreement with the remarks regarding this matter which appear on p. 386 of your journal dated 7th ult.

I enclose my card, and sign myself

President for One Year Only.

May 3rd, 1916

Justice for the Inventor.

Your leader, and the letter in the current issue of the REVIEW on the above subject, will certainly be appreciated by everyone interested, but more especially by those, like myself, who were just applying for a patent when the war started.

Kindly to state my own case. For some months before the

commencement of the war I worked hard to perfect a device for which, at that time, there was a certain market; there were but a few days between the outbreak of hostilities and my application for the patent, and, hoping for the best, I paid the money, which I have since sorely needed.

The patent was granted, and I have since submitted the invention to certain people with a view to their adopting it; the opinions expressed regarding the merits of my invention were very pleasing, but there will be no market for it until we return to a state of peaceful industry. Three months from now, two years of the life of my patent will be gone, and as my invention is not of much use in connection with the manufacture of munitions, it is exactly in the position it was in when the patent was granted, and will probably remain so until a considerable time after peace is restored.

Nevertheless, if when the renewal fee is due I have had no return for my labours and initial outlay, and cannot afford the amount demanded, I lose everything. This is not very encouraging for British brains to help to capture the trade previously held by the enemy. It could hurt nobody, and would be only justice to the patentees, if patents which were shown to be adversely affected by the war were granted an extension of life, or, rather, a "stay of progression," equal to the duration of the war—by which I mean that the renewal fees and the ultimate expiration of the patent should be deferred to the extent of that period; but it must be free, or in many cases, like my own, it would be useless.

Invention is the seed of industry; therefore, if those who cultivate it are discouraged, there will be a scarcity of the seed.

G. W. W.

The Electric Cooker in India.

While agreeing generally with Mr. C. S. Jeffrey's article under this head, may I say that servants are not quite so impossible as he would make them. When I was transferred from Calcutta to Simla my servants aggregated 85 years' service, several having been with me over 15 years, while other long-timers died in my service earlier. Also, the fetish of charcoal for the kitchen is easily overcome. My cooks have always used coke except for pastry making. I have found the electric kettle and iron invaluable, but they must have an earth wire, for the reason given by Mr. Jeffrey.

J. W. Meares.

Clive Hall, Shrewsbury, May 7th, 1916.

INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

No report has yet been made public as to what took place at the meeting of Government electrical officials in Calcutta last cold weather. Their deliberations lasted over a week, and they are said to have worked very hard: the only tangible result up to now seems to be that a very good photographic group was taken—copies of which adorn their office walls in each presidency.

Mr. J. W. Meares, the electrical adviser to Government, has gone home on furlough, and his work is being done by Mr. C. C. Eastgate, who is Government electrical inspector to the Punjab. Mr. Tufnell, the electrical inspector to the United Provinces, has joined the Army, and his work is being done by Mr. Bell, who is municipal electrical engineer to Mussoorie Municipality. Mr. Warren ably assists Mr. Bell as assistant electrical inspector. Mr. R. J. Browne, electrical inspector to Bengal, Assam, and the new Province of Behar and Orissa, has gone home on sick leave. His duties are now divided between Mr. A. N. McIntyre, who takes over sole charge of Behar and Orissa Province, and Mr. A. K. Taylor, who is acting as electrical inspector in Bengal.

Lucknow.—The work of building and equipping the new power-house is making progress. This is in the hands of Messrs. Crompton & Co., who have now accumulated a rare experience in town lighting in India. No certain date is yet given for actual supply of current; but, judging by the multiplicity of electrical contractors now opened up in Lucknow, wiring work should be brisk—and inexpensive. The great ambition of the average Indian electrical engineer—be he the result of a technical college or, as more often is the case, the result of a few months' so-called apprenticeship with a European contractor firm—is to start on his own, open up a business with a high-sounding name, and get a few jobs, mostly from among relatives, and then, in most cases, go "phut," as the saying is, either from want of capital or, "which is generally the case, from want of experience. Allahabad, which, as well as its sister city Lucknow, is going to have an electrical supply shortly, is also a happy hunting ground for the small one-horse contractor. This city is also being equipped by Messrs. Crompton & Co., and a good return

should be shown after a few years' working. In Indian cities like Lucknow and Allahabad, a certain revenue can be always counted on from large Government offices and buildings—a revenue almost large enough to pay interest on capital and establishment charges annually. The surplus may fairly be counted upon as profits. The hot-weather load, with its innumerable fans, is, of course, a feature of Indian electric supply.

It is surprising with what regularity machinery and electrical accessories are still imported to India, in spite of the immense shipping difficulties. Of course, the delays are considerable, but with a little patience the goods get here some time. Shortages are, perhaps, noticeable now in electrical accessories, particularly rubber and flexible wire, especially the latter.

Japanese electrical goods are making great headway, especially insulators, lampholders, flexible wire, and so on. The material is passable, though not up to English standard; insulators particularly are below the mark, their finish, instead of being white or creamy, is of a grey-bluish tint, due probably to the glaze. The adaptable Japanese will shortly, however, better this, and given another year of present conditions he will have a very firm grip on the Indian electrical market for light material.

WAR ITEMS.

Exemption Applications.—On the application of Mr. Dashwood, electrical engineer, the Canterbury Tribunal has granted another month's exemption to a wireman.

At the Newcastle Tribunal, an electrical engineer appealed on the ground that he supported his parents, and that his occupation was a reserved occupation. It transpired that his parents were not wholly dependent upon him, and that his occupation was with a cinematograph company. When told that he must serve, he asked whether he could go into a munition factory, and was told that he must fight.

At the Brighton Tribunal a lecturer in physics and electricity at the Brighton Technical College appealed for exemption on the ground of the importance of his work. The Brighton Education Committee also appealed for him on the ground that the work he is engaged in is of more national importance than his services in the Army would be. Six months' conditional exemption was granted.

At the Southport Tribunal a firm of electrical engineers asked for the absolute exemption of a branch manager on the ground that they were engaged in the supervision and carrying out of important Government sub-contracts and other jobs of national importance. He was 35 years of age, and the only eligible single man in their employ. The Tribunal said that it was not prepared to deal with the application; it would simply mark the man as at present holding a badge.

Before the Rawmarsh Tribunal, on May 5th, five employees—four connected with the generating station, and the other a motor-man—were appealed for by the Mexborough and Swinton Tramways Co. Mr. Priestley said that two of the men were switchboard attendants, and, in reply to the military representative, stated that there was not a girl on a switchboard in any generating station in the country. The military representative said he knew of cases of girls attending switchboards in important places, such as large theatres. If they could do that they could, with a little training, do the work of these men. The Chairman said he did not think girls could do the work of the generating station. A member suggested that older men could be obtained, and Mr. Priestley replied that there were great difficulties in the way of getting other men; considerable training would be required. The Tribunal granted exemption to each man until the end of June, the military representative in the meantime to ascertain whether the men were legally exempted under the heading of "Public Utility Service."

Before the Cornwall Appeal Court, Mr. John Jewell, of Redruth, appealed for exemption for his son, Mr. Wm. Jewell, electrical engineer, who was in charge of an electrical plant at a tin works. The Local Tribunal had granted two months' exemption. The Court considered that another man at the works could carry out the duties, and the appeal was dismissed.

At Nuneaton, exemption was appealed for on behalf of Mr. A. N. Lilley, aged 18, a pupil in the electrical engineering department of the Corporation. It was stated that the indentures expired on October 30th, and at the end of that period he would be put in the Officers' Training Corps or under the Admiralty. Exemption was allowed to the end of May only.

At Glossop, the Urban Electric Supply Co. appealed for a motor-man, but the request was refused on the ground that he was not in the position he held on August 15th, 1915.

At Dover, on May 3rd, exemption was applied for by the Corporation for Mr. Goodwin, traffic clerk on the tramway staff. It was stated that he was the only clerk left. A member asked if a woman could not do the work, and a negative reply was given. Exemption was allowed for two weeks from May 29th for a substitute to be found.

The Whitehaven Tribunal have granted exemption until June 20th to the son of a principal of a local firm of electrical engineers, and engaged in the business, which caters for firms who are on war work. It was stated that the only male left was a Belgian, and that the places of men who had left had been filled by women.

At Gloucester, the Corporation appealed for a motor-man engaged on the tramways. Mr. Corson, for the Council, said the time was quickly approaching at which the employment of women as drivers must be settled; it was a question whether women should be employed in such a capacity. As the service was still normal, it was contended by the military that it might with advantage be curtailed, and a number of men thus released. The appeal was put back to ascertain what arrangements could be made for releasing a portion of 13 attested motor-men who remained in the service.

Before the Gloucestershire Appeal Court, the Bourton-on-the-Water Electricity Co. applied for exemption for their assistant electrical engineer, on the ground that he was in a certified occupation—public utility service. It was explained that the installation supplied 1,463 lights, while the company ran a motor pump at the local hospital. The assistant engineer was the sole man in charge of the Bourton installation, his chief was stationed at Burford, and if he went his place could not be filled, and the town would be left without artificial light. The Tribunal granted exemption until Michaelmas.

The Herts County Tribunal has dismissed an appeal for further exemption for G. E. Way, electrician at the Berkhamstead Picture Palace, for whom a substitute had not been found.

At Oxfordshire Appeal Court, the military appealed against exemption granted by the Local Tribunal to Raglan D. Price, of the Oxford Electric Tramways staff, on the ground that he was not in a certified occupation. It was contended that Price only did the work of a mechanic. Mr. A. A. Tyler, manager of the tramways, said that Price examined the engines and fittings of buses, which were at the disposal of the military for the wounded free of cost. He was a fitter and did fitter's work. The appeal was dismissed, but the exemption was varied, and granted until November 2nd.

At Horsham, on Monday, a private estate electrician claimed exemption on the ground that he was indispensable, but he was allowed only a month's postponement.

At Bath, on Monday, the military appealed against exemption granted to Mr. W. J. Fussell (23), engaged with Messrs. Kendall, electrical fitters, and said that the man was employed in a private concern and should be released for service, while the age for men in this occupation to be regarded as reserved men had been raised to 30. The appeal was allowed, and exemption cancelled.

At the Stockton-on-Tees Tribunal, exemption was sought for 16 drivers employed by the Imperial Tramways Co., Ltd., on their Middlesbrough, Stockton and Thornaby system. It was stated that 115 men had been released by the company and provision made for their dependents. Since the last appeal to the tramway employees, a representative of the Ministry of Munitions had visited the company's premises, and, after investigation, admitted that the absolute limit had been reached so far as the release of men was concerned. The Chairman said the Tribunal was of the opinion that the number of drivers could be reduced, and that the single men should be spared. Mr. F. Freshwater, manager, replied that for every three men they took away, it would mean the taking off of a tramcar. Conditional exemption was granted in regard to nine drivers who are over 25 years of age, but the remaining seven were dismissed.

Russian Presspahn.—A writer in a Russian semi-official journal, complaining of the want of tone in Russian industry, observes that the production of insulators in the country might be extensively developed, including special cardboard. Until the war opened, this cardboard—presspahn—was imported from abroad, "that is Germany." When the war started, it was found that presspahn could not be had at any price. But after inquiries, presspahn was found within the boundaries of Russia itself. It appears that in Russia the manufacture of presspahn and fibre has existed for a long time, but electrical industrialists were quite unacquainted with the fact. There were factories making presspahn and fibre, using the presspahn for binding copybooks and block notes, and they sold the fibre for the manufacture of peaks for caps and for cartridges. But presspahn and fibre for electrical insulators were ordered from abroad. "These examples are extracted from the latest publications by the industrialists themselves. They are astonished by the fact, and are endeavouring to throw the blame on third parties."

Lighting Prosecution.—The manager of a large Middlesbrough drapery and furnishing establishment, when charged on May 2nd with having failed to observe the lighting regulations, pleaded that it was the fault of an electrician who had been doing work on the premises, and had tapped the wrong main. Instead of tapping one of the mains through the shop, he tapped a main controlling the lights in the whole of the windows. A junior switched up the lights in mistake.—Fined £2.

Johannesburg and Trade After the War.—According to the "South African Mining Journal," the Executive of the Johannesburg Chamber of Commerce has submitted a series of recommendations on post-war trade. They urge co-operation between the Imperial Government and the Dominions so as to make the Empire self-supporting; that the Imperial and Dominion Governments should be urged to encourage, for a period of years, the continuance by subsidy or otherwise of new and "key" industries established within the Empire prior to or since the commencement of the war, or which may hereafter be established; that the assistance of the Imperial and Dominion Governments in the organisation of industries is essential to a more complete development of the Empire's resources with a view to ensuring that each industry shall be enabled to obtain all its requirements from sources within the Empire itself; that steps be taken to prevent dumping and under-valuation of all foreign goods imported into British markets after the war, and certificates of origin should be required to be signed by British Consular agents; that the British Consular service should be strengthened by the appointment of men qualified to safeguard and promote the interests of British trade; and that it is of the highest importance that various Governments of the Empire should take steps for the development of technical institutions and scientific research, and their adaptation to industrial and commercial ends. They further urge that the Union Customs tariff should be amended in order to provide for preferential trading between all parts of the Empire; reciprocal arrangements with foreign countries, excepting present enemy countries (against whose produce and manufactures a prohibitive tariff should be enforced), and a special tariff on a prohibitive scale against the products and manufactures of present enemy countries; differential charges against enemy shipping; the prohibition of the entry of enemy trading journals, catalogues, and price lists; that no trading licences be issued to enemy subjects or to agents of enemy firms; that no foreign patents be allowed to be held in South Africa unless they are worked or the articles so patented are made in the British Empire; and that Government departments, municipalities and other bodies administering public funds should be required to confine purchases to products and manufactures of British firms whenever articles required are obtainable within the Empire.

Trading with the Enemy.—In the Cape Town House of Assembly, on April 26th, according to a Reuter dispatch in the "Times," the debate on the Enemy Trading Bill was resumed. Mr. Burton declared that the Government were determined to pass the measure during the present Session. General Botha described the measure as a deplorable necessity, but nevertheless a necessity, for the protection of the inhabitants of South Africa. He quoted a German Act of Parliament dealing with British interests in Germany, adding that if Germany at the end of the war refused to return the goods of British subjects, South Africa would be in a position to adopt a similar attitude towards German goods.

In the "London Gazette" for May 9th there appear new schedules of persons or bodies with whom trading is prohibited in the following countries, and alterations in previous lists:—Denmark, Greece, Japan, Norway, Philippine Islands, Portugal, Sweden, Brazil, Netherlands East Indies. A number of well-known electrical names appear in the lists.

Scarcity of Metals in Austria.—Reuter's correspondent at Zurich reports that lead and tin are now required very badly for military purposes in Austria, and new decrees have been issued for their requisitioning. Manufacturers and merchants are required to give up 80 per cent. of their stocks of lead and tin goods, including plumbing materials, baths and boilers. Type foundries, printers and newspapers are also required to give up 20 per cent. of their type. If such reports as these regarding German and Austrian metal supplies be correct, it is not easy to reconcile them with reports of a coming big after-the-war dump of manufactured goods—and any rate, in the metal-using trades.

Municipal Corporations and Enemy Contracts.—Hackney B.C. is recommended by its General Purposes and Establishment Committee to support the Manchester Corporation in adopting similar standing orders with regard to contracts with foreign manufacturers, viz.:—That in future no contract shall be entered into with any person of German or Austrian nationality, or with any firm or company whose subscribed capital (whether by way of shares or otherwise) is held or controlled to the extent of one-third or upwards by persons of German or Austrian nationality.

Bacup Town Council last week adopted new standing orders to the effect that no contract be entered into with any person of German or Austrian nationality, nor with any firm or company whose subscribed capital was held or controlled to the extent of one-third or upward by persons of German or Austrian nationality.

An Australian Board of Trade.—In a discussion by the Melbourne Chamber of Commerce as to how to remove German trade influence, one member suggested the creation of an Australian Board of Trade.—"Times."

The Paris Conference.—The Parliamentary correspondent of the "Daily Telegraph" says that the Economic Conference of the Allied Powers in Paris has been fixed to commence on Monday, June 5th.

To be Wound Up.—The following further companies have been ordered to be wound up:—

Coutinho, Caro & Co., 134, Fenchurch Street, E.C., metal merchants. Controller: N. W. Wild, 22-28, Broad Street Avenue, E.C.

Wolf Safety Lamp Co., Boston Street, Sheffield, engineers and lamp manufacturers. Controller: T. G. Shuttleworth, Sheffield.

E. M. Brinkman & Co., 99, Redcross Street, London, S.E., merchants (electric lamps, batteries and gas mantles). Controller: K. C. Fox, 45, London Wall, E.C.

Enemy Firms in Hong-Kong.—The "Board of Trade Journal" for May 4th contains a list of enemy firms in Hong-Kong under liquidation, to some of whom British firms, obviously under misapprehension, continue to send advertising literature, trade papers, &c. The following appear in the list:—Arnold Karberg & Co.; Bume & Reif; Carlowitz & Co.; Siemssen & Co.; Garricks, Bomer & Co.

Artificial Limbs for Returned Soldiers.—Following the example adopted in Germany, an exhibition is about to be opened in Petrograd of artificial limbs specially designed to enable wounded soldiers to follow industrial employment when they return to civil life.

LEGAL.

HANDS v. J. DAVIS & CO.

An application was made to Mr. Justice Astbury, in the Chancery Division on May 5th, to enter judgment for the plaintiff in the action by Albert Hands against J. Davis & Co. (Southampton), Ltd., electrical engineers, of Bedford Place, Southampton, the defendants having entered no defence. The action asked for a declaration that the plaintiff was entitled to a charge on the company's assets to secure the payment of debentures.

His Lordship entered judgment as asked.

CHARGE OF BRIBERY.

At Leeds City Court, last week, Thomas William West (37) a War Office viewer, of London, was remanded for a week on a charge of attempting to obtain a bribe from Mr. A. S. Taylor, of Armley, works manager of the Cremer Lamp & Engineering Co.

Mr. E. O. SIMPSON, for the War Office, said the defendant was a viewer, or inspector, in the Ordnance Department at Woolwich, and it was alleged that whilst visiting the Cremer Co.'s works at Leeds to inspect some lamps that were being made under contract, he offered to pass the lamps if he were given £5, half of which he would share with Mr. Taylor. There was another charge of falsifying accounts respecting the time spent in Leeds, which might be preferred against him.

The defendant pleaded "Not guilty," and said that after inspecting lamps Mr. Taylor took him to lunch, saying the "guy" nor would pay, and it was suggested to him that he should stay the weekend and inspect some more lamps. He stated that he had not enough money with him, and he alleged, Mr. Taylor said: "I could do with making a bit," and added that he would get £5 and they could go halves.

ILKLEY U.D.C. v. EVANS.

BEFORE the Otley Bench, on May 5th, Edgar W. C. Evans, electrician, Bradford, was summoned for fraudulently diverting electricity at Ilkley on February 10th.

It was stated on behalf of the Ilkley Council that the defendant was manager for Messrs. Christopher Pratt & Sons, Ltd., of Bradford, who electrically wired a number of premises at Ilkley. Amongst these was a shop, into which was put an electric motor. It was later found that two lights had been connected with the power meter, and thus the consumer was able to obtain electricity for lighting at the power rate.

MR. SIDNEY H. BILL, electrical engineer for the Ilkley Council, admitted in cross-examination that in Bradford and Leeds it was the custom to have two or more lights from the power meter, but this did not prevail at Ilkley. It was contended for the defence that the defendant had been accustomed at Bradford to connect one or two lights with the power meter.

Without asking the defence to call witnesses, the Bench dismissed the case, and ordered each side to pay their own costs.—*Leeds Mercury.*

SHRIMPTON AND ANOTHER v. THE NORTHERN LIGHT, POWER, AND COAL CO., LTD., AND OTHERS.

THIS case came before the Court of Appeal on Friday, May 5th, upon the appeal of the plaintiffs from a judgment of Mr. Justice Peterson. The matter was referred to in our issue of December 24th, 1915.

At the conclusion of the arguments, their Lordships dismissed the appeal, with costs.

THE ACCURACY OF ELECTRIC METERS.

AT Morpeth County Court on 8th inst., the Northern Counties Electricity Supply Co. sued Andrew Foster, a local tradesman, for £1 15s. 4d. for energy supplied.

Mr. P. CORDEE, who represented the plaintiffs, said it was a question of the accuracy of the meter.

The DEFENDANT said he had refused to pay, because while he was using nine lights before the war, and had only used two since, the cost had been very much larger. He produced accounts in support of this statement. The meter had been changed three times.

One of the company's testers said the tendency of the meters was to go slower in use, rather than faster.

Mr. Bibliz, one of the company's electrical engineers, said the last meter had been tested and found to be quite accurate.

Judgment was entered for plaintiffs, with costs.

"Z" ELECTRIC LAMP MANUFACTURING CO., LTD., v. W. DENTON, LTD.

In the King's Bench Division on Tuesday, May 9th, this case was in the list to be mentioned before Mr. Justice Rowlatt.

Mr. Wateley was for the plaintiffs and Mr. Morle for the defendants.

It was stated that the defendants now submitted to an order for the payment of a sum of £32 4s. 6d., and High Court costs.

ADAMS MANUFACTURING CO., LTD., v. BROADBENT,

In the City of London Court, on May 5th and 8th, before his Honour Judge Rentoul, K.C., an action, which had been instituted in the High Court of Justice, was brought by the Adams Manufacturing Co., Ltd., Bedford, against Mr. Frank Broadbent, electrical engineer, London, to recover £71 for electrical switches supplied.

Mr. C. P. Blackwell appeared for the plaintiffs, and Mr. Fortune for the defendant.

MR. BLACKWELL said that the claim was really reduced to £43 by payment. It was brought in the name of the Adams Manufacturing Co. by Mr. Hardy, who was appointed the receiver and manager for debenture-holders by an order of the Court on April 11th, 1913. Various contracts had been sanctioned by the Court. The claim was for electrical switches sold by Mr. Hardy after his appointment. The company ceased to be able to carry on business on the appointment of Mr. Hardy. Defendant had admitted that except as to £20 the rest of the claim was admitted, but he said that the claim had been assigned by the plaintiffs to the Igranic Electrical Co., Ltd. In fact, it was intended to assign the debt due to the plaintiffs to the Igranic Co., but it was never done. Defendant had not paid the Igranic Co. or the plaintiffs. Defendant had said that he granted to the plaintiffs full and exclusive licence and authority to manufacture and sell electric switches under letters patent, or any improvement or modification thereof. Plaintiffs agreed to pay defendant a royalty of 5s. on the price of every switch so manufactured. The agreement did not in truth confer on the plaintiffs any right to sell or manufacture in respect of any improvement or modification. There were several patents concerned; one had lapsed by effluxion of time because the defendant had not paid the necessary fees.

MR. FORTUNE said that Mr. Hardy had gone, so far as the receiver was concerned, and the company were the real plaintiffs.

MR. J. MORLEY, plaintiffs' solicitor, said that Hardy sold the business of the Adams Manufacturing Co. and the assets for £15,000 to the Igranic Co.

MR. FORTUNE said that the wrong plaintiff was suing. The Igranic Co. had been using the defendant's patents for making electric switches on which defendant was entitled to royalties.

MR. BLACKWELL said that the patents were not valid, and plaintiffs had been making the switches without licences, as they did not consider they were necessary.

When the hearing was resumed on Monday, the JUDGE said that the receiver and manager appeared to have sold the plaintiffs' business to Bacon, and Bacon sold to the Igranic Electric Co.

MR. BLACKWELL: He did not sell this debt—that is the point.

MR. FORTUNE: They have given us notice of assignment of this debt to the Igranic Co., and the choice in action is in the Igranic Co. The sale was to take place on April 11th, 1913. The whole business passed to Bacon on that day. Hardy had no interest in the business; he was going to be indemnified as regards any out-goings. The claim is for electrical goods sold after April 11th. Hardy had it in trust for Bacon. Hardy could only sue as Bacon's agent.

MR. BLACKWELL: Yes; but although the debt might become vested in Bacon, and that was contemplated, I say that it never has become vested in Bacon, although he can direct ultimately what shall be done.

JUDGE RENTOUL was sure that neither side wanted to get a judgment that they could not hold when the other side went to the place which dealt only with points of law and had no conscience—the Divisional Court.

MR. FORTUNE: They have treated everything as assigned to the Igranic Co. until they come to this action. We claimed this money we are now counter-claiming. The Igranic Co. have taken a part of the debt, and we are not claiming that.

JUDGE RENTOUL said he could only consider the legal documents. No matter how many people had acted in the matter in another way, that could not affect him. If he could settle the case altogether—if there were no appeal—he might possibly look at what he thought roughly was the justice of the case, that did not enter into the matter at all.

MR. FORTUNE: No. I am entitled to say: "I have a counter-claim against your principal, because you were only trustee or agent, and you have no interest in the action you are bringing; you are only a cloak for a principal." Leaving out the question

whether the new patents are new patents or modifications, this action is by the receiver. I claim my minimum royalties on the 1906 patent so long as he has been receiver and manager.

JUDGE RENTOUL: The first point is who is the right plaintiff and, as far as I can see, the plaintiff is the right man; the right to sue was never in the Igranic Co. There must be judgment for the plaintiffs on the claim. Now about the counter-claim.

MR. FORTUNE said that must be regarded as another action in which the receiver was acting in the name of the Adams Co. The receiver had sold certain goods during the time of his receivership, and during that receivership there was a contract going on between the company and the defendant whereby the company were manufacturing under those licences. The receiver took no steps to terminate the licences; they went on for the life of the patent, subject to the company giving three months' notice.

MR. BLACKWELL did not agree.

MR. FORTUNE said the Receiver did not do that, and he sent out a notice wherein he said he was going to carry on the company as usual.

MR. BLACKWELL added that the company went into liquidation on April 22nd, 1913. The company's business came to an end, except for the purpose of realising the assets of the company for the debenture holders. There was no contract continuing. There was no grant of improvements or modifications to the company.

MR. FORTUNE: The company were manufacturing with a view to selling to the Igranic Co.

MR. BLACKWELL: Not after the liquidation.

MR. FORTUNE: Oh, yes.

MR. BLACKWELL thought that if agreements which were made covered the new patents which were entered into, inasmuch as the company, during the time of the Receiver, did manufacture and sell on plaintiff's evidence under the new patents, the defendant might, be able to maintain a counter-claim against the plaintiffs.

MR. FORTUNE said that Hardy could have repudiated the licence, but he sat on it, and therefore he had to pay the dead royalties, even if he never manufactured at all under it. He did not mind whether Hardy was acting for the Adams Manufacturing Co., or for Bacon, or for the Igranic Co. Defendant was entitled to £50 a year for 15 months, or £62 10s. from April 11th, 1913, to September, 1914.

MR. BLACKWELL replied that the receiver and manager was neither a successor nor the assignee of any contract with the company. He did not come within the words of the contract at all.

JUDGE RENTOUL: Could he repudiate it?

MR. BLACKWELL: Yes, in the sense that he could say "I am not going to express my willingness to take over the contract;" but he is under no obligation to repudiate, because it is not a contract which is binding upon him. It is a breach of contract on the part of the company in not carrying out the agreement. They had failed by selling and manufacturing or by omitting to pay the dead royalty. Mr. Blackwell added that every one thought the Igranic Co. would take over the patents, but they did not do so.

JUDGE RENTOUL gave judgment for the plaintiffs on the claim for £43 and costs, and for defendant on the counter-claim for £62 and costs.

BUSINESS NOTES.

Catalogues and Lists.—BRITISH WESTINGHOUSE ELECTRIC AND MANUFACTURING CO., LTD., Trafford Park, Manchester.—A number of new publications giving descriptive particulars and illustrations, and, in most cases, prices, of a variety of electrical manufactures, as follows:—

- No. A56/A1.—Type RA oil-immersed auto-starters for squirrel-cage motors.
- No. A56/B1.—Type MF rotor starters for A.C. slip-ring motors.
- No. A56/C1.—Type D starters for D.C. motors.
- No. L358/A1 and L358/A3.—A.C. single-phase watt-hour meters, type N.
- No. L358/A1.—Performance curves, and diagrams of connections, of type N single-phase watt-hour meters.
- No. 319/3.—Horn type switch fuses.
- No. 47/3.—Brake solenoids for single-phase connections.
- No. 47/4.—Brake solenoids for three-phase circuits.
- No. 322/A.—Knife switches for low and medium pressure switches, type B.
- No. 7,703/1.—Westinghouse motor applications: Notes on the electrification of a modern floor mill.

MESSRS. SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham.

—List No. 627, illustrating and giving prices of several designs of inspection lamps for shells and other articles such as car-boys, etc., where interiors can only be inspected through small apertures. The largest design shown is for the inspection of the interior of hogsheds, and it is fitted with a spigot for removing stray corks. The smallest lamp shown is designed for the inspection of 18-pounder shells or other small work. Some of the lamps are fitted with small switches in the handles; some are without switches, whilst one specially robust type for munitions work is fitted with a standard tumbler switch in a convenient position near the handle. All the fittings are sent out complete with lamps and flexible, with earth-wire connected.

MESSRS. MELDRUM, LTD., Timperley, Manchester.—20-page illustrated catalogue of the Meldrum forced-draught furnace, with a host of extracts from tributes paid thereto by firms in all departments of industry.

For Sale.—The Postmaster-General has for disposal, and is open to receive offers for, a quantity of surplus stores. The Corporation of Accrington Electrical Engineering Department invites tenders for one 175-kw., 460-D.C., direct-coupled generating set, and three 56-kw., 230-volt, D.C. Willans-Johnson & Phillips sets. Particulars are given in our advertisement pages to-day.

Temperature Measurement.—During the past month the CAMBRIDGE SCIENTIFIC INSTRUMENT CO. have received contracts for temperature measuring instruments for various Home Government departments, also for the Victorian Government Railways, the Small Arms Factory—Lithgow, Australasia, and the Russian Government Supply Committee.

Australian Imports.—We have received from the Australian Association of British Manufacturers and their Representatives at Melbourne a copy of their statistical statement of competitive imports into the Commonwealth of Australia for the 12 months ended June 30th, 1915. The statement has been compiled differently from those previously issued, as it is considered that it will be of more value to give the totals and values of goods imported into the Commonwealth under preferential and non-preferential tariff rates, than to show the percentages of imports into each separate State from the United Kingdom. Further, as imports from Germany have now disappeared, figures are shown for imports from British Dominions and Possessions and the United States of America, as well as the United Kingdom.

The United Kingdom share of the Commonwealth imports of competitive manufactured merchandise (1914-15) was 64·9 per cent. We make the following extracts:—

IMPORTS FROM ALL COUNTRIES (1914-15).

CLASS.	Total.	Preference.	Non-Prefer.
Metals—Manufactured	£9,441,123	£9,422,708	£18,415

A copy of the annual report of the Association for 1915 is also before us. It shows that the number of members has increased by 35 to 270, of whom 134 are British manufacturers and 136 representatives of British manufacturers. The principal subject referred to is that of the Federal Income-Tax, a new tax to be imposed in addition to those previously in existence.

"The Federal Act imposes a tax on persons selling goods in Australia on account of persons not resident in Australia, or on account of companies not registered in Australia, and lays down that the principal shall be deemed to have derived from such sales a taxable income of 5 per cent. upon the price at which the goods were sold. The person selling the goods is made personally liable for the payment of the tax if he disposes of or parts with any fund or money out of which the tax could legally be paid. An amending Bill was later introduced which provided that goods shall be deemed to be sold in Australia on account of a person not resident in Australia or of a company not registered in Australia if any person in Australia receives a commission in respect of the sale of the goods or is paid a salary for obtaining orders for, or for influencing the sale of, the goods. During the passage of this amending Bill through the House, your Executive Council waited on the Secretary to the Prime Minister as a deputation, and protested against the unfairness of these provisions, pointing out that the British manufacturer who is sufficiently progressive to have an agent or representative in Australia who employs labour, pays taxes and generally contributes to the welfare of the country, would have to pay this tax on all business done by or influenced through his agent or representative, while the British manufacturer who is content to merely sell to some London merchant or to people in Australia by means of distributing catalogues through the post, would entirely escape taxation, and would thereby obtain a trade advantage over his more progressive competitor. Further, the fact that British Manufacturers require every assistance at the present time was accentuated, and that they already have to pay very heavy British Income-Tax on the profit on all goods manufactured at their works, whether sold at home or exported overseas. . . . The Prime Minister insisted that as the whole purpose of the Act is to obtain revenue, he could not agree to sacrifice that which would be levied under the provisions to which exception was taken, but after a lengthy debate he finally agreed to an amendment which exempts the agent from personal liability in respect of business done before June 30th, 1915, and also confines such personal liability to tax in respect of goods sold by the agent. The Prime Minister further undertook that the subject would be brought up by the Government for further consideration before the provisions as to the personal liability of agents come into operation, so that the matter will be discussed again by the House when the rates for next year are fixed probably about April or May, 1916."

The Executive Council of the Association have again placed their views before the Federal Government in writing, and have lodged an application for a date to be appointed for a deputation of members of the Association to wait on the Treasurer.

The Executive Council have on several occasions had before them suggestions that some steps should be taken to prevent

enemy countries regaining trade which they have lost on account of the war, but as this is a matter so much bound up with questions of tariff, national treaties and future, discussion of terms of peace, they have found it difficult to formulate any definite proposals. The following resolution was unanimously adopted and copies have been forwarded to the Prime Minister, the Attorney-General and the Minister of Trade and Customs, and also published in the Press:—

That the Executive Council of the Australian Association of British Manufacturers and their representatives, bearing in mind the fact that countries at present at war with the British Empire are certain to make strenuous efforts to recapture trade which they have lost during the war, wish to impress on the Government of the Commonwealth of Australia the necessity of taking such steps as will absolutely prevent the importation of German and Austrian goods after the declaration of peace.

The Association has strongly urged the necessity of the British Government and British financiers, stipulating in regard to all future loans granted to, or underwritten for, Colonial Governments, that all money loaned must be spent within the Empire, and not, as has so frequently been done in the past, paid away to foreign firms.

The policy of the Association in endeavouring to obtain preferential treatment for goods of British manufacture has been persistently pushed on every possible occasion. The Cabinet of the New South Wales Government has decided that a 10 per cent. preference shall be extended to goods or material of local, British or Empire manufacture as against those of other countries. It was also decided that such margin of preference shall be inclusive of any preferential Customs duty that may obtain in the case of the particular material affected. All Government departments and corporate bodies operating under the aegis of the Government have been asked to give effect to this policy forthwith.

Electrical Trade in the Caucasus.—H.M. Consul at Batoum says that the electrical trade is a branch of British industry that might very profitably be developed in the Caucasus. Until the outbreak of war, and for some time after, the electrical engineering appliances and materials required locally came principally from Germany. If the intention to capture German trade under this head is to be realised, British manufacturers should take advantage of the present opportunity to prepare for the competition that will exist after the war. The needs of the Caucasus in all manner of electrical appliances from the smallest to the largest are indeed very great, and when normal conditions are resumed there is no reason whatsoever why British sources of supply should not be preferred to those of Germany. The quality of the articles produced in the United Kingdom is admitted in the Caucasus to be superior to that of German-made goods, but the question of price will have to be studied closely together with that of the terms of payment. In March this year most supplies were almost exhausted. The Consul says that if we are to successfully compete with German firms our manufacturers should enter the field now, if only for the purpose of making preliminary arrangements. Our travellers should speak Russian, and carry Russian price lists, with prices worked out in roubles at the current rate of exchange. Manufacturers of other countries are very alert just now in the Russian markets.

Trade with Serbia.—Dr. Svotosar Groich, speaking on Anglo-Serbian economic and political relations, at the London Chamber of Commerce, said that by freeing himself from the control of the Central Powers, Serbia would have to solve a very important and difficult economic problem, and she hoped and expected that England would give her adequate assistance in this work. British commercial influence in Serbia had hitherto been far too inadequate. The radical changes of conditions after the war, and the acquisition of direct commercial communication by sea, would enable England to occupy the predominant position hitherto held by the Central Powers in Serbia. To encourage Anglo-Serbian trade, it was necessary to organise a few Anglo-Serbian commercial and industrial syndicates of well-known and experienced business men of both nations.—*Times*.

Dissolutions and Liquidations.—BERNERS ELECTRIC CO., electrical engineers and contractors, 65, Berners Street, London, W.—Messrs. C. J. Heffer & F. E. Bayley, have dissolved partnership. Debts will be attended to by the Berners Electric Co. CEDES ELECTRIC TRACTION, LTD., London.—First meetings of creditors and contributories, May 19th, at Carey Street, W.C. M. & G. TRUCK AND ENGINEERING CO., LTD.—This Company is winding up voluntarily with Mr. C. Cooper, 30, Moorgate Street, E.C., as liquidator. A meeting of creditors is called for May 17th, at 14, Old Jewry Chambers, E.C.

ARDWICK ELECTRIC REGULATOR CO., LTD.—A meeting is called for June 9th, at 67, Princess Street, Manchester, to hear an account of the winding up from the liquidator, Mr. J. W. Shepherd.

Bankruptcy Proceedings.—W. C. WILD, electrical engineer, Halifax.—Trustee (Mr. W. Durrance), released May 5th.

Trade Announcement.—Owing to increasing search-light work and lamp-lowering gear business the LONDON ELECTRIC FIRM, of Croydon, require additional space, and they are building a new works at Brighton Road, Croydon.

Electrical Imports to the Argentine Republic.—According to a recent official return, the imports of electrical goods into the Argentine Republic, during last year, only attained a value of £751,009, as contra to with £1,405,000 in 1914.

Book Notices.—*The Exporter's Handbook and Glossary.* By F. M. Dudeney. London: Sir Isaac Pitman & Sons. 5s. net.—The author had begun his work before the outbreak of war, and he has adhered to his original plan of preparing a permanent handbook to the export trade, resisting the temptation to point the commercial lessons of the war, about which so many other authorities are writing and speaking to-day. The book is intended to give an exposition of the principles and methods of export business which will assist British manufacturers and merchants who determine to secure a larger share of the world's trade. It consists of some 40 chapters, a glossary of abbreviations and terms used in export trade, and inset there are many useful specimen shipping documents, such as advice notes, bills of exchange, bills of lading, Consular invoices for different countries, Customs specifications, certificates of origin, a marine insurance policy, and so forth. It is an instructive and educative work throughout, and should be valuable to exporting firms and their employees, especially at a time when it is recognised that there is room for improvement in the commercial training of the younger generation who will have to play a large part in the maintenance and extension of our Colonial and foreign trade after the war. Among the matters dealt with in the course of its 40 chapters are:—The advantages and general principles of export trade; the indent; types of overseas importers; the native importer; the merchant shipper; the export agent; manufacturers' overseas representatives; travelling representatives; export advertising; a summary of methods to be followed in order to secure export trade. The author proceeds in the second part to discuss and describe such matters as financial machinery, bills of exchange, credits and terms of payment, and in Section 3 he tells how to quote to overseas buyers, how to prepare export catalogues, emphasises the wisdom of giving metric equivalents in all quotations, classifies the weights and measures systems of different countries, and handles such points as sampling, packing, marking, and methods of shipment. In the fourth section the subjects covered include freight, bills of lading, demurrage, marine insurance, Consular invoices and certificates of origin, Customs requirements, consignors' and consignees' liability, &c. In several places the author refers to the important part which must be played in certain markets by the technical representative who is able to supplement the efforts of the commercial or sales representative, especially in connection with mining and electrical machinery and other engineering classes of exports. He appreciates the importance of adequately compensating the right man, a direction in which British manufacturers have, unfortunately, played too often into the hands of the Germans in past days. One of the most interesting chapters in the book, so far as we are concerned, is that in which emphasis is laid upon the great part which must be contributed by reputable export trade journals. The author says that the solid basis of any general export advertising campaign must be the specialised export trade journal—systematically reaching overseas buyers who can be got at in no other way. He remarks that there are comparatively few, even of these, which can honestly claim effectually to fulfil their purpose, but those which really do offer sound value for the advertiser's money, are undoubtedly among the most potent levers available for creating and extending export connections. He proceeds to remark that figures of circulation are not to be regarded as the gauge of value in regard to the more respectable export publications. These of an refuse to divulge such figures, knowing that the true test is quality rather than quantity, "which latter any mushroom print can guarantee, and even provide, without the advertiser being one jot the better for it." "The only circulation worth considering is that which covers the *bona fide* wholesale importers in a given market or markets." Elsewhere, in discussing the want of co-operation between commerce and finance in pursuit of export business, he advocates an adaptation of our present system to the needs of the times. There is a chapter on "How the Government Helps Manufacturers in which the part played by the Board of Trade in placing export trade information at traders' disposal is more fairly dealt with than is sometimes the case. From the foregoing summary of the contents it will be observed how complete a work on the subject Mr. Dudeney has set himself to produce. He has brought together a vast amount of most useful information in a very well-arranged form, and the book deserves, and, no doubt, will have, a ready sale among the commercial community.

"Proceedings of the Physical Society." Vol. XXVIII, Part 3, April 15th, 1916. London: Electrician Printing and Publishing Co., Ltd. Price 4s. net.

Telegraph and Telephone Journal, Vol. II, No. 20, May, 1916, London: G. P. O. North, the Editing Committee. Price 3d.

"Anglo-Russian Trade: Exposure of the Russian Chamber of Commerce in London." London: *Daily Chronicle* Office. Price 6d. *The French Exporter* is a new monthly journal for the "defence and the expansion of French interests." It will appear separately in the English and French languages. A number of interesting illustrated articles on such matters as the Lyons Fair, the Economic Conference, French automobile and carriage trade, &c., appear in the April number, a copy of which is before us. Price 1 fr. per copy; published at 24, Boulevard des Italiens, Paris.

International Company Law.—According to the *Manchester Guardian*, Sir John S. Randles, M.P., chairman of the Commercial Committee of the House of Commons, moved at the Congress, in Paris, of the Commercial Committees of the Allies' Parliaments: "That a reform of company law amongst the Allied nations is very desirable, with a view to enable business men of the Allied countries to buy and sell more freely." Money, said Sir John, lacked nationality; it went where it could find a congenial and profitable field. While money, however, was cosmopolitan, national boundaries remained, and a company was often under two jurisdictions, with an inevitable conflict of laws. The moment was ripe for the annunciation of an agreement upon leading principles of joint-stock company law such as could be accepted by virtually all European nations, and would be of incalculable convenience to all who were engaged in company enterprise, in addition to affording an inestimable stimulus to the investment of further active funds in this form of enterprise.

LIGHTING AND POWER NOTES.

Accrington.—**YEAR'S WORKING.**—There was a loss of £3,410 on the working of the Council's electricity undertaking during the past year, as against £3,670 in the previous year. The income was £35,247, and the expenditure £38,657.

The Tramways and Electricity Committee has decided to enter into a five years' agreement for an additional supply of current to the Calico Printers' Association.

Australia.—**HYDRO-ELECTRIC SCHEMES.**—A series of proposals for the generation of electric power by the utilisation of waterfalls in various parts of New South Wales is to be submitted by the Government to the Public Works Committee. The principal proposal is in connection with the overflow from the Burinjuck dam, and would cost about £100,000; it would provide power and light in many towns and districts.

The Upper Clarence River would provide a hydro-electric scheme at a cost of £25,000.

The schemes have been tentatively recommended by engineers as the result of inquiries set on foot by the Government about 18 months ago.

The Sydney City Council, on May 1st, commenced the supply of electricity to Lane Cove (North Sydney) Municipal Council.

Additional plant is being installed in the rolling mill of the steel works of the Broken Hill Proprietary Co., Ltd., at Newcastle, N.S.W., and, in order to supply the necessary power, a further 1,000-kw. set is being added to the electrical generating plant.

Belfast.—**YEAR'S WORKING.**—For the year ended March 31st the net profit on the Corporation electricity undertaking—according to the *Northern Whig*—was £17,000, this being a record. The highest previous surplus was £13,175. The total receipts were, roughly, £115,000, and the expenditure amounted to £68,579. The output sold for lighting and power, exclusive of tramways supply, was 9,149,000 units, as against 8,193,000 units in the previous year; the tramways supply was 31 per cent. less than in 1914-15. The excellent result is attributed to the growing power supply, coupled with the recent increase in price.

Blackpool.—**ANNUAL ESTIMATES.**—The electricity department's estimated income for the present year is £46,200, and the expenditure £26,925. Gross profit is estimated at £19,275, but capital charges will absorb £17,275, leaving an estimated surplus of £2,000, as compared with a surplus for the year just closed of £2,478. The estimated receipts are up by nearly £2,000. During the last three years there have been 1,028 new consumers.

Bootle.—**PRICE INCREASE.**—As from June 30th next, 12½ per cent. is to be added to the charges for electricity for lighting, power, and other purposes, except in cases where special agreements limiting the charges for electricity exist.

Bo'ness.—**LOAN SANCTION.**—The T.C. has been notified by the Secretary for Scotland that he is prepared to sanction the borrowing of an additional sum of £12,000 for the extension of the electricity undertaking, subject to the condition that one-twentieth of any sums borrowed under the sanction is paid off, or set aside, to a sinking fund annually. The Council has approved of the terms of the letter, and has agreed to ask the National Electrical Construction Co. to submit the particulars of the modified scheme, with estimates, for the acceptance of the Council.

Bury.—**YEAR'S WORKING.**—The profit for the past year on the Corporation electricity undertaking was £2,003, £1,000 of which is to go to the relief of the rates, and the balance to the reserve fund.

Carnarvon.—**LOAN SANCTION.**—The T.C. has received the sanction of the L.G.B. to the borrowing of £2,680 for additional plant at the electricity works.

Chile.—A decree has been issued granting permission to Don Horacio Urrutia Gundian to install electric light and power systems in the towns of Illapel, Salamanca, and Vicuña.—*Board of Trade Journal.*

Continental.—**SWITZERLAND.**—An influential Swiss electrical concern is the Columbus Electrical Society, formed some years ago at Glarus. It is associated with the Brown-Boveri group and possesses 75 per cent. of the capital of the Italo-Argentine Electrical Co., of Buenos Aires, which enjoys a concession similar to that of the Deutsche Uebersee Elektrizitäts Gesellschaft, and has secured a number of private, municipal and State contracts. The Italo-Argentine Co. holds the majority of the shares in the electrical companies in the Argentine cities of Dolores, Corrientes, and Pergamino.

Cumberland.—The C.C. has granted the Cumberland Waste Heat Owners' Co. permission to cross the Whitehaven, Egremont, and Cleeton Moor, and Egremont Main roads with electric cables, provided they are placed underground. Objection was taken to overhead lines on the ground of danger to the public in rough weather.

Dartford.—**INCREASED ASSESSMENT.**—The Assessment Committee has increased the assessment of the electricity undertaking from £450, rateable value, to £1,700, and the refuse destructor from £166 to £300. Notice of objection has been lodged.

Greenock.—**PLANT INAUGURATION.**—Last week, a new 5,000-kw. Westinghouse-Rateau turbine set was started up at the Dellingburn power station, this being a duplicate of the one installed two years ago. The alternator is of the totally enclosed self-ventilated type with compensating windings. In the course of some remarks at the inauguration ceremony the convenor mentioned that the output of the works in 1913-14 was 11,000,000 units, while it was expected that the present financial year would show an output of considerably over 20,000,000 units.

Horwich.—The U.D.C. has consented to the Bolton T.C. supplying energy to a consumer in the urban area, on condition that other applicants will be supplied.

Hove.—**WAR BONUSES.**—As a result of a petition from the employés of the Corporation electricity department, it has been decided to grant various members of the staff an extra war bonus of 3s., in addition to the present bonus of 2s. per week.—*Sussex Daily News.*

India.—**ALL-ELECTRIC COLLIERY.**—The Burelia Colliery of Messrs. Bird & Co. is the only entirely electrical colliery in India. Two groups of two shafts have been sunk, the power being supplied from a station at the Chichuria pits equipped with two 300-H.P. Belliss-Siemens generating sets. Four similar electric winding engines are installed, each driven by a 25-H.P., 500-R.P.M. motor, and having a capacity of 200 tons in eight hours, using single 15 cwt. tub cages. One pump is installed at each dip shaft with a capacity of 6,000 gallons an hour against a head of 320 ft. Four additional three-throw dip pumps on trolleys are also in use. Two Turbon fans are to be installed, one at Chichuria and one at Dahooka.

A ropeway in two sections is provided, to connect the two collieries with the screens, and this is driven by a 60-H.P. motor.

Llanfyllin.—Mr. R. A. Jones, who has completed an E.L. installation for the town, has offered to undertake the public lighting at £2 per lamp per annum. This, compared with the present cost of gas lighting, will ensure an annual saving of £30. The T.C. has decided to consider the matter at a special meeting.

London.—**HAMMERSMITH.**—The Electricity Committee recommends the Council to conclude an agreement with the Osram-Robertson Lamp Works, Ltd., for a supply of electricity to Brook Green Works for a period of four years from April 1st, 1916, and afterwards, subject to determination by six months' notice, at '8d. per unit. The minimum guaranteed payment to be £5,000 per annum, representing 1,500,000 units.

FULHAM.—Owing to the difficulty of obtaining adequate supplies of water from the river for condensing purposes in connection with the Council's electricity undertaking, owing to low tides and other causes, the Electricity Committee recommends that the circulating water pipes be extended further into the river, at an estimated cost of £1,500. The work can only be carried out during the summer.

BATTERSEA.—Owing to the increase in the demand for electricity in the Nine Elms and Church Road districts, the Electricity Committee recommends the adoption of the scheme of the electrical engineer providing for a sub-station at Nine Elms, with a rotary converter, which, with mains, will cost £3,723; also for additional transformer and switchgear in the New Road sub-station, at a cost of £875, and an additional feeder cable at a cost of £780.

On Wednesday, last week, an inquiry, lasting six hours, was held into the application of the Charing Cross Electricity Co. to be allowed to increase its statutory charges during the war. The City Corporation, the L.O.C., the Port of London Authority, and about 30 private consumers appeared to oppose the application.—*City Press.*

BETHNAL GREEN.—The B.C. has given notice to the Stepney B.C. of the commencement shortly of the supply of electricity in Bethnal Green.

Middlesbrough.—**BULK SUPPLY.**—The Cleveland and Durham County Electric Power Co. has approached the Corporation with a view to advancing the price of energy temporarily by 15 per cent., as from January 1st, 1916, until six months after the termination of the war. The matter has been left with a Sub-Committee pending a proposed meeting of the principal consumers of the Power Co.

Middleton.—**PRICE INCREASE.**—The charge for electricity for lighting has been increased by 3d. per unit, and for power purposes by 1½ pence.

Newcastle-under-Lyme.—**PRICE INCREASE.**—Owing to the high price of fuel, the T.C. has increased the tariff for general electrical lighting by 5 per cent.; for power, by 16½ pence; cinemas, increase of 10 per cent. on lighting, and of 20 per cent. on power; North Staffs. Railway Co., increase of 20 per cent. on power; Messrs. Hammond's mills, increase of 10 per cent. on power.

Rochdale.—**PROPOSED LOAN.**—The Gas and Electricity Committee has recommended that application be made to the L.G.B. for sanction to borrow £60,900 for extensions to buildings and plant at the electricity works. The T.C. has decided to call a special meeting to discuss the matter.

Salford.—**BULK SUPPLY.**—The Council last week adopted a recommendation of the Electricity Committee varying a resolution of February last relative to the supply of electricity in bulk, by agreeing not to require the Lancashire Electric Power Co. to supply a demand of over 2,000 kw. unless the company has the necessary plant available, and subject to reasonable notice being given by the Corporation.

South Africa.—The Boksburg T.C. has had under consideration an offer from the Victoria Falls Power Co. to supply the town with electricity under a 15 years' contract. Apparently the town has spent £13,000 on electric plant and buildings, and, if the offer is accepted, it will be necessary to dispose of the plant at an estimated loss of £1,300; it will also be necessary to spend £500 in connection with the proposed supply; assuming that the proposed supply costs an average of 1'25d. per unit, the addition of financial charges on the amounts above mentioned would bring the cost to 1'43d. per unit.

South Lancashire.—A correspondent informs us that the completion of the equipment of the Hulton Colliery Co.'s new pits at Huyton is being hindered by the difficulty in obtaining delivery of the equipment for the electric winders which are to be installed.

Torquay.—The Corporation Electric Light Committee has deferred consideration of the proposed increase in the price of current to the Tramway Co. until the expiration of the company's year of account in August next.

Walkden.—A new generating station has been completed at Lord Ellesmere's Mosley Common Collieries, in which exhaust steam turbine and air-compressing plant is installed; generating stations have also been erected at the Bridgewater and Ashton Field collieries.

Warrington.—**LOAN SANCTION.**—The L.G.B. has sanctioned the borrowing of £9,536 for extra boilers at the electricity works, and has authorised the work to be put in hand.

Wigan.—**PROPOSED EXTENSIONS.**—The T.C. has adopted a scheme of electrical extensions based on the recommendation of Mr. H. Dickinson, city electrical engineer of Liverpool. Application is to be made to the L.G.B. for sanction to the borrowing of £53,920 in connection with the proposal, which involves the installation of new boilers, turbine plant, &c.

Wolverhampton.—**LOAN SANCTIONS.**—The L.G.B. has sanctioned the borrowing by the Corporation of £4,000 for the laying of mains and £2,000 for sub-station equipment in connection with the electricity undertaking. The Electricity Committee has entered into an agreement to supply the works of Arcorundum Abrasives, Ltd.

TRAMWAY AND RAILWAY NOTES.

Accrington.—The last year's accounts of the Corporation tramways show total receipts amounting to £29,393, compared with £27,850, and working expenses amounting to £19,498, against £16,438 in the previous year. The passengers carried totalled 4,841,334; the traffic revenue per car-mile was 12'86d., and the working expenses 8'67d.

Bacup.—Representatives of the Bacup Tramways Committee and the Rywenstall Corporation are to meet to discuss questions relating to tramway stages and fares, upon the suggestion of the Rywenstall Corporation.

The Corporation has approved draft tramway rules and regulations, as amended by the L.G.B.

Belfast.—**YEAR'S WORKING.**—At the quarterly meeting of the Corporation the annual statement of the tramway accounts, the details of which were given in these notes last week, was approved of after much criticism. Councillor Daff said that he did not think that a surplus of £5,000, was enough when other systems gave from £50,000 to £70,000.

Birkenhead.—**FEMALE LABOUR.**—Some criticism having been made recently regarding the work of the women car conductors, Mr. Halsall (chairman of the Tramways Committee), made a statement at a meeting of the T.C. on May 3rd, to the effect that the women were doing their duty very satisfactorily. Inspectors had been specially employed checking the women conductors' pay-sheets on the routes during the hours of the heaviest traffic, and it was found that very few fares had been missed on the cars. The management were satisfied with the work of the conductors.

Blackpool.—The Easter traffic returns on the Corporation tramways were remarkable. They were only £100 short of an absolute record, being £3,380, as compared with £3,480 in 1914, which was £800 better than any preceding year in the history of the department.

A statement has been prepared showing estimated receipts on the tramways for next year of £76,000, and expenditure amounting to £46,200, leaving a gross profit of £29,800. Capital charges will absorb £19,800, leaving an estimated surplus of £10,000. For the year just closed the estimated surplus was only £2,500, but the actual surplus was £16,500.

Bolton.—**ELECTRIC VEHICLES.**—The T.C. has agreed to a recommendation of the Electricity Committee that an electric charging station for battery vehicles be installed at Spa Road works; also that the attention of the various Committees of the Corporation using vehicles be drawn to the enormous advantages to be gained by substituting electric vehicles for other types, and that a deputation from the Electricity Committee confer with those Committees on the subject.

Bradford.—**ELECTRIC VEHICLES.**—The Electricity Committee proposes to purchase an electric battery vehicle for conveying coal from the railway yards to the electricity works, and ashes from the works to available tips. The authorities will be able to compare the advantages of this vehicle with the railless trolley 10-ton conveyance which the tramway department has put on the streets to help local industries to overcome transit difficulties.

The *Sheffield Independent* states that the new vehicle on the railless trolley system, which is to inaugurate a service of goods haulage on the tramways made its appearance on Monday last; it took a 2-ton load to Wibsey, running at the speed of an ordinary tramcar when in touch with the overhead wires, and at the same time accumulating power for use when leaving the tramway routes. It will be regularly used for the purpose of conveying wool from railway depots to the various warehouses in the city, and will greatly ease the strain caused by the shortage of ordinary cartage facilities.

Dublin.—Gangs of men are making good the damage caused by the rebel outbreak of Easter week. The damage done to the tramway system appears to have been exaggerated, as by the end of last week the power station and the distributing stations were virtually working as usual. Some damage was done to the rolling stock, as some of the cars were seized by the rebels to form parts of street barricades. The electric lighting, &c., in Sackville Street is, of course, badly damaged owing to the havoc wrought by the rebels, fires, and the artillery bombardment.

The Dublin and Lucan Electric Railway, notwithstanding the danger prevalent in the neighbourhood of Conyngham Road, was able to maintain a complete service of cars. The manager reports that during one period, hundreds of bullets passed over the company's buildings, though no material damage was done.

Gateshead-on-Tyne.—The question of paving in connection with the tramway doubling on the Bensham route is being discussed by the T.C. and the Tramway Co., the latter disagreeing with the Council's requirement that it shall pave margins at the road side.

Glasgow.—The receipts from the Corporation tramways last week totalled £23,152, which is the highest amount yet received during a normal week.

The Sub-Committee on Tramways Finance has agreed to recommend that the depreciation for the current year be at the same rates as for the preceding 12 months.

The Tramways Committee has decided to recommend that the works and properties of the department be insured against aircraft risks.

Halifax.—The Tramways and Electricity Committee has been authorised by the Council to carry out extensions at the Skircoat depot, at an estimated cost of £2,700.

Nottingham.—The Corporation tramways, gas, and electricity undertakings have contributed £60,350 this year to the relief of rates, as compared with £71,000 last year.

Salford.—**YEAR'S WORKING.**—At a meeting of the T.C. last week, Ald. Linsley, chairman of the Tramways Committee, said the Committee had a net balance of £18,000 on the year's working of the tramways, and it was proposed to borrow £4,000 from the reserve fund in order to contribute £22,000 to the relief of the rates.

Stretford.—The U.D.C. is applying to the B. of T. for an extension of time for the completion of the construction of

lines authorised by the Stretford Light Railways Order, 1906, and the West Manchester (New Lines, &c.), Order, 1906.

Sheffield.—The Corporation tramway receipts during the Easter holidays totalled £11,439, an increase of nearly £3,000 as compared with the previous year.

U.S.A.—The Brooklyn Rapid Transit System has recently introduced an articulated car made up of two single-truck cars and a low floor vestibule for its street lines. This type of car is really of an experimental character, and data as to its working will be collected over a number of lines. The complete car is 62 ft. 10 in. overall, comprising the centre vestibule 13 ft. long, two car bodies each 20 ft. long, and two end platforms each 4 ft. 10 in. long. The car is fitted with a motor-driven coin register in the centre entrance vestibule, and the latter is provided with pneumatically-operated doors.

CHICAGO-MILWAUKEE ELECTRIFICATION.—The Chicago, Milwaukee and St. Paul Railway was expecting to inaugurate electrical operation on the second section of its electrified district about April 15th. The road has been operated electrically since last December between Three Forks and Deer Lodge, Mont., a distance of 115 miles, and the new electrified section comprises that part of the road between Harlowtown, Mont., and Three Forks, a distance of about 113 miles. This will make a continuous piece of electrified railroad for both heavy freight and passenger service for a total distance of some 228 miles.

The new electrical equipment having been in service throughout the winter months, Mr. C. A. Goodnow, assistant to the President, has authorised the statement that the results of the electrification have in every way exceeded their expectations. At times when the severe cold weather was seriously impeding operation by steam the electric locomotives were moving without any trouble. The new equipment has given satisfaction not only with respect to tonnage handled and the mileage made, but also with respect to regularity of operation and freedom from failures. One electric locomotive is taking the place of four steam engines and promises eventually, at full efficiency, to supplant even a larger proportion of steam locomotive power. Moreover, the electric locomotive handles its full tonnage at 15 to 16 miles per hour as against 8 or 9 miles per hour by steam. The mileage of the heavy trains drawn by electric locomotives is 200 in 24 hours, which compares with 114 miles by steam locomotive. On the 115 miles now operated electrically, 24 steam locomotives, Mallet and other heavy types, have been released already by the nine electric locomotives which are now in service, and the trains are moved more quickly and cheaply. The maximum loads will be 3,000 tons over the mountains, 3,450 tons between Deer Lodge and the mountains, and 4,500 tons between Bitter Root mountains and Deer Lodge. These trains will be handled with one engine except for short stretches where a helper will be used. A rough estimate is made at present that repair costs on the electric locomotives will amount to about one-half the expense of the steam locomotive. The regenerative braking feature is working as satisfactorily as are other features of the equipment. It is possible to dispense with the air brake entirely in ordinary operating, thus avoiding heating and possibly broken wheels, and the excessive wear of brake shoes, with a stopping of the freight trains every 10 or 12 miles to cool wheels.—*Railway Review*.

Wigan.—**YEAR'S WORKING.**—There was a profit on the past year's working of the Corporation tramways of £663.

TELEGRAPH and TELEPHONE NOTES.

Dublin.—During the recent rising in Ireland, the rebels neglected to cut the Stock Exchange telephone wires; had that been done, Dublin would have been isolated and the troops at the Curragh would not have been warned in time. Fortunately, some of the military got to the Exchange on Easter Monday in time to protect it, arriving exactly three minutes before the rebels came to cut the connection.

Telephone for Forest Rangers.—A portable telephone, made of aluminum and weighing only 25 lb., the invention of a U.S. forest officer, R. B. Adams, will be part of the regular equipment of patrolmen in the U.S. National Forests during the coming season: it is regarded as a great improvement over the set formerly used, which weighed 10 lb. A field man equipped with this telephone, a few yards of light emergency wire, and a short piece of heavy wire to make the ground connection, can cut in anywhere along the 20,000 miles of Forest Service telephone lines and get in touch with the headquarters of a supervisor or district ranger.—*Electrical Review and Western Electrician*.

Trans-Atlantic Wireless Telegraphy.—Marconi's Wireless Telegraph Co., Ltd., announces the resumption of the deferred night and week-end letter services, which were suspended recently owing to the trouble in Ireland, and their traffic can now be expeditiously handled, as their land-line communication with the high-power trans-Atlantic wireless station in Ireland is restored.

Wireless Telephony.—Mr. Daniels, Secretary of the United States Navy, has communicated, by means of a wireless telephone, with the commander of a battleship off the coast. This is the first time communication by wireless telephone between ship and shore has been established.—*The Times*.

Wireless on Aeroplanes.—According to the *Daily Express*, Mr. Marconi has succeeded in developing apparatus which makes it possible not only to transmit wireless messages, but also to receive them on aeroplanes, besides improving the reception on airships: he stated that the improvement would make wireless communication more efficient, and would make it more difficult for the enemy to intercept our messages. Hitherto it has not been possible to receive messages on aeroplanes, on account of the noise of the engines, but this difficulty has now been overcome. Mr. Marconi considered that the Allies were ahead of the enemy in science as applied to wireless work, but not in organisation. He stated also that wireless telephony from aircraft was already feasible, and that not too much importance should be attached to the German attempts to jam the wireless between our warships at sea.

Meter Contracts.—The following contracts have been placed with the Electrical Apparatus Co., Ltd.:—Burnham and District Electric Supply Co., electricity meters for one year; Malvern U.D.C., electricity meters for one year; Leyton U.D.C., electricity meters for one year.

Sunderland.—T.C. Tenders accepted on Wednesday: E. W. & C. J. Phillips.—Four boiler-draught gauges. E. Green & Son, Ltd.—C.I. damper. General Electric Co., Ltd.—Six 5 h.p. main boxes.

Wolverhampton.—Electricity Committee. Accepted tenders:—

J. E. Perry & Son.—To purchase and remove three Lancashire boilers, steel girder, and flooring, £655. Strachan & Henshaw.—Installation of ash handling plant, £216.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—SYDNEY.—May 24th. N.S.W. Government Railways and Tramways. 16 600-volt D.C. motors for tramway stores, Randwick.*

June 20th. Sydney Municipal Council. Two-ton electric lorry. City Surveyor, Town Hall.

MELBOURNE.—May 31st. Victorian Government Railways. Transformers for five years. First order, 220 transformers in six months.*

June 14th. Victorian Railways. Electric lamps and lampholders for signal system.*

Belfast.—May 24th. Electricity Committee. Chain-grate mechanical stokers. See "Official Notices" to-day.

Canada.—May 15th. Ten knots of single-conductor submarine telegraph cable (107 lb. copper, and 150 lb. gutta-percha per knot) with iron wire sheathing, for Canadian Government Telegraph Service, Department of Public Works, Ottawa.*

Keighley.—May 22nd. Wiring of Fever Hospital and Sanatorium, Morton Bank. Specifications (10s.), Mr. H. Webber, Borough Electrical Engineer, Coney Lane.

Liverpool.—May 31st. Liverpool Overhead Railway. Twelve months' supply of electrical fittings, Particulars from General Manager, 31, James Street.

Manchester.—May 17th. Electricity Committee. Automatic coal-handling plant at Stuart Street station. See "Official Notices" May 5th.

Alternating-current or direct-current motors, 200 B.H.P. capacity, at Stuart Street station. Specifications (£1 1s.), Mr. F. E. Hughes, Secretary, Electricity Department.

New Zealand.—June 23rd. Oamaru Borough Council. Overhead mains and street-lighting equipment (Contract No. 2); power-station equipment (Pelton wheels, alternators, &c.) (Contract No. 3); service meters (Contract No. 4); line transformers and accessories (Contract No. 5).*

PAHIATUA.—July 10th. Borough Council. Overhead wires, poles, street lamps, gas engines, producers, dynamos, and auxiliary apparatus, accumulators. Specifications from Borough Offices or E. J. Fenn, Consulting Engineer, Auckland.*

Swindon.—May 30th. Corporation. Steam coal for the electricity works and waterworks respectively. See "Official Notices" to-day.

Wolverhampton.—May 19th. Corporation Electricity Department. Small coal. Mr. S. T. Allen, Chief Engineer and Manager, Commercial Road (returnable deposit of £1 1s.).

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Accrington.—Electricity Committee. Accepted tenders: Water-cooling tower.—Lancashire Water Cooler Co. 2,000-kw. turbo-alternator, with condenser, &c.—B.T.H. Co., Ltd. Boiler feed pumps.—J. P. Hall & Sons, Ltd. Feed water heater.—Holden & Brooke, Ltd. Modernising one set of mechanical stokers.—Bennis & Co., Ltd.

Canterbury.—T.C. Repairs to economiser: Green and Co., Ltd., £130.

Glasgow.—T.C. Tramways Committee. Recommended tenders:—

Points and crossings and special junction work.—Hadfields, Ltd. Chilled-iron brake blocks (three months).—Miller & Co., Ltd. Steel axles (six months).—Glasgow Railway Engineering Co., Ltd. Steel tires (six months).—Brown Bayley's Steel Works, Ltd. Fire-clay goods (12 months).—Glenboig Union Fire-clay Co., Ltd.; Douglas Fire-brick Co.; Speirs, Gibb & Co.

Keighley.—Corporation. Accepted tenders:—

Dorman, Long & Co.—Steel girders and steelwork for foundations for new 5,000-kw. turbo-alternator, £132. H. V. Robinson, Ltd.—Foundations for 5,000-kw. turbo-alternator, £1,217.

FORTHCOMING EVENTS.

Physical Society of London.—Friday, May 12th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Papers on "The Latent Heats of Fusion of Metals and the Quantum Theory," by Mr. H. S. Allen; "Lenses for Light Distribution," by Mr. T. Smith; "The Choice of Glass for Cemented Objectives," by Mr. T. Smith.

Royal Institution of Great Britain.—Saturday, May 13th. At 8 p.m. At Albemarle Street, W. Lecture (II) on "X-rays and Crystals: First Results and their Applications," by Prof. W. H. Bragg, F.R.S. Friday, May 19th. At 5.30 p.m. Lecture on "The Movements of the Earth's Pole," by Col. E. H. Hill, F.R.S.

University College, London.—Monday, May 15th. At 5.30 p.m. At Gower Street, W.C. Lecture on "The Manufacture of Nitrates from Air by Electric Power," by Mr. E. Kilburn Scott.

Tuesday, May 16th. At 6 p.m. Lecture on "The Role of Chemical Science in Civilisation," by Prof. F. G. Donnan, F.R.S.

Royal Society of Arts.—Monday, May 15th. At 4.30 p.m. At John Street, Adelphi, W.C. Cantor Lecture on "Vibrations, Waves and Resonance," by Mr. J. Erskine-Murray (Lecture III).

Institute of Engineers and Shipbuilders in Scotland.—Tuesday, May 16th. At 2.15 p.m. At the Royal Technical College, Glasgow. Address on "Engineering Industry in the Economic War," by Mr. T. C. Elder.

Chemical Society.—Thursday, May 18th. At 8.30 p.m. At Burlington House, Piccadilly, W. Lecture by Prof. F. Gowland Hopkins.

Institution of Mechanical Engineers.—Friday, May 19th. At 6 p.m. At Great George Street, S.W. Paper on "Spur-Gearing," by Mr. D. Adamson.

NOTES.

Electrical Methods in Surgical Advance.—At the Royal Institution on Friday last, Sir James Mackenzie Davidson delivered a lecture on "Electrical Methods in Surgical Advance." He said that the discovery of X-rays had revolutionised surgical diagnosis, but the shadow-picture produced by X-rays, however realistic it might appear, was not like an ordinary photograph from which the relative positions of objects could be inferred. To obviate this difficulty the stereoscopic method was largely used, but this, while invaluable in many respects, was not precise enough for exact localisation, and in order to arrive at the measurements required with mathematical accuracy, some system based on the principle of similar triangles was necessary. The lecturer gave a description of his own cross-thread localising method, and of a rapid procedure by which the measurements could be carried out with a small hand fluoroscope. Having ascertained the position of the foreign body, there were various electrical aids to the surgeon when he came to the question of its extraction. Of these, one of the most useful was the telephone attachment (already described in these columns); one terminal of the telephone being attached to the surgeon's instrument, and the other to a carbon plate placed on the patient's skin, a click was heard in the receiver when the electrical circuit was completed by contact with the foreign body. Another device was a telephone forceps with fluorescent screen attached, adapted by Dr. A. E. Barclay, of Manchester. Another instance of the adaptation of electrical methods to war surgery was Prof. Bergonié's electromagnet; this device, largely used in France, and of which the lecturer gave a demonstration, consisted of a large electromagnet excited with an alternating current. When the magnet was held over the suspected part, a vibratory motion was imparted to the projectile (if this were in the magnetic field), synchronising with the pulsing of the current. The surgeon felt the part, and became instantly aware of any vibration of the tissues, which indicated the presence of the metal. The point of maximum vibration having been selected, he made an incision at that point if convenient, and then the magnet was again used, and the incision deepened in accordance with the information it gave. It was stated that vibration was induced, not only in the ordinary magnetisable metals, but also in some of the non-magnetisable, including aluminium and copper.

A new Tungsten Arc Lamp.—At the meeting of the RÖNTGEN SOCIETY on May 2nd, Major Wilson, of the Canadian Medical Service, demonstrated a new enclosed tungsten arc lamp which he has devised for therapeutic purposes. He said that his idea originally was simply to produce a lamp capable of giving ultra-violet rays, but much more cheaply constructed than the ordinary large arc in use at some of the hospitals, and at the same time

more effective than the ordinary Finsen-Reyn lamp, and costing less for running than the Simpson arc. For this purpose he had devised a lamp, one of the electrodes being of pure tungsten, while the other was of carbon cored with tungsten, the tungsten powder being made into a paste and forced into the central cavity of the ordinary carbon. When the arc was formed, the tungsten was reduced in the intense heat, and rays of very short wave-length were liberated. The spectroscopic results showed that it was possible to get down to a wave-length of 2,000 Angstrom units. Cerium and other materials were tried, but nothing gave so good a result as tungsten, nor was any arrangement so effective as the tungsten and the carbon cored with tungsten powder. There was no sputter, and the arc worked quite automatically, a good quartz compressor being effective for bringing the rays on to the part in the therapeutic treatment of wounds. The president (Mr. J. H. Gardiner) suggested that uranium might be tried in the place of tungsten, the uranium spectrum being remarkable for its great masses of fine lines, and approaching a continuous spectrum. Radiations higher than a wave-length of 2,000 units could be obtained with metallic uranium. At the same meeting Mr. H. E. Donnitheore read a paper on a new modification of the ionisation method of measuring X-rays, and complained of the inadequacy of the ordinary milliamperemeter, which utterly failed to measure the exact value of the current passed through the tube.

Newspaper Science.—In these days, when all the non-technical Press has awakened to the fact that the demands of the technical Press for the cultivation of science, reiterated continually during the past 20 years, are fully justified, we may perhaps be merciful and regard its errors with a lenient eye. Yet we cannot altogether ignore a blunder which is not only ridiculous but also utterly gratuitous, especially when it is found in the columns of the leading daily journal, which has been a prominent advocate of reform in the nation's attitude towards science. Referring to Sir J. Mackenzie Davidson's lecture at the Royal Institution on "Electrical Methods in Surgical Science," the *Times* of May 6th, states that the lecturer dwelt upon the utility of the *spectroscope* in localising bullets in the body. How the reporter managed to substitute "spectroscope" for "stereoscope" we cannot tell, but it is clear that neither he, nor the sub-editors, had any notion of the respective uses of the two instruments, which are about as much alike as a compound microscope and a pair of spectacles, and are employed for purposes differing as widely. The operating surgeon has no use for the spectroscope, but has used the stereoscope with radiograms for years, and no one who knew the A B C of the subject could possibly have confused the two instruments.

Economy in Use of Coal.—The following letter has been sent by the Board of Trade to gas and electric lighting undertakings:—

"I am directed by the Board of Trade to state that, as you will be aware, difficulties have been experienced for some time in securing adequate supplies of coal for manufacturers of munitions, and other consumers of national importance, owing to the decline in the output of coal from the mines and the increase in the demand for war purposes. The position has been met in the past to a large extent by the restriction of export, but coal which is now being exported goes largely to meet the urgent requirements of our Allies, or is valuable as a weapon in negotiating with neutral countries.

"The Board have observed with some concern the recent decline in coal exports, and in their opinion it has become necessary that special steps should be taken to maintain, and if possible to increase, the exportable surplus of coal, and that for this purpose everything possible should be done to encourage economy in the use of fuel at the present time. A copy of the notice which they recently issued, recommending a reduction in the consumption of domestic coal, is enclosed for your information. The question has been further considered by the Central Coal and Coke Supplies Committee, and they have recommended that a general policy of economy in lighting should be adopted, and that gas and electric lighting undertakings should be asked to do what they can to reduce consumption by a definite amount. The Board think there can be little doubt that there are many cases in which light is at present being used needlessly or wasted altogether. They have accordingly decided to request owners of gas and electric lighting undertakings that they should notify their consumers that the Government desires to see the consumption of coal for lighting purposes reduced by 10 per cent., and they should do all in their power by notices and inspection to see this recommendation carried out. The Board would suggest that inspectors should be sent round as often as possible to examine meters, and hand to consumers, where necessary, a notice reminding them of the recommendation, and calling attention to the fact that they have not yet carried it out. The Board would be glad to be informed of the steps taken."

The Electrical Wholesalers' Federation, Ltd.—The annual general meeting of this Federation took place on Wednesday, April 26th. The chairman, Mr. R. W. Smith, in presenting the report of the Committee and reviewing the work of the year, said that many questions affecting the wholesale electrical trade had arisen, which the E.W.F. had been able to negotiate successfully. He appealed for more support from *bona fide* wholesale firms, so that the Federation should be thoroughly representative. Wholesale electrical firms desirous of becoming members can obtain all information from the Secretary, Electrical Wholesalers' Federation, Ltd., Amberley House, Norfolk Street, W.C.

Foreign Trade.—THE APRIL FIGURES.—The following are the electrical and machinery figures given in the official returns for April:—

IMPORTS.				
Electrical goods and apparatus, excluding machinery and un-insulated wire...	Month of April.	Inc. or dec.	Inc. or dec. to date compared with 1915.	
Machinery ...	£148,575	+ £58,432	+ £195,688	
Machinery ...	637,917	- 239,889	- 13,998	
EXPORTS.				
Electrical goods and apparatus, excluding machinery and un-insulated wire ...				
Machinery ...	273,274	+ 34,375	+ 220,386	
Machinery ...	1,284,348	- 290,107	- 400,967	

X-Rays and Crystal Structure.—On the occasion of the sixth annual May lecture of the Institute of Metals, delivered on May 4th, Prof. W. H. Bragg, F.R.S., gave an interesting account of the new method of applying the properties of X-rays to the study of crystal structure, including the structure of certain metals. The method, it was shown by the Professor, results in the determination of the exact relative positions of the atoms of which the crystal is composed. It is not successful in every case as yet because of the lack of practice and experience of the experimenters in the new field, and because some of the interpretations are not fully understood.

Silver and copper have been shown to possess a very simple structure, in which the atoms are arranged as in the piling of shot. Bismuth and antimony have a distorted arrangement; but these two, as well as zinc, have not been completely determined. A beginning had been made with iron; the war has, however, stopped all work of the kind on this metal.

This new field of research, according to Prof. Bragg, depends on the well-known principle that when a regular train of waves falls upon a surface separating two media, part is reflected and part goes on. If the part that goes on meets another separating surface, a second portion is reflected, and some of this emerges from the second medium in the same direction as the beam reflected from the first surface. It will happen in general that the two reflected beams are out of phase, and to that extent destroy one another. Whether they do so or not depends upon the relation between the wave-length, the angle of the inclination of the beam to the reflecting surfaces, and the distance between the surfaces. In this way are explained the colours of the soap film, of the thin layer of oil on the surface of a liquid, of steel when being tempered, and so on. It is an essential cause of this effect that the wave-length and the spacing are not very different in amount. The X-rays consist of waves which are something like ten thousand times shorter than the wave-length of light. The layers of atoms in the crystal provide suitably spaced reflecting surfaces, and it is found that when a pencil of X-rays of a definite wave-length is allowed to fall upon the face of the crystal, and the crystal is gradually turned round so as to alter the angle of incidence, the reflection of the beam, as a whole, is non-existent except when the angle is right. Then it flashes out strongly. When this angle is observed, the relation of the wave-length to the spacing is known.

The instrument used is called the X-ray spectrometer. It has no lenses, because X-rays cannot be refracted; and the rays are invisible, so that, in place of the telescope, there is a chamber containing gas, which is ionised by the X-rays. The resulting electrical effect is observed in an electroscop. The measurement of the result is quantitative, so that in this respect the new spectrometer has an advantage over the old. In this way, if we use always the same X-ray, we can compare the spacings between the layers parallel to one after another of the natural faces of the crystal; and in this way we arrive finally at the crystal structure.

Engineers' Wages at Birmingham.—The Birmingham branch of the A.S.E. has made application to the Engineering Employers' Federation for an increase upon the day rate of wages. The men have pointed out that in many instances unskilled workers engaged under the piecework system are receiving higher wages than skilled engineers, and, further, that the increases which have already been granted are not commensurate with the increased cost of living and the additional responsibility placed upon them in consequence of the introduction into factories of workers with no previous experience. The *Birmingham Daily Post* states that some of the employers have met the demand of the men, but as others have not, the question is now the subject of negotiation between the Employers' Federation and the engineers' society. The matter has also been laid before the Minister of Munitions.

Faraday House Awards.—The following awards have been made as the outcome of the recent scholarship examinations at Faraday House Electrical Engineering College:—

A Faraday Scholarship of 50 guineas per annum, tenable for two years in college and one year in works, to F. I. Ray, of Bourne-mouth School.

A Maxwell Scholarship of 50 guineas per annum, tenable for one year in college and one year in works, to C. F. Fowler, of Brighton Grammar School.

An Entrance Exhibition of 20 guineas per annum, tenable for two years, to W. Parr-Dudley, of Cranbrook School.

Institution and Lecture Notes.—Belfast Association of Engineers.—The annual general meeting was held on April 27th, Mr. J. W. Kempster, D.L., presiding. In the course of his address the chairman said that in other centres the Engineering Associations were actively interesting themselves in the future, and the Manchester engineers had commenced an organisation by which they hoped to compete successfully with the foreigner when the war was over. Engineers needed to make up their minds whether collective effort on their part was desirable, and what it could effect; and if they thought it could do any good, they should throw in their lot with whatever organisation was formed to further the movement. They must not expect everything from the Government; the latter could only make use of the forces which were in existence.

Mr. Stanley Johnston moved:—"That this meeting of the Belfast Association of Engineers approves of the prompt organisation of the engineering industries within the British Empire, in co-operation with other industries, under State auspices, with the object of stimulating internal progress and of exerting collective influence and common action in the severely intense competition for trade in the markets of the world that it is anticipated, will arise immediately upon the termination of the present war. That a copy of this resolution be sent to Mr. Edmund L. Hill, the honorary secretary of the Engineers' Club, Manchester, asking him to lay it before the Council for the Organisation of British Engineering Industries, assuring him of the co-operation of our Belfast Association of Engineers in the effort to organise the British engineering industry, and expressing the hope that the organisation may extend to all industries throughout the Empire, including those of Ireland." He said when the war broke out British engineering firms were unprepared; they were isolated from each other, and their own petty jealousies were keeping them apart. It was not until the Ministry of Munitions was established that there was any co-operation, and now they were all working as one great organisation, under one head. This moulding together of our great engineering industries had been one of the wonders of the Allies. Three thousand firms had been taken over and controlled by one department, and 13,000 firms, with almost 2,000,000 employees, were working on munitions. The great question to be faced now—not when the war was over—was: what had to be done to turn those 2,000,000 workers back to the ordinary commercial life that existed before the war? They were told that Germany was ready to dump on the United Kingdom, after the war, a greater quantity of goods than ever before. Were they going to sit down and wait for that event? This was the problem which had to be faced, and the sooner we had a Ministry of Commerce the better. The motion was unanimously passed.

Institution of Electrical Engineers.—A special general meeting of the Corporate Members will be held on May 25th, at 5 p.m., for the purpose of considering the following resolution:—"That the following words be added to Article 41 of the Articles of Association, namely:—

"(a) On and after the 15th day of June, 1916, no person, whether a naturalised British subject or not, who is or shall be or has or shall have ever been a subject of a country or State, then or thereafter at war with His Majesty or his successors, shall be or continue to be or be eligible for election as a member of any class of the Institution, provided nevertheless that the above disability shall not apply to a person who having at any time been a subject of such a country or State as aforesaid shall have become and shall be a naturalised British subject and shall prove to the satisfaction of the Council that under the laws of such country or State he has ceased to be and is not a subject thereof."

Should the above resolution be passed by the requisite majority, a further special general meeting of the Corporate Members of the Institution will be held on June 15th, at 5.15 p.m., when the resolution will be submitted for confirmation as a special resolution.

At the meeting of the YORKSHIRE LOCAL SECTION, on Wednesday last, a paper was read by Mr. G. Dearle on "The Economical Production of Power from Coke-oven Gas."

Electrical Association of Australia (Victorian Section).—At a meeting held on March 30th, Mr. F. A. McCarty delivered his presidential address.

Association of Supervising Electricians.—The meeting announced for May 16th will not take place, owing to Mr. F. C. Raphael having accepted a commission in the Royal Engineers. Other arrangements are being made, of which notice will be given.

The Textile Institute and Research.—The outstanding feature of the annual meeting of the Textile Institute, which was held in Manchester on Friday last, was the evidence of increasing recognition of the importance of research work. The annual report stated that in addition to a special investigation which was to be carried out at the Bradford Technical College, a special research in relation to the control of the electrification of textile fibres during processes of manufacture had been initiated. Dr. William Garnett (late educational adviser to the London County Council), in a paper on "Industry, Education, and Research," spoke of the need for breaking down the academic isolation of the schools and bringing them more closely into touch with the everyday life and experience of the children—a reform which must commence in the training colleges. His principal word to the manufacturers of the country was the need of confidence and combination for successful competition with Germany and America after the war. Individualism might serve very well in competition for home trade, where all were on an equal footing, but it could not compete with organised collectivism in foreign markets. If in one country all the manufacturers in a

particular trade combined to carry out scientific research, and so to distribute manufactures that there was the minimum duplication of plant, and each works produced those goods which it could manufacture with the greatest economy, they need not add the assistance of the Diplomatic Corps to see sufficient reasons why the individual firms of another country should find it hard to compete. Dr. Garnett spoke hopefully of the possible work of the Advisory Council for Research, and stated that the Council had made a start on sound lines. After outlining the way in which the Textile Institute might further industrial research in the textile trades, he concluded with one "small piece of advice"—never to regard with complacency the loss of any branch of trade, however small or unremunerative. It was very easy to be too late in defensive action.

Mr. H. Lesser, President of the National Federation of Employers' Approved Societies, read a paper on "Employers and National Health Insurance," in which he described the formation and work and advantages of approved societies for the employers of one or more employers. Mr. Joseph Taylor, secretary of the British Thomson-Houston Employers' Friendly Society, Rugby, opened the discussion. He alluded to the closer relationships between employers and employed that were often made possible through the employers' friendly society, and remarked upon the willingness of the employers to give help in any way which was calculated to be mutually advantageous. His own society had well-equipped ambulance stations throughout the works, not only for dealing with accidents but for attending to, say, a man with a headache, who could be given a draught by qualified persons which would probably put him right and enable him to resume his work and prevent him losing time, while giving the employers the advantage of having his machine running, and not idle. Mr. Taylor strongly recommended textile manufacturers who had not their own friendly societies to start them without delay. Other speakers spoke appreciatively of the benefits of these societies, not only to the employees but to the employers as well.

Sir William Mather (President of the Institute) who has been indisposed recently, was not present at the meeting. He was re-elected President for a second year.

The Metric System.—*Aprapas* of the recent references in our columns to the metric system, the following extract from the paper on "Education, Industry and Research," read by Dr. William Garnett before the Textile Institute in Manchester, last Friday, is interesting:—"There is one subject of instruction in the schools in respect of which the trade of the country is in a better position to form a judgment than any education authorities or bodies of teachers; I refer to the metric system. I am quite prepared to set aside for the present the question of decimal coinage, but all our children should be taught to think in terms of the metric system of weights and measures. I have recently been examining statistics respecting the food supply of this country and of Germany. I find that sometimes two Government departments adopt different units for their statistical returns. I find ounces, pounds, hundredweights, tons, quarts, gallons all used more or less indiscriminately in the books I have consulted, and then, as soon as physiological science is brought to bear on the statistics, grammes and litres, kilogrammes and metric tons, with the great and small calorie and the kilo-litre calorie for heat values, are introduced along with the ounces and pounds of the British statistics. But these difficulties are trivial as compared with the effects of an insular system of weights and measures on foreign countries which have adopted the metric system. . . . The metric system is slowly, but very slowly, gaining ground in this country. Metric screw threads have found their way into British tool making, and only a few days ago I was interested in finding a small boy in a venter shop in Shoreditch quoting three-ply birch in millimetres of thickness. The average Briton, however, still refuses to read any article which is written in terms of the metric system, regarding it as outside his comprehension. . . . For the purpose of foreign trade we are bound to learn a system which is almost universal among other civilised countries."

South African Electrical Trade.—The annual report of the Johannesburg Chamber of Commerce, in reviewing the trade of 1915, states that the electrical trade has suffered throughout the year, owing to shortage of stocks consequent upon the abnormal conditions prevailing in British manufacturing circles, and also the restriction of shipping facilities. The demand from the mines for electrical machinery and supplies has been substantially maintained, but there has been a reduced inquiry from the Government Department and electrical wiring contractors. Cost prices have increased considerably, and this fact, in conjunction with the increased rates of freight and insurance and shortage of stocks, has caused a substantial rise in selling prices. While the British firms have derived some benefit from the elimination of cheap German goods, there has been a considerable amount of competition from neutral countries. It seems evident that when the war is over and German goods are again available, British electrical industries will continue to be seriously affected, unless some preventive steps are taken. The prospects for the current year (1916) are not too encouraging.—*South African Mining Journal*.

Fatality.—BRADFORD.—An inquest was opened on Friday last week, and adjourned to Wednesday, in regard to the death of Alfred Dickinson (31), married, a switchboard man in the employ of the Corporation electricity department. It seemed that he was engaged in his employment at Thornbury sub-station, when he touched a live wire and died as a result of the shock.

Electric Vehicle Committee.—The Society of Motor Manufacturers and Traders, Ltd., has appointed Mr. T. C. Pullinger, of Arrol-Johnston, Ltd., to represent this society upon the Electric Vehicle Committee.

Inquiries.—Makers of ferro-type sheet for telephone diaphragms are asked for.

Appointments Vacant.—Engineer-in-charge (40s. to 45s.), for the Borough of Bedford electricity department.

Volunteer Notes.—ENGINEERING INSTITUTIONS' V.E.C.—At the desire of General Sir O'Moore Creagh, the Corps has joined with the 4th Battalion Central London Regiment (Architects' Corps), under the command of Lieut-Col. C. B. Clay, V.D., to form the 1st London Engineer Volunteer Corps. The identity of the Corps will be preserved in the Engineering Institutions' Company, and the funds will also remain separate.

1st LONDON ENGINEER VOLUNTEERS.—Orders for the week by Lieut-Col. C. B. Clay, V.D., Commanding.

Friday, May 12th.—Technical, at 46, Regency Street, S.W. for Sections 3 and 4, No. 3 Company; Squad and Platoon Drill for Sections 1 and 2, No. 3 Company, at Chester House; Signalling Class and R cruits, No. 3 Company, at Chester House.

Saturday, May 13th.—Company Commander E. G. Fleming's Instruction Class, at Chester House, at 2.30.

Musketry.—See notice, Tables A and B, at Headquarters.

Sunday, May 14th.—Major-General Sir Francis Lloyd, K.C.B. (G.O.C. London District), will make an inspection of the Corps at work on the Sections of the South London Defences allotted to them. Every member should make special efforts to attend. Parade, Victoria Station (S.E. & C. Railway Booking Office), at 9 a.m., for special train. Uniform, haversacks and water-bottles. Mid-day rations to be carried. Railway vouchers will be provided.

Notice.—The Parade for Richmond Park, on Sunday, May 21st, is cancelled.

MACLEOD YEARSLEY, Adjutant.

May 8th, 1916.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, May 11th, 1916:—

Week-End Parades.—**Saturday.**—The Battalion will Parade at Baker Street Station, at 2.30 p.m., and proceed by train to Wembley Park for Battalion Drill.

Sunday.—The Battalion will Parade at 9.30 a.m., at Liverpool Street Station (Low Level entrance, G.E.R.), and proceed by train for Entrenching duties. Members will carry their own lunch, and the Quartermaster will make arrangements for light liquid refreshments. The Battalion will return to town about 6 p.m.

Musketry.—Inter Battalion Cup Competition. Bisley Range will be open for shooting all day on Saturday next, the 13th inst., to those members whose names appeared in Monday's Orders.

Morning Train.—Members to report, in uniform, to Sergeant Burmester, at 9.20 a.m., Platform No. 6, Waterloo Station.

Afternoon Train.—Members to report to Platoon Commander M. H. Galsworthy, at 12.45 p.m., same platform.

A. G. JOINER, Major and Adjutant, O.R.C.

South African Agencies Wanted.—H.M. Trade Commissioner in South Africa (Mr. W. G. Wickham) reports that a firm in Johannesburg wishes to obtain agencies covering the Transvaal, Natal and Rhodesia, of United Kingdom manufacturers of H.T. oil-break switches and switchgear, motors, transformers, electricity meters of all descriptions, and electric mine-signalling apparatus (such as bells, pulls and pushes). The name and address of the firm can be ascertained on application to the Commercial Intelligence Branch of the Board of Trade in London. Reference number 161.

Electrical Operation of Panama Canal Locks.—At a meeting of the Western Society of Electrical Engineers, held in Chicago, it was stated in a paper entitled "The First Year's Operation of the Panama Canal Locks" by Messrs. F. C. Clark and R. H. Whitehead, respectively superintendent and assistant superintendent of lock operation, that in the first year 1,370 vessels were locked through the canal without any accident whatever. The control apparatus had given excellent results, and it was only by the use of such a control system that so large a system of locks could be operated properly. Both up and down lockages were made at about twice the speed that was anticipated. Both lock operators and canal pilots were given very careful training. The night illumination of the locks had proved entirely satisfactory, so that vessels could pass through the locks as freely at night as by day. Electric locomotives used in towing and guiding vessels through the locks were designed for a speed of two miles per hour; it was feared that this speed would be too high when it came to handling very large vessels, so a scheme by which the locomotive speed could be reduced to one mile an hour was developed through concatenation of the motors. It had been found, however, that practically all vessels could be manipulated at the speed of two miles an hour without danger or trouble. Bids were being sought on a number of additional towing locomotives, in which certain improvements were to be incorporated.—*Electrical Review and Western Electrician*.

Bequest.—The Times states that the late Mr. Thomas Taylor, of Blackpool, left £1,000 to the Corporation of Ashton, for scholarships in electrical science at the Reginbottom Technical Schools.

Substitute for Platinum Leading-in Wires.—A note in *La Revue Electrique* describes a substitute for platinum for the leading-in wires of glow lamps, invented by Mr. Byron E. Eldred. Two conditions must be satisfied to make a permanently sound joint between the wire and the glass: the metal must be "moistened" by the glass, to secure adhesion, and the glass and

metal must have practically the same coefficient of expansion. Platinum fulfils both these conditions, but expands slightly more than glass, so that when the joint is cold, the wire contracts more than the glass, and thus the glass sheath, sticking to the wire, is in a state of tension. Obviously it would be preferable to use an alloy having a coefficient of expansion slightly less than that of glass, so that on cooling the glass would be compressed. This condition is fulfilled by certain nickel-iron alloys, which, however, do not possess to so high a degree as platinum the property of adhering to glass. To remove this objection, Mr. Eldred uses a nickel-steel wire coated with a layer of copper and a final layer of platinum, the thicknesses being so chosen that the joint coefficient of expansion is a little less than that of glass, while the coating of platinum ensures good adhesion. The layer of copper improves the conductivity of the wire—a matter of some importance when dealing with very fine wires—and regularises the expansion of the nickel-steel, which presents some perceptible irregularities between the temperature limits that the wire must endure.

Metallurgical Research.—On Monday last the Standing Committee on Metallurgy, appointed by the Advisory Council for Scientific and Industrial Research, held its first meeting, under the chairmanship of Sir Gerard Munz, who is also chairman of the Section on the Metallurgy of Non-ferrous Metals, Sir Robt. Hadfield being chairman of the Section on the Metallurgy of Ferrous Metals. In the course of an opening statement to his Section, Sir Robt. Hadfield referred to the necessity of improvements in electrical pyrometers, electric furnace practice, and the electrical and magnetic properties of various alloys.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The Reading Tramways Committee has recommended that the salary of the general manager and engineer be increased from £550 to £600 a year from April 1st, instead of January 1st next.

Aberdare U.D.C. has increased the salary of Mr. A. J. ABRAHAM, general manager of the electricity and tramways departments, by £50 per annum.

A Sydney newspaper states that the proposal of the Electric Lighting Committee to appoint Mr. P. T. DAVIES, of Montreal, to the position of deputy general manager of the electric light department, caused a long discussion in the City Council. As against the appointment of Mr. Davies, the claims of Mr. S. T. MALING, a Victorian, were urged by Ald. Farrell, who vigorously pleaded for the appointment of an Australian. Eventually an amendment approving of the appointment of Mr. Maling was carried.

The Wolverhampton Corporation is recommended to increase the salary of Mr. J. S. DUDLEY, maintenance engineer, from £160 to £170 a year, and that of Mr. J. WYATT, second clerk in the electricity department, from £114 to £125 per annum.

General.—SIR HIRAM MAXIM has accepted the invitation of the Aeronautical Institute of Great Britain to become its first president.

The Tonbridge U.D.C. has decided to grant £12 10s. per annum to the electrical engineer, Mr. M. P. PLUNKETT, for taking over the responsibility of the electrical plant at the sewage works.

The marriage took place at Southampton, on April 26th, of Mr. Wm. BOWEN, A.M.I.E.E., of Leeds, to Miss Elsie Marion Winship.

Mr. G. G. HAZARD, London representative of Siemens Brothers Dynamo Works, Ltd., of Upper Thames Street, E.C., has been appointed to the A.S.C., M.T., as from May 8th.

Mr. R. C. HATTON, Southern sectional engineer of the Yorkshire Electric Power Co. (previously on the staff of the mains department of the County of London Electric Supply Co., Ltd.) was married on April 22nd.

Sir C. A. PARSONS, K.C.B., and Mr. CHAS. BRIGHT, F.R.S.E., are two of the members of the new committee which has been appointed to inquire into the administration and command of the Air Service.

London Gazette notice: Territorial Force. London Electrical Engineers. Second-Lieutenant (temporary Captain) A. R. Z. PORTER, from London Regiment, to be Lieutenant (temp.).

Roll of Honour.—Amongst the prisoners taken by the Turks at Kut-el-Amara on the surrender of the garrison is Mr. A. J. WALDRON, who was, before the war, on the staff of the Western Union Telegraph Co., at Penzance.

Flight Sub-Lieutenant WARNER H. POBERDY, formerly a student engineer with the British Thomson-Houston Co., Ltd., of Rugby, and who was later in Canada, has been invalided home to Rugby as the result of a serious aeroplane accident in Flanders.

Private CHAS. HAROLD DAVID, of the Canadian Regiment, who was on the staff of the Bell Telephone Co., of Toronto, until he joined the Expeditionary Force, has fallen in action in France.

Private ALFRED WHITEHEAD, of the Royal Fusiliers, who, prior to his enlistment, was engaged at the British Westinghouse Works, Trafford Park, has been wounded, and his right leg has had to be amputated.

Lieutenant MULLINER, assistant borough electrical engineer at Ecdes, is on sick furlough. He has been suffering from nervous breakdown, after service at the Front. He has now left the Hospital for Officers at Hampstead, and gone to his home at Malvern.

Mr. WM. HAMBLEN, formerly a fireman at the Barnsley power house of the Yorkshire Electric Power Co., who was in the K.O.Y.L.I., was killed in France in January.

Second-Lieutenant J. FISHER, of the North Staffordshire Regiment, to which he was commissioned from the Honourable Artillery Company, has died from the effects of gas received at the Front. He was formerly engaged at Siemens Brothers Dynamo Works, Stafford, and was 25 years of age.

Obituary.—LIEUT.-COL. ST. GEORGE R. S. CAULFIELD.—The *Morning Post* states that Lieut.-Col. St. George R. S. Caulfield, of the Royal Engineers, while playing golf at Leeds, died from heart failure. He was for a time Chief Instructor at the School of Submarine Mining and Electric Lighting.

Will.—According to the *Times*, the late Mr. HAROLD FARADAY, Hampstead, and Wardour Street, W., electrical engineer and manufacturer, left £29,495.

NEW COMPANIES REGISTERED.

K. E. Syndicate, Ltd. (143,777).—Registered May 5th by Kenneth Brown, Baker, Baker & Co., Lennox House, Norfolk Street, W.C. Capital £1,000 in £1 shares. Objects: To acquire certain options and rights in respect of two inventions, relating respectively to electric arc lamps and to improvements in direction indicators, to carry on the business of electricians, manufacturers of and dealers in electrical, geometrical, chemical, photographic, and scientific apparatus and materials, &c., and to adopt an agreement with G. A. Knappott and H. Justus Eck. The subscribers (with one share each) are: H. C. Leggatt, 36, St. Mary's Square, Kennington, S.E., solicitor's clerk; H. T. Page, 60, Ballance Road, Homerton, N.E., solicitor's clerk. Private company. The first directors (to number not less than two or more than four) are G. A. Knappott, H. Justus Eck, F. Rutherford Harris (chairman), and R. O. Graham, each of whom may retain office for five years. Solicitors: Kenneth Brown, Baker, Baker & Co.

Haddow & Co., Ltd. (9,579).—This company was registered in Edinburgh on April 28th, with a capital of £3,000 in £1 shares (500 pref.), to take over the business of electrical contractors carried on by Haddow and Co., at 107, Douglas Street and 102, West George Lane; and by A. Wylie & Co., 10, Wemyss Place, all in Glasgow. The subscribers (with one share each) are: A. F. Wylie, Calderwood Road, Glasgow; J. S. Hutchison, 107, Douglas Street, Glasgow. Private company. The number of directors is not to be less than two or more than five; the first are A. F. Wylie and J. S. Hutchison. Registered by J. Oswald & Son, Edinburgh.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Sun Electrical Co., Ltd.—A memorandum of satisfaction to the extent of £275 on April 28th, 1916, of debenture stock dated March 31st, 1912, securing £7,000, has been filed.

Productive Engineers, Ltd.—Issue on April 27th, 1916, of £600 debts., part of a series of which particulars have already been filed.

Burgess Hill & District Electric Supply Co., Ltd. (£5,698).—Capital, £6,000 in £1 shares (3,000 pref.). Return dated March 10th, 1916. All shares taken up; £5,900 paid; £100 considered as paid. Mortgages and charges: £1,200.

Record Electrical Co., Ltd.—Particulars of £7,000 debts., created April 6th, 1916, filed pursuant to Section 93 (3), Companies (Consolidation) Act, 1908, the amount of the present issue being £6,000. Property charged: The company's undertaking and property, present and future. No trustees.

G. H. Turner & Co., Ltd.—Issue on April 14th, 1916, of £200 second debts., part of a series of which particulars have already been filed.

CITY NOTES.

For the last half of 1915 the amount to credit of revenue is £93,553, as compared with £49,935 in the corresponding half-year of 1914, and the expenses have been £22,987, against £31,251. Including the balance brought forward and interest on investments, there is available £14,649. The directors propose dividends for half-year to December, 1915, on the first preference shares at 6s. per share, and on the second preference shares at 6s. per share, carrying forward £2,880. The board have thought it well to recommend that the above balance be carried forward. The traffic receipts for the half-year show a falling-off of £16,529 as compared with those of the corresponding period of 1914, when an abnormal volume of traffic was carried. Beyond the reduced traffics the company also suffered from the hurricane referred to below. At the date of the last report it was not possible to gauge the effect of the severe hurricane that in August passed over the West Indies, extending from Cuba and Jamaica to Guadeloupe, to which disturbance the simultaneous interruption of their two main cables between Porto Rico and Jamaica is attributable. This interruption lasted for twelve days, and necessitated the

use, at considerable cost, of alternative connecting lines for carrying the traffic during the emergency. It is many years since a similar disaster happened to these two cables. Consequent upon, and as a direct result of, war conditions, the working expenses, although on the whole less than those for the corresponding period, are above the average of the previous few years, and no immediate reduction can be hoped for. The value of cable used in repairs and renewals was particularly heavy during the half-year; and, in the opinion of the board, the amount properly chargeable on this account against reserve for depreciation is £5,451.—*Financial*.

For 1915 the profit is £31,084 (compared with £33,602 for 1914), plus £4,703 brought forward, making £35,787. There has been transferred to reserve for renewals account £10,000, and applied in reduction of the preliminary expenses account £2,000; a dividend of 7 per cent. for the year, less income-tax, requires £22,400, leaving £1,387 to be carried forward. The loss by exchange on subsidiary coinage in 1915 was £31,707, which was equal to 9.91 per cent. on the capital. Profits had been converted into sterling at an average rate of 1s. 9d. to the Mexican dollar, as against 1s. 9½d. for the preceding year. Since the close of the year the improvement in the rate of sterling exchange had been material, and there was a tendency towards improvement in regard to depreciation of subsidiary coinage, which was likely to be maintained while the price of copper retained its present high level. The effects of the war on general conditions in Shanghai, and on the company's traffic, were seriously felt during the first half of the year; gradual recovery had since taken place, and the traffics and net receipts for the current year were the best in the history of the company. Ten motor cars had been added to the rolling stock, making 90, and an application had been made to the Municipal Council for leave to introduce a further 15 trailers, making 70 in all. They also had seven railless cars. After the relaying of Fokien Road in cement concrete, the service of railless electric cars was resumed on July 6th, 1915, and had operated successfully ever since. These cars were extremely popular. Application had been made for sanction to a small extension of this route, for which the cars in stock were sufficient. Passengers carried 59,749,710, an increase of 4,102,472; passengers per car mile 17.86, as against 16.97 in 1914; gross receipts per car mile 8.46d., an increase of .08d.; average effective receipts per passenger .35d., as against .37d. in 1914. Annual meeting: May 19th.

For the year ended March 31st, 1916, the profit, including the amount brought forward and after writing off depreciation and transferring £7,500 to general reserve, was £59,218. The preference dividend of 10 per cent. absorbs £8,500, 10 per cent. dividend for the year on the ordinary requires £11,500, and a bonus of 10 per cent. for the year (making a total of 20 per cent.) requires a further £11,500, leaving £27,718 to be carried forward. It is anticipated that the excess profits tax for 1914-15 and 1915-16 will absorb the greater part of this carry-forward. The increasing business of the company has necessitated acquiring additional factory accommodation. New premises will shortly be taken over at Clissold Park of approximately 20,000 superficial feet area, and it is hoped that this factory will be in full working order by the end of May, 1916. The business is a controlled establishment under the Ministry of Munitions. Annual meeting: June 1st.

Lisbon Electric Tramways, Ltd.—The result of operations during 1915, after deducting interest and amortisation due on the debentures of the Companhia Carris de Ferro de Lisboa, and after the

payment of £25,570 for interest on and redemption of the debentures of this company, and also the payment of London office expenses and directors' remuneration, shows a net profit of £59,917, plus £2,883 brought forward. The usual 6 per cent. preference dividend has been paid, absorbing £25,533, and after paying 4½ per cent. net for the year on the ordinary shares, £8,736 is to be carried forward. In order to meet this year's contribution to depreciation reserve, £25,000 has been transferred to that account from the exchange reserve to represent this year's appropriation, it being considered that this sum would have been available out of profits for this purpose, had it not been for the heavy fall in the rate of exchange, and as the exchange reserve account was set aside for this purpose it now falls to be drawn upon. The tramways carried 67,101,249 passengers, earning Es.2,022,143 £93.5, as compared with 63,758,037 passengers, earning Es.1,988,210-£79.8 in 1914, but though the receipts and passengers continued to expand, there was a considerable addition to the expenditure consequent upon the abnormal high price of coal and other supplies, and of labour. The company also suffered from the heavy depreciation in the exchange, the average rate of which during the year has fallen from 43.43d. to 35.97d. The system was closed down for two days during May, 1915, owing to political disturbances; this was the only interruption. With the exception of one small incline, which it is hoped will be completed during 1916, the remainder of the Ascensores line have been electrified and re-opened to traffic during the past year. The directors express their appreciation of the services of the local board in Lisbon, of Mr. A. O. Kolkhorst, the general manager, and of the entire staff. Annual meeting: May 17th.

West India and Panama Telegraph Co., Ltd.

STOCKS AND SHARES.

TUESDAY EVENING.

Calcutta Tramways Co., Ltd.—SIR HENRY KIMBER presided at the annual meeting on May 4th. He said that the traffic receipts showed a falling off of only £1,313, and the working expenses were less by £2,683 than in 1914. During the first half of the year there was a drop of over £5,000 in traffic, as compared to pre-war takings, but in the second half there was an increase of upwards of £4,000. The principal portion of the new capital expenditure of £11,720 was due to the outlay on the completion of the new Dalhousie Square sub-station, and the major portion of the cost of the new A.C. set at the Nonapookur power station and the works in connection with its erection. With regard to the prospects for the current year, whilst the aggregate receipts up to now showed an increase of £4,721 over those for the same period last year, they must expect that, with the continuance of the war, the cost of all materials, freights, &c., would continue to advance, with the addition of increased import duties and income-tax to be levied in India. There had been a discussion going on in a great number of companies having their headquarters in England, and their works and businesses overseas, with a view to escaping double income-tax. The speaker referred to, and quoted from, a paper on the subject issued by the London Chamber of Commerce, giving the reasoning for and against double income-tax. The company now had a system of about 35 miles; their traffic receipts were 10.16d. per car mile, and the expenses 5.21d.

Indian Electric Supply and Traction Co., Ltd.

MR. J. G. B. STONE, presiding at the annual meeting on May 5th, said that the increase in the number of units sold was 598,928, or 25 per cent. and the net profit in Cawnpore increased by about 25 per cent. The actual price per unit was slightly lower, but this had been more than balanced by the lower cost of generation. The supply side of the business continued to expand, and there were new districts awaiting development as soon as general conditions allowed. They must for the time being refrain from undertaking new work, for even supposing they were able to raise the capital, there would be a difficulty in getting the Treasury to sanction its issue. They must also consider the enormous increase in the cost of copper, machinery, plant, and material, and the prohibitive rates for freight. In regard to the last of these, the increase was from 50 per cent. to 75 per cent. over pre-war rates, and, in addition, there were increased amounts to pay for insurance. The short length of tramway still yielded no profit, although it was a convenience to the Indian population. It was too short to become a paying concern on the very low fares it was necessary to charge to attract passengers, there being no European traffic, and at present there was no encouragement to extend the system. They had placed to general reserve £2,000, and to depreciation and renewals account £3,000; they had also written £500 off the expenses of the debenture issue. The position for the current year was satisfactory, as the profits showed an increase.

Canadian Westinghouse Co.—The annual report shows net earnings for the year 1915 amounting to \$800,628; property and plant account takes \$150,000, and \$261,285 is carried forward. The total surplus of the company is now \$1,823,775, and the total assets \$6,330,757. Regarding business conditions, the annual report says:—"The industrial life of Canada during the year just closed experienced a remarkable recovery from the suspended activity of the preceding year. Many plants which had with difficulty kept together an irreducible minimum of their operating organisation found themselves early in 1915 strained to their utmost capacity under night and day operation. In addition, numerous new industries have been brought into being, the changed conditions in these respects being the direct result of large purchases in Canada by the British and Allied Governments of various supplies and munitions of war."

Anglo-Portuguese Telephone Co., Ltd.—The profit and loss account shows a gross revenue of £81,923, of which operating, management and general expenses absorbed £51,577, and royalties to the Portuguese Government £2,459, leaving a gross profit of £27,886. After payment of income-tax £1,349, and providing for depreciation interest £1,937, and sinking fund £1,662, the amount available for disposal, including £5,471 carried forward, is £28,409. Of this amount £2,000 has been added to exchange fluctuation account, and £10,000 to the renewals fund. An interim dividend of 3 per cent. was paid, less income-tax, last November. The directors now recommend a further dividend of 5 per cent., less tax, making a total distribution of 8 per cent. for the year, leaving £4,409 to be carried forward.

Eastern Telegraph Co., Ltd.—A final dividend of £2 5s. per cent. is recommended on the ordinary stock, also a bonus of £2 per cent., both free of income-tax, making a total of 8 per cent. for the year 1915.

Bell's United Asbestos Co., Ltd.—For 1915 the total distribution on the ordinary shares has been 15 per cent., placing £15,000 to reserve, and carrying £7,942 forward.

Auckland Electric Tramways Co., Ltd.—An interim dividend of 7d. per share, less tax, on the ordinary shares is announced.

Stock Exchange markets are somewhat under the influence of the new Military Service Bill. Members of the House, their staffs, and their clients are all affected, in a greater or less degree. There is, of course, no shirking of the responsibilities or of the sacrifices which are called for. But if all men up to the age of 41 are called up within any brief space of time, business must suffer from disorganisation; and it will be some little while before the machine of commerce gets into smooth running order again. The Daylight Saving Bill is vigorously discussed in the Stock Exchange, but has had no effect in the market for electric lighting shares. The encouraging Board of Trade figures for April are helping Home Railway stocks. In the telegraph section, there is more inquiry than hitherto for the issues of the Anglo-American companies. The Globe Telegraph & Trust has increased its dividend by 1 per cent.

The Electric Lighting market's prices are unchanged, despite the proposed introduction of the Daylight Saving Bill. The market views the measure with equanimity, and the proprietor of electric lighting shares need not be troubled by the recent newspaper outpourings with reference to the effect it is likely to have upon the companies.

The summer-time is obviously the lean one for Electric Supply concerns. In some cases, the undertakers reduce the price of their current, by way of inducement to users, and it is well-known that in pre-war days they earned comparatively little in the summer months. The Government's appeal to the public that they should economise in the matter of coal, gas, and electric light, may affect the first two items, but so far as the last is concerned the public have probably got down to something like bed-rock in their bills for light and power.

As it is not proposed that the Daylight Saving Bill should be in operation throughout the winter, when the demand for current is greatest, it is contended in the Stock Exchange that the Bill will have little effect upon the receipts of the companies. A few investors in these shares show signs of nervousness, due, probably, to a lack of appreciation of the actual position—moved thereto by the newspaper comments aforementioned. The great body of proprietors, however, is not at all likely to be disturbed by the latest developments; and a guess may be hazarded that neither the Daylight Saving Bill nor the Government appeal will affect the dividends of the industry to the extent of one per cent.

Underground Electric income bonds have started to recover, but Districts continue dull, and have slipped back to 18½ on the offering of a little stock for deceased accounts. Central London assented ordinary keeps very steady. There is, however, a few hundred pounds of the Company's deferred ordinary offered at 65½ thereabouts, the return on which works out to 6 per cent. on the money, though the dividend on this, unlike the interest payments on Underground Electric income bonds, is paid less income-tax. The unassented deferred stock of the Central London Railway is changing hands at 25, some 40 points below that of the assented issue.

Anglo-American Telegraph preferred has risen to within a fraction of par, and the deferred stock braced up to 2¼. The Eastern group is steady, with a further rise in Globe Telegraph ordinary shares to 12, on the increase of 1 per cent. in the dividend to 7 per cent. Great Northerns are £1 up, but Indo-Europeans at 49 have lost an equal amount, though it may be doubted whether a buyer, even at 50, would find many Indo-Europeans available at that price. West India and Panama shares eased off to 1 1/16. Marconis are a slightly better market, the parent shares hardening to 2 3/16; but the subsidiaries are dullish at 14s. 9d. for Americans and 7s. 9d. for Canadian Marconi.

The telegraph manufacturing shares are strong. India-Rubbers at 10½ have gained the fraction. Telegraph Constructions went up £1 to 36½; while as regards Henleys and Callenders, there are very few shares about. British Insulated at 10½ are a good market.

Edison & Swan fully-paid shares, after their remarkable jump of 12s. 6d. last week, have receded ¾ to 1½, shares naturally being tempted out by the big advance. At the same time, the partly-paid eased off to 11s. 6d., this still leaving them 2s. 6d. higher than they were a fortnight ago. British Westinghouse preference continue to mend, and Electric Constructions at 16s. 6d. are better.

The rises in the chemical group have suffered something of a check, although the market in them generally is a firm one. Here, however, as in the rest of the Stock Exchange, business is handicapped for the time being by the various uncertainties that arise out of the Military Service Act, which have had the effect of removing buying orders. Babcock & Wilcox keep steady, the little disappointment in connection with the dividend being counterbalanced by the excellence of the report. Rubber shares are heavy and dull. All the sparkle has evaporated from the market for the moment. Unexpected

restrictions laid upon the export of rubber to Russia, and the falling away in the demand from the United States, are put forward as being the two principal reasons for the way in which the wind has gone out of the sails of the market, leaving them flapping heavily and idly. The provinces have ceased their voracious rush for shares; and the disposition now is to wait and see what is going to happen next.

Brazilian Tractions lost the rise that they gained last week, New York coming in with shares to sell. Mexican utilities are generally better. The first mortgage bonds of both the Tramways and the Light & Power Companies have strengthened to 41, stock being wanted at that figure in each case. The rise in the price of silver has been well held; and notwithstanding the absence of definitely good news from Mexico, indirect evidences add point to the hope that the country may be settling down, after all.

Argentine Tramway shares, first and second preference, have dropped 1, there being some little pressure to sell them on the part of proprietors disappointed with the outlook for the Republic, which seems to be slower than Brazil in overcoming the difficulties that arose in connection with the war. British Columbia issues are firmer, and there has been a little inquiry for Bombay Electric preference shares. The Calcutta Electric Supply report shows the fine net profit of £163,000, an improvement of £22,500 over the previous year. The dividend on the ordinary shares is retained at 9 per cent. the price is firm at 6½, and the 5 per cent. preference at 4½ middle.

Telegraph Works Co., Ltd.	r W. F. Dennis & Co.

Winnipeg Electric Railway Co.—The directors have decided to suspend dividend payments on the common stock for the present. The passing of the dividend, which came as a rather unpleasant surprise, follows successive cuts in the annual rate from 12 per cent. to 10 per cent. in March, 1915, and from 10 per cent. to 8 per cent. in January last. It is likely that earnings are in excess of the 8 per cent. requirements, but as earnings fell short of dividends by \$85,388 in 1914, and by \$388,898 in 1915, the company has probably expended itself financially, and will require some time to recuperate.—*Montreal Herald*.

Craigpark Electric Cable Co., Ltd.—For the year ended March 31st there was a net profit of £9,482 (after making provision for excess profits tax), which, with £1,147 brought forward, makes £10,629. The directors recommend placing to depreciation £2,500, to reserve £1,000, dividend on the ordinary shares at 6 per cent. for the year, leaving a balance of £2,028 to be carried forward (subject to payment of directors' fees). In spite of transport and labour difficulties and the high price of raw materials, the result of the year's trading has been good. The quantity of work on hand at the moment is satisfactory. The directors have made provision out of the profits for Excess Profits Tax. Annual meeting: To-day, at Glasgow.

Calgary Power Co.—The gross earnings in 1915 amounted to £29,613, an increase of \$58,427. Net earnings, after deducting all operating and other expenses chargeable against revenue, amounted to £27,159, an increase of \$56,952. Interest charges (\$156,966) deducted leave \$80,193, which has been transferred to surplus account.—*Financial*.

Capital Reduction.—*New Canadian Alloys, Ltd.*—The reduction of capital from £25,000 to £1,875 has been confirmed by the Court.

Richard Johnson, Clapham & Morris, Ltd.—Out of the year's net profit of £32,215, 10 per cent. is paid on the ordinary shares and £20,000 is carried to reserve.

Brisbane Electric Tramways Investment Co., Ltd.—After paying a further dividend of 4 per cent., making 8 per cent. for the year, £34,292 is to be carried forward.

Merthyr Electric Traction & Lighting Co., Ltd.—After placing £1,000 to reserve and paying 7 per cent. on the ordinary shares, £906 is to be carried forward.

FROM THE POWER-HOUSE WINDOW.

By "ROVER."

I BELIEVE it was Mark Twain who designed his house with the kitchen windows looking out into the street. He declared the kitchen to be the most important room in the house, and said further that his cook would work better with a cheerful view before her than if she had only other kitchen walls to look at. Perhaps Mark's philosophy does not apply to power houses, but I think I understand his cook's point of view.

My first station experience was in a Midland town. The windows were so high up that only the sky could be seen, but, Heaven be praised, there was a door which opened direct upon a lane, not a very respectable lane, but one in which human beings disported themselves. They looked in our open doorway, stared at our strange machinery, asked foolish questions, and somehow shortened our night hours. Across the lane was the back of a large hotel, with the "club-room" just opposite our door, and occasionally we would hear "A Jolly Good Fellow" sung with fervour or would listen, without invitation, at a "smoker"; but the hand of progress was against us. Our chairman reported "The extensions made necessary by the increasing demand on our plant have now been completed, and the two new big 200-kw. sets and switchboard have been installed in the new engine room." Good-bye to the door which opened into the lane!

Next, a seaside resort. The power house here was placed, not on the front, but some distance inland. On one side of us we had a mortuary, and on the other, a cemetery. In the summer the mortuary was fairly busy, as this particular resort was found very convenient for purposes of suicide by distressed Londoners.

I think my next point of view was even worse—a small town in Ireland. Here we had no outlook at all, but a high wall separated us from the public abattoir, and every day we heard the death cries of countless pigs. I do not think centuries in Ireland would accustom me to the last shrill agony of the pig.

From Ireland to America was a natural change—a power house, hydro-electric, with many windows, seven miles from a town, in the heart of the Ontario bush. The camp, containing about a dozen souls, stood at the crest of a hill in full view of the men on duty, but too far off for a man to be distinguished. We rarely saw a stranger from our many windows—nothing but trees, trees, trees, and but two varieties of trees, the pine and the birch. We felt almost grateful when the bush fires started to devour whole acres of the accursed trees, and for a day or two we watched the smoke with some satisfaction. Later on, when the camp was threatened with extinction, we changed our minds as to the usefulness of bush fires. At night, the power-house men had to watch the flames and give the alarm if the fire came too close, in which case all the residents of the camp were to take refuge in the power house—the only non-inflammable building. I remember my wife made a parcel consisting of all our jewellery and three cans of evaporated milk for the baby, and we considered ourselves prepared for the worst, which, luckily, never came. I do not hope to watch another bush fire from a power house window. As it was, our transmission lines were burnt down for half-a-mile.

At another plant, about 100 miles further north, I had a similar outlook of bush, but, although the nearest town was 20 miles away, we got more passers-by. This was in the gold district, and many prospectors were looking out for precious metal. They came in twos and threes by canoe, and were generally very uncommunicative as to the locality in which they expected to make their "lucky strike." They would discuss every other subject discussed by civilised or barbarian man. They were nearly all American, and all most interesting talkers, and I came to the conclusion that prospecting for gold greatly stimulates the imagination. Usually they came just before the mosquitoes made bush life unbearable, disappeared for three weeks or a month, and returned with depleted knapsacks. They gave us a cheerless recognition at the power-house door and hurried home.

The Indians had even less to say. At certain times of

the year whole tribes move to other hunting grounds, and there would be a procession of canoes past our door. The men and boys were nearly all dressed in dungaree overalls, but the squaws and girls had a passion for vivid colours. They all handle a canoe perfectly, and to see them shooting a rapid is a sight worth while.

We used to catch some decent trout from our power house windows, and some monster pike, too. Sometimes we would see a bear, and more rarely a moose, although early one morning a big bull moose so far forgot himself as to swim across our tail-race. In winter, we had little but snow to see, but an occasional Indian dog team or a couple of Indian hunters on snow-shoes would break the monotony.

Back to a London central station in fog-time. Nothing outside to be seen—even the other end of the engine room could be properly distinguished when the usual fog was in evidence.

Last of all sunny Spain—all, all too sunny. From our windows, a vista of bare red rock, but with one precious green spot where a Spaniard has, with infinite labour, made an orchard. Close to the orchard is a spring of drinking water, and from the power house can be seen Spanish girls, each bearing on her head the heavy "cantara" or water-bottle of precisely the same design as those used by the Mediterranean race of how many thousands of years ago.

THE LJUNGSTRÖM TURBINE AND ITS APPLICATION TO MARINE PROPULSION.

By ROLAND S. FORTHAM.

(Abstract of paper read before the INSTITUTION OF ENGINEERS AND SHIPBUILDERS IN SCOTLAND.)

(Concluded from page 522.)

Fig. 10 shows the outer blade-rings of the 10,000-B.H.P. machine, and the rigidity of the structure is clearly apparent. The cylindrical stress caused by the lineal velocity in the 10,000-B.H.P. size is moderate, and the factor of safety is ample. Fig. 11 illustrates the complete 10,000-B.H.P. turbo-alternator and condenser. The overall length is 24 ft., height from bottom floor, including condenser, 21 ft., and weight of turbo-alternator 60 tons.

The overhang of each generator frame is supported by a pair of steel ties, each connected to the foundation through a stiff spiral spring or buffer, which effectively prevents any tendency to hogging in the event of any difference of temperature between any portion of the casing.

My endeavour has been to show the symmetry and compactness of the design and the care taken to eliminate any traces of distortion due to temperature changes, so that the highest possible temperature of superheat can be used. The fact that the steam velocity is at its lowest when the temperature is greatest is in marked contrast to the ordinary type of turbine, either of the impulse or impulse reaction type, where maximum velocities and maximum temperatures are invariably associated.

The whole turbine has been so designed as to be manufactured in ordinary lathes, such as may be found in any modern engineering shop. The fitter is almost entirely replaced by the turner. The manufacture of the blade rings is ordinary repetition work, to which unskilled boy or girl labour can be trained in a few weeks. The completed machine has a factor of safety larger than in any other type of turbine. Blade stripping is unknown, due to the mechanical construction of the rings, the blades being firmly held at both ends.

SOME STEAM TRIALS OF LJUNGSTRÖM TURBO-ALTERNATORS.

Date of test.	Normal max. output in kw.	Trial output in kw.	Steam per kw.-hour, lb.	Pressure on turbine inlet (absolute) lb. per sq. in.	Super-heat, degs. Fahr.	Vacuum, in. per cent.	Thermodynamic efficiency compared with ideal engine, per cent.
1911	1,000	1,000½	11½	168	302	96	76
1914	1,000	990	12·7	160	150	94	77
1915	6,000	2,000	11·1	170	270	97	79
1916	3,000	2,700	11·15	160	280	88	87

Attention is called to the remarkably good results shown by the 3,000-kw. turbine at 90 per cent. full load. Reduced to marine conditions of 220 lb. boiler-gauge pressure per sq. in., vacuum 95 per cent., and 240 deg. F. superheat on the inlet valve, the steam consumption of the turbine would be 7.25 lb.

per B.H.P. per hour, or 8 lb. per S.H.P. per hour, including generator and motor losses, but excluding condensing and propelling auxiliaries. With electrically-driven auxiliaries, and including excess steam tapped from the turbine at 30 lb. pressure for feed-heating purposes, this would represent a total propelling steam consumption of 9 lb. per S.H.P. per hour, equivalent with coal of 14,000 B.T.U. and an actual evaporation of 10 lb. of steam per lb. of coal with 210 deg. F. feed temperature, to 0.9 lb. of coal per S.H.P.

It might be said that trial conditions of consumptions may not be maintained in practice, due to possible wear of the labyrinthic edges which vary from .004 in. to .01 in. in the different radii of the blade rings. It has been found, however, that there is no perceptible increase in consumption. Recent trials carried out with the 1,000-kw. set installed in 1913, at the North Metropolitan Power Station, Willesden, show no increase on the original consumptions after a period of two years' continuous operation for 18 hours a day.

FIG. 10.—OUTER BLADE-RINGS OF 10,000-H.P. TURBINE.

Comparison of the *Mjølner* and the *Mimer* shows that—

1. There is a relative trial fuel economy of 42 per cent., and fuel economy in service of over 38 per cent. in favour of the former.

2. The machinery weight and space shows a relative reduction of about 25 per cent.

diminished fuel consumption, weight of propelling machinery, and resultant increased cargo-carrying capacity should in normal times repay the additional cost of the installation in a period of under two years.

4. In respect of maintenance, the experience of sixteen

FIG. 11.—LJUNGSTROM 10,000-H.P. TURBO-ALTERNATOR AND CONDENSER.

months' running of the *Mjølner* has proved this to be extremely low. The cost of upkeep of the turbines, motors, and gearing has been practically nil.

5. During the period under review, the ship has not required to stop through any defect of the main propelling machinery; this is a pioneer installation, and the entire

FIG. 12.—VIEW OF MOTORS AND GEARING.

3. As regards capital cost, if the propelling machinery in the electrical ship is more expensive for smaller powers than in the equivalent reciprocating ship, it will be found that the

absence of breakdown must be considered a satisfactory feature.

As reversing is effected on the motors, an astern turbine is

FIG. 13.—CONTROLLING GEAR.

dispensed with. The prime mover runs under the best possible thermal conditions, which include as high a superheat as can be commercially obtained without unduly sacrificing the efficiency of the boilers. The gain in thermal efficiency due to such increased temperature eliminates the electrical conversion losses. Further, the Ljungström electrical method of propulsion, in conjunction with mechanically-gearred motors, is a system which embodies the maximum degree of reduction between prime mover and propeller shaft, whilst the total weight of engine-room machinery is lower in the smaller powers and not greater, even in the larger powered merchant ships, than any form of mechanical reduction with the ordinary impulse or impulse-reaction turbine. The reduction in weight of boiler-room machinery is obviously in direct proportion to the steam consumption of the propelling plant.

To have at least two independent turbo-generators of equal power for each marine installation is advisable, not only in respect of the factor of safety through such duplications, but also in regard to the economy to be derived therefrom when running at reduced speeds. There is no necessity, however, in any class of merchant ship to increase the weight and expense

should have the benefit of the reduction in weight of machinery as regards draught.

The actual trial consumption showed that the *Mjölner* only consumed 58 per cent. of the fuel of her sister-ship. During a period of six months' service conditions, the owners have certified that the coal per ton mile consumed by the *Mjölner* was 62 per cent. of the coal consumed by her sister-ship for the same period.

The table below shows some of the trial results.

There are two turbo-generator sets in the *Mjölner* which run at 7,200 R.P.M., and supply three-phase alternating current at 500 volts, 120 cycles per second. The maximum load is approximately 400 kw. per generator unit—i.e., 800 kw. for the complete installation. The over-all length of the turbo-alternator is 10 ft., the external turbine blade ring 15 in., and the weight of the turbo-alternator 7 tons.

The generating plant has been designed so as to avoid any possible trouble from salt or dust deposited on the generator stator or rotor. The generator rotor contains no air ducts. The stator air-ducts are straight, and, consequently, easily swept without removing or dismantling any other portion of the plant.

Mica only is used for the insulation of the rotor windings, which are consequently able to withstand a considerable amount of overload without injury.

The condensers, of a modified contraflow type, easily maintain a vacuum of 97 per cent. in service with a sea temperature of 63 deg. F. This high vacuum is in part due to the efficiency of the air-pump plant, and in part to the care which has been exercised in obtaining an air-tight condenser. No auxiliary engine exhausts are led into the main condensers, and where outlets are unavoidable water locks have been fitted to exclude the entry of outside air. An electrically-driven vertical centrifugal pump draws the condensate into the kinetic tank.

The condensate from the feed heaters is led to the main condensers through additional small heaters in series with the main feed-pipe.

of the motors by pole-changing devices. To run at half speed or about one-ninth power one of the two generator sets would run at half speed, absorbing about 25 per cent. of its normal full power. Between three-quarters and full speed, both sets are run in parallel at speeds corresponding to these two requirements, consequently the turbines run under at least as efficient conditions, and with the same elasticity, as in the case of ordinary geared turbines where the regulation is effected on the throttle or nozzles of the turbine.

The reversing switch and its resistances need only be used when manoeuvring astern; the whole of the regulation from dead slow to full speed and *vice versa* can be effected on the turbine. The motor speed falls in direct proportion to the reduction of speed on the prime mover.

Twenty-one ships of an aggregate S.H.P. of 32,000 are at present under construction on the Ljungström turbo-electrical system, for British, Russian, Japanese, Swedish, Norwegian, and Danish owners. These vary from ocean-going vessels of 5,400 S.H.P. to river steamers of 550 S.H.P. They include one light-draught paddle steamer of 1,500 S.H.P., the power being transmitted from the turbo-alternator to two electric motors

The circulating pumps are three in number, each electrically driven by direct-coupled motors running at a speed of 3,600 R.P.M. The current is supplied from the main generators. The air-pump system is of the kinetic type.

One electrically-driven rotary multi-stage feed-pump is supplied for each generator unit, each capable of feeding both boilers under full power. The power taken by the feed pump is less than 1 per cent. of the total shaft horse-power. The pumps deliver the water to the boilers through feed heaters of the inverted-condenser type.

The propelling motors are of the standard three-phase induction type with slip-rings, and run at 120 periods, 900 R.P.M. and 500 volts. They are connected with the driving pinions by means of slipping clutches of a novel design, which are constructed to prevent breakage of propeller blades or shaft in the event of the propeller fouling block ice or any similar obstacle.

The gearing is of the helical type. The pinions are of chrome nickel steel, and the wheel of forged carbon steel. The shafts carrying the pinions run in fixed bearings of the same type as the rotor bearings; they are designed for minute adjustment, with great rigidity. Fig. 12 shows the two pinions, wheel, and one-half of the gear case, which is fitted to a box section bedplate on which the two motors are supported.

Owing to the motors and gearing, fig. 15, being on a common bedplate, the plant as a whole is self-contained, and all adjustments can be made at the works of the manufacturer. The lubrication of the gearing is effected by a separate oil-pump delivering the oil to the bearings and to the teeth under pressure. The gearing runs perfectly cool. The speed of the teeth is low, about 27 ft. per sec.

A Michel thrust bearing is mounted on the forward side of the gear casing.

Manoeuvring is effected by the hand wheel shown on the switch-box illustrated in fig. 13. If the hand wheel is moved from the central stop or mid-position in one direction, the propeller turns in a similar direction, its speed corresponding

FIG. 14.—S.S. MJÖLNER.

FIG. 15.—MOTORS AND GEARING, COMPLETE.

running at 450 R.P.M., each geared by single reduction to the corresponding paddle-wheel shaft, which runs at from 35 to 40 R.P.M.

In an appendix, a brief description is given of the Ljungström turbo-electrical propelling plant fitted in the *Mjölner*, and particulars are furnished of the comparative trials of the *Mjölner* with her sister ship *Mimer*, the latter possessing reciprocating engines.

These two ships, each of about 2,250 tons displacement, were ordered in 1913 for coasting trade, and delivered to their owners at the end of 1914. The following guarantee was given:—

On trial, the consumption per I.H.P. (equivalent) per hour of the electrically-propelled vessel should not exceed 70 per cent. of the consumption per I.H.P. per hour of the standard triple-expansion engine of the other vessel under equal conditions, excepting that the turbo-electrically driven vessel

to the angle through which the wheel has been turned. About 131 deg. represents full power ahead, and 120 deg. in the other direction represents full power astern.

Regulation of the speed of the motors when reversing is effected by inserting in series with the rotors of the motors resistances of the liquid type. These resistances consist of two sets of cones, of which the lower ones are stationary and filled with a saline solution, whilst the upper cones are mounted on vertical spindles which can be raised or lowered into the lower cones by the hand wheel, thereby inserting a greater or lesser resistance in the circuit. In mid or stop position, the upper cones are lifted entirely out of the liquid and lower cones; thereby the circuit is broken and the motors come to rest. At full speed the two cones come nearly into contact, the resistances being simultaneously cut out through a short-circuiting switch.

Reversal is effected with the wheel in mid or stop position—that is, when the rotor is open-circuited—and is accomplished by a changeover switch which reverses the phases in the main or stator current. A solution of dilute potash is used as the liquid resistance. This solution is circulated and cooled by a small centrifugal pump which is mounted on the same spindle as the circulating pump. The cones are of nickel and thus non-corrodible, and are counterbalanced, so that the power required to turn the hand wheel is nominal.

The switches are of the ordinary open type, the pressure in the rotor current of the generator being automatically lowered before the circuit is broken; they are found to work perfectly satisfactorily. For larger powers, oil switches are used.

The elasticity of control is considerable, the speed of the propeller ranging from about 12 R.P.M. to 90 at full speed. The total time of propeller reversal from full speed ahead to full speed astern was carefully tested on the trial trip of the *Mjölnir*, and averaged fifteen seconds.

LABOUR DEMANDS

AND RESPONSIBILITIES AFTER THE WAR. (Some Mistakes Which Must not Recur.)

By JOHN MARKS.

ONE of the best features of the *ELECTRICAL REVIEW* is that it appeals to the workmen of the electrical industry as well as to the most advanced scientific workers who are busily engaged in furthering new ideas and advances in the matter of applying electricity to ever wider and more varied uses.

This being the case, the writer considers that if a short time is spent in consideration of mistakes which in the past have not only tended to embitter workmen and their employers, but also to injure seriously the calling by which they both obtain their livelihood, it may have a really good chance of influencing the more thoughtful workmen to take a more reasonable view of the difficulties under which the manufacturer works; to realise that in any struggle between the manufacturer and themselves they must necessarily come off a bad second; and to hope that the influence of such men may have a deterring effect on the more erratic and hot-headed portion of their fellows.

The writer proposes to point out where, in the past, the workmen in various engineering trades have allowed themselves to be badly injured by following out the usual policy of antagonism towards the manufacturer in season and out.

The latter expression is purposely used, for the writer's own personal experience teaches him that too often the attitude of suspicion has had its rise in dealings, which were far from fair, on the part of manufacturers of an older school, who, for the most part, are now gone from us for ever.

Why should the unfair methods which obtained in days gone by make the workman suspicious of an employer who wishes to-day to treat him fairly? Why should the good and skilful man be forced to work, and work hard, for no greater return than the mediocre man, or even the duffer, who, in times of good trade, must be employed?

It is often stated, from the workmen's side of the question, that the demanding of a minimum wage, and the utter refusal to work on some type of piece or bonus system, does not prevent the manufacturer from rewarding a smart man with greater wages than the poor man. This, however, is quite a fallacy; the manufacturer has to average the cost and output of each man he employs when he is making up an estimate of what any particular contract will cost. He now pays all men the same level rate, and the good man must restrict, and does restrict, his output, in order not to show up the slower and less-skilful man. Thus the manufacturer only gets a meagre output compared to what might be possible; he is not only compelled to refuse to pay the smart man a better wage, but, in order to face competition, he is also bound to take such precautions in the matter of providing supervision, that the slower man is kept constantly at his work, and is, in fact, made to accelerate his output to a degree which for him is uncomfortable, in order that the total cost for labour on any contract shall not be so heavy as to be prohibitive. The writer speaks from practical experience of both sides of the question.

Apprenticed to a firm who would not allow its premium men to idly, but forced them to work, or cleared them out, the memory of the work in the shops, though very pleasant, has this thought constantly at the back of it. The almost hopeless nature of the state of a man, who perhaps gifted with good brains and clever fingers, is compelled to go on year after year turning out so many parts per day, often of the same machine, and sometimes of one style and size, for a wage at the end of the week which will be the same when he is 50 as it was when he was 25. Surely there is some way of remunerating a man's skill and the result of his accumulated years of experience; and what better form could this remuneration take than extra wages, which would contribute to his everyday comfort, and tend to make him a more independent member of society, as well as to render him much more valuable to the community as a whole?

It may be said that the smart man will always rise from the bench or machine; that, however, is not true, in that we cannot all hold supervising and managerial positions. The correct policy then is to make the prospect before a workman better than it has been in the days before the war. The most important member in this matter is the workman himself.

If he will, he can raise himself to a far higher plane than he occupied before the war, and he can make his own position more certain and less liable to attacks of short time due to bad trade. This can only be accomplished if he assists the manufacturer by turning out a greater volume of work per man, and by assisting and not hindering the turning out of much more work from every individual machine used.

The level at which wages now stand cannot be maintained after the war unless the workman will consent to work with the firm and lock upon the well-being of the firm as his very particular and personal interest. The writer is stating no mere empty platitude when he calls attention to the fact that the manufacturer has gone as far as he can in helping the workman; any further help must come from the workman himself, or it will not come at all.

It may be asked, what is meant by the idea of the workman helping himself, and the employer being unable to help him further.

The matter is simplicity itself: before the war, people who had money to invest, first asked about the security of the trade they intended to put their money into; next they wished to learn the probable dividend they might reasonably expect would be payable year after year. After some such inquiry, they very often decided to invest their money otherwise than in the electrical trade. Why? Because they could see but little in the way of good dividends paid throughout the trade as a whole, and also because they noted that in many cases the capital invested was none too safe; that is, a share bought for £1 to-day, stood a good chance of being only valued at 18s. in the course of a few months or a year or two.

People who advise persons who are about to make investments, would always draw the attention of their clients to the element of risk in the engineering, and particularly in the electrical engineering, trade.

Now these matters may not appear to affect the workman, and far too many men declare that they do not and cannot affect him.

They do affect the workman, however, because when such a state of things occurs in any industry, it becomes difficult to obtain capital with which to put down fresh machinery, or to erect new works. In order to attract sufficient capital, the management of such an industry must promise, and must pay, a somewhat high return on the money invested. Thus the works must now earn a greater margin than ever between the cost of constructing and selling its products, and the price it receives from the customer; as the manufacturer is subject to keen competition, he is forced to speed up the output of his men. There is no other explanation of the matter, he is absolutely forced to make the men work at a hot pace, in order to preserve the industry by which they both earn their livings.

Also we have the spectacle of the workman's adviser, whether he be his Trade Union representative, or the leader writer in the labour paper to which he subscribes, stating that all piecework or bonus work systems are methods of inducing the workman to sweat himself.

Let us suppose for a moment that they are for this purpose: it will at least be admitted that at the end of a self-sweating week, the wages packet is considerably heavier, than under the ordinary dotal system of paying wages, and to that extent the workman is a considerable gainer. Under the present system, the Trade Union rules actually make it imperative for the master to drive his men, in return for a smaller wage than they might easily earn by using their skill, experience, and brains, for the purpose of expediting their output; and every man knows that when a workman has a direct monetary incentive to turn out more work, he does not feel the speeding up, simply because he does it willingly; whereas at present he is kept to his task whether he wishes or not.

Now let us take a glance at what will be the after-war conditions of our industry, in relation to the obtaining of sufficient capital. It is no use arguing that the State should own the means of production and exchange; the State does not own them, and will not do so for many a long year, if ever. Meanwhile both the manufacturer and workman have to live, and whilst it is a fact that most manufacturers could get a fairly comfortable living if they retired from trade and invested their money in Government securities, it is equally true that not one workman in 10,000 can so exist, simply from lack of capital.

Thus, for the present, we depend on capital flowing into the industry, in order to make a living possible for anyone.

Before the war a man could get, with safety, 4 per cent. on

money he invested with municipal or equivalent safe concerns. He put his money into business because he anticipated making a clear 3 or 10 per cent. out of it. In some cases he preferred to take 5 or 6 per cent. in order to be a little safer, but he always demanded considerably more than the safe rate of 4 per cent. In short, he would not take risks for the sake of an extra 10s. per cent. dividend.

The manufacturer not only looked to this return on his invested money, but he recognised that by using his managerial abilities in a trade in which he had some degree of interest, he could earn for himself a good salary as a manager. Thus, such a man has everything to persuade him to enter and keep in business, and will often do so when the return on his invested capital is really low. The shareholder, however, has not this double interest, he is interested only in the dividends earned, and will not bring his money to the industry if the return is low; as this man is the person who finds the majority of the necessary capital, he must be considered, or the business goes to the wall for want of money to work with.

It is quite certain that after the war people with money to invest will be somewhat scarce, and that they will require a high return on their money, simply because they can obtain Government security with a dividend of 5 per cent.; if they are to take the risks of an industry subject to keen competition, they will require much more.

Also, the manufacturer with money and ability will, if the returns of business are meagre, simply refuse to be subject to the worries inseparable from the management of a large business; he will save himself worry, improve his health, and prolong his days by the simple method of investing all his money with the Government, and none in industry.

The writer makes no philanthropic claim for the manufacturer, he simply states what will be the policy dictated by common sense; no man in his senses is going to submit his capital to the risks of business, and himself to heavy and responsible duties, unless he is able to get a good consideration for so doing.

Now in every dispute between the workman and the employer the workman is at a disadvantage, owing to the fact that the employer can, and the workman cannot, live without working; consequently, it should not be necessary to point out that only in the greatest extremity should the workman resort to a strike, simply because it injures him and those dependent upon and connected with him to a far greater extent than it can ever injure the employer.

Take a recent case when a few years ago the late secretary of the A.S.E. advised the men on the North-East Coast not to strike: they threw his sound advice in his teeth, and, as usual, dubbed him traitor. Mr. Barnes knew both sides of the question, and, on that account, he advised the men not to strike. He was publicly flouted and insulted, and as a consequence resigned his position as secretary.

The strike lasted nine months, and the men went in on the employers' terms, after subjecting their wives and children to the misery and serious privation of a long strike, and the wicked wasting of sufficient capital to bring in an income of over £10,000 a year at a 4 per cent. rate.

During the great coal strike of a year or two ago over the minimum wage, the proprietor of certain iron mines, asked permission from the Miners' Union, to obtain sufficient coal from his own pits in order to keep his blast furnaces going.

This situation was somewhat peculiar, and is thus more interesting. The owner of the iron mines was a member of a family who had worked those particular furnaces for over 130 years; he was on the best of terms with his men, and owned valuable coal pits 5 miles away. The iron ore he raised was so good that he had received many offers from iron masters in different parts of the country to buy the ore from him at a price which would have left him a much greater profit than he obtained from the iron run at the blast furnaces. He was a very wealthy man, and to the writer's knowledge refused three times to sell the ore instead of smelting it, on the grounds that the furnaces were going to be worked by him as his family had worked them before him.

His proposition was that he should pay for a check man at his coalmines who would see to it that no coal went from the mines other than to the blast furnaces; every man employed on working coal for this purpose was to be paid a lump sum at the end of the dispute, which would have represented the agreed increase of wages from the start of the trouble; that is, any advance obtained was to be made retrospective.

In vain did this owner plead that if the miners persisted in shutting down the furnaces, they would throw out of employment 200 men who were comfortably situated, and in vain did he point out that every man working coal for those furnaces would be paying into the Union funds, instead of drawing from them. So serious did he consider the matter, that he addressed mass meetings of the local men, in order to lay the proposition before them. Finding nothing but stubborn rebuffs, he warned the men that if they shut the furnaces down, they would not be started up again in his lifetime; neither persuasion nor warnings had any effect. The furnaces must close in order that as far as possible the whole nation should suffer and sit up over the coal strike.

The furnaces were shut down: the strike progressed, and ended. Knowing members of the strike-mad section of the community waited for the furnaces to start up again, and even gave the dates of the restart. The iron ore men certainly restarted, and then loaded the stuff into the railway wagons, to go away and be smelted elsewhere; the offer of other iron masters had been accepted, and 200 men were done out of a comfortable living by the unparalleled folly of their own class.

The critic may retort, that as the smelting had to be done elsewhere the men were not done out of a living. It is true that

those who still possessed their youth and pluck packed up and followed the ore, after waiting about for a month or two to see what would happen. Finding their resources absolutely at an end, they sought work elsewhere, and found it—not amidst the country surroundings of the old place, but in the dirty and high-rented quarters of a large industrial district. The writer's contention therefore that they were done out of a comfortable living is quite correct.

Some of the men who did not wish to leave the district, and who had one or two permanent ties in and around the locality, were forced to take up any sort of a job that they could find.

The writer will not easily forget the spectacle of a healthy man of about 45 asking a relative for a labouring job at an adjacent works, and stating that his family obligations would not permit him to remove; that he had been provident and made some provision for bad times and old age, but that work he must have if he was not to start realising his capital, which consisted of two cottages, and an excellent plot of gardening ground.

This man plainly stated that he had worked for the iron company for over 30 years, that he had never had any quarrel with them, and that the miners' attitude had thrown him absolutely on his beam ends.

This man was no slacker, and no fawning humbug; his frugal investment made it impossible for him to follow the iron ore without great sacrifice, and an objectionable change for his family and himself, into a dirty industrial district. He was willing to walk, and did walk three miles from his home to the next works which could offer him even a pittance, providing that he could stay where his interests were.

Thus folly on the part of one section of men brought distress to another section of working people; distress of a permanent nature. The greatest folly of the whole matter was that the man they had worked for was admittedly a thorough gentleman, and a most considerate employer.

This last statement brings the writer to his final argument. Why should workmen so often tantalise and aggravate those firms which treat them best? This is simply folly of the worst description, and if persisted in will ultimately throw all control into the hands of the less desirable type of manager.

Let anyone with extensive experience of municipal control think of the manner in which advantage is taken of the known sympathy of the Council towards the Trade Unions; this experience, like those mentioned above, has been personal with the writer, and is no hearsay matter. Often has the question been asked, "Why do you not leave us alone instead of badgering us in this fashion?" "Why do you not annoy some of the worst paying firms in the town until the management there gives you something like what you get here, both as regards wages and conditions of work? Why do you follow a stupid policy which must alienate men with a friendly feeling towards you?"

No satisfactory answer is usually offered, except that it is considered good policy to squeeze; where squeezing can be done; and so the shortsighted game goes on, and results in the opposition to Trade Union methods spreading even to those officials, who in theory have at one time approved the Unions.

The plea is advanced that ideal conditions will bring out the best in the worker; this is absolutely incorrect.

Let us take an example of an industry run by working men themselves for their own benefit. The reference is to the factories run by the Co-Operative Wholesale Society.

This society is not only up-to-date in its manufacturing methods, but its constitution insists that full Trade Union wages shall be paid, the shortest possible hours worked in return, and that the best of conditions must be maintained for the workers in those factories.

Now do we find unalloyed contentment in those places? The answer is in the negative; on more than one occasion strikes on trivial and absolutely piffling matters have broken out and caused annoyance and loss to the management.

Again, taking the retail side of that same movement, the writer knows of discontent obtaining amongst a number of employees who are paid above the district rate for their labour, and who work many hours less per week than the ordinary shopmen. Yet here, again, we get the pettifoggery, annoying manufacturing of petty grievances, which could enter the mind of no man who was busy with a fair day's work.

In one instance in a large town, the managing Committee, mostly composed of working men and Trade Unionists, were so disgusted and hurt at the spirit displayed towards them by a well treated set of employees, that they placed their regret in writing on the minutes of that particular society.

In conclusion, the writer assures the workman that no way of improving his status and pay will avail permanently other than that of assisting the employer to reduce the cost of manufacture. This he can do by agreeing to work on a bonus system whereby he turns out more work in a given time, and receives more money for doing so.

The manufacturer's share comes from the fact that the charges for rent, rates, taxes, cost of maintaining the establishment, lighting and running, are very heavy. More work turned out means a lower standing or dead charge on each finished article, and a quicker realising of the profit thereon. Thus a smaller profit can be taken on each article because it is taken on more articles per year.

The cost of each article is reduced by the time saved, and the cost to the customer can, therefore, be reduced; by following the above method of intensive production, the customer gets a lower price, the man a greater wage, and the manufacturer a larger profit.

If works A can make an engine of a certain type for £100, and works B cannot make it for less than £120, then works B will

have to shut up. Apply the comparison to countries A and B with regard to the whole of their manufactures, and it follows that country B will have to go down.

Which we are to be in the hands of our workmen. If they will try to abolish old time suspicion and work hand in hand with the manufacturer to speed up output, both the country and themselves will benefit by long-continued prosperity; and under such a system the present rates of wages could be maintained after the war has finished.

The war will not finish to-morrow, but to-morrow will be too late to consider the matter. It must be considered now, and with an open mind.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

CHILE.—With reference to the announcement in the REVIEW of March 17th respecting a proposed new specific Customs Tariff for Chile, it appears that the enactment of the new Tariff has now been reported (by cable on April 16th) by H.M. Minister at Santiago, who states that merchandise cleared through the Customs within 30 days of the promulgation of the new Tariff will be assessed for duty at the old Tariff rates, notwithstanding that the new Tariff will, in principle, take effect from the date of promulgation.

JAPAN.—The Government Bill proposing to modify the Customs duties on various articles imported—see the REVIEW of April 21st—has now been passed by both Houses of the Diet, and was promulgated in the *Official Gazette* of March 6th. The new rates of duty provided for by this measure came into operation on April 15th.

FRANCE.—A Government Bill has been laid before the Chamber of Deputies, proposing to authorise the Government, so long as hostilities continue, to prohibit by Decree the importation of foreign goods, or to increase the Customs import duties thereon.

FRENCH INDO-CHINA.—Owing to the difficulties experienced at the present time in regard to the shipment of goods from the United Kingdom to Indo-China, the French Government have decided that, subject to the necessary "authorisation" being given by the French Consul-General in London, the "Minimum" Tariff rates of duty will be applied during the continuance of the war to all British goods forwarded from the United Kingdom to Indo-China, whether in British or French bottoms, with possible transshipment at Marseilles, Singapore, or Hong-Kong.

The above-mentioned concession is in addition to that notified in the REVIEW on March 10th, under which transshipment at Singapore only was allowed.

SPAIN.—In virtue of a Royal Decree of October 22nd, 1914, bonded warehouses have recently been established in Cadiz, reports the British Vice-Consul at that port. Goods placed in these warehouses remain free of import duties, transport and port works dues, until imported for consumption into Spain. If re-exported from bond they are not subject to these taxes. Merchandise may remain in the bonded warehouses for a period up to four years, except where it is liable to decay. Goods such as explosives and articles dangerous to the preservation of other merchandise or to the security of the buildings are not admitted.

A table of warehousing charges for deposited merchandise is included in an explanatory pamphlet forwarded by the Vice-Consul, a copy of which (in Spanish) may be inspected at the Commercial Intelligence Branch of the Board of Trade.

The prohibition of the exportation of articles wholly or partially manufactured with copper or brass has been withdrawn.

BERMUDA.—A new Customs Tariff came into force on January 1st, and will continue in force till December 31st. With few exceptions the rates of duty and the free list are identical with those previously in operation. It is provided, however, in the present Tariff that on all goods which are liable to specific or to *ad valorem* duties a surtax shall be levied of 10 per cent. on the amount of duty so payable.

EGYPT.—Revised Tariff valuations for use in assessing duties on certain metals imported into Egypt have been issued, with effect from April 1st to May 31st.

- 4,402. TELEGRAPH MACHINES. L. M. POTS, February 8th, 1915. (Divided application on 1,997/15.) Patent No. 106,259.

A Lamp Test.—A projecting bracket, beneath which was suspended an opal glass sign with the letters "G.E.O." upon it, was blown down during one of the recent gales, outside the branch premises of the General Electric Co., Ltd., at Swansea. An illustration that lies before us shows that the bracket terminated in a hook bearing a reflector and an Osram lamp. The opal sides of the sign was completely smashed, but the 1,500-watt Atmos-type Osram was found to be unbroken, and, when tested, gave forth its light as usual, the filament being intact.

1916 EDITION

READY.]

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

IN our last issue we referred, in passing, to the excellent address of Sir Wm. Beardmore to the Iron and Steel Institute; there is so much of value in this address that we have thought it well to reproduce a large portion of it, and have omitted the remainder with regret. The author speaks with knowledge based on an exceptionally wide experience in connection with engineering undertakings of the first magnitude, and we are glad to see that he wholeheartedly advocates the application of scientific method to industrial affairs, giving many striking instances of the improvements and economies which have resulted from its adoption. The fact that immediate benefits may not accrue is clearly brought out in the address; in the case of the great dye industry which the Germans built up on the scientific foundation provided by British genius, no less a period than 17 years was spent in patient and unflagging research before success was achieved, at a cost of a million sterling—but the desired end was eventually attained and immense profits were secured. On the other hand, examples are given of investigations which bore valuable fruit within a comparatively short time of their inauguration.

Another feature of the address to which we would direct attention is his appreciation of the importance of pure scientific investigation, with no apparent bearing upon industrial matters. The researches and discoveries of Faraday, which have given rise to the electrical industry, afford a familiar example of this nature; but others even more striking are adduced by Sir William, such as the discovery—first by pure theory—of Thomson and Joule that a gas expanding through a porous plug was lowered in temperature, upon which is based the liquefaction and separation of gases, now employed on a large scale in various branches of industry, or the recalcence of iron studied by Prof. Barrett, a well-known phenomenon, the investigation of which has led to revolutionary improvements in the manufacture and treatment of steel alloys of the utmost importance to the engineering industries.

There is, however, a jarring note which runs through Sir William's address—the reluctance of the workers to "play the game." He demonstrates, with startling clearness, the fact that *even in war time*, they deliberately restricted their output, and to such an extent that girls, with necessarily very little training, were able to turn out more than double the production of thoroughly trained mechanics working under the same conditions and for the same hours. The gravity of such a statement cannot easily be over-estimated, and the author's conclusion that men capable of such unpatriotic conduct are unworthy of the privileges of citizenship is thoroughly justified. It is not thus that Germany

wages war. We fear that his forebodings as to the future due to the lack of a sense of duty on the part of the worker are only too well-founded. That in pursuing a policy of restriction of output the workman is acting against his own interest is undeniable, and if he could be induced to make a trial of the "square deal" he would soon realise the fact. But the difficulty is to persuade him to try it, and probably past errors on the part of foremen in cutting down piece rates unduly when a man increases his output have a good deal to do with his suspicious attitude towards the employer. It is not only the worker who is selfish.

National Industrial Organisation.

FROM articles which have been appearing in a number of leading newspapers during the last ten days, we gather that the scheme for combining the several movements which have for their object the formation of a strong national organisation of manufacturers and industries has been advanced a further stage. Circulars are understood to have been issued bearing the signatures of Mr. F. Dudley Docker, C.B., Mr. F. J. Nettlefold (chairman of the Institute of Industry), and Mr. W. P. Rylands (representing the "Central Association"), intimating that as soon as one hundred preliminary members, each guaranteeing an entrance fee of £1,000, have been obtained, the new Association of Manufacturing Interests will be established. Nearly half that number have been secured.

It is safe to assume that the great majority of our numerous large industrial concerns are by now fully convinced of the crying need for such an organisation efficiently to watch over British manufacturing interests, and worthily to represent those interests in the right circles without antagonising Labour. That being so, if these concerns can be convinced, as we think they can, that the combined effort now seeking their co-operation is a serious one, with very substantial backing of influence and funds, they will throw in their lot with those who are eager for the organisation to get to work in time to assist in putting our industrial house in order before Peace is declared. The Association will embrace practically all classes of manufacturing industry—"a sort of industrial Parliament," are the words credited to Mr. Dudley Docker in the Press—but engineering and electrical manufacturing form so extensive and vital a part of the industrial life of the nation that they will inevitably rank very prominently in such an organisation. It is stated that Mr. A. W. Tait, of Basildon House, E.C., is acting as honorary secretary *pro tem.*, and that all correspondence on the subject should be addressed to him.

A Diesel Engine Explosion.

THE recent fatal explosion of a compressed-air receiver in connection with a Diesel engine at the Smithfield Markets electric lighting station has been very fully dealt with at the meetings of the Diesel Engine Users' Association, of which reports have appeared in our columns. In some respects the accident was of a similar nature to that which took place at the Bray electricity works in 1912, with most unfortunate results. In both cases, apparently, a mixture of oily vapour with air (enriched with oxygen at Bray) exploded and fractured the containing vessel—the intermediate "purge pot" or receiver in the present instance, the blast bottle at Bray.

While in the latter case the presence of excess of oxygen was probably the main cause of the accident, we pointed out at the time that the insertion of a check valve in the course of the pipe from the blast receiver to the fuel valve would have prevented the

explosion. It will be noticed that the makers of the air compressor at Smithfield Markets recommend a similar precaution in the case of the pipe from the compressor to the blast receiver, to prevent the return of air from the receiver to the pump, in the event of faulty operation of the high-pressure valves on the latter.

The dangers arising from the association of compressed air and oil vapour have been well known for many years, and as both these elements are necessarily present in the working of the Diesel engine, in which, moreover, the risk is aggravated by the exceptionally high pressures employed, elaborate precautions to prevent the possibility of accident would be fully justified. All the more, therefore, is it incumbent upon the makers and users of these engines to adopt the simple and inexpensive expedients to which we have referred, and we hope that both parties will by such means endeavour to render the Diesel engine as safe as any other prime mover. The Association, which, though necessarily small, is one of the most active and efficient of our technical societies, may be trusted to throw its influence into the scale of safety and progress.

NOTWITHSTANDING the prohibition Lead. of speculative dealings under the regulations in force, the run of business

has been fairly active within the last week or so, at a somewhat lower range of prices, however, due to the fact that the market for early delivery has been chiefly fed by the disposal of controlled lead or metal that was ear-marked or held on behalf of the British Government. Developments, as a matter of fact, have been chiefly the outcome of the operations conducted by Government brokers. The supplies now coming to this country from Australia and Spain are, apparently, largely under Government control; but the fact is worth noting that this control has not resulted in any very material cheapening of the price of the commodity, which, after all, depends chiefly on the law of actual supply and demand. Considering the very liberal quantities of metal which have come on the market of late, the latter has certainly given a good account of itself. The price of prompt delivery dropped to about £33 12s. 6d., thus showing a depreciation of quite £2 15s. a ton from the extreme highest point recorded this year, which has given consumers who were rather short of stock an excellent opportunity of replenishing on more advantageous terms than generally anticipated. A fair number of transactions have just lately taken place in forward positions, whereas business has been for some time past, or since the enforcement of the new regulations, almost entirely confined to near lead. Forward metal is certainly not offering with anything like freedom, which is not surprising, for indications as to future supplies do not point to any excessive surplus.

As shown by the official returns of imports for the past month, the deficit of supplies as compared with the previous year is greater than ever, though this is, to a considerable extent, offset by the fact that the re-exports have fallen off materially this year, which is partly due to the Government restrictions upon export business. For several weeks past, indeed, licences have been very hard to get. So far this month, the arrivals have been again very light, and the surplus for near delivery having been whittled down to moderate proportions, the market now shows greater resistance, although dealers are not disposed to carry much stock, and, in fact, they chiefly confine their purchases to actual demand from consumers. The chief sustaining factor in the situation continues to be the big outlet for munitions, while the demand for ordinary industrial purposes is considerably under the normal, which is explained by the marked slackness of the building trades. Rollers, however, are being kept fairly busy by the large Government orders for war purposes.

The fact may be mentioned that operations on the part of white and red lead manufacturers are seriously hampered by the ever-growing scarcity of labour, while a keen demand has been experienced for this material for some time past. The bulk of the English output of white lead is, apparently, absorbed or reserved for Government purposes, and those consumers who placed orders in America find considerable difficulty in securing shipments through lack of freight, while American terms have been raised considerably. The position of pig lead in America is not quite so tight as it was a few weeks ago, the demand having fallen off somewhat, both for domestic and export, and prices have eased off appreciably, but they still stand at a relatively high level, which practically prohibits the resumption of shipping business with this side. The French takings from Spain direct continue on a large scale.

The Working of "Unsealed Patents."

A NEW range of patents—"the unsealed patents"—is now thrown open to applicants for licences. An application of considerable moment, the first under new legislation of this year, was made to the Controller of Patents, Mr. Temple Franks, and the Deputy-Controller, Sir Cornelius Dalton, on Thursday last week. The Patents Court was set up by special legislation to deal, under the Patents, Designs and Trade Marks (Temporary Rules) Acts, 1914, with the patents of alien enemies. Hundreds of German patents, a good many electrical, have been applied for by British manufacturers, who desired to manufacture under a Board of Trade licence for the supply of the British and Colonial trade. The novel application heard last week was made under new legislation passed only a few weeks ago—the Trading with the Enemy Amendment Act, 1916. This relates not to letters patent already granted, but to an important department of the newest examples of inventive skill—the applications which have been received from the Continent since the outbreak of the war, or immediately before it, for British patent rights for new devices, for which as yet no sealed patent has been issued. Specifications have been required to be filed, but the authorities in this country have done nothing in the direction of conferring rights and transforming the applications into sealed patents. These "unsealed patents," as they are called, are now thrown open for the investigation and application of British manufacturers and users. The first application under this new legislation is, therefore, a significant event, not to be overlooked by those who are consulting the needs of the public and of British industry in these times.

The first application for an "unsealed patent" had to do with the German Timmer machine for grinding blades, and was made by two Sheffield firms in order to fulfil War Office contracts of so extensive a kind that they could not ordinarily comply with them.

The machine, curiously enough, comes from the German Sheffield—Solingen. The Controller made clear the procedure in this new class of case. The Public Trustee will probably be made custodian of the "unsealed patents," and while the licence has been issued by the Board of Trade hitherto, the new type of licence will be executed by the Public Trustee and granted in his own name, though it will be prepared by the Solicitor of the Board of Trade. The Public Trustee will hold the royalties, and it will be necessary (the Controller pointed out) for somebody to pay the sealing fee, for the unsealed patents must be sealed to someone before they can be used.

It is stated that there are some two thousand of these "unsealed patents" filed, together with their specifications. The first application, the Controller announced, would be granted.

CENTRAL ARGENTINE ELECTRIFICATION.

AN important railway electrification scheme, which is approaching completion, is that comprising the Central Argentine Co.'s suburban line from the new Retiro Station (Buenos Aires) to Tigre (*via* Victoria), which has a route length of 28 km. From a description of this scheme which appeared recently in the *Central Argentine Railway Magazine*, it appears that Messrs. Merz & McLellan reported favourably on this project in 1910, and that the scheme, having received the approval of the Argentine Government, steps were subsequently taken to carry it into effect, with the result that it is practically completed. Electrical energy will be generated in the company's power house at Canal San Fernando, and transmitted through 20,000-volt underground cables to sub-stations at the Canal San Fernando, Victoria, Olivos, Palermo and Retiro. The sub-stations at Canal San Fernando, Olivos and Palermo will convert to direct current at 800 volts, at which pressure the current will be supplied to the third rail. The sub-station at Victoria is a static sub-station, and will supply three-phase current at 440 volts for power and lighting requirements at the Victoria workshops and station. Retiro sub-station will convert to 220-volt direct current for the supply of light and power to the new Retiro station and goods yards.

Electrical energy will be supplied to the trains by means of a third rail, and will return to the traction sub-stations by means of the track rails. The rolling stock is arranged on the unit system, and each unit will consist of one motor coach coupled to one trailer coach. A train can thus consist of one to six units, that is, two to twelve coaches.

With the exception of Tigre C. and Victoria the electric lighting at the local stations on the electrified system will be supplied direct from the third rail. At Victoria, the Victoria sub-station will supply the current, while at Tigre C. motor-generators will reduce the current at 800 volts from the third rail to a pressure of 200 volts, at which pressure the lighting will be carried out.

The power house is situated on railway property midway between the Canal San Fernando station and the River Luján. The foundations are in the form of an armoured concrete raft supported on about 3,000 piles driven to a depth of 10 metres.

The power house, with its machinery, is now completed. The building is of steel framework, with walls of reinforced cement plaster, and is divided into two main parts, the engine house and boiler house. There is a bay along each side of the engine house; in one the high-tension switchgear is housed, and in the other, which is adjacent to the boiler house, all the water tanks and feed pumps are situated. The engine house is spanned by an electrically-driven travelling crane.

The boiler house has three main floors: a basement, or ash-handling floor, a boiler house floor, and an economiser floor. The boilers and economisers are arranged on each side of the boiler house, and above them are coal-bunkers which have a capacity of 1,000 tons. Alongside the boiler house in the open is a coal store for 6,000 tons of coal.

In the engine room are installed four 3,300-kw. turbo-alternators of the Parsons type. The alternators generate at 2,500 volts, 25 cycles, and run at 1,500 R.P.M.; they are direct coupled to step-up transformers, which raise the voltage to 20,000. Below each turbine is situated its surface condenser and auxiliary machinery.

The circulating water is obtained from the River Luján by means of four electrically-driven circulating pumps which pump the water from the river to the condensers.

The high-tension switchgear is installed in concrete cells reaching from the basement to the roof of the switch house.

There are six boilers of the multitubular type fitted with mechanical stokers, superheaters, induced and forced draught. Each boiler has its economiser placed directly above it, the waste gases from each pair of boilers being dealt with by the one chimney. The ashes and soot are handled by means of the vacuum ejector system.

Coal, as a rule, is brought from Campana, or Villa Constitución in wagons, and lifted by an electrically-driven jib

crane, with grab attachment, into the open coal store, or into receiving hoppers. Two coal-crushers reduce the coal to a small size; a bucket elevator conveys it to the top of the boiler house, where it is transferred to a tray conveyor running over the overhead bunkers. It is expected that about 50 tons of coal will be burned per day.

Practically all the cables have been laid and jointed, and are ready for use. The H.T. cables are all of the three-core, paper-insulated, lead-covered and wire-armoured type, and are in duplicate. In general, the cables have been laid in

traction sub-stations and several of the signal cabins. The third rail will be protected throughout by means of creosoted boards attached to the top and side.

In all, 117 electric coaches have been ordered. Of these 50 are trailer coaches, 55 are motor coaches fitted with two motors per coach, and 12 are motor coaches fitted with four motors per coach. The four-motor coaches will be used principally for express trains and special trains on race meeting and regatta days.

Owing to the war, only 30 trailers and 42 two-motor

PLAN SHOWING PRESENT AND PROPOSED ELECTRICAL LINES, CENTRAL ARGENTINE RAILWAY.*

the ground at the boundary lines on each side of the track. Each H.T. feeder has laid alongside it a pilot cable for the automatic protective gear for cutting out faulty feeders.

Telephonic communication has been arranged for by means of underground telephone cables, which link up the various points of the electrified system.

The three traction sub-stations are practically identical, and have been completed. The buildings are of the same type as the power-house building. Each sub-station contains three rotary converters, each of 1,000-KW. capacity. The direct-current feeders are paper-insulated, bitumen-sheathed, and are laid in fibre conduits filled with bitumen.

Work has just been commenced on the foundations of the Retiro sub-station. Besides the machinery required to convert the H.T. current, there will be installed a large battery to ensure a continuous supply at Retiro station, in case of repairs to, or breakdown of, the power-house plant or distribution cables. It is expected that this sub station will be ready for use before the end of the year. 'Victoria sub-station will be completed in a month's time.

Most of the third rail has been laid. It is in the form of a channel with the open side of the channel towards the track. The shoes on the train make contact with the underside of the top flange of the third rail. The whole third-rail system is divided into sections controlled by switches and circuit-breakers housed in the

coaches have been received. The balance is not expected until some time after the war has ceased. The trailer coaches were received about two years ago, and lately the electric equipment has been fitted to these coaches. The 42 two-motor coaches are practically ready for service. The coaches are equipped with 250-H.P. motors and control gear.

It is expected that with this stock the express trains from Tigre to Retiro will make the journey in about 30 minutes,

making two stops on the way, while the electric trains stopping at all stations will be able to make the journey in approximately 45 minutes. Repairs to the rolling stock will be carried out at Victoria work-shops, at which large alterations and additions to the buildings and machinery are being made for the carrying out of this work.

The tracks between the Canal San Fernando Station and the Tigre (R.) Station have been equipped with the third rail, so that electric trains can be run there for the purpose of giving motormen a

thorough course of instruction and training before the electric service is commenced. Since the middle of September an electric train composed of two motor and two trailer coaches has been running daily for the purpose of showing up any faults there might be in the electrical equipments. So far, this train has run 3,600 km., and not a single fault has developed.

* Map reproduced from *Proceedings, West of Scotland Iron and Steel Institute*.

TURBINE PLANT AT THE CANAL SAN FERNANDO POWER HOUSE.

ACCOUNTING FOR POWER FACTOR IN THREE-PHASE SUPPLY TARIFFS.

THREE-PHASE generation and distribution being undoubtedly the standard system of the future in all industrial districts, and industrial loads being frequently of low power factor, any proposals for taking power factor into account in charging for A.C. supply are of quite special interest. That the wattless current demanded by a load of poor power factor does involve considerable idle investment in generators and cables is well known, and no doubt readers are acquainted with the investigations and proposals of Prof. Arno in this connection. Broadly, these proposals are that costs due to low power factor be covered by charging each consumer for his true consumption plus a fraction of the difference between his real and apparent consumption, this fraction varying with circumstances from 25 to 50 per cent. Taking 33 per cent. as an average value for this fraction, the power for which the consumer has to pay (in a case where the real power is $E I$

ELECTRIC TRAIN, CENTRAL ARGENTINE RAILWAY (see p. 556).

$\cos \phi$ and the apparent power $E I$), is $\frac{2}{3} E I \cos \phi + \frac{1}{3} E I$. The method proposed by Arno for measuring this complex quantity was displacing the driving pressure-coil field backwards with regard to the driving current-coil field by an angle greater than 90° , and varying (according to the range of power factor for which the meter is designed), between 100 and 150° or so.

On non-inductive load the reading of such a meter is identical with that of an ordinary watt-hour meter, but on inductive load the special instrument reads higher. The units in which it records are, however, "complex" units, so that even if the law of the country does not preclude the use of an Arno meter as the sole basis of charging, there is no indication for the benefit of the supply engineer and the consumer concerning the actual power consumption and power factor. It is obviously desirable that the supply engineer should know the actual power and power factor, otherwise he cannot judge properly the development of his undertaking, and remodel tariffs from time to time. The consumer is more than likely to chafe at the mystery of the "complex unit" on which he is charged, and there is certain to be trouble if, due to lower power factor, his bill comes to more than in a preceding

FIG. 1.

FIG. 2.

period, for which his ordinary working records show that the true power consumption must have been greater. The consumer has every right to demand that, if he is to be charged on power factor as well as true power, his meter should give him such information as will enable him to check, and possibly improve, both these quantities. Finally, there is the serious objection that an Arno meter reading, say $\frac{2}{3} E I \cos \phi + \frac{1}{3} E I$ will not give correct readings with any other fractional coefficients, though it is obviously quite likely that, due to extensions or other changes in the supply station and network, the fraction of wattless current charged for should vary from time to time. Similarly, if a consumer's installation gave at first a power factor between unity and 0.8 , but subsequently was extended by the addition of a number of motors, so that the power factor then varied between 0.85 and 0.6 it would be necessary to substitute a differently adjusted meter. These difficulties, though not insuperable in a laboratory or special installation, become of the gravest importance under commercial conditions where continually varying loads are concerned.

It is not necessary, however, to use the special Arno meter (which is inferior in electrical and mechanical characteristics, to most modern watt-hour meters), in order to work on Arno's principle of charging for real power plus a proportion of the wattless demand. R Stoppler, in a recent copy of the *Elek. Zeitschrift*, points out that separate measurement of the two products $E I \cos \phi$ and $E I \sin \phi$ provides all the essential information and requires only the use of meters of standard construction, whilst overcoming all the objections cited above. If the load current lags on the supply pressure E (fig. 1), a meter reading $E I \cos \phi$ would record the watt component $E i_1$; and a meter reading $E I \sin \phi$ would record the wattless component $E i_2$.

Connections for such meters are given later. Assuming for the moment that their readings are available, they may be used for a complete analysis of the load conditions by aid of fig. 3. In this chart values of ϕ and $\cos \phi$ are plotted against values of $\tan \phi$ as abscissa: ($\tan \phi = E I \sin \phi / E I \cos \phi = \text{reading of sine}$

FIG. 3.

meter/reading of cosine meter = wattless component/watt component).

The meanings of the factors n and k introduced on this chart are as follows:—Arno's basis of charging is [real power + n (apparent—real power)] where n is a fraction. This reduces to $(E I \cos \phi + n(E I - E I \cos \phi)) = (1 - n) E I \cos \phi + n E I$, which may be expressed as $k \times E I \cos \phi$, where k is the factor by which the real power reading must be multiplied to give the value of Arno's complex power. It will be seen, therefore, that from the readings of meters recording $E I \cos \phi$ (i.e., true power) and $E I \sin \phi$ respectively, there can be deduced the power factor and the correct total for charging on Arno's system for any value of n and for any load power factor. To eliminate calculation of $\tan \phi$, a chart can be prepared on the principle shown in fig. 2, setting $E I \cos \phi$ along the axis of ordinates, and $E I \sin \phi$ along the axis of abscissa; the length AB represents the apparent power $E I$ to scale and the angle $OAB = \phi$.

In applying this system of metering it is simply necessary to add

FIG. 4.

to the existing meter which records real power ($E I \cos \phi$), a similar meter so connected as to record $E I \sin \phi$. In the case of a balanced three-phase load an ordinary A.C. motor meter may be connected as in fig. 4, the current coil in one phase, and the pressure winding across the two other phases. The driving fields are then in phase and the meter registers proportionally to $E I \sin \phi$. In the vector diagram to the left of fig. 4, the flux F_2 lags 90° on E_2 , the E.M.F. E_2 which produces it, and is in phase with i_1 so long as the load is non-inductive.

A better arrangement for recording the wattless component $E I \sin \phi$ correctly in any three-phase system, at all power factors and states of load balance, is indicated in fig. 5, and really amounts to duplicating the arrangement in fig. 4. The flux F_2 is made to lag 60° on E_2 , and hence to lag 30° on i_1 ; and the flux F_1 is made to lag 120° on E_1 , and hence to lag 30° on i_2 . When thus arranged the meter yields high torque, has small internal loss and is easily calibrated.

For a three-phase, four wire circuit, three measuring systems are required, connected as in fig. 6 with the pressure windings in star, and each connected to another phase than the one containing the current coil with which it works. The fields of the pressure coils being made to lag 60° on the E.M.F.'s producing them, they

FIG. 5.

come in phase with the main current fields when the main load is non-inductive and the torque produced is proportional to the wattless power of the outers against the neutrals. Other arrangements are possible in the above and other cases, but enough has

FIG. 6.

been said to illustrate a convenient means of applying the admittedly sound principles enunciated by Arno, without incurring the practical difficulties involved by using meters designed to record automatically a composite quantity which includes an arbitrary and gradually changing numerical factor.

A RAILLESS TROLLEY-BATTERY VEHICLE.

THE new motor-wagon designed by Mr. C. J. Spencer, general manager of the Bradford City Tramways, for the conveyance of goods in connection with the ordinary passenger tramway service, which was referred to in our "Notes," was given a trial recently, and the *Yorkshire Observer* says it was found to work with smoothness and efficiency in every respect. The new vehicle is quite simple in design, but wonderfully adaptive to the purposes to which it is to be put. Taking the chassis of an old railless trolley-car, Mr. Spencer has built upon it a long, broad lorry, similar in shape and dimensions to the motor-lorries which have become so familiar in recent times. The great difference is, that instead of using petrol, which is so dear in these days, the new transport wagon is run by means of the existing electric tramway equipment. It may thus have the advantage of greatly reducing the demand for the precious petrol, minimising running costs, and at the same time contributing greatly to the public convenience at a time when there is so serious a deficiency in transport services.

The adaptability of the new wagon was demonstrated to the chairman of the Bradford Tramways Committee (Mr. Enoch Priestley) and several other interested persons, at a test of the vehicle on the 8th inst.: at the Thornbury tramway depot it was seen manoeuvring with the facility practically of an ordinary motor-car. A load of two tons was put on the wagon, and with this it made a satisfactory journey to Wibsey. The great advantage of the new wagon is that it can travel either by means of the electric equipment of the tramway system or independently of it, by means of a battery carried on the vehicle.

The equipment of the chassis of the railless trolley-battery vehicle is similar to that of the ordinary railless trolley-chassis, with the addition of the battery, and includes two 20-H.P. motors with ordinary series-parallel control, and it will therefore operate on a 500-volt circuit. The earthing device is an extension of the steering arm of the vehicle, bearing on the track by the medium of a cast-iron block, and at the same time automatically steering the vehicle. (This device, which has been used with considerable success for some time in connection with the

Bradford railless trolley-cars when taking them over the tramway routes to the depot, was designed by Mr. E. Cross, the general manager of the Rotherham Tramways.)

The accumulators employed are 120 cells of the Edison type, giving a normal voltage of 150.

These supply current to the ordinary 500 volt motors, the only difference being that the motor with battery supply runs correspondingly slower, that is, *pro rata* to the voltage, but as the torque of a series motor is proportional to the current passing through the windings, the vehicle is capable of climbing steep gradients, but at a speed corresponding to the low voltage.

Whilst the vehicle is running on the 500-volt circuit the battery may be in series with the motors, thus charging it whilst the car is in trolley service. The battery is capable of running the vehicle about 10 miles.

The change-over from battery to overhead wire is merely a question of throwing over a switch, the putting of the trolley on the wire and the earth connector on to the steering gear.

We are indebted to Mr. C. J. Spencer for these details and for our view of the vehicle.

DIESEL ENGINE USERS' ASSOCIATION.

AT the May meeting of the Association reference was made to the fact that the list of membership was now representative of upwards of 30,000 B.H.P. of Diesel engine plant. Several further engineers having control of such plant were elected members.

Discussion on the Smithfield Market explosion was resumed. Mr. R. L. QUERTIER, the London manager of Messrs. Ravell and Co., Ltd., who attended the meeting by invitation, made some remarks on behalf of his firm, who were the makers of the air compressor concerned. While not wishing to be dogmatic, he said, they had a theory which seemed to fit the case, and which, if correct, showed that quite a simple precaution should prevent further accidents of a like nature. The abnormal conditions shown by the examination of the compressor after the accident were, so far as they knew, confined to the high-pressure suction and delivery valves, which were exceedingly badly carbonised, and to the relief valve on the intermediate purge-pot, which, when tested after repair, only blew off freely at about 380 lb. per sq. in. This relief valve was set by the makers to blow off at about 275 lb. per sq. in., so that it must have been re-adjusted by screwing up the spring to the limit.

The accident occurred almost immediately on starting up after the engine had been out of service for some hours, and therefore the temperature of the compressor was very much lower than normal, and it would seem that the conditions were not at all favourable for an explosion to take place. There seemed no doubt, however, that an explosion did occur, as, in the first place, a calculation of the strength of the purge-pot showed that the bursting pressure would be in the neighbourhood of 2,500 lb. per sq. in.; and, secondly, the fact that it was broken into fragments indicated a heavy and instantaneous shock, and not the fracture at the weakest section, which one would expect with a steadily-increasing load, even if that were rapidly applied.

RAILLESS TROLLEY-BATTERY VEHICLE FOR GOODS SERVICE ON TRAMWAYS.

Assuming, therefore, that an explosion occurred, and that this was caused by the ignition of lubricating oil, it had been suggested that such explosions were caused by the ignition of oil in the form of mist or fog. One, therefore, had to account for the oil fog and for the means by which the temperature was raised to ignition point. His firm's theory was as follows:—

The high-pressure valves were not functioning, with the result that there was, more or less, open passage connection between the final delivery-pipe to the blast-bottle and the intermediate purge pot. The valve between the blast-bottle and the compressor was opened just before the accident, and this would allow the dense air in the blast bottle to rush back along the pipes to the intermediate purge pot by way of the high-pressure cylinder. They suggested that the velocity at which the rush took place and the density of air caused it to lock up and carry away any oil deposited on the pipes and to churn this into a fog. The intermediate relief valve, as tests recently made proved, was capable of dealing with all the air aspired by the compressor with a rise in pressure of not more than 30 lb. per sq. in., but it was obviously incapable of dealing with an almost instantaneous rush of air from the blast bottle, and consequently the pressure rose till a balance was attained. All the while, of course, the intermediate cylinder was delivering air, and had now to compress against this greatly increased pressure, so that the temperature of the delivered air rapidly increased till it was sufficient to ignite the oil mist in the purge pot and cooling pipes. It was not necessary for this rush back of air to take place immediately the blast bottle valve was opened, because the compressor was at work and the conditions necessary, namely, a more or less free passage into the I.P. purge pot and coils, might not have been immediately present. Again, the same conditions would be obtained with a slower leak back if for any reason the I.P. relief valve were not in proper working order. If this theory were the correct explanation of the explosion, it was clear that the greatest safeguard possible would be a back-pressure valve inserted in the final delivery pipe between the blast bottle valve and the compressor. Mr. Quertier thought that this valve should be fitted close to the blast-bottle end of the pipe, as there the air pulsation would be less definite and the air would be cooler. These conditions would ensure the valve working freely without undue wear or tendency to stick.

Quite apart from the accident above referred to, he thought it was clear that no undue rise in temperature could occur in the compressor, even if either or both the high-pressure valves failed, if in the first place the air in the blast bottle were prevented from rushing back by the above-mentioned check valve, and, secondly, if the intermediate-pressure relief valve were kept in proper working condition, so that it would prevent the I.P. delivery pressure rising, by blowing off all the air aspired by the compressor with the reasonable rise in pressure for which the relief valve was designed. The next meeting of the Association will be held on Friday, June 23rd, when Mr. Geo. E. Windeler will read a paper on the subject of "Methods of Lubrication and the Difficulties of Efficiently Lubricating a Diesel Engine."

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Special X-ray Reflectors for Half-Watt Lamps.

To permit advantage to be taken of the well-known merits of the X-ray lighting system, when using half-watt lamps for the

"Jove" type for low windows.

"Jupiter" type for high windows.

FIGS. 1 & 2—X-RAY SILVERED GLASS REFLECTORS FOR MAZDA HALF-WATT LAMPS FOR WINDOW LIGHTING.

E.C., have developed three new reflectors for use with Mazda half-watt lamps. These reflectors embody the same merits as the ordinary X-ray reflector in respect of scientific design, freedom from striation, and permanently high reflecting efficiency. The distinctive feature of the new patterns is the provision of a special backing to withstand the high temperature of half-watt lamps, which would destroy the silver backing of the ordinary X-ray reflector.

The "Jove" X-ray reflector, which is very similar in appearance to the "Scoop" type, is intended for use with 100-watt Mazda half-watt lamps, and is suitable for windows of average proportions. It throws an equal amount of light back and down, which distribution is suitable for windows from one to one and a-half times as high as they are deep. If the window height be about twice as great as its depth (measured from the front glass to the background), the "Jupiter" X-ray reflector, in conjunction with a 100-watt Mazda half-watt lamp, throws a powerful beam of light downwards, and thus meets the needs of the case. In general appearance, the "Jupiter" reflector much resembles the "Helmet" pattern of ordinary X-ray reflector.

The "Jumbo" reflector, for use with 500, 750 or 1,000-watt half-watt lamps, is altogether a unique production. It is the largest one-piece glass reflector ever blown (16½ in. diameter, 13½ in. high), and is particularly suitable for the efficient direct illumination of very large interiors. This reflector requires a special metal hanger, at the top of which a special holder can be supplied with an adjustable feature, which makes it possible to obtain two or three degrees of spread to the light.

The makers confidently anticipate that the "Jumbo," "Jupiter" and "Jove" super-X-ray reflectors will continue for half-watt lighting the sterling services already rendered by X-ray reflectors in the development of good lighting.

Westinghouse Flour Mill Plant.

A description of a flour mill installation, in which the electrical equipment was supplied by the BRITISH WESTINGHOUSE CO., of Trafford Park, Manchester, appeared in a recent issue of the *B. W. Gazette*, from which the following notes are abstracted.

The original engine-drive included a good deal of gearing which it was desired to supersede. The main mill consisted of four floors, each with a line of shafting, and a wing of the building contained the cleaning and conditioning plant. The question of the electrical sub-division of the drive was considered, and it was decided to install a 110-H.P. motor to drive each of the four main lines of shafting, while the drives for the cleaning, conditioning and auxiliary plant were determined by the circumstances in each case.

The mill contains a 35 40 (280 lb.) sack plant, and is fitted throughout with three-phase slip-ring motors.

Owing to the lack of space, the motors for the main mill were let into the lines of shafting, and coupled up by flexible couplings, as shown in fig. 3; in order to use high-speed motors, the shafting speed was increased from 175 to 375 R.P.M., and as changes in pulleys were necessary, it was decided to increase the break-roll speed by 15 per cent, and that of the reduction-rolls by 25 per cent, the result of which has been quite satisfactory.

In order to ensure that the four motors shall be started simultaneously, the starters for the rotor circuits, shown in fig. 4, are geared together, and operated by one handle; the starters are

FIG. 3.—WESTINGHOUSE SLIP-RING PIPE-VENTILATED MOTOR DRIVING LINE SHAFT

direct lighting of shop windows or other interiors, the BRITISH THOMSON-HOUSTON CO., of Mazda House, 77, Upper Thames Street,

also interlocked with stator circuit-breakers on the wall behind, so that the latter cannot be closed unless the former are in the off

position. The circuit-breakers, which are oil immersed, are fitted with time-element overload and no-volt releases, and, in addition, emergency push-buttons in various parts of the mill can operate the latter releases.

The speeds of the scalpers, centrifugals, &c. were not altered. The wheat-washing and conditioning plant has a separate motor drive, as also the wheat-cleaning plant.

FIG. 4.—COUPLED WESTINGHOUSE LIQUID STARTEES.

Separate motors are also installed for driving the grain intake plants, sack hoists and general warehouse plant. In practice, it is found safe to speed up sack hoists 25 per cent.

The current is derived from a supply company's transformer, and passes through a distribution board. The work was carried out by the British Westinghouse Co., under the supervision of Messrs. Horace Boot & Partners, consulting engineers.

Large Direct-Current Switchboard.

During the last few years the GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, E.C., has produced a considerable number of heavy-current switchboards for various municipalities, and a recent example of this class of board is shown in fig. 5. This board consists of 23 panels, comprising generator panels for controlling the continuous-current side of two 1,620-KW. motor-generators, with Witton-Kapp phase-advancers, which are being manufactured by the G.E.C. at Witton. It also includes a large

FIG. 5.—VIEW OF BACK OF HEAVY-CURRENT "WITTON" SWITCHBOARD, SHOWING ONE OF THE SIDE PORTIONS.

number of feeder panels for distributing the energy. The board has been constructed in a form occupying three sides of a rectangle; the panels have a thickness of $2\frac{1}{2}$ in., being composed of oiled slate slabs; in addition, all the circuit-breakers are mounted upon their own slabs, $2\frac{1}{2}$ in. thick. The circuit-breakers controlling the generators have a capacity of 10,000 amperes. Some idea of the heavy character of the gear can be gained from the size of the bus-bars, the latter being composed of 24 strips of copper, each $\frac{1}{4}$ in. \times $\frac{1}{2}$ in. thick.

The Employment Department.—The Board of Trade announces that the Labour Exchanges and Unemployment Insurance Department will in future be known as the Employment Department of the Board of Trade.

THE APPLICATION OF SCIENCE IN FACTORIES.

By SIR WILLIAM BEARDMORE, BART.

(Extracts from a Presidential Address to the IRON AND STEEL INSTITUTE.)

Tar war, with its revelation of great influences at work, has taught us all lessons which must be assimilated and acted upon to the fullest extent. These lessons are ethical, political, and industrial. They are interdependent; each affects the other; and it is difficult to discuss one without involving the other. But, obviously, in this Institute we are more concerned with the industrial and economic factors of the problems. Even with this limitation, the subject offers wide scope for consideration. The industrial lessons involve science and technique, design and manufacture, volume and economy of production, and, finally, the relation of both employer and employee to all of these. All are correlated, and we can only achieve our aim if everyone, from the least skilled of workers to the greatest of industrialists, resolves to consider the bearing of each not only upon himself, but upon the prosperity of the Empire.

Science comes first. It is the dominant factor, because it should be the beginning of all things, and yet it is only one element in the problem, because there must be co-operation between laboratory research and manufacturing development. This should be strongly enforced, as there is a tendency at the moment to neglect the other factors. There is a great need for the extension of research and experiment, and my experience is that much of this work is highly remunerative, either positively in improved processes of manufacture, or negatively in eliminating faults and obviating wastage. Much of it, however, is unremunerative, and in any case all of it requires money. Excessive competition in manufactures narrows profits, and leaves little money for such work. Manufacturing firms have therefore difficulty in finding the wherewithal to embark initially on scientific research work, or they are compelled, after starting it, to limit expenditure on its continuance. The refusal of workers to utilise to the best advantage improved methods of manufacture, evolved by experimental research; discourages industrialists in their evolution and application. These are axioms whose truth could be established by many examples. When a charge of lack of enterprise is made against manufacturers, blame should at the same time be laid at the door of workers who do not realise that their interests are intimately affected by the attitude they display in all such cases. There lies the political connection with the problem. It is not enough for the State to assist or otherwise encourage scientific research and experiment. The nation is equally concerned with the profitable application of the results, in order that national prosperity shall be augmented by ensuring that the fullest utility will be derived from scientific research and experiment. The question, therefore, is a national one. The employment of the people and their well-being depends upon plenty of work. This, in turn, requires the maintenance of a great export trade. Efficiency and economy in manufactures can do much to win and retain foreign as well as British Imperial markets. This necessitates advance towards perfection of design and greater volume of output, through improvement in the mechanical means of production evolved by experiment. It follows that research should be a charge on the selling price. To counterbalance this charge it is essential that the volume of output should be increased. Thus, when we reach the bedrock of industrial conditions we find that, unless restrictions and limitations dictated by workers' organisations are abolished, much of the gain possible to the nation due to research and experiment must be lost.

An example may here be given of the influence of the restrictive methods of Trade Unions. Early in the war it was found at the Parkhead Forge that the output from the respective machines was not so great as what the machines were designed for, and one of the workers was induced to do his best to obtain the most out of a machine. He very greatly increased his output, notwithstanding his predilection for trade union restrictions. When it was found that the demands of the Government for a greatly accelerated production of shells required the employment of girls in the projectile factory owing to the scarcity of skilled workers, these girls in all cases produced more than double that by thoroughly trained mechanics—members of the trade unions—working tentative cases may be quoted thus: In the turning of the shell body the actual output by girls with the same machines and working under exactly the same conditions and for an equal number of hours was quite double that by trained mechanics. In the boring of shells the output was also quite double, and in the curving, waving and finishing of shell bases quite 120 per cent. more than that of experienced mechanics. These conditions applied to war time, when the peril of the nation demanded unselfish, patriotic exertion by everyone, and the men who thus limited the output can only be regarded as unworthy of the privileges of citizenship. In peace time the same results, due to restrictive measures, must necessarily handicap severely all manufacturers in their aim to advance the prosperity of the nation by ensuring adequate employment for all.

There is little need to demonstrate that ideal conditions in manufacture are associated with a higher rate of wage and large total earnings per worker per week, and this is attainable without forfeiture of a satisfactory profit, provided—and this is the crux of the whole problem—all workers make the most of all the appliances which scientific research and mechanical experiment may place in their hands, by increasing the volume of production per unit of time and by working full time. These, again, are well-known economic laws, but they are not enforced often enough. Until they are applied, the gain from the application of science to industry will not be fully realised for the benefit of the workers of the nation.

The awakening of the worker to such responsibility is thus as important as the arousing of the nation to the need for more scientific methods. But that does not in any way excuse the manufacturer for any deficiency in enterprise. In fairness, however, it should be made clear that some progress has been made in this direction in our own history. A few iron and steel manufacturers as long ago as the 'eighties began tentatively to carry on chemical and metallurgical research work, and they have been steadily and continuously increasing the extent of the work done, with very satisfactory results. The present crisis and the prospect of a great trade war in the near future justify a consideration of the importance of increased diligence in this essential department of industrial activity and of the encouragement afforded by results in the past.

Scientific research falls naturally into two main divisions, and in considering how such work can be extended it is important at once to differentiate between the two. The work may be characterised in the one case as purely theoretical, almost classical; in the other as distinctly technical or practical. In the one, the results are indicative of potentialities for the future, more or less remote; in the other they are for immediate application, or generally contemporaneous with actual manufacture. Obviously only a limited amount of what I have termed classical research can be undertaken by the manufacturer, particularly where the current demands for chemical, metallurgical, or mechanical research for practical work monopolise much time and apparatus. Such classical work must, therefore, be separately undertaken. Where it is not dependent upon experience in every-day industrial work, it would seem that State or other public laboratories could readily undertake it. This condition would apply to new processes, to new discoveries, or to new materials. This line of demarcation of scientific work is further justified, because in public laboratories the difficulty of practical direction or control is often experienced. Where there is an attempt to do work capable of immediate application, it becomes essential that the guiding influence should be immediately conversant with every-day practice in the factory. In this category there are, therefore, included improvements, whether in chemical or mechanical processes, in combinations of metals, or in the reduction of the cost of production. All of these are more or less dependent on precedent, and consequently require complete intimacy with existing conditions.

There should be no disposition to limit the original or purely classical work in scientific research. When this is borne in mind only good can accrue from close association, even in such purely scientific research, between the industrial and the theoretical scientist. What is distinctly theoretical to-day may become the practice of to-morrow, and no one who has been associated with such work can fail to realise that there are no more difficult questions presented for decision than the potentialities, from a commercial point of view, of problems solvable in the laboratory.

Purely theoretical research may yield important commercial results, and we are thus brought into contact with one of the difficult problems associated with national expenditure on such work. It is admitted that science knows no boundaries; but at the same time there is the important commercial rule that national expenditure must be justified by national gain. Where humanitarian work is involved no one will object to the gain from national expenditure being universal. Thus, all work for the prevention of accidents in mines, or in other employments, may be undertaken by the State, and the publication of results broadcast be justified. But where a new discovery, a new process, or new materials of great advantage to the industry of a nation are evolved, the advantage ought to accrue to that nation. It is admitted that between the discovery of the germ of a great idea and its application to manufactures much diligent work must be done, and that, too, of an important scientific character. But with the disclosure of the basic idea the subsequent work becomes inviting, perhaps comparatively easy, even if it is expensive or requires long and expert experiment. With the conduct of research in public laboratories a difficulty arises in connection with the publication of scientific results.

There should, however, be a great extension of the practice of conducting experiments on behalf of firms who direct and pay for such research, particularly of firms who desire to follow a definite line of research not immediately connected with any of their manufacturing processes, and whose current work does not permit of such researches being undertaken. No doubt in the future there will be much of this work for such public institutions, and a satisfactory measure of secrecy will be attained. There would no longer be the objection that the fullest experience of current works practice is not available by those engaged in the public laboratory if there were such direct and close contact between the public laboratory

and the works of the firm directing and paying for the research.

One of the difficulties in finding a scientific staff for the factory is the limitations of our educational system. It has been put on record recently that at Cambridge only four colleges are presided over by men of scientific training; at Oxford not one; and that of the 35 largest and best-known public schools 34 have classical men as headmasters, and in no case do scientists hold a high place. It may be contended that such institutions were intended originally to give a classical or liberal education; that they were based on the concept that the fundamental principle of education is the cultivation of the mental faculty. On the other hand, science has become so essential, not only to the industrial, but even to the domestic life of the nation, that scientific training might be made to serve a greater part in the future than in the past in cultivating the mental faculty. In any case, the accepted principle that entrance to the largest number of posts in the Civil Service should be contingent on an examination where science plays the smallest, if not a negligible, part, tends to encourage the youth of the country to neglect scientific training, and to bring into the service of State departments, many of which are concerned with scientific work, men with little knowledge of and less sympathy with science. The State endowment of research has been delayed, and is now hampered, by the absence of this influence in Government staffs. Until there is an educated and liberal-minded control of our industrial and commercial Government departments, the true relation of the State to science can never be realised nor its benefits fully materialised. It is because of the gradual awakening of publicists to these considerations that many look with the greatest measure of hope to a quickening of interest in scientific research within factories. No firm which neglects such work can expect to achieve the highest success, industrially or financially. We must still pursue a vigorous policy of enlightening the working classes on the importance of the fullest advantage being taken of all chemical and mechanical improvements conducive to increased production. But, at the same time, no opportunity should be neglected of enforcing the need for a more active participation in research and experiment by manufacturers in all processes of production.

I am persuaded, from my own experience, that reward follows from the pursuit of scientific methods. Continuous investigation by a trained staff is absolutely necessary for efficient work, and it is essential that managers and works superintendents should be sufficiently acquainted with the scientific side of their work to apply in a practical way the recommendations made from the laboratory and ensure the desired results. This presupposes co-ordination between the manufacturing staff and the research staff, so that we have here, again, a proof that scientific work must be done in the works, under the stimulus of the chief. For this reason, too, it is desirable that young men should have at least the first part of their practical laboratory training within the works. Educational authorities should maintain a closer contact with the works, so that not only would these young men be grounded in school laboratories for practical work, but the student would have a better chance of being placed subsequently in a position in the works laboratories where his ability would more readily be developed. And here I cannot refrain from the suggestion that the training in works laboratories should be regarded as part of the higher education of the future metallurgist, and that there should not be an immediate desire for high remuneration. Experience is of far greater permanent value than the earning of a big wage at the commencement of a scientific career.

While we should be masters in one branch of science we should know a little of all others, and watch all progress sympathetically and intelligently.

In 1889 Sir Robert Hadfield dealt before this Institute with alloys of silicon and iron, and his investigations, taken up by others, led to the important discovery that certain elements, like silicon and aluminium, could render steel more permeable under low magnetic fields than the purest commercial iron then available. The usefulness of this discovery to the electrical engineering trade was at once recognised, and a special silicon steel was shortly afterwards applied to the manufacture of transformers. From this purely scientific work there has sprung the trade in special transformer sheets, &c., and it has been computed that in the nine years from the introduction of this material the aggregate output in America alone of machines using it amounted to no less than 14,000,000 k.w., and the annual saving in the latter year in electrical energy due to its better magnetic properties, was about 10,000,000 dollars.

A further illustration of the value of organised research applied to the improvement of an industrial product is afforded by that undertaken to find the factors which prevented the present metallic-filament lamp from being run at a higher efficiency than one watt per candle-power. By adopting the results arrived at, a lamp was made which had an efficiency of 0.5 watt per candle-power and an average life of 2,000 hours—the now well-known "half-watt lamp." This, it is safe to predict, will ultimately supersede all other forms of glow lamp, and be a serious rival even to the flame arc itself.

Scientific methods applied in the works can achieve much in avoiding wastage, in ensuring greater reliability in processes, in providing labour-economising mechanical appliances, and by recovering all by-products. Every industrial process should be examined constantly and methodically by

the trained scientific staff, whose sole duty it would be to elucidate the principles upon which the process depends, and to ascertain, in the laboratory first, and afterwards in the works, the conditions of maximum efficiency. Every failure and every flaw should be recorded and explained, so that the cause may be avoided and the process of manufacture improved. Responsibility, therefore, rests upon all manufacturers to make such research work part of their productive methods.

A great duty and responsibility rests also upon the State and upon the worker. Instead of being hampered by legislation manufacturers should be encouraged, because on manufactures the prosperity of the nation will depend much more in the immediate future than in the past. What is required is that everyone, scientist, technologist, employer, and worker shall do his best for the common weal. It would be easy to demonstrate that many developments towards improvement and increase in production, in a great variety of factories, have been regarded as mediums only for justifying the same wage earnings for the same output with less physical effort. Were the highest efficiency of all such improvements realised by the workers, their earnings would be higher and the output would be greater without any increase in physical effort. Charges would be spread over the greater volume of output, manufacturers would be encouraged to prosecute research work to a still greater extent, and by the improving of the character of the production and the cheapening of its price the nation would be better equipped to face the keen competition in all the markets of the world which is bound to arise in the immediate future. There would be no unemployment problem. Thus, while we foster metallurgical science, we must not neglect the equally important subject of industrial economics and the duty of the State and the worker towards such problems.

WAR ITEMS.

The German in British Commerce.—At the annual conference of the Association of Trade Protection Associations of the United Kingdom, held last week in London, in bringing forward a resolution on behalf of the London Wholesale Hardware Club, which recommended the affiliated societies to ask their members to print names of partners or directors on their stationery, and against these names to put the country of the partner's or director's birth, Mr. Nettlefold (according to the *Ironmonger*) thought that a main object of every trade society and Chamber of Commerce ought to be to get rid of the Germans who had come over to do business here. "Most business men left at home were now unfitted for shouldering the rifle, but they might well take the knife and try to get rid of the cancer which had been undermining the country's strength. There were two classes of Germans involved: one was the unnaturalised, which was being dealt with by the Board of Trade, which, like all Government departments, moved slowly. If the war went on another ten years they might perhaps dispose of 20 per cent. of this class. The Association should suggest that an Advisory Committee of every trade in the country should be brought together to help the Board of Trade in this matter in their own special individual trades. If, however, they were going to get rid of the naturalised Germans in trade, it must be done by showing there was a feeling of repugnance against them."

Exemption Applications.—At the Saltburn Tribunal an application for extension made by an electrical engineer was refused.

At Stockton-on-Tees, Ald. T. B. Watson applied for exemptions in the case of John Thomas Walton, aged 39, the manager of the electrical fitting and plumbing business of T. B. Watson & Son, at Middlesbrough, and of his son, Coun. H. O. Watson, aged 36, who is in charge of the plumbing and electrical department at Stockton. Exemption for three months was granted in the case of the manager at Middlesbrough, and the application in regard to Coun. Watson was adjudged.

At Stalybridge, last week, Mr. F. Schofield, commercial manager of the Joint Tramways & Electricity Board, appealed for the exemption of Samuel Holt, aged 25, traffic clerk. The three other clerks formerly employed in the office are now on military service, and it was urged that special training was required for the position of traffic clerk. Conditional exemption was granted.

At the Exeter Tribunal, an electrician who applied for a wireman said it was true that women were being trained in this calling in the city, but they would not be able to do the work for at least six months, if they could then, which was very doubtful.

At the West Sussex Appeal Tribunal, a Worthing Kinema appealed for the exemption of a single man, aged 27, an electrician, wireman, and spare-part maker. His was claimed to be a certified occupation. The Local Tribunal had refused exemption as the occupation was not certified. Capt. Dawes said that this was the very class of man who was wanted for the Army. A wireman was no longer an exempted occupation, and recruits of the class were wanted for the Royal Engineers. The appeal was dismissed.

At the Southwark Tribunal, Messrs. Alexander Hawkins and Sons, electrical engineers, applied for the exemption of the manager of their dispatch department, who was responsible for the repair of electric motors in works where Government contracts were being carried out. He was granted exemption as being in certified occupations, the stipulation being that he should join the Volunteer Training Corps for Home Defence, if required. Mr. F. J. Hawkins, a member of the firm, was also granted a similar exemption. He was a fully-trained electrical fitter, and was superintending the erection of motors in munition works. The firm had lost 13 men since the outbreak of the war.

At a sitting of the Newcastle Local Tribunal on 9th inst., Mr. E. Hatton, manager of the Corporation Tramways, appeared in support of the application for the exemption of certain tramway employés from military service. He said they had a number of married men conductors who were being trained as drivers. Out of 823 employés, there were 133 who were eligible for service. There were 30 single motor-men he must keep, and there were 100 married men who had received conditional exemption. There were 107 conductors who were being trained as drivers, and these he desired to be exempted. In reply to the Chairman, Mr. Hatton said if the Government would release soldiers who were no longer needed for service, he would be glad to release some of the Corporation employés, but the Government would not hear of it. There was, too, an increasing difficulty in getting hold of women. The Chairman suggested that an application be made to the Ministry of Munitions to secure released men so that further tramway employés might be released. It was agreed that the motor-men should be given conditional exemption, and a similar course was adopted with respect to 32 single drivers, who were being trained as drivers, and 75 married conductors. It was also decided that all up to and including Group 7 (men under 25) should be refused exemption, all inspectors up to and including Group 40, and all labourers at the power station also should be refused exemption.

Total exemption has been granted to Mr. Ernest Bond (31), applied for by the Wedmore Light & Power Co., Ltd. It was stated that Mr. Bond was the only one left to supervise the gas plant, engines, dynamos, batteries, and other apparatus, and to do the necessary repairs.

Before the Herts. Appeal Court, a Luton electrical engineer appealed against a period of exemption granted by the Local Tribunal. He said that he was induced to start business through being misled at the recruiting office, where he was told that he would not be required by the Military. The appeal was refused.

At Colchester, the manager of an electrical engineering business at Marks Tey, owned by a lady, was granted three months' exemption. The employer stated that appellant was the only one left in her employ, and if he went the business would be closed, and she would be without means.

The Southend-on-Sea Tribunal has exempted until June 1st an electrical engineer, who has been in business for nine years at Westcliff. He said that he had contracts to complete, and that he employed two assistants who were under military age.

A Buxton electrical engineer appealed to the Local Tribunal for himself and one of his men. He stated that all his capital was invested in the business, and military service would mean financial ruin. He was engaged on military hospital work, which would take some months to complete. Five of his staff had enlisted, and he had failed to find a successor for the man appealed for. The employer was given six months, and the employé two months.

The Heckmondwike Tribunal has granted conditional exemption to an electrician engaged by a local firm.

Conditional exemption has been granted to the resident electrical engineer at the Keswick generating station. It was stated that he was the only electrician available, and that if he went the works would have to be closed.

At Coventry, Messrs. Hutt Bros., electrical engineers and contractors, appealed for Mr. A. Franklin, electrical engineer, the only eligible man left. Mr. Hutt stated that he was running the business single-handed, and was himself called up. The matter was put back for 14 days with a view to badges being secured for Mr. Hutt and his employé. Mr. Frank D. Chambers, electrical contractor, who also appealed, was exempted until May 31st.

At Buxton, application was made for exemption for the engineer-in-charge of the electric light plant at a local hydro, who, it was asserted, could not be replaced. The Tribunal allowed exemption until October 5th.

At Dover, on May 10th, the manager of the Burlington Hotel, appealed for the hotel electrical engineer (30). The Advisory Committee recommended no exemption, and this was agreed to.

The Amersham Tribunal has refused extended exemption to Hugh R. Butler (24), electrician to Mr. Freeman, of Chertbridge, who stated that he was engaged upon important experimental work, and that Mr. Butler was essential, as he maintained the plant.

An electrician, 32 years of age, married, applied to Clayton-le-Moors Tribunal, on May 12th, for exemption on business grounds. He had contracts to complete, and he could not

get anyone to take his business. He was the only electrician in Clayton-le-Moors. Exemption granted to July 10th.

At the Tynemouth Tribunal application was made on behalf of an electrician, aged 27, employed by a local firm. The head of the firm stated that the young man was the only qualified electrician left in the town (North Shields), the others having either gone into "controlled" establishments or joined the Colours. Conditional exemption was granted.

At Oldham, an electrical engineer and contractor who had lost four men, appealed on his own behalf, and was exempted till September. He also appealed for his brother-in-law, aged 19, who was employed by him as an electrician and wireman. He urged that he was absolutely indispensable, but the appeal was disallowed, the man, however, not to be called up before June 1st. Temporary exemption for two months was sought by another Oldham electrician for an employee in order that existing contracts might be completed. This appeal was disallowed, but the man is not to be called up before July 1st.

At Warrington, an electrical engineer and contractor appealed for exemption, and it was stated that seven of his employees had joined the Army. He was responsible for the maintenance of the electrical plants at some of the local munition works. Application had been made for badges for himself and some of his employees, and on hearing this the Tribunal adjourned the case for a month.

Johannesburg and Trade After the War.—In our last issue we reprinted from a South African contemporary a series of recommendations respecting after-the-war trade which had been before the Johannesburg Chamber of Commerce. This report, it is interesting to state, was adopted at a general meeting of members called at the suggestion of the B.E.A.M.A. South African Overseas Committee, and held on April 3rd. All the B.E.A.M.A. Overseas Committees are working towards the same end, namely, the protection and maintenance of the British electrical export industry, and in connection with these efforts they are enlisting the co-operation of engineering and commercial associations in their respective territories in bringing their objects before the various Dominion Governments.

To be Wound Up.—The following appear in the latest list of enemy businesses to be wound up by order of the Board of Trade:—

Bleichert's Aerial Transporters, Ltd., 36, New Broad Street, E.C., constructors of aerial wire railways. Controller: Mr. W. Hancock, 90-91, Queen Street, E.C.

The Flender Co., Broad Street House, E.C., wooden pulley manufacturers. Controller: Mr. J. Baker, Eldon Street House, E.C.

Hammer, Bayreuther & Co., 21, Mincing Lane, E.C., rubber merchants. Controller: Mr. R. J. Knight, 3, Raymond Buildings, Gray's Inn, W.C.

Prohibited Exports.—A number of pages of the "Board of Trade Journal" for May 11th are occupied with a lengthy list (revised and complete) of prohibited exports.

The list will also be found in the "London Gazette" for May 12th.

Germany's Investments Abroad.—A Reuter dispatch from Christiania states that the German firm Schuckert, of Nuernberg, which owned half the shares in the Hafsund Joint Stock Co., has recently sold its shares to a Norwegian firm. It is understood that the purchase price was 18,000,000 kroner (about £1,000,000).

INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

THE present week, April 21st, ends the longest period which India has been without a full mail since the war began; the last mail received being dated March 17th, and the next mail in will be April 22nd. The mail of home date, March 25th, was apparently on the ill-fated *Sussex*, and only a very few bags reached India. Electrical firms are inconvenienced as much as most others, as one looks out for home mails these days with extraordinary anxiety, for our invoices of goods long ordered and still not advised.

A stroke of extraordinary luck overtook a particular well-known firm recently. With big lamp orders booked, and not a word of advice of their shipment from home, a message was unexpectedly received from the harbour authorities that a consignment of 10,000 lamps was lying in the goods sheds awaiting delivery with demurrage daily mounting up! Delivery of the lamps was soon taken.

Metal-filament lamps are about the only electrical goods which have not advanced in price in India since the war began. In fact, if anything, the prices have decreased somewhat. The principal lamps marketed are the Osram, Mazda, Ediswan, Phillips, and Wotan.

An attempt was made some time ago to regulate prices, and meetings were held, attended by representatives of the different lamp interests, but nothing practical was done; in fact, worse price-cutting than ever took place afterwards. This is somewhat of a pity, because electrical business in plant and other electrical material is slack

and is bound to continue so, and consequently a legitimate profit on lamps would be welcome.

The Calcutta Supply Co. has recently offered a reduction in its rates from July 1st, to five annas for lighting units and three annas for fan and small-power units or, if preferable, a flat rate of four annas all round, with substantial rebates after the first 5,000 units. Although this seems a substantial reduction, it only affects the large consumer to any extent. A flat rate has been asked for by the public for some time as it simplifies installations, lessens meter rents to half, and incidentally reduces the first cost of wiring by about 20 per cent. This, in itself, is something, but the small consumer still cries out for more reduction.

LEGAL.

RONTGEN RAY ELECTRIC APPARATUS.

IN the Patents Court, on Wednesday last week, Messrs. Watson and Sons (Electro-Medical), Ltd., applied to avoid or suspend Letters Patent Nos. 9,499, of 1912, and 13,903, of 1913, registered in the name of the Siemens & Halske Aktien-Gesellschaft, Berlin, in order themselves to manufacture in this country an electrical appliance for use in connection with Röntgen-ray radiographs.

The applicants' case was presented by Mr. E. C. R. Marks, and Mr. Imray appeared for the patentees, the patents being nominally registered as owned by the German company, though they were said to be beneficially owned by Messrs. Siemens Bros. and Co., Ltd. of Woolwich.

The patents cover improvements on the ordinary form of electric apparatus, in order to obtain a more satisfactory discharge in the X-ray tube. The invention aims at reducing the time constant of the apparatus, by varying the primary circuit at the moment of commutation. Immediately prior to commutation the whole of the primary winding is in circuit. The commutator automatically cuts out half the primary, so that at the moment of commutation only half the primary coil is in circuit. The same result may be obtained by having two primary windings with different time factors. Before the commutation, the patentees have the primary of higher time constant in the circuit, and at the moment of commutation they automatically cut in a second primary having a lower time constant.

A statutory declaration was read by Mr. Geoffrey Pearce, managing director of Watson & Sons (Electro-Medical), Ltd., who explained that the applicant firm were a sub-company of a very old-established British company, Messrs. W. Watson & Sons, Ltd., of 313, High Holborn, London, and were on the contractors' list of the Admiralty, the War Office, the India Office, and many foreign Governments and were engaged in the manufacture of X-ray and electro-medical apparatus.

The company possessed every facility for the manufacture at their own works by their own British workpeople of apparatus constructed in accordance with the specifications, and they desired to manufacture the apparatus to fulfil an urgent Government order which they had obtained. They had also other orders and inquiries for the apparatus, and it was highly desirable at the present time that this apparatus should be manufactured to an adequate extent in this country, to meet the growing demand.

Mr. IMRAY pointed out that Messrs. Siemens Bros. & Co., Ltd., were beneficially interested in the patents, were doing a great amount of Government work, and were prepared to carry out the manufacture of this type of apparatus. However, as the Government had approached Messrs. Watson & Sons (Electro-Medical), Ltd., Messrs. Siemens Bros. & Co., Ltd., would not object to a licence being granted to them. The only question that remained was the question of royalty.

Mr. MARKS offered 2½ and 3 per cent. on the patented part of the apparatus, roughly half of the entire apparatus, which would cost about £100. Finally, the applicants agreed to pay 4 per cent. on the selling price of the entire machine.

THE CONTROLLER OF PATENTS (Mr. Temple Franks) intimated that he favoured the issue of a licence to the applicants, and stated that they would hear from the Board of Trade on the subject in due course.

ADAMS v. BROADBENT.

With reference to our report of this case, Mr. Frank Broadbent writes as follows:—

"One or two little inaccuracies have crept into your report of the above case, but there is only one which I desire to correct, namely, the statement that the counsel for the plaintiff expressed the opinion that my later patents were not valid. This is not the case: the plaintiff's witness admitted in cross-examination that if my patents were valid his company had infringed them, but he expressed no view at all as to the validity."

MUNITIONS CASES.

AT the Oldham Munitions Tribunal, last week, a Trade Union secretary appeared on behalf of two men who desired leaving certificates from their employers—an electrical firm. When the case was called, the representative of the firm said he thought he could save time by making a short statement. The two men, he said, were in a reserved occupation, being engaged on certain work in the meter department. The firm had communicated with the

military authorities, and it had been agreed that they should release as many of their hands as possible. They had stuck to that, and the firm could now release these two men who were applying for leaving certificates, as they would be able to replace them with female labour. He proposed, therefore, to inform the military authorities that his firm no longer desired to keep these men in the reserved occupation, and he took it that they would enter the Army. The Trade Union secretary was commencing to address the Tribunal about something that was said by the firm's representative at a sitting of the Tribunal some months ago, when the Chairman (Mr. James Holgson) interrupted, and said that had nothing to do with the matter. The applications of the men were granted. The Trade Union secretary said he should take the matter up elsewhere, and would instruct the men to register as munition workers. The Chairman said he was afraid he could not hear the secretary any further. The firm's representative had undertaken to grant the leaving certificates, and there was nothing before the Court.

At the same Court, a man appealed for a certificate enabling him to leave the electrical works where he was engaged, and return to his former employment as a coal miner. The firm's representative said they left it to the Court to decide whether the man was rendering greater national service where he was than if he were in the pit. The appeal was refused, the Chairman stating that the man had made out no case for a certificate.

PETITION FOR PROLONGATION OF PATENT.

THE hearing of a petition for the prolongation of the patent of 1902, granted to the Runcorn White Lead Co., Ltd., Mr. George Vincent Barton and others, for improvements connected with the production of lead oxide, was concluded by Mr. Justice Sargant in the Chancery Division on May 12th.

MR. FAIRFAX, K.C., with whom was Mr. Moritz, said the subject matter of the patent was litharge, an oxide of lead which had a very extensive application, especially in the construction of storage batteries. This particular substance was also converted into white lead or red lead. Mr. Barton, while manager of the Runcorn White Lead Co., made the invention which was the subject of the patent. Messrs. Rowe Bros. & Co., Ltd., of Exeter and Runcorn, were now the owners of the patent, and though the business carried on under the patent had not up to 1915 been successful, in that year the receipts were greater than the expenditure, and Messrs. Rowe now hoped to turn the patent to advantageous account. They had had to face labour difficulties at Runcorn and heavy cost of freight, besides German dumping and competition among British manufacturers, but they had purchased land at Liverpool and were to erect thereon works on a larger scale for the manufacture of litharge and its conversion into white and red lead, and they expected to save 15s. a ton in respect of freight for raw material and products. In these circumstances Messrs. Rowe and Mr. Barton, who was paid a royalty on the products, petitioned for an extension of the term of the patent.

The Crown, represented by the Solicitor-General, K.C., and Mr. Austen Cartmell, opposed the petition on the ground that the patent was of no commercial value.

At the conclusion of the arguments his Lordship reserved judgment.

HILL v. JOHN LYSAGHT, LTD.

IN the King's Bench Division on Tuesday this action came on for hearing.

Plaintiff, an electrical fitter living at St. Albans, claimed to recover damages from defendants for personal injuries sustained through the alleged negligence of a servant of the defendants.

The defendants denied the alleged negligence.

The hearing was adjourned till Wednesday.

BUSINESS NOTES.

Book Notices.—*Electrical Apparatus Making for Beginners*. By A. V. Ballhatchet. London: Percival Marshall and Co. Price 2s. net.—This is an excellent guide for the novice, being obviously written by one who has been through the mill, and knows from experience the troubles and difficulties that will be met with. He recommends a liberal equipment of tools, and with this we cordially agree; but the whole of the work described in this book can be done without a lathe. The construction of primary cells of various types, simple galvanometers, a moving-coil galvanometer, a rheostat, electromagnets, bells and indicators, a Morse sounder and key, simple motors, an induction coil, telephones, voltmeters, &c., is clearly explained, with great detail, on the basis of the author's own work, and we think the ambitious amateur will find the book of the greatest interest and value.

The Arc is "a magazine written and edited by No. 3 Coy. L.E.E., R.E.(T.)," at its station on the coast it has reached its fourth issue, and is going strong, with numerous advertisements, and all the usual symptoms of prosperity. We have been turning over the pages of the last three issues, and note that the contents are varied in the extreme, brightly written, and full of local and topical interest, while the many jests are proof of the cheery spirits of our comrades on active service. The following specimen of frightful.

ness occurs in a column of queries: "What condition the editor must have been in to spell Mesopotamia, Mesopotamewhere?" Nevertheless, we congratulate the producers on the energy and originality displayed in their scanty leisure, and wish success to their lively magazine.

"Scientific Papers of the Bureau of Standards." No. 273: General Design of Critically-damped Galvanometers. Washington: Government Printing Office.

Sale of Tyneside Plant.—MESSRS. D. H. LONGBOTHAM & CO., LTD., of Ings Foundry, Wakefield, have purchased from the Newcastle-on-Tyne Electric Supply Co., Ltd., several Parsons turbo-alternator sets, with condensers, &c., ranging from 2,500 to 5,000 KW. These sets are being taken out for the sole reason that it is necessary to make room for larger sets, consequent upon the continued development of the company's undertaking.

Trade with Russia.—THE RUSSO-BRITISH TRADE EXCHANGE, LTD., 16, Regent Street, London, announce that they are taking steps to establish in Moscow a series of exhibition show-rooms and salesrooms, with Anglo-Russian technical and clerical staffs, for the representation of British and Colonial manufacturers and merchants on a co-operative basis. The details are set forth in a circular which has just been issued.

Stoker Contracts.—We have received a list of contracts for stokers recently received by the UNDEFEEED STOKER CO., LTD. Among these are many contracts for municipal corporations, a number of collieries in this and other countries, mills, iron-works, &c., also the Midland Electric Corporation for Power Distribution, and the Compagnie Generale de Distribution Electrique, Billancourt.

The National Electrical Code 1915.—The office of H.M. Trade Commissioner in Canada has forwarded copies of the "1915 National Electrical Code." This Code has been adopted by the Canadian Fire Underwriters' Association, and British firms are notified of the necessity of complying with the requirements of the Code before undertaking the sale of their goods in the Dominion of Canada. A few copies of the Code are available for distribution to United Kingdom manufacturers of electrical apparatus, and they may be obtained by such manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, London, E.C.—*Board of Trade Journal*.

For Sale.—The City of Leeds Electricity Department has for disposal 1,000-B.H.P. triple-expansion, 3-cylinder vertical Bellies engine, 2 sets horizontal surface condensing plant, with pumping and circulating engines, six 700-KW. two-phase alternators and exciters, and one additional circulating engine.

A sale by public auction, by order of the liquidator of the Consolidated Diesel Engine Manufacturers, Ltd., and Diesel Engine Co., Ltd., will be held at the Ipswich Works, Hadleigh Road, Ipswich, by Messrs. Wheatley Kirk, Price & Co., on Wednesday, June 7th, of the stock of Diesel engines, spare parts and stores.

For further particulars see our advertisement pages to-day.

Advance in Prices.—THE WALSALL ELECTRICAL CO., LTD., announce that, from June 1st, their prices will be increased by a further 10 per cent., owing to the heavy increase in cost of labour and material.

Canadian Trade.—The Ottawa correspondent of the *Times* states that a Commission of six leading Canadian business men is to visit Great Britain, France, and Italy, to study ways of developing Canadian commerce. The Commission may be accompanied by Sir George Foster, Minister of Trade and Commerce. Sir George Foster has arranged with the British Board of Trade to have sent to Canada a display of German and Austrian products to be exhibited in leading Canadian cities. He is making plans for the encouragement of chemical and industrial research work in Canada, with the co-operation of the Universities and chemical societies.

Dinner.—The employés of MESSRS. H. T. BOOTHROYD, LTD., electrical engineers, Bootle, sat down to dinner together on Saturday, May 6th, at the Bear's Paw Restaurant, Liverpool. The guest of the evening was Mr. J. H. Woollicroft, who has just resigned from the position of general manager, in order to commence business on his own account. Mr. Woollicroft was presented with a silver rose-bowl and a silver match-box, and, in response, he suitably expressed his appreciation. For a concert which followed, the talent was provided by a number of the employés.

Liquidations.—BALDUR ENGINEERING AND SUPPLY CO., LTD.—A meeting of creditors is called for May 22nd, to accept the resignation of the liquidator, Mr. H. C. Caley, who is now on active service abroad, and to appoint Mr. J. W. Buck, of 39, Victoria Street, S.W., in his place.

BIDDLE AUTOMATIC SIGNAL, LTD.—This company is winding up voluntarily with Mr. W. Braby, 25, Victoria Street, S.W., as liquidator. A meeting of creditors is called for May 22nd.

UNIVERSAL CHEAP CABLES LTD.—A meeting of creditors is called for May 16th, at 30, Bush Lane, E.C.

COLSTON ELECTRICAL WORKS, LTD.—A petition for the winding up of this company presented by Haslam & Stretton, Ltd., Cardiff, creditors, will be heard at Bristol on May 31st.

E. E. CONNOLD, "late electrician," carrying on business at Canterbury, now R.N.A.S.—Receiving order made May 11th on debtor's petition.

LANCASHIRE MOTOR AND ENGINEERING CO., LTD., Preston.—First meetings of creditors and contributories, May 25th.

Bankruptcy Proceedings.—ARTHUR FARADAY HAWDON, electrical engineer, Yetholm, Elmfield Gardens, Gosforth, Northumberland.—The application for discharge of the above-named debtor was fixed for May 11th, at the County Court, Westgate Road, Newcastle-on-Tyne, but was withdrawn. Bankrupt not to be at liberty to apply again without the leave of the Court and notice to the Official Receiver and payment of the costs.

Trade Announcements.—MR. R. E. CONNOLD, electrician, of 6A, The Parade, Canterbury, having joined the Forces, has discontinued the business. The stock is to be sold by auction on May 23rd.

The firm of H. HARTJEN & Co. has been turned into a private limited company under the title of Holder, Harriden, Ltd. Mr. F. W. Lang is the sole director.

MESSRS. A. HURST & Co., announce that their address is now again, 59, Farringdon Road, London, E.C.

Catalogues and Lists.—MESSRS. SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham.—Sixteen-page publication in which Mr. L. M. Waterhouse gives an illustrated account of the protective coverings of Simplex conduits—their new "Zenex" and "Negrex" finishes. The former is a pure zinc covering, and the latter is a pure zinc finish subsequently treated with enamel. The firm have recently installed at their Birmingham works what is said to be probably the largest automatic plant in the kingdom for dealing with the deposition of pure zinc on the surface of steel conduits. It is claimed that the extra expense involved in initial outlay will be more than compensated by the increased life and freedom from faults and breakdowns. "Simplex" fittings are finished in exact conformity with the "Zenex" and "Negrex" finishes of the conduits.

"Z" ELECTRIC LAMP MANUFACTURING CO., LTD., Southfields, London, S.W.—Three book-markers are being issued to the trade generally as part of the company's publicity measures relating to "Z" lamps.

MR. C. E. MILLER, New York.—Catalogue and price list of automobile and other like supplies.

LIGHTING AND POWER NOTES.

Accrington.—LOAN SANCTIONS, &c.—Ald. Higham, the chairman of the Electricity Committee, referring to the loss of £3,410 on the electricity undertaking last year, following a loss of £3,670 in the previous year, pointed out that they were losing money on the contracts made before the war. He was sanguine, however, that their finances would improve considerably during the coming year. They had made out their case, that the load on their station was such as they could not cope with without the extension of plant. The B. of T. had intimated that on formal application, sanction would be given to borrowing £7,000 for a new chimney, boiler, and flue to the destructor plant, and £14,000 for new electrical generating plant, cooling tower, boiler and feed pumps.

Australia.—The *Australian Mining Standard* states that there is every likelihood of the proposed electric light and power scheme for Ipswich (Q.) being carried out, if the Queensland Treasurer agrees to allow 12 months' grace to the company, in view of the difficulties arising from the war. The terms of the Order-in-Council granting the concession stipulate that the period shall not exceed 25 years, and that the local authorities and probably the State Government shall have purchasing rights at the end of 15 years and 25 years, under certain conditions. The price to be charged to local authorities for tramway supply is to be £5 per kW. of maximum demand per annum plus 3d. per unit, and for the city pumping plant, should the city decide on electric pumping, 3d. per unit plus a reasonable kW. charge. The municipal authorities have agreed not to exercise their purchase rights before 25 years, and to request the Minister to grant the 12 months' grace asked for.

Barnes.—Owing to the fact that the net profit (£769) on the electricity undertaking for the past 12 months is not sufficient to meet all eventualities, more especially as in the eight years immediately prior to the war the average net profit amounted to £2,500, the electrical engineer suggests that as from the June quarter an amount equivalent to 10 per cent. should be added to all accounts. This proposal would, the engineer states, provide a sum of approximately £1,250, and provided the cost of materials remains the same, would ensure a net profit of about £2,000 for the year 1916-17. The Lighting Committee will consider the question at its next meeting.

Canada.—The Court of Appeal has upheld the claim of North Vancouver municipality for power to expropriate the electric distributing system within its borders, this being part of the B.C. Electric Railway Co.'s system.

A bill has been introduced in the local legislature of New Brunswick to permit the development of electrical energy from the St. Croix River.

Continental.—SPAIN.—A new central station has just been inaugurated in Segovia by the Sociedad Co-operativa Electrica Segoviana, a company supplying light and power. The first

equipment comprises two hydroelectric groups of Francis turbines, built by Escher, Wyss & Co., and two alternators furnished by the Swedish General Electric Co.—*Industria e Invenções*.

Dover.—LOANS, &c.—The Loaning Authority has agreed to renew for five years, at 5 per cent., the loan of £157,000 for the electricity undertaking.

Gravesend.—PROPOSED LOAN.—The T.C. has decided to approach the L.G.B. with regard to a loan for an electric supply to the Town Works, Northfleet, of the Thames Metal Co. The estimated outlay is £3,000, and the company guarantees for three years a minimum annual payment of £400. Without any guarantee, the company now pays over £2,000 a year for current supplied to its Rotherhithe works.

Great Harwood.—PROV. ORDER.—The U.D.C. has instructed its clerk to apply to the B. of T. for the renewal of the E.L. order.

India.—RANGOON STREET LIGHTING.—The chief engineer of the Rangoon municipality, while in England, will inquire into the various systems of street lighting. The need for this has arisen from the fact that the present electric lighting of Rangoon is not considered satisfactory by the Municipal Committee.—*Indian Engineering*.

Kendal.—The T.C. has offered to supply current for power, during the present year, at 1½d. per unit, to Messrs. Atkinson & Griffin, and Mr. H. J. Croft, if each guarantees a consumption of 8,000 units during that period.

Knottingley.—PROV. ORDER.—The B. of T. has extended the Electric Lighting Order for one year from July, 1916.

Leigh.—LOAN SANCTION.—The T.C. recently applied for permission to borrow £18,300 for extensions at the electricity works, and sanction has now been received for the borrowing of £5,536. It appeared that if the full scheme had been sanctioned there would have been danger of men being drawn from more urgent work.

Lincoln.—REVISED PRICES.—The various firms taking power under contract have agreed to pay the increased price for electricity decided upon by the T.C. some weeks ago.

Llanfyllin.—PUBLIC LIGHTING.—With reference to the offer of Mr. R. A. Jones to light the town by electricity, mentioned in the last issue of the *ELECTRICAL REVIEW*, the T.C. has decided to take the opinion of the ratepayers on the matter. The present price of gas is 8½d. per 100 cb. ft., and Mr. Jones offers to undertake the public lighting at a cost which will save 2d. in the pound on the rates.

London.—L.C.C.—The Finance Committee recommends the sanction of the Council to the borrowing of £3,000 by the Hammersmith B.C. for electricity mains, transformers, switchgear and house services; and of £3,000 by the Hampstead B.C. for purchase of a new switchboard.

STOKE NEWINGTON.—The Electric Lighting Committee recommends the installation of surge arresters at the electricity substation, at an estimated cost of £61.

SHOREDITCH.—LOAN SANCTION.—The L.C.C. has advised the B.C. that it is prepared to advance the £2,000 required by the electricity department for house services and meters, and the B.C. has been recommended to take up the loan. The B.C. is making representations to the B. of T., the Railway Executive Committee, and the Admiralty Coasting Trade Office on the matter of coal supply.

WESTMINSTER.—The City Council has been recommended to agree to the increase in charges for electricity supplied by the Charing Cross and St. James's Companies to the Council Buildings.

Middlesbrough.—The Electricity Committee has decided to extend the supply to a large local works.

New Zealand.—The installation of the Kaponga Town Board's hydro-electric plant was expected to be completed last month; the township is situated on the Kaipokonui stream across which a concrete dam has been built. The plant consists of a single-discharge horizontal-shaft type Bowing turbine capable of developing 70 B.H.P., coupled to a 45-kw. 230-volt dynamo; a D.P. battery of 128 cells, and about 2 miles of pole line. The system is two-wire D.C., with the street lighting on a separate circuit.—*Commonwealth Engineer*.

Licences have been granted for electrical installations and lines in Thames County, in the borough of Spreydon, in Kidnapper survey district and in Mangohua County.—*Board of Trade Journal*.

Pendlebury.—The new power station which has been erected and equipped for the Acme Spinning Co., Pendlebury, is expected to be running by the end of the present month. The firm has used electricity for driving purposes for several years at the No. 1 Mill, and now the electric drive is being adopted at the firm's other factory, the whole of the power to be derived from its own power station. Hitherto the electric supply for the newer of the two mills has been obtained from the Lancs. E.P. Co. The B.T.H. Co., of Rugby, has supplied the electrical machinery.

Rochdale.—EXTENSIONS AND LOANS.—The recommendation of the Electricity Committee that action should be sought from the L.G.B. for the borrowing of £60,900 for extensions at the electricity works was considered at a special meeting of the T.C. on May 11th. Councillor Walker said the Committee did not propose to spend the whole of the money now or in the immediate future. The outlay proposed now was on a new chimney, economiser, induced draught plant, and other work, estimated to cost about £10,000. The other money would be spent as required, and the Council would be able to consider the development step by step. An amendment that borrowing powers be sought to carry out the portion of the scheme stated to be urgently required—No. 3 chimney, induced draught plant and economiser—was adopted by 22 votes to 10.

In a supplementary report on the electricity undertaking, Mr. S. L. Pearce (Manchester City electrical engineer) recommends that the question of a further increase in the prices charged for current should be considered.

Swansea.—PUBLIC LIGHTING.—The Electricity Committee has approved the proposal of the engineer to change over the whole of the existing enclosed arc lamps to incandescent lamps.

West Hartlepool.—YEAR'S WORKING.—It was reported last week that the income from the Corporation electricity undertaking for the past year showed a net increase of £1,295, chiefly from power supply. The income from public and private lighting was greatly reduced. The expenditure increased by £1,023, the principal item being for the purchase of coal. After meeting all expenses there was a credit balance of £316, against £44 in the previous year.

Worcester.—LOAN SANCTION.—The T.C. has received permission from the L.G.B. to borrow £240 for the extension of the supply to the works of Messrs. Heenan & Froude.

TRAMWAY and RAILWAY NOTES.

Asley.—Owing to the extension of coal mining in the Asley district, the South Lancs. Tramways Co. is being urged to extend its system in this area.

Birmingham.—The Corporation tramways last year carried 14 million more passengers than in the previous year, and the traffic revenue increased by £125,000.

Bury.—YEAR'S WORKING.—The total mileage worked by the Bury cars in Bury and adjoining areas, during the year ended March 31st last, amounted to 1,549,366, and 15,810,869 passengers were carried. The gross traffic receipts in the several areas, were: Bury, £45,837; Radcliffe, £14,361; Heywood, £7,438, and Salford, £1,986, making a total of £69,622, as compared with £68,908 in the preceding year. The total receipts amounted to £69,792. The financial result showed a net surplus of £18,334, of which £7,315 represented the net profit on the Bury undertaking, after paying £1,645 war allowances. The profit was allocated as mentioned on page 482. The Bury generating station supplied 1,404,707 units, and the Radcliffe station 389,014 units, the energy consumption showing a slight increase per car-mile, owing to the lack of skill of the new men, while the price of electricity has also been increased by 10 per cent. Mr. Clough, the manager, points out that of the estimated life of the rails, 15 years, about 12 have now expired, and that the period for renewals is fast approaching. A fund of £30,000 is available for this purpose.

Canada.—According to the statement of the general manager of the Western lines, the Canadian Pacific Railway is still considering the electrification of its lines through the mountains of the British Columbia division. The matter has, of course, often been mentioned before.

East London Railway.—ASSESSMENT.—The electrically-operated East London Railway, which is worked by a joint committee of six companies, and runs from Shoreditch, under the river, to New Cross, has for the last 30 years been assessed at a figure varying from £2,000 to £8,000. The joint committee, which had unsuccessfully appealed to the London Quarter Sessions on four previous occasions, has now, on its fifth appeal, obtained a reduction on rateable value from £5,092, recently fixed by the Assessment Committee, to a nominal figure of £100. The Assessment Committee was ordered to pay the joint committee's costs.

Heywood.—YEAR'S WORKING.—There was a loss of £518 on the tramway undertaking during the past year. In the previous year there was a loss of £1,042.

Leeds.—TRAMWAY GOODS TRAFFIC.—The annual report on the Corporation tramways points out that since October the tramways have been used for carrying fireclay across the city for a local firm. Mr. Hamilton (the manager) has been asked to report fully on the possibility of using the tramways for goods traffic, particularly those in the northern area, which is unserved by railways or canals.

London.—I.C.C.—The following comparative statement shows the income and expenditure relative to the working of the Council's tramways in respect of the two years, 1914-15:—1914, income £2,268,669, expenditure £1,615,466; 1915, income £2,399,817, expenditure £1,700,572. The expenditure for the year ended March 31st, 1915, includes a charge of £42,209, in respect of allowances made to officers and employees of the tramway department serving with H.M. Forces. The surplus on (working) revenue account for the year 1914-15 amounted to £699,276; the net revenue account showed a deficiency of £33,173, which was met out of the balance standing to the credit of the general reserve fund.

The Finance Committee has had under consideration the question of the periods to be allowed for repayment of capital expenditure in connection with the substitution of turbine sets for reciprocating plant at the Greenwich generating station, and after conferring with the Highways Committee and with the approval of the Treasury, recommends for:—

Expenditure on river works, foundations for new machinery, and alterations to buildings (for completion of works of a permanent character (£23,640)—60 years.

Other alterations to existing buildings (£1,310)—25 years.

Expenditure on new plant and machinery (other than additional steam, exhaust, feed condenser, &c., pipes)—15 years, on the understanding that, in the event of payments into the renewals fund on the agreed basis being resumed at any future date, the question of the period for repayment shall be reviewed.

Expenditure on additional steam, exhaust, feed condenser, &c., pipes—25 years.

Cost of re-blading turbines and re-winding generators to be charged to revenue account or renewals fund.

Outstanding debt in respect of each of the old machines—to be provided for in two years, from the end of the financial year during which the old machine in question is replaced.

The Highways Committee during the quarter ended March 31st, 1916, has settled 483 claims against the Council in respect of accidents arising in connection with the working of the Council's tramways, amounting to £6,478. In 22 other cases actions were brought against the Council. In 13 of these a verdict against the Council was given, and sums amounting to £1,023 and costs had to be paid. The remaining nine actions resulted in the Council's favour; £584 has been received in settlement of claims made by the Council in respect of damage to tramway property.

Luton.—ASSESSMENT.—In November last the Commissioners of Taxes dismissed the T.C.'s appeal against the assessment of the Corporation for income tax under Schedule D in respect of the rent received from the tramway lessees (Messrs. Balfour, Beatty & Co., Ltd.). A claim was thereupon made that the Council should have an allowance made for depreciation. The lessees contended that they alone were entitled to the depreciation allowance, but after protracted negotiation an arrangement has been made with the lessees and the Inland Revenue authorities, whereby the Corporation shall have the benefit of so much of the usual depreciation allowance as will release the Corporation from the payment of income tax except to a small extent during the two last years of the existing lease.

Nelson.—The Tramways Committee has decided to have five additional cars fitted with new bodies by the United Electric Car Co., of Preston.

Plymouth.—ELECTRIC VEHICLE.—The City Council has decided, by 29 votes to 20, to purchase an electric lorry at a cost of £1,055.

Ramsbottom.—WAGES.—The Traction Committee has refused to grant an application of the tramway men for an increase of wages, on the ground that the present rate of pay is equal to that paid to drivers on small tramway systems like that of Ramsbottom.

Rochdale.—Three persons were injured as the result of a tramway smash on Friday, last week. A car in Drake Street got out of control owing to the failure of the brakes on the greasy rails, and collided with two coal carts, subsequently running into a double-deck car. Several passengers received a shaking.

Southampton.—YEAR'S WORKING.—The tramway manager strongly recommends the levying of a charge for excess luggage on the cars, that is to say parcels other than personal luggage not exceeding 28lb. in weight. For the twelve months to March 31st last, the receipts of the undertaking amounted to £78,064, an increase of £10,022 compared with the previous year. There was also an increase in the number of passengers carried to the extent of 2,228,651, although the mileage run fell short of the figures for 1915 by 66,929. There was a decrease of 4,499 units in the energy used. The receipts, passengers carried, and units consumed per car mile all show an increase as compared with twelve months ago, the former by 1'862d., the second by 1'675d., and third by .045d. The manager is to report upon the penny sections, and as to the advisability of revising them.

Southend-on-Sea.—The Light Railways Committee has instructed the electrical engineer not to proceed with the proposal for engaging women as temporary drivers, but to apply for the exemption provisionally of 17 motor-men, and to appoint temporarily other suitable men for the season traffic when the necessity arises. The Committee has considered the question of the fares at present charged on the tramways, and the rates charged for the supply of energy, but has decided to make no alteration at the present time.

Salford.—**WAR BONUS.**—A recommendation has been put forward that female conductors shall be paid the same bonus as males for similar duties.

Swansea.—**EXTENSION OF TIME.**—The Tramways Committee proposes to instruct the town clerk to make application for an extension of time for the construction of the Carmarthen Road and Port Tennant Road tramways.

U.S.A.—**ELECTRIC FREIGHT YARDS.**—The detailed plans of the West Side Improvement in New York city, which have been filed by the New York Central Railroad, include the electrification of the company's 12-mile freight entrance to the city, and extensive track reconstruction work, involving the covering of the tracks through several miles of parks, at an approximate cost of \$50,000,000. Particular interest attaches to the work because of the large scale of the freight switching operations which will be involved; there are four important freight yards on the route. The trains will operate on either 1,200 or 600 volts, and the locomotives will be insulated for 1,200-volt operation, according to the company's practice in connection with its recent passenger locomotives. The locomotives will be available for either 1,200 or 600-volt working; it is expected that 75 will be required, and there will handle two classes of service, viz., through freight trains and switching service. Under present conditions trains of 3,000 tons or less in weight. Much of the traffic has to be handled at relatively high speed on account of the dense passenger traffic on the New York Central's electrical route to which the West Side tracks connect. The road locomotives will operate between New York and Croton, the northern end of the present electric zone, a distance of 34 miles. A new 20,000-kw. turbine set will be installed in the company's Yonkers power station which supplies this section of the railway, and three substations will be provided for the new electrical lines.

A new public service terminal building has been opened in Newark, N.J., which is stated to have cost \$6,000,000. Electric cars enter the terminal from the east over an elevated structure and from the west through a subway. The ground floor or concourse contains public gas and electric showrooms, &c., while the upper floors contain offices. The terminal is connected with surrounding districts by 10 lines, and has been provided to accommodate this traffic and prevent interference between it and local traffic.

West Hartlepool.—**YEAR'S WORKING.**—To the Corporation, last week, it was reported that the past year's revenue from the tramways was £19,482, against £19,506 in the previous year, the working expenses being £13,126, as against £11,574 in the preceding 12 months. Notwithstanding the increase in working expenses, a sum of £1,278 was carried to the reserve fund, making the total amount of that fund £5,706.

It was reported that an application from motormen and conductors for an increased war bonus, had been referred to the Management Sub-Committee.

TELEGRAPH and TELEPHONE NOTES.

Marconi Station in Danger.—The Dublin correspondent of the *Daily Telegraph* states that a large body of rebels plotted to seize the Marconi station at Skerries, county Dublin. The local police got word of the attack on Easter Tuesday; there was only a small military force at the station, but every preparation was made to meet the attack. On Wednesday the rebels captured the villages of Swords and Donabate, and prepared to march on Skerries, but just then a destroyer came along and landed 200 men, who at once entrenched themselves around the station. The rebels, on learning of the presence of the destroyer, went off in the direction of Dublin.

Spain.—The city of Seville possesses a telephone system, but the municipal authorities have refused to extend it beyond the bounds of the city. An interurban company serves the principal provincial capitals of Spain; but its system has no direct connection with the urban system. Now it is suggested to combine the urban and interurban systems, and to extend the interurban system to the cities and towns in the neighbourhood of Seville. In the six provinces adjacent to that of Seville there is a population of 5,170,000 inhabitants, with 49 important cities and 319 of lesser grade. The Interurban Co. which is studying these extensions is the *Compania Peninsular de Telefonos Interurbanos*. —*Industria e Invenções*.

United States.—The annual report of the directors of the American Telephone and Telegraph Co. (the Bell system) states that at the end of 1915 there were over nine million stations connected, an increase of half a million; the total mileage of wire in use was 184 million miles, 93 per cent, being of copper, and 10½ million miles are underground, the total cost of the underground conduits and cables being 41 million pounds sterling. The length of phantom circuits in use amounted to 196,841 miles; this item is reported this year for the first time. The effect of adopting phantom circuits is to obtain three speaking circuits from four wires, and it is possible to use two phantom circuits in like manner for a super-phantom called a "ghost," giving 7 circuits from 8

wires—but this is not used commercially, as the gain does not justify the added complications. The daily average traffic in 1915 was 26 million messages, making the immense total of 8,652 million effective connections per annum, exclusive of all uncompleted calls. The expenditure on capital account during the year was 6½ millions sterling, compared with 10 millions in 1914. Provision for depreciation of plant absorbed 9 millions, an average of 5½ per cent, on the cost of plant, it being a firm policy of the company to provide each year out of revenue a sufficient amount to cover the estimated wear and tear, obsolescence, and inadequacy of plant accruing during that year, so that when any plant has to be superseded sufficient reserve is available to meet the resulting loss of capital. This is the only way in which present telephone users can be made to pay for the wear of the plant they are using.

The total capital expenditure of the system amounts to no less than 273½ million pounds sterling.

During the year trans-Continental communication was accomplished, and the service proved so satisfactory that the work of extending the improved form of construction was at once put in hand. It is now possible to talk from any State in the Union to at least some point in any other. The engineering department also succeeded during the year in transmitting speech by wireless telephony from Arlington, Virginia, to California, Paris, and Hawaii, and the transference of the speaking vibrations from wire to space, and *vice versa*, was also achieved. As regards the possibility of wireless telephony ever taking the place of wire telephony, the engineers of the company emphatically state that, so far as present knowledge and indications are concerned, there is no such prospect.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—June 20th. Municipal Council. Two-ton electric lorry. City Surveyor, Town Hall.

MELBOURNE.—June 14th. Victorian Railways. Electric lamps and lampholders for signal system.*

Bedford.—May 25th. Coal for the Corporation Electricity Works; Mr. Chas. Stimson, Town Clerk.

Belfast.—May 24th. Electricity Committee. Chain-grate mechanical stokers. See "Official Notices" May 12th.

Keighley.—May 22nd. Wiring of Fever Hospital and Sanatorium, Morton Banks. Specifications (10s.). Mr. H. Webber, Borough Electrical Engineer, Coney Lane.

Liverpool.—May 31st. Liverpool Overhead Railway. Twelve months' supply of electrical fittings. Particulars from General Manager, 31, James Street.

Manchester.—May 23rd. Coal (best steam cobbles). Tramways Committee. J. M. McElroy, General Manager, 55, Piccadilly.

May 26th. Electricity Committee. Stores for one year. Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall.

New Zealand.—June 23rd. Oamaru Borough Council. Overhead mains and street-lighting equipment (Contract No. 2); power-station equipment (Pelton wheels, alternators, &c.) (Contract No. 3); service meters (Contract No. 4); line transformers and accessories (Contract No. 5).*

PAHIATUA.—July 10th. Borough Council. Overhead wires, poles, street lamps, gas engines, producers, dynamos, auxiliary apparatus and accumulators. Specifications from Borough Offices or E. J. Fenn, Consulting Engineer, Auckland.*

Rochdale.—May 24th. A 110, economiser; A 111, electrically-driven induced draught; A 112, chimney and flues; A 113, ash-handling plant. Specifications, &c., £1 1s., from Mr. C. C. Atchison, Engineer, Dane Street.

Spain.—Municipal authorities of Almorox (Province of Toledo). Tenders for the concession for the electric lighting of the town during six years.

May 30th.—Municipal authorities of Figueras (Province of Girona). Tenders for the concession for the electric lighting of the town during five years.

May 31st. Municipal authorities of Adradros (Province of Segovia). Concession for the electric lighting of the town during ten years.

Swindon.—May 30th. Corporation. Steam coal for the electricity works and waterworks respectively. See "Official Notices" May 12th.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

NOTES.

Government Contracts.—List of new contracts for April, 1916:—

WAR OFFICE.

Distribution boards.—Dorman & Smith, Ltd.
 Battery boxes.—Hewson Manufacturing Co., Ltd.; Marshall, Sons & Co., Ltd.; Ransome, Sims & Jefferies, Ltd.
 Brake magnets.—Evershed & Vignoles, Ltd.
 Electric cable and wire.—Craigpark Electric Cable Co., Ltd.; General Electric Co., Ltd.; Johnson, Matthey & Co., Ltd.; Johnson & Phillips, Ltd.; Liverpool Electric Cable Co., Ltd.; St. Helens Cable & Rubber Co., Ltd.
 Electric cranes.—Babcock & Wilcox, Ltd.
 Electric secondary station.—D.P. Battery Co., Ltd.
 Electrolayers and accessories.—Mather & Platt, Ltd.
 Engines, dynamo, switchboard, &c.—Peters, Ltd.
 Generating sets.—Austin Motor Co., Ltd.
 Electric lamps.—Hogin & Mock, Ltd.
 Switchboards.—Drake & Gorham, Ltd.
 Works services.—Electric equipment for power house, British Westinghouse Electric & Mfg. Co., Ltd.; electric lighting, telephones, &c., T. Clarke & Co.; electric lighting installations (various), T. Clarke and Co.; G. E. Taylor & Co.; Ellis & Ward, Ltd.; Foote & Milne, Ltd.; S. Dixon & Son, Ltd.

INDIA OFFICE STORE DEPARTMENT.

Backs and cups.—Bullers, Ltd.
 Cells.—Siemens Bros. & Co.
 Elements.—General Electric Co., Ltd.
 Engines.—Lancashire Dynamo Co.
 Switchboards.—Eckstein, Heap & Co.
 Transformers.—British Electric Transformer Co., Ltd.
 Wire.—T. Bolton & Sons; Shropshire Iron Co.; Callender's Cable Co., Ltd.

POST OFFICE.

Electric lighting, Bolton new Post Office.—Grindlay, Ross & Co., Ltd.
 Testing apparatus.—General Electric Co., Ltd.
 Telegraph cable.—Telegraph Construction & Maintenance Co., Ltd.
 Telephone cable.—London Electric Wire Co. & Smiths, Ltd.; Telegraph Construction & Maintenance Co., Ltd.
 Dry cells.—Siemens Bros. & Co., Ltd.
 Telephone cords.—London Electric Wire Co. & Smiths, Ltd.
 Insulators.—Doulton & Co., Ltd.; Taylor, Tunncliffe & Co., Ltd.
 Telegraph ironwork.—Bullers, Ltd.
 Glow lamps.—British Thomson-Houston Co., Ltd.; Edison & Swan U.E.L. Co., Ltd.; General Electric Co., Ltd.
 Bronze wire.—F. Smith & Co. (incorporated in the London Electric Wire Co. & Smiths).

Hants.—The Hants County Council has entered into an agreement with the Chloride Electrical Storage Co. for the maintenance of the storage battery at the Park Prewett Asylum for ten years from the date of its first charge, for £61 a year.

Kirkcaldy.—Council. Electricity meters for one year. Chamberlain & Hookham, Ltd.

London.—L.C.C.—The Highways Committee has accepted the under-mentioned tenders for the supply during 1916-17 of tramways equipment, &c.—

Electrical equipment (motor and generator spares, A. Clare & Co. (six months only); British Westinghouse Electric and Manufacturing Co., Ltd.
 Electrical equipment (controller, circuit-breaker and other switch details, and magnetic brake) ares.—British Westinghouse Electric and Manufacturing Co., Ltd.
 Contact fingers and parts, segments, &c.—British Westinghouse Electric and Manufacturing Co., Ltd.; Dyer & Young; E. Showell & Sons, Ltd.; Tramway Supplies, Ltd.
 Electric cable, fuse wire, and cotton-covered wire.—Liverpool Electric Cable Co., Ltd.; Callender's Cable and Construction Co., Ltd.; British Insulated and Helsby Cables, Ltd.; London Electric Wire Co. and Smiths, Ltd.
 Copper bonds.—Watlington & Co.
 Moulded insulators.—British Westinghouse Electric and Manufacturing Co., Ltd.; Crystallite Manufacturing Co., Ltd.; Ebonestos Manufacturing Co., Ltd.; Litholite, Ltd.
 Track insulators and porcelain for electric track work.—Bullers, Ltd.; Taylor, Tunncliffe & Co., Ltd.
 Machined bronze bearings.—Anti-Articulation Metal Co., Ltd.
 Brake shoes.—Pease & Partners, Ltd.

Malvern.—U.D.C. Contract renewed for a year for electric meters with the Electrical Apparatus Co.

Southend-on-Sea.—Light Railways Committee. Material for the fixing of the new overhead equipment on the Leigh route:—

D. B. Rose. Pairs, £49.
 R. W. Blackwell.—Strainers, wire bolts, and mechanical frog, £25.

FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, May 19th. At 6 p.m. At Great George Street, S.W. Paper on "Spur Gearing," by Mr. D. Adamson.

Royal Society of Arts.—Monday, May 22nd. At 4.30 p.m. At John Street, Adelphi, W.C. Lecture on "Vibrations, Waves and Resonance," by Dr. J. E. Erskine-Murray (Lecture IV).

Wednesday, May 24th. At 4.30 p.m. Peter le Neve Foster Prize Essay, on "Zinc, its Production and Industrial Applications," by Mr. J. C. Moulden.

Royal Institution of Great Britain.—Friday, May 26th. At 5.30 p.m. At Albemarle Street, Piccadilly, W. Lecture on "X-rays," by Prof. C. G. Barkla, F.R.S.

Resuscitation After Electrical Shock.—In the *Electrical World* Mr. W. P. Strickland recently wrote as follows:—Recently one of our foremen after climbing a pole preparatory to stringing primary wires received a shock that caused him to fall to the ground. It is inferred that in adjusting his belt and shifting his position his spur cut out, and that to save himself he instinctively reached out and touched the wires carrying 2,300 volts. When the other linemen and ground hands reached him to all appearances the man was dead. One of the linemen, following instructions, immediately took hold of the ankles of the limp body, lifting it until the whole weight rested on the neck and then letting it fall. He then took a pair of connectors and hammered the soles of the injured man's feet without removing his shoes. Another lineman opened the man's mouth, pulled forward the swallowed tongue (which occurs in electric shock) and was about to begin the Schaefer prone method of resuscitation when the man returned to life. He was removed to the hospital and is alive and well to-day, though suffering severely from his burns.

For the past year the writer has been teaching his men to strike the feet without removing the shoes in all cases of electric shock. Some years ago an accident occurred where a man came in contact with 6,600 volts, fell from the pole, and was restored to consciousness by this means, although he was terribly burned and died three days later. Another accident that came to the writer's attention happened in New Jersey when a man came in contact with a wire carrying 2,200 volts. This man was struck violently on the feet, his tongue was pulled out, and he was restored to consciousness before the arrival of the doctor.

A Canal Comedy.—The *Times* has received from a correspondent copies of a correspondence which would be merely amusing if it did not reveal a lack of serious thought and energetic enterprise on the part of some of those who are responsible for the working of canals in this country. It appears that the South Metropolitan Electric Light and Power Co. wanted to avoid paying the high freight for the carriage of coal from the north, and inquired of the Grand Junction Canal what facilities that company could offer. A reply was received stating that as the company was not a carrier, the letter had been passed on to a canal carrier. A discouraging note was appended to the effect that it was practically impossible to bring coal from Yorkshire collieries to Greenwich. A letter to the Regent's Canal Co. brought forth a reply in which the writer gave his enthusiastic blessing to the scheme, but said that the matter had been referred to another canal company which, owing to its greater length of waterway, ought to be more interested. Another difficulty arose at this stage owing to one of the canal companies suggesting that it might be necessary to tranship the coal at Brentford, as it was rather dangerous for the canal barges to venture so far down the river as Blackwall. Meanwhile, communication having been established with the canal carrying concern, it was learnt that the canal carrier had died, and his executors, after carefully examining the position, had come to the conclusion that no further work could be undertaken owing to the extra demand made for boats by the usual traders. The South Metropolitan board communicated further with the canal companies, but so far the only help it has derived from is a suggestion that it should form a syndicate to buy or build barges!

The Chemical Society and Alien Enemy Members.—As the result of vigorous action on the part of the members, the Council of the Chemical Society called a special general meeting to consider the question of removing the names of nine alien enemies from the list of members; the meeting took place on Thursday last week, when an amendment retaining the names on the list was carried by 93 to 91 votes. The society is constituted by Royal Charter and provided by the nation with free quarters at Burlington House. After a long and heated discussion, the meeting was adjourned, and on its resumption the amendment will be submitted as a substantive motion.

We hardly need remind our readers that it is to the fiendish ingenuity of German chemists that such loathsome devices as poisonous gas, lachrymatory shells, and "liquid fire" are due, and of all classes of German scientists, these have achieved the most brilliant success in debasing their manhood and befouling the fair fame of science in the eyes of the human race.

The Electrochemical Equivalent of Silver.—According to No. 271 of the Scientific Papers of the Bureau of Standards, U.S.A., which deals with the question of inclusions of foreign materials in silver voltameter deposits, the value adopted for the electrochemical equivalent of silver by the London Electrical Congress of 1908 (111800 mg. per coulomb) is the closest figure that can be assigned to this constant, and appears to be correct to within a few parts in one hundred thousand; the atomic weight of silver is not known to this degree of accuracy. Taking the present international value of the atomic weight, 107.88, the value of the Faraday is 96,494 coulombs, but for general purposes the round figure 96,500 is recommended.

Longitude by Wireless.—The determination of the difference in longitude between Paris and Washington with the aid of wireless telegraphy, which has been in progress since October, 1913, has been completed. The distance between the stations is 6,175 km. The result, expressed in terms of time, is 5 hours 17 minutes 35.67 seconds, and has a probable accuracy of the order of 0.01 second.

Association of Electrical Station Engineers.—The most active branch of the A.E.S.E. at present is Manchester, which has become concerned with the introduction of female labour into various stations in the district. The following resolutions were passed at a recent meeting.

1. *Attitude of Association.*—That this branch views with extreme disapproval the introduction of female labour into electrical stations unless convinced by the authorities that the same is a military necessity.

2. *Wages.*—That the wages paid for female labour be the same as that to the men displaced.

3. *Guarantees.*—That guarantees be obtained that the positions shall be restored to the men displaced, at the termination of the war.

With respect to No. 3, the chairman of the meeting emphasised the fact that guarantees could only be enforced and maintained by a strong united body of station engineers.

During the last few weeks, the number of members of the A.E.S.E. who are undertaking military and naval service has considerably increased, and very few of these are able to continue their subscriptions to the Association. Some anxiety was occasioned to the Executive. Extra efforts were therefore made to obtain new members, and the result has been extremely satisfactory.

American Electric Cooking Campaign.—A special meeting of representatives of electric stove manufacturers was held at the offices of the Society for Electrical Development, New York, to consider the question of a national electric range campaign; the meeting was preliminary to the appointment of a national electric range committee representative of all electrical interests, and it is considered that the Society for Electrical Development should organise the campaign, collecting and publishing data, advertising, &c. A special committee is to meet at the N.E.L.A. Convention in Chicago to elaborate plans.

Scientific Research in Australia.—At a meeting of the Circle of Scientific, Technical, and Trade Journalists, held at the Institute of Journalists on Tuesday, Mr. Gerald Lightfoot, a member of the staff of Mr. Hughes, Prime Minister of Australia, explained the scheme for the promotion of scientific and technical research which is being developed by the Commonwealth Government. In December last Mr. Hughes stated that the Government was prepared to spend half a million sterling, if necessary, for this purpose, and in January a committee was appointed to draw up a scheme. The proposals of the committee provide for the formation of a Scientific and Industrial Advisory Council of nine members, and an Executive Committee of three, the chairman to be a man of wide experience and proved ability, with a full appreciation of the value of the application of science to industry, and the other two to be men of high scientific standing. These three would confer with the Advisory Council, which would consist of representatives of industry and science, but they would not be obliged to adopt the advice of the Council; they would be free from political control, and would occupy positions similar to those of judges, having salaries of £2,000 to £2,500 a year, and being removable only by a resolution of Parliament.

The Executive Committee would go about the country and ascertain the problems immediately calling for solution; it would then allocate the work of investigation to the existing scientific institutions, laboratories, &c. The Federal Government would furnish liberal grants to defray the cost of equipment and maintenance in carrying out the researches, and it was hoped that by this means it would be possible quite soon to organise and stimulate the development of research in the Universities.

A second object was to establish a Bureau of Information, which should collect information on industrial and scientific subjects and distribute it to manufacturers.

Thirdly, there were certain important fundamental investigations which should be carried out in Australia, and which necessitated the foundation of national physical and chemical laboratories, which would be centralised, and engineering laboratories for which, it was thought, the existing laboratories of colleges, &c., could be utilised. Also an Agricultural Bureau would be established, on the lines of that of the United States, which had proved highly successful.

The whole scheme would be based on co-operation between the Federal and State Governments and Universities, and with the employers' and employees' associations. A stimulus would also be given to the teaching of science in the elementary schools. The scheme had not yet been definitely adopted by the Government, as Mr. Hughes was awaiting information as to what was being done in England and the United States; but an assessment was being made by the Provisional Committee in Australia, and steps were being taken through the colleges and universities to ascertain the problems that were pressing for solution.

An associated proposal was that the formation of a central authority in England was essential to the proper co-ordination of effort, to prevent duplication; it was suggested that an Imperial Bureau of Information should be established to act as a sort of clearing house on an imperial basis. It was considered that co-operation throughout the Empire was indispensable to success.

Charge Dismissed.—At the Salford Police Court, on May 12th (according to the *Manchester Evening News*), Joseph Atkinson, secretary of the London (South-Western) Branch of the Electrical Trades Union, of Salford, was summoned on a charge of wilfully withholding £20, the moneys of the Union. Defendant did not appear, nor was he legally represented, but Mr. J. Brown, general secretary of the Union, said that defendant had admitted the deficiency. The Stipendiary said he could not hold that the money had been wilfully withheld, and he accordingly dismissed the summons.

Engineering Industry in the Economic War.

Mr. T. C. Elder, of the British Electrical and Allied Manufacturers' Association, spoke at a meeting in Glasgow, under the auspices of the Institution of Engineers and Shipbuilders in Scotland, the West of Scotland Iron and Steel Institute, and the Glasgow Chamber of Commerce, on Tuesday, May 16th, Lord Provost Dunlop presiding. Mr. Elder traversed much the same ground as he had covered at similar meetings held in other parts of the country. He summed up what he described as a somewhat straggling address in the form of the following propositions:—

1. That it is necessary for the world's peace that Germany shall be restrained, as far as possible, from retaining her past and present proportion of military power.

2. That to accomplish this it is necessary to cripple her engineering industry, and force her populace into peaceful pursuits.

3. That this end can be attained by an international convention of the Allies and the British Empire.

4. But that it will also need a reconstruction of British trade policy, with special regard to the engineering and allied industries.

5. And such a reform will need to be accompanied by a practical conception of the common interests of all engaged in British engineering trade, and by the exertion of collective power on the part of manufacturers for the development of business abroad.

The author's remarks evoked an interesting discussion, in the course of which Sir Archibald Denny, Bart., Dumbarton, said he had to confess that the attitude of those who said they would never again trade with Germany was not a correct one. But if they did trade with Germany again they should do it with their eyes open and armed to resist insidious trading. He was a born Free Trader, and while there was something wrong with their Fiscal trade relations, he had not quite made up his mind that total exclusion was the best way of dealing with organised dumping. Every trade should organise itself now. His great hope was in the organisation of the employers. The men were fully organised and loyal in one direction, and if they joined up with the employers he had not the slightest feeling of despair. Mr. Murray, chairman of directors, Glasgow Chamber of Commerce, pointed out that at the outbreak of the war there were certain industries essential to this country which were practically controlled by Germany, and commercial men were blamed for want of foresight in allowing the deliberate undermining of our trade, which had been going on for many years. They must all admit the partial justice of that condemnation, but he asked if our commercial men were solely to blame. Personally, he did not think so. It had been the ingenious policy of the German Government to staff their Ministry of Commerce with business men who knew a great deal in the way of getting over difficulties which were inevitable in the opening up of foreign trade. The unanimous opinion of business men was that the Board of Trade was overburdened, and was unable, as at present constituted, to deal promptly with any problems which might arise. They were determined, as business men, to make it clear to the Government that the demands of the business community must have attention. Sir John Cowan (Edinburgh) expressed himself in entire sympathy with the appointment of a Ministry of Commerce, provided they got the right men to manage it. If they did not get the right men they would be no better off than they were now. They, as engineers and business men, had the matter in their own hands. Engineers in this country must wake up and do a great deal better than they had done in the past. He emphasised the necessity for complete organisation. It did not matter what their organisation was. It might be perfect, but unless the management and equipment of their works was right the organisation could not pay. Mr. W. S. Workman (Glasgow) agreed with Sir Archibald Denny. What they had seen and heard within the past six months made one think that they would have to change their minds and introduce some new machinery in the shape of tariff reform. They realised that Parliament could do a great deal for them if the Government would only go in the direction business men wished. Another speaker drew attention to what was being done in the United States in preparation for the coming economic war. A naval consulting authority had secured the co-operation of the five national engineering societies, whom they had asked to appoint a representative from each State, who was charged with the preparation of an inventory. That was their first step towards industrial preparedness. Such a system might with advantage be copied in this country.

On the call of Mr. W. W. Lackie, the speaker was thanked.

Prospects in South Africa.—A correspondent inquires whether any of our readers can give information as to the present prospects in South Africa for a man, as described below:—

Sound knowledge of electrical engineering, both theoretical and practical. Undoubted business ability, though the latter has not been developed by actual experience. Born in Holland, of Dutch parents, but father of English descent; name English; married into English family. Speaking, reading, and writing, almost like a native, English, Dutch and German; French also very well. A very important question is: Would those who know advise a man to go out to South Africa with his family "on spec"?

Perhaps some of our readers will kindly assist our correspondent, who, it will be seen, is of Dutch nationality.]

America's Electrical Week.—This is the title selected for a great electrical celebration, after the style of the "Electrical Prosperity Week," which is planned for December 2nd to 9th, 1916; a start has already been made with the preparations, under the guidance of the Society for Electrical Development.

Appointments Vacant.—Meter and mains assistant for Rotherham Corporation electricity works; mains engineer (£156), for the Borough of Eastbourne Electricity Department.

Educational. **MANCHESTER MUNICIPAL SCHOOL OF TECHNOLOGY.**—We have received the prospectus of summer evening classes, which were to begin this week; they include mechanical, electrical, and municipal engineering, chemical technology, &c. Prof. Miles Walker is at the head of the electrical engineering department.

SHEFFIELD UNIVERSITY.—One of the bequests contained in the will of the late Sir Edgar Allen was a legacy of £32,000 to the University of Sheffield, of which £5,000 is to be allotted to the Applied Science department, the remainder being devoted to providing scholarships. Sir Joseph Jonas, chairman of the Applied Science Committee, has added another £5,000 to the legacy, and the total sum of £10,000 is to be used in erecting a laboratory for testing engineering materials.

IMPERIAL COLLEGE OF SCIENCE.—Yesterday a party of Members of Parliament was conducted over the College by the Rector, Sir Alfred Keogh, and the Commercial Committee of the House of Commons, in order that the members might be shown the original research work which has been done at the College in connection with industry.

Fatalities.—An inquest was held at Fence Houses (County Durham) on Monday, touching the death of Henry Allison (25), who was killed electrically on the previous Friday while following his employment as a cleaner-out in the Lady Ann coal mine at Lambton. Deceased was found dead, his body being in contact with the frame of an electric coal-cutting machine. The jury found that death was due to an electric shock accidentally received through contact with the framework of a coal-cutting machine, which was "alive" due to a fault in the cable.

John James Jevons (16), of Droysder, was killed through falling into a coal hopper at the Manchester Corporation electricity works. At the inquest on Monday it was stated that it was not a boy's duty to go into the hopper, and that it was customary for anyone going into the hopper to have a rope tied round his body. The youth had been told not to go into the hole, but he simply laughed and went down.

Volunteer Notes.—1ST LONDON ENGINEER VOLUNTEERS.—Orders for the week by Lieut.-Col. C. B. Clay, V.D., Commanding.

Monday, May 22nd.—Technical for Sections 1 and 2, No. 3 Company, 46, R-gency Street, S.W.; Squad and Platoon Drill, Sections 3 and 4, No. 3 Company; Signaling Class and Recruits.

Tuesday, May 23rd.—School of Arms, 6 to 7; lecture, Mr. J. Roberts "The Geography of Oxford," 7.15; Recruits, 7.15 to 8.15, Archbishop's Park.

Wednesday, May 24th.—Platoon Drill, No. 2 Platoon, No. 1 Company.

Thursday, May 25th.—Platoon Drill, No. 6 Platoon, No. 2 Company; Shooting for Sections 3 and 4, No. 3 Company, Miniature Range; Recruits, 5.45 to 7.45; Instructional Class, 5.45.

Friday, May 26th.—Technical for Sections 3 and 4, No. 3 Company, 46, R-gency Street, S.W.; Squad and Platoon Drill, Sections 1 and 2, No. 3 Company.

Saturday, May 27th.—Route March: Parade, Golder's Green Station, 2.30; Uniform.

Sunday, May 28th.—Entrenching at Oxford: Parade, Victoria Station (S.E. & C. Railway Booking Office), at 8.35 a.m.

Musketry.—For Nos. 1 and 2 Companies, see Notice and Tables A and B, at Headquarters.

Notice.—Unless otherwise indicated, all drills, &c., will take place at Chester House.

MACLEOD YEARSLEY, Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, May 18th, 1916:—

Week-End Parades.—**Saturday.**—The Battalion will Parade at Baker Street Station, at 2.30 p.m., and proceed by train to Wembley Park for Drill under Company Officers.

Sunday.—The Battalion will Parade at Liverpool Street Station (Low Level entrance, G.E.R.), at 9.30 a.m., and proceed by train for Entrenching duties.

Derby Recruits.—Members called up under Lord Derby's scheme are requested to send in their names to the Adjutant before 9 a.m. on Saturday next, the 20th inst., with a view to application being made for them to serve together in the same Battalion.

Musketry.—The range at Bisleigh will be open to members. Morning train, 9.20 a.m., Platform 6, Waterloo Station. Afternoon train, 12.45 p.m., same platform.

A. G. JOINER, Major and Adjutant, O.B.C.

Institution and Lecture Notes.—**Illuminating Engineering Society.**—The report of the Council for the past year states that the membership has been maintained. The Presidents of the Institutions of Gas and Electrical Engineers, Mr. John Young and Mr. C. P. Sparks, have consented to act on the Council. The Interim Report of the Committee on Research was presented at the annual meeting last week, and contained a long list of subjects on which research was desirable.

Association of Mining Electrical Engineers.—At the last meeting of the Yorkshire branch, Mr. J. W. Harbottle read a paper on "The Winkey Detector" for earth faults.

Daylight Saving.—On Wednesday the Summer Time Bill received the Royal Assent, and the Act will come into force next Sunday morning, when the clocks on all railways and in Government buildings, and public clocks generally, will be put forward one hour. The "summer time" will remain in force up to and including September 30th.

Enemy Firms.—In reply to a Parliamentary question, the President of the Board of Trade says that he is aware that lists of enemy companies have been published in Australian journals. The names of companies and firms in this country ordered to be wound up are given in the *London Gazette*, and he does not think it advisable to publish the names of other companies and firms in which there are enemy interests, on account of the injustice which would result in certain cases to the British shareholders, and the undesirability of damaging a business when the enemy interest may be transferred to British subjects.

Engineers and the War.—At the annual meeting of the Institution of Engineers and Shipbuilders of Hong-Kong on March 31st, Prof. C. A. Middleton-Smith, the president, delivered an address, in which he referred to the part that engineering and engineers were playing in the war, to the achievements of British engineers in all parts of the world in the past, and to their intentions for the future. In alluding to the future course of trade in China, he emphasised the advantage that would ensue from Chinese and British co-operation in utilising and developing the great mineral and other resources of China. The speaker also referred to the great commercial struggle that would commence when the war was over. Engineers must inevitably take a great part in that struggle, and they must carry out the British tradition and play the square game. The meeting accorded a hearty vote of thanks to Prof. Middleton-Smith upon his retirement from the presidency.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Mr. G. H. BROWNE, acting engineer and manager, Ilkeston tramways and electricity department, has been appointed engineer and manager to the Mexborough & Swinton Tramways Co.

Mr. E. FISHER, junior assistant and temporary mains superintendent in the Nelson electricity and tramways department, has resigned on receiving an appointment at Heywood.

The Ashton T.C. last week adopted a recommendation of the Tramways Committee that the salary of Mr. ERNEST HOLZ, manager of the tramways department, be increased from £200 to £260 per annum.

Dover T.C. has appointed Mr. A. H. JONES as a charge engineer at the electricity works. The mains superintendent, the senior charge engineer, and the works superintendent at the electricity works have been granted 10 per cent. increases of salary on account of the high cost of living.

Roll of Honour.—Private G. B. WIVELL, of the Royal Fusiliers, who has fallen in action, was at the time of his enlistment on the staff of the British Westinghouse Electric and Manufacturing Co., Ltd., at Manchester. Just before the outbreak of war he was engaged for the firm at Johannesburg.

Private A. E. TAYLOR, of the 2nd Leicestershire Regiment, who is reported killed in action, after being missing since May 15th, 1915, was, prior to joining the regiment, on the electrical staff of the Holwell Ironworks, Asfordby, Melton Mowbray. He was 26 years of age.

Rifleman H. A. CLARKE, of the Machine Gun Section of the Rifle Brigade, who was, at the outbreak of war, on the Rugby staff of the British Thomson-Houston Co., Ltd., has lost his life at the Front in a mine explosion.

Sergeant J. HINDLE, of the Lancashire Fusiliers, formerly a member of the staff of the British Westinghouse Co., Trafford Park, has been killed. Deceased was 34 years of age, and he has left a widow and five children.

Lieutenant EDWARD WILSON, South African Infantry, whose death is reported, went out to South Africa after taking his degree at Cambridge, and, through an introduction to Rhodes (says the *Times*) was placed in charge of the transport of the Transcontinental Telegraph Co., on the section from Chindi, on the Zambesi, to the north end of Lake Nyassa.

The *Times* states that Captain R. J. SMITH, Lancashire Fusiliers, who fell on May 5th, was an Associate of the Royal College of Science, Ireland. When the war began he was in the service of the British Westinghouse Co., Manchester, before which he had been a teacher in Newry Technical Institute.

General.—The Post Office Provincial Superintendents and the Headquarters Staff of Traffic Managers have now been amalgamated into one establishment, under the control of Mr. R. A. DALZIELL, with the title of Chief Inspector of Telegraph and Telephone Traffic. His two principal assistants will be Mr. L. HARVEY LOWE, late Deputy Controller of the London Telephone Services, and Mr. J. LEE, with the title of Deputy

Chief Inspector of Telegraph and Telephone Traffic. Mr. W. A. VALENTINE, late Provincial Superintendent, has been appointed Deputy Controller of the London Telephone Service.

Mr. J. W. TURNER, Post Office engineer of Darlington, has retired after 45 years in various positions in the Post Office Telegraph Service. His late colleagues presented him with a draught screen and other gifts. Mr. Turner, in replying, recalled the occasion when he attended the first telephone experiment by Sir W. Preece at the Guildhall, Plymouth.

Obituary.—MR. EDWIN THORNTON.—At the funeral, at Barrow-in-Furness on Saturday last, of the late Mr. Edwin Thornton, A.M.I.E.E., whose untimely death occurred as the result of a motor-car accident on the road near Carnforth on April 29th, those present included Ald. J. P. Smith, Chairman of Barrow Electricity Committee; Mr. Wm. Drysdale, A.M.I.E.E., representing the Barrow Chamber of Trade; representatives of the Barrow Technical Schools and Barrow Master Builders' Association, &c. The deceased, who was 50 years of age, and eldest son of the late Mr. W. R. Thornton, was managing partner of the firm of Messrs. W. R. Thornton and Son, electrical engineers. The deceased's only son is in the Army in Egypt.

MR. RICHARD S. BLACKBURN.—Mr. Richard S. Blackburn, electrical engineer and contractor, of Hebden Bridge (Yorks.), died suddenly on May 8th after undergoing an operation. He was 54 years of age.

MR. EDGAR W. SALIS.—According to the *Times* "Deaths" column, Mr. Edgar W. Salis, representative at Rio, Brazil, of the Marconi Co., third son of the late Major-General Salis Schwabe, C.B., died in London last week aged 41.

LADY CROOKES.—Lady Crookes, wife of Sir William Crookes, O.M., passed away last week at the advanced age of 80 years. We tender our sincere sympathy to Sir William in his loss.

MRS. WORDINGHAM.—The many electrical friends of Mr. C. H. Wordingham will regret to learn of the death, on the 11th inst., of his mother, the widow of the late W. H. Wordingham. The loss of a parent is one of those misfortunes which no one may hope to escape, but in some cases the blow is heavier than in others; and without intruding too far into so delicate and personal a subject, we may venture to say that it is an open secret amongst his intimate friends that to his mother Mr. Wordingham ascribes all that he has achieved—to her he looked for sympathy, inspiration, and encouragement, and he looked upon her as a true comrade. We sincerely condole with him in his bereavement.

MR. W. DEAN.—The death is notified of Mr. W. Dean, assistant electrical engineer with the Merthyr Electric Traction Co., Ltd. He was 28 years of age, and in the new year had a serious attack of pneumonia.

PRIVATE G. L. F. EDWARDS.—Private G. L. F. Edwards, of the King's Shropshire Light Infantry, who has lost his life through the accidental discharge of a revolver, was, prior to the war, engaged as an electrician with Messrs. Lea & Son, electrical engineers, of Shrewsbury. He was the son of Capt. Geo. Edwards, of the same regiment, and had been at the Front since last July.

NEW COMPANIES REGISTERED.

British Graphite & Trading Co., Ltd. (9,597).—This company was registered, in Edinburgh, on May 13th, with a capital of £12,000 in 8,000 participating pref. shares of £1 each and 80,000 ord. shares of 1s. each, to carry on the business indicated by the title. The subscribers (with pref. share each) are: J. Logan, 95, Bath Street, Glasgow; J. J. Fiskien, 20, West Campbell Street, Glasgow. Private company. The number of directors is not to be less than two or more than seven; the first are J. Logan and J. J. Fiskien. Qualification, 200 shares of either class. Remuneration, £100 per annum. Solicitor: D. Gardner, Glasgow. Secretary: A. Grimmont. Registered office: 53, Bothwell Street, Glasgow.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Wakell's, Ltd.—A memorandum of satisfaction to the extent of £130 on April 15th, 1916, of debentures dated May 7th, 1914, securing £720, has been filed.

Brilliant Arc Lamp & Engineering Co., Ltd.—Memorandum of deposit on April 25th, 1916, charged on certain contracts, to secure all moneys due to or to become due from company to London & South-Western Bank, Ltd., 170, Fenchurch Street, E.C.

Llandrindod Wells Electric Light & Power Co., Ltd.—Particulars of £2,200 debentures, created December 11th, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital and land, buildings, and premises in West Ham and Liverpool. Trustees: J. S. Cockburn, J. Ferguson, Sir Henry C. Mance, Kt., C.I.E., and Hon. S. E. Marsham.

Willans & Robinson, Ltd.—Debenture dated April 28th, 1916, to secure £20,000 (ranking *pari passu* with a debenture £40,000 issued 1st December, 1911), charged on the company's undertaking and property, present and future, including uncalled capital subject to prior charge. Holders: G. H. D. Coates, Rugby, and W. C. Buckley, 71, Lombard Street, E.C.

Ernst Hildebrandt, Ltd. (112,286).—Capital, £5,000 in £1 shares. Return dated March 16th, 1916. All shares taken up; £1 per share called up on 4,002 shares; £4,002 paid; £798 considered as paid. Mortgages and charges: Nil.

W. T. Glover & Co., Ltd. (56,124).—Capital, £214,850 in £1 shares (100,000 pref.). Return dated April 24th, 1916. 100,000 pref. and 114,850 ord. shares taken up; £1 per share called up on 67,000 pref. and 50,000 ord. shares; £117,000 paid; £97,850 considered as paid on 33,000 pref. and 64,850 ord. Mortgages and charges: £192,800.

CITY NOTES

The following particulars appear in the annual account of this company for 1915, as published in the *American Electrical Review* and *Western Electrician*:—

	1915.	1914.
Sales billed	\$55,522,070	\$90,467,692
Costs, including operating maintenance depreciation charges	76,898,183	61,496,728
Profit	8,623,887	8,970,963
Interest and sundry revenue	2,129,266	1,570,431
Income from securities	1,554,343	1,313,989
Total income	12,307,996	11,855,383
Debt interest	570,086	567,556
Net profit	11,737,910	11,287,827
Dividends	8,129,919	8,142,867
Surplus	3,607,992	3,145,060
Previous surplus	20,084,879	16,939,819
Profit and loss surplus	23,692,871	20,084,879

The net profit was equal to 11.56 per cent. earned on \$101,510,600 capital stock, against 11.12 per cent. earned on \$101,485,700 stock in 1914.

In his remarks to stockholders, Chairman C. H. Coffin said that the value of orders received by the company for electrical apparatus and devices in the past year was \$96,385,891, an increase of \$14,637,370, or 17 per cent. over those of 1914. This increase was largely due to the general revival of business in the latter part of the year. "These figures are exclusive of orders for special war munitions, which amounted to \$33,980,000 during 1915. These have been so restricted as to interfere as little as possible with the regular product of the company. The percentage of profit from these orders will probably be less than that of the average of the company's output. The amount of sales billed was \$55,522,000, a decrease of \$4,945,621, or 6 per cent." The number of employees engaged in the factories and offices, and in those of subsidiary companies at the end of 1915 was about 60,000. The company has followed its customary practice in writing off against income account its total expenditures in 1915 for patents, applications for and licences under patents, and other outlays relating thereto, amounting to \$838,455. The patent account is carried at \$1, as in previous years. Stocks, bonds, and other securities are carried at a valuation of \$32,916,593, of which \$19,687,965 represents securities of subsidiary companies, and \$13,228,628 those of public utility and other companies. Current accounts and notes receivable are carried at \$19,619,215. Sales of several small factories substantially offset the manufacturing floor space added in 1915; and plant expenditures amounting to \$4,485,068 were chiefly for improvements in existing construction and equipment, and the purchase of special tools and machinery which are subject to a high rate of depreciation. Because of the nature of these expenditures, and on account of the liquidation of the book value of the factories sold, the reduction in the plant account for the year was \$5,985,068.

German Electrical Companies.

The Concordia Elektrizitäts Ges., of Dusseldorf, which is now associated with the Berlin-Hagen Accumulator Co., records net profits of £8,600 for 1915, as compared with £12,000 in 1914. It is intended to pay

a dividend of 7½ per cent., as against 10 per cent. in the previous year.

The Berliner Elektrische Bahnen, whose share capital of £300,000 is held almost entirely by the City of Berlin, propose to pay a dividend of 1 per cent. for 1915, as in the previous year. The directors state that they hope soon to be in possession of new motor trams in order to enter into competition with the Grand Berlin Tramways.

The report of *Korting & Mathiesen, of Deutsch, near Liepsig* (arc lamps and electricity meter works) states that Army contracts were only carried out to a limited extent in 1915, but activity in all departments was satisfactory, and the turnover was greater than that in the preceding year. After providing for depreciation, the net profits are returned at £10,500, as compared with £9,200 in 1914, and the dividend at 5 per cent. is the same rate as in the previous twelve months.

The Elektrizitäts Lieferungs Ges., of Berlin, after reporting that the development of the supply industry in 1915 was hampered by the unfavourable situation of the times, states that the production of the works owned by the company, and of others in which it is also interested, increased by 3,240,000 kw.-hrs. to 55,672,000 kw.-hrs. As net profits, the accounts indicate the sum of £169,000, as contrasted with £179,000 in the previous year, and the dividend in contemplation is 10 per cent., as in 1914.

The accounts of the *Bergmann Elektrotechnik Werke A.G.*, of Berlin, show gross profits amounting to £1,061,000 for 1915, as compared with £555,000 in the previous year. After deducting general expenses and interest charges, and setting aside £15,000 for depreciation, as against £15,000 in 1914, the net profits are returned at £573,000, as contrasted with £198,000. It is proposed to pay a dividend of 10 per cent., as compared with 5 per cent. in 1914, to place £50,000 in a goods reserve account, £200,000 to the war and war tax reserve account, and £2,500 to the benevolent funds, and to carry £19,000 forward to 1916.

French Electrical Companies. The *Compagnie d'Electricité de Limoges* earned gross profits amounting to £31,000 in 1915, and net profits of £20,000. It has been decided to pay a dividend of 6 per cent. on the ordinary shares and set aside certain sums for the renewal of batteries, redemption of loans, &c.

The *Société Française des Electrodes* has declared a dividend at the rate of 10s. per share out of net profits amounting to £12,700 in 1915. It was mentioned at the recent general meeting that, notwithstanding the scarcity of labour, more satisfactory results could be expected for the current year.

The *Union Electrique*, whose revenue experienced a large decline in 1914-15 as compared with the preceding year, reports gross profits of £32,000, as against £36,000 in 1913-14. After defraying general expenses and financial charges, the net profits of £192 have been carried forward, this result contrasting with a dividend of 2 per cent. which was paid for 1913-14.

The *Compagnie l'Energie Electrique du Sud-Ouest* reports a large increase in the receipts in 1915, and net profits and balance forward amounting to £52,000. A dividend at the rate of 5 per cent., or £1 per share, has been declared. During the year extensions of the works were undertaken in order to cope with the growing demand, and an investigation is being made with a view to the utilisation of two new falls on the Dordogne, between Tulières and the Mauzac barrage.

The *Compagnie Française Thomson-Houston* reports a gross revenue of £301,000 for 1915, as compared with £302,000 in the previous year, of which £209,000 and £204,000 were derived from manufacturing and sales in the two years respectively, and the balance from investments. After meeting general expenses, financial charges, and placing £72,000 to the depreciation fund, the net profits and balance forward are returned at £127,000, or practically the same as in 1914. It is intended to distribute £1 per share on the ordinary capital, being the same rate as in 1914.

At the annual meeting held on May 11th, the Chairman (Mr. P. V. LUKK, C.I.E.) said that the capital expenditure during 1915 was £122,344, compared with £61,443 in 1914, the increase being chiefly on account of a new 6,000-kw. turbo set installed at Cossipore; the mains laid in connection with the supply of current to the docks of the Calcutta Port Commissioners; switchgear for the new sub-stations; and the ordinary expansion of the business. The total generation costs increased by £4,906, mainly owing to the larger quantity of coal used, 5½ million additional units having been generated. Revenue expenditure was practically the same. Revenue from sale of current showed a satisfactory increase of £24,404. Meter rents were reduced by one-half last July. The war tax of 50 per cent. on excess profits affected, or would affect, them seriously, although their excess profits were accounted for entirely by the growing expansion of the business, and were in no way due to the war. On the contrary, the business was adversely affected by the greatly increased cost of materials and transport. If their additional profits were in any way due to the war no exception could be taken, but on a business in a state of development it fell with a severity which hardly appeared equitable. There was no desire on their part to make a grievance of having to assist in the prosecution of the war. They had carried forward a much larger sum than usual in order to provide for the tax, which had now been increased to 60 per cent. Another matter of importance was the increase in the ordinary income-tax, which in India had been more than doubled, being raised from 5 pies in the rupee to 12 pies, or one anna; while the English income-tax would be for the current year 4s. 6d. in the £, and they had to pay both the Indian and the English tax. Moreover, an *ad valorem* import duty, on goods imported into India, had been imposed, which would affect them in the current year to the extent of 7½ per cent. on cables and 2½ per cent. on machinery. At the last two annual meetings he had alluded to their intentions to make certain reductions in the charges to their consumers in Calcutta. Consistent with their duty to their shareholders, they had ever before them the desire to make the supply of electrical energy as cheap as possible, and it was their intention to persevere in that direction. Their average dividend on the total subscribed capital had been 7 per cent., and considering the class of business it could not be argued that they had made undue exactions from the public. In setting aside large sums for reserve and depreciation they had been guided by figures well recognised in similar undertakings in this country, and these were by no means excessive, in fact, probably the opposite. As much as 77 per cent. of their reserve had been derived from premiums on shares issued and interest on investments. In regard to superseded plant, they

had spent, roughly, £500,000 in bringing the undertaking up to date. This had necessitated laying aside a large amount of machinery which, though not worn out, was none the less uneconomical for their purposes. Had that plant served its full life the original cost would have been written off against depreciation, but not having served its full life the book value was still quite a large figure, larger than what they would sell it for. They had disposed of a considerable quantity of it, and the difference must be made good out of revenue. They had decided to spread the liquidation of that debt over several years, during which period additional sums, over and above what was required to cover current depreciation, must be set aside before the Corporation could be as generous as it might otherwise be to either its consumers or its shareholders. Therefore the reductions in charges to the public in Calcutta had been as liberal as the position of the Corporation justified. The chairman proceeded to show in detail that the aggregate result of several reductions in 1914 and 1915 in charges amounted to £22,000 per annum. He replied effectively to letters which appeared in the Calcutta Press on the matter of the charges to the public. Considering the unsettled state of the war and its consequences, they had acted toward consumers as liberally as circumstances permitted. Though the war had not affected them in Calcutta so detrimentally as it had done similar undertakings in England, it had not been without its sinister influence. The speaker proceeded to show how prominent members of the staff and others were assisting in the war, the difficulty in obtaining the services of suitable men from England, and the difficulty, almost impossibility, of getting any new plant from English factories. They were fortunate in getting delivery, though belated, of a 6,000-kw. turbo set ordered in December, 1914, from the British Thomson-Houston Co., Ltd., and in having it safely erected in Calcutta. In order to ensure the certainty of a supply of direct current for the auxiliary plant and the station lighting in case of any accident in future which might cause a complete breakdown on the H.T. side, a secondary battery had, as a special safeguard, been erected at Cossipore, which had cost, including the switchgear, £3,800. All the pumps, both for air and water circulation, are driven by D.C. motors, and will be kept running by this battery. This will enable the station to be started up again much more quickly, and in the case of a comparatively insignificant failure of the D.C. supply at Cossipore, the battery would probably prevent a total shut-down. The construction of four new sub-stations, badly needed to meet the expansion of business, was put in hand during the year, and one was started up in December. A ten years' contract had been made with the Port Commissioners for a supply of current to the docks. The great distance of the docks from the Cossipore station had involved a large expenditure of capital in mains, which had to be duplicated by different routes so as to ensure a safe supply. Several inquiries received for large extensions pointed to a considerable access of business after the war. There was a further improvement in regard to units unaccounted for. The bonus scheme distribution to the staff in India was £1,629, as against £1,406 in 1914.

Chesham Electric Light and Power Co., Ltd. The profit for 1915 after paying all charges, including interest on debentures and temporary loans, but exclusive of depreciation, was £1,563. After deducting £500 for depreciation and £152 for proportion of costs connected with the debenture issue, and adding £1,958 brought forward, there is an available balance of £2,870. A dividend of 4 per cent. absorbs £600, and £2,270 is to be carried forward. The gross earnings, exclusive of profits on wiring, have shown a steady increase for the past five years; for 1915 they were £6,315, against £5,085 in 1914. Extensions at Berkhamstead and Amersham had been further proceeded with. The capital expenditure during 1915 was £4,767. The heavier load had necessitated plant, &c., additions at Chesham, which had been fully warranted by the reduction in the cost of the electricity supplied. The bankers' loan had been increased to £4,000, leaving £1,000 still at the company's disposal. It is proposed to write off the remainder of the cost of the debenture issue by six annual instalments of £151. Units generated, 712,641; units sold, 618,067.

Callender's Cable and Construction Co., Ltd. For the year 1915 there is a balance at the credit of profit and loss of £113,367, plus £163,169 brought forward, making £276,536. From this are deducted: interest on debenture stock, £13,500; preference dividend £10,000; depreciation of buildings, plant and machinery, £10,335; depreciation of office furniture, £254. It is proposed to pay a dividend on the ordinary shares at the rate of 10 per cent. per annum, less income-tax, being 10s. per share; a bonus of 5s. per share and a special bonus of 5s. per share, both less income-tax; and £207,347 is to be carried forward. The year's operations have been carried on under exceptional difficulties as to men, materials, and transport, and the directors are pleased to submit a report which shows such satisfactory results. The company has been a controlled establishment since August last. No firm in the electrical industry has rendered more effective service to the nation. The ordinary home trade has consequently been much interfered with, but it has been possible to carry out some municipal and other contracts in connection with munition work, and also to satisfy to some extent

the demands of the old and valued customers of the firm. The shortage of shipping has seriously interfered with the delivery of orders for overseas customers, but in spite of this, good work has been done in several of the Colonies, and in some of the neutral countries, which will, it is hoped, be of considerable service after the war. It has been necessary to rearrange many of the departments of the factory, so as to adjust them to the new conditions. There have been difficulties in doing this, but the arrangements have now been made in a satisfactory manner, and the works at Erith and at Leigh are fully and most usefully employed. Substantial additions to the plant and machinery at Erith and at Leigh have been necessary, and further additions are being made. The Anchor Cable Co., Ltd., whose operations are so closely interwoven with those of this company, has also been able to show satisfactory accounts of its year's working. The Leigh factory has been running for many months continuously day and night on work on behalf of this company. Both at Erith and at Leigh great difficulty has been experienced in regard to labour, owing to the drain on the available supply for the direct manufacture of munitions, and the large number of the workmen and staff who have joined the Colours. At the Anchor works women have to a large extent taken the place of men, and arrangements are now being made at Erith for the employment of female labour upon an effective basis. Annual meeting: May 25th.

Eastern Extension, Australasia, and China Telegraph Co., Ltd.

The report for 1915 states that the gross receipts amounted to £950,030, against £819,583 for the previous year. The working expenses, including £51,312 for maintenance of cables, absorb £386,672, against £364,978, leaving £563,358, plus £31,371 brought forward. £30,096 is required for interest on mortgage debenture stock and £85,817 for income-tax payable in England and excess profits duty. Three interim dividends of 1½ per cent. each have been paid, and £200,000 has been credited to the general reserve fund. The directors now recommend a final dividend of 2½ per cent., with a bonus of 2 per cent., making 8 per cent., free of tax, for the year, carrying forward £38,816. In addition to the £200,000 above referred to, the general reserve fund has been credited with £40,912 in connection with the closing and disposal of the Banjoewangie-Roebeck Bay cable owing to the establishment of improved means of communication with Australia making it unnecessary to continue the maintenance of this cable. On the other hand (says the *Financial Times*), the fund has been debited with £74,685 for partial cable renewals carried out during the year, £11,382 representing the loss incurred on the sale of investments and £25,000 as a further provision on account of investment fluctuations, bringing the total provision against depreciation up to £225,000. An agreement has been concluded with the Australian Commonwealth Government enabling the company to deal direct with the public in Melbourne, as at Sydney, Adelaide, and Perth, and an office has been opened by the company for the reception and delivery of telegrams in Melbourne.

Eastern Telegraph Co., Ltd.

During the year ended December, 1915, the revenue was £2,104,431, less £655,888 ordinary expenses, and £202,609 for expenditure relating to maintenance of cables and other expenses, leaving £1,245,934, plus £32,742 brought forward. After providing for income-tax payable in England and excess profits duty, interest on mortgage debenture stock, and preference dividends, the balance is £821,638, out of which £460,000 has been placed to the general reserve, £10,000 to insurance of war risk at stations fund, and £5,000 to insurance of goods in transit fund. A final dividend on the ordinary stock of 2½ per cent. and a bonus of 2 per cent. make a total of 8 per cent., free of income-tax, for 1915, and £26,638 is to be carried forward. The general reserve fund has been charged with £204,880 in respect of the new Aden-Colombo cable and other special expenditure, and with £125,000 as a further provision on account of investment fluctuations. At the annual meeting on May 24th shareholders will be asked to approve the payment of the directors' remuneration free of income-tax.

Kidderminster and District Electric Lighting & Traction Co., Ltd.—During 1915 the capital expenditure was £309. The net receipts of the lighting undertaking were £4,561, plus £3,471 dividends received in respect of investments, and £219 brought forward. After deducting administration and general expenses, interest on temporary loans and debenture stock, and providing £500 for renewals, there remains £3,708. Of this, there is to be put to reserve £750, to dividend on cumulative preference shares £1,500, and there is carried forward £1,458. The profit on the working of the tramways company, after providing for renewals, is £2,439, plus £163 brought forward. There has been put to reserve £500, a dividend at the rate of 3½ per cent. absorbs £2,002, and £100 is carried forward.

Stock Exchange Notice.—The Committee has ordered the undermentioned to be quoted in the Official List:—

South Metropolitan Electric Light & Power Co., Ltd.—Further issue of 45,926 six per cent. cumulative second preference shares of £1 each, fully paid, Nos. 350,001 to 395,926.

Craigpark Electric Cable Co., Ltd.—At the annual meeting, in Glasgow, the Chairman said that the year's working had been satisfactory taking everything into consideration. They had been somewhat handicapped by shortness of labour and difficulty in getting delivery of material. They could have done more business but for these circumstances. There had been a big rise in the price of copper, but at present they were fairly well off with regard to purchases. He moved the payment of a dividend of 6 per cent. on both preference and ordinary shares, and, Prof. MAGNUS MACLEAN seconding, the report was unanimously adopted.

West Coast of America Telegraph Co., Ltd.—The gross receipts during 1915 were £65,475, as against £61,129 in 1914. The working expenses were £46,215, as compared with £43,054. After deducting £477 for excess profits duty, the revenue account shows a balance of £18,782, plus £1,994 brought forward, making £20,777. £6,000 has been paid for interest on the 4 per cent. debentures, £800 provided for the interest on the 4 per cent. income bonds, £5,000 transferred to the general reserve fund, and £6,000 to the provision on account of investment fluctuations, leaving £2,977 to be carried forward.

South Metropolitan Electric Light & Power Co., Ltd.—There is being offered to the holders of the shares and debenture stock for subscription, £30,000 4½ per cent. first mortgage debenture stock at £55. The issue is necessary owing to the continuous expansion of the business; the stock will rank *pari passu* with the other 4½ per cent. debenture stock, and it is repayable at par on July 1st, 1931, or earlier on six months' notice at £110. Allowing for redemption, the return at the price of issue is about 6 per cent. per annum. The Treasury raises no objection to the issue.

Birmingham District Power & Traction Co., Ltd.—The total revenue for 1915 was £101,909. Surplus, after providing £9,000 for renewals, £58,738. The directors recommend placing to reserve £5,000, a dividend on the preferred ordinary shares at the rate of 4½ per cent., carrying forward £2,551.—*Financial Times*.

Babcock & Wilcox, Ltd.—Speaking at the annual meeting on May 9th, Mr. J. DEWRANCE said that considering the enormous changes that had taken place since the last meeting, the balance sheet must be a source of great satisfaction. In pre-war days they made boilers, cranes, and conveyors; these were now cast aside, and they were making anything for which their factory was suitable without any stint of labour.

Kalgoorlie Electric Power & Lighting Corporation, Ltd.—The report for 1915 states that the average profit of previous years has been maintained. A further £7,000 has been added to the debenture redemption fund, bringing that item up to £14,000, and, after writing off £6,500 for depreciation and paying debenture interest, the balance carried forward is £1,139.—*Financial Times*.

Submarine Cables Trust, Ltd.—The revenue for the year ended April 15th was £25,489, and the expenses were £1,509, leaving £23,979. After providing £15,843 to meet payment of the coupons, £8,109 has been transferred to the redemption fund, leaving £77 to be carried forward.

Anglo-Argentine Tramways Co., Ltd.—The gross receipts for 1915 were £2,709,616, a decrease of £141,380. The expenditure was reduced by £94,256. No dividend on the ordinary shares is recommended. The credit balance of £91,120 is to be carried forward.

United River Plate Telephone Co., Ltd.—The directors recommend a final dividend of 5 per cent. on the ordinary shares, making 8 per cent. for the year 1915, free of income tax, carrying forward £6,234.

Victoria Falls & Transvaal Power Co.—The financial Press states that the net earnings (including those of the Rand Mines Power Supply Co.) for the quarter ended March 31st amounted to £192,874.

British Electric Traction Co., Ltd.—The directors, according to a financial daily, recommend a dividend of 3 per cent. on the new ordinary stock for the year ended March 31st.

Capital Reduced.—*British Uralite Co. (1908), Ltd.*—The Chancery Court last week sanctioned the reduction of capital already referred to here.

Melbourne Electric Supply Co., Ltd.—Interim dividend, 5 per cent., free of tax, on the ordinary stock.

STOCKS AND SHARES.

TUESDAY EVENING.

One of the principal features in the Stock Exchange market this week is the influence exerted over securities, particularly those of the best class, by the removal of the minimum prices from the pre-ordinary stocks in the Home Railway market. These have been protected in this way, of course, since the Stock Exchange re-opened, last January twelvemonth, and there was considerable speculation in advance as to whether

the freeing this market from the restriction of minimum prices might not drive a blow at other gilt-edged securities.

So far, however, no harm has been done to any of the gilt-edged departments; and the extension of the arena of high-class issues which the development entails has been accomplished without any disturbance to other existing values. Prices in the Home Railway market have fallen from 10 to 20 points, the movement being accompanied, oddly enough, by advances in the ordinary stocks of this market, for which the explanation is adduced that trustees of deceased accounts will now be able to sell prior-charge Home Rails instead of being compelled to limit their realisations to the junior securities.

The railway stocks with which we are more particularly concerned in these columns, to which the minimum prices have applied hitherto, are as follows:—

Stock.	Minimum.	Now.	Fall.
Metropolitan 3½ per cent. debenture	83½	65	18½
Metropolitan 3½ per cent. "A"	82½	64	18½
District 4 per cent. Prior Lien	92	74	18
London Electric 4 per cent. debenture	85	74	11
Central London 4 per cent. debenture	93	75	18
Central London 4½ per cent. preference	99½	78	21½
Metropolitan 3½ per cent. preference	77½	64	13½
Metropolitan 3½ per cent. "A"	74½	64	10½
Metropolitan convertible preference	74½	63	11½

The quotations in the second column—that is to say, those now current—are to some extent nominal even yet, because business is still a little cautious of returning to this market. Holders of the stocks argue that they have perforce kept them for so long that they may as well retain them a little longer, in the expectation of buyers giving more than the figures quoted above. Whether they will be right to refrain from selling, if they really wish to get rid of the stocks, seems to us a little doubtful, unless they are prepared to keep them for some time after the conclusion of peace.

Generally speaking, the best-class debentures have fallen to a level at which they pay 5 per cent. on the money; upon this platform, of course, they stand equal with the Exchequer Bonds of 1920. The preferences are approximately valued by the market upon a 5½ per cent. basis of yield; and it will be observed that the returns from the stocks, given in our list above, conform roughly to this scale.

With Daylight Saving so close at hand, it would certainly not have been surprising to find most of the electric lighting shares lower on the week. As a matter of fact, however, the only falls are those of ½ in County of London and in Westminster ordinary shares; while Cities are actually better at 12. There is, perhaps, less reason for dulness in Counties than in almost any other share throughout the list, since the company derives so substantial a part of its profit from supply of current for power that it should be less hit than its peers by the Daylight Saving Bill. The City of London is another concern with a big business amongst power consumers. Edison & Swan of both classes have further receded, their recent dramatic rises being too swift to last; as it is, however, the prices stand substantially higher than they did a month ago.

Anglo-Argentine Tramways continue to give way, and the first preference have dropped to 3½, at which they show a yield of 7½ per cent. on the money. Brazil Traction regained the loss of the previous week, moving up to 56½ in consequence of a recovery in the Rio rate of exchange to a shade above 1s. The principal rises in this section, however, stand to the credit of the British Columbia Electric Railway group, where the deferred is 5 points, the preference 4 and the preferred stock 1 point to the good. Traffics of late show comfortable evidence of amendment, and there is a well-founded impression that the severity of the competition endured for some time past has slackened noticeably at last.

The news from Mexico is scarcely so good just recently, and those who declared themselves buyers of Mexican utilities are exhibiting some little hesitation when a seller comes along. The nominal prices of the securities, however, are unchanged. The Carranzist Government is said to have prohibited the export of silver from any of the Mexican mines, from which the inference is obvious that it is desired to place the terribly depreciated paper currency upon a better basis. This, however unjust to the silver-producing mines of the country, might turn out to be a bull point for the industrial concerns; though, as vigorous protests have been lodged against the proposed prohibition, it may come to nothing after all.

Telegraph stocks and shares are strong, the only exception being West India and Panama ordinary, which have dropped 3/16 on the passing of the dividend. The Eastern Extension report shows splendid results, net profit coming out at £563,000, and the carry-forward of £38,800 being £7,500 more than was brought into the accounts. Anglo-Americans are good, the preferred hardening to par. Globes continued their improvement on the increase in the dividend. In the manufacturing group, Telegraph Constructions gained 10s., and India-Rubbers half as much.

Projectiles, at 20s. for the 1s. shares, are the main feature of strength amongst the armament group. The rubber market is calmer again; business is remarkably quiet in contrast to the rush before Easter. The Commodity market is something of a dark horse at the moment, but share prices are maintained with a good deal of firmness, and buyers from the provinces have begun to re-assert their confidence.

THE ELECTRICITY SUPPLY OF GREAT BRITAIN.

THIS subject was discussed at a meeting of the MANCHESTER LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS, the discussion being opened by Mr. J. A. ROBERTSON, who said that the present position of the electricity supply business in this country called for serious consideration in view of the steps which would have to be taken at the end of the war to re-organise and re-establish our national industries. The restrictions placed by the Local Government Board last year on new capital expenditure, coupled with the largely increased output of energy for war munition purposes, had reduced the reserve plant capacity in most central stations to a margin which would have been considered totally inadequate in normal times; the problem of utilising to the very best advantage the existing plant in central stations was, therefore, one that should receive the immediate and careful attention of all interested in electricity supply. The most serious difficulty with which central stations had had to cope during the last year had been the high price and the shortage of fuel supplies. The Prices of Coal (Limitation) Act, passed in July, 1915, conferred an immediate benefit in restricting the inflated prices which were then demanded, but the intention of the Act was not being fulfilled, and large quantities of coal were being sold at prices considerably above the maximum increase of 4s. per ton. The existing conditions called for thorough investigation, and, if found necessary, the Act should be amended to carry out the intention of Parliament. Indirectly, the difficulties under which central stations had been operating would do much good. Manufacturers who were still generating from private plants, or using steam or gas power, had found their power costs increasing by 30 to 40 per cent., while the central-station consumer had not been called upon to pay more than 10 or 15 per cent. increase in the rates for electricity. They had, therefore, the unique position of manufacturers applying for power supplies who were previously convinced they could produce more cheaply with their own plants, while central-station engineers were refusing applications for supply which no amount of canvassing could formerly obtain. The ultimate effect was bound to be beneficial to the electrical industry, and the time was, therefore, opportune to consider steps for improving and strengthening their position after the war. In the paper read by Mr. Williams at the Institution in London, they had Dr. Ferranti's splendid idea for centralising electricity supply put into the form of a concrete proposal. Mr. Williams believed that the time had arrived when a national scheme of bulk supply from large central stations might be introduced which would gradually supersede the inefficient, and in some cases obsolete, stations now in operation. All central-station engineers would agree that centralisation was desirable, but there were certain stages of development to be passed and difficulties to be overcome which were overlooked in the paper. The technical difficulties could not be set aside, particularly the differences in periodicities in various districts.

The present Government control of electricity undertakings by three departments was unsatisfactory, but the proposal to set up a Board which would operate electrical undertakings on such a large scale, and to give the Board powers now exercised by three Government departments, was open to severe criticism. He thought, also, that to place the control of a district comprising, say, the Midlands or the North-West of England, in the hands of one engineer-manager would not commend itself either to engineers or local authorities. The scheme did not propose to interfere with existing undertakings, but simply to set up a trading concern selling electricity in bulk. The power companies had been trying to do this for years, and had made little headway because they found in most cases that bulk supply could not be given to central stations at a price which would pay the standing charges on the necessary cables, converting and transforming plant, and also the standing charges on the superseded generating plant. Again, the Central Board would have no powers to compel a local authority to shut down its generating station, or to fix the price which the existing authorities were to charge for energy. A local authority might, therefore, continue to operate its own plant, and even to pay its extensions out of revenue, or it could purchase energy from the State system in bulk, and resell it at prices which were deliberately fixed high to ensure large profits for the benefit of the district rates. In either case, the object of a bulk supply scheme, i.e., the provision of cheaper electricity for all industrial and domestic purposes, would be defeated. State ownership might be the ultimate solution of the all-electric problem, but they would be faced with an enormous difficulty probably in a few months, or, at most, in a year or two, to meet the demand for a cheap power supply which was vitally essential for increasing the productive capacity of manufacturers after the war. Their task for the present was to ascertain what steps could be taken to utilise their existing facilities to the fullest extent, taking care only to make extensions or adopt methods which could be worked in as part of a larger scheme, when the time was ripe for it.

The policy of linking up existing undertakings, which had been adopted in one or two London boroughs, would have

to be seriously considered. The country for electrical purposes divided itself into eleven areas, which represented the important industrial and coal-mining districts. In each of these districts, the existing central stations could be linked up at a moderate cost. Later on, it would be a simple matter to supply the network thus formed from one or two large modern stations. About 220 generating stations out of a total of 364 in the whole country would be included in those areas. Most of the remainder were in residential districts, and it would not be profitable to connect them to any system of high-tension networks.

As an instance of what linking-up might do, the Manchester district was a striking example. There were situated within the Manchester area 15 generating stations with an aggregate generating capacity of 170,000 kw. Nine of these stations were generating three-phase energy at 50 periods, and there were no technical difficulties to prevent them being linked up immediately. The stations would act as reserves to each other, and the aggregate demand could be increased by 30 to 40 per cent. with perfect safety.

Hitherto, the chief obstacle to co-operation between existing authorities had been local jealousy, but if machinery was put in motion to combine these authorities for a common object this jealousy would probably disappear.

He proposed the formation of a joint board for each district, consisting of representatives elected by the supply authorities, along with a certain number of independent members appointed from the local manufacturers, who were, after all, the parties most interested in the question of cheap power supply.

As the joint board would require to raise capital, Parliamentary powers would be necessary, which might be limited at first to the raising of capital for the consolidation of existing undertakings. The powers might be enlarged later to include the extension of existing undertakings and the building of new stations. By this means they would obtain uniformity in administration, and other benefits, such as standardisation of rates for supply, would naturally follow.

It was not suggested that this proposal would provide a complete solution to the problem, but it would, at least, prove more workable than any nationalising scheme could possibly be at this stage; it could be put into operation with the minimum of cost, and, what was more important at present, with the minimum delay.

He agreed with the suggestion that the powers now vested in the Local Government Board, the Board of Trade, and the Home Office should be combined in a Central Electricity Board. This Board, which would be mainly composed of electrical engineering experts, would be the sanctioning authority for loans, and would, therefore, be able to exercise technical supervision over the proposals of the district boards.

There was another question closely bound up with the centralisation of electricity supply which, unless dealt with on national lines, would prove a serious hindrance to the object aimed at. Oil fuel might be left out of account while they were dependent on foreign markets for supplies. They were, therefore, absolutely dependent for the production of power on the supply of coal. Coal getting and coal distribution were an outstanding example of their haphazard methods in dealing with matters of vital importance. The colliery owner was left free to extract the coal, and to sell it to the highest bidder, even though he were the agent of a foreign Government not too friendly to this country. There was no attempt to grade or classify coal from particular districts for industrial purposes. Prices varied within wide limits, and at one time they were threatened with interruption of supplies through strikes, while at another stocks were held up in order artificially to inflate prices. The time had arrived when a Commission should be appointed by the Government to report on the national supply of fuel with the object of utilising it to the best advantage. The question of transport should also be dealt with, so that they would not witness the anomaly of coals being shipped from Newcastle to Manchester district, whilst collieries within a 20-mile radius of Manchester were actually sending consignments of coal to Newcastle for export. The Limitation of Prices Act would require to be strengthened and compulsory arbitration introduced to prevent an interruption of coal supplies through strikes. To avoid such strikes some form of profit-sharing might be established which would give the worker a direct interest in the concern for which he worked.

These proposals might seem somewhat daring, but if they were to make good the wastage caused by the war and to retain their commercial supremacy, the problem must be dealt with on broad lines. The ideal to aim at was to convert their natural resources, fuel and labour, into power, light, and heat, so as to achieve the highest individual and national efficiency.

If the war caused them to scrap their old methods and to reorganise existing systems with the view of attaining higher standards, the enormous sacrifices which it had entailed would not have been in vain.

Mr. J. S. HIGFIELD said that one of the reasons for the success of electricity supply undertakings was the possibility of working with less coal than the individual manufacturer. He thought it was a mistake originally to grant powers to public companies with terminable concessions, as during the last few years preceding the termination it would be difficult to raise capital for so short a period, and they would not invest their reserve funds freely in the business because of

the doubt as to what they would get for the undertaking when it was sold. When the Power Acts were granted in 1900, that fault in the original legislation was realised, and power companies were formed without compulsory purchase clauses. Even without such a Board as had been suggested, a great deal might be done with regard to linking up, so that the small stations should not be unnecessarily extended. The electrical industry in this matter had suffered from professional jealousy; there had not been that assistance given between managers of supply authorities which would have made connections possible. He had not much belief in Government control, because it was not possible to alter human nature by legislation. The war was going to do a lot for them, and it was making people see that the success of one's neighbour was in a very large measure one's own success.

Ald. W. WALKER said that in principle the linking-up of stations would be a good thing for the community; when, however, details came to be discussed the human element entered into the matter. When dealing with representatives of public bodies and directors of private companies, with their professional and technical staffs, one immediately found that each took a conflicting view as to which was the main concern. At present they were handicapped by having to go to Parliament for permission before a step could be taken to improve the conditions in a given area. There ought to be some body to whom an appeal could be made, who would consider these questions solely on their merits, and not with sentimental or political motives.

Mr. A. E. MCKENZIE said that in Manchester the price of gas had been increased approximately 24 per cent. in the last twelve months, as against 10 per cent. to 15 per cent. for electricity. Mr. Robertson's suggestion that the proposed Board should fix the selling price would involve considerable difficulty, as each municipality had its own ideas as to the amount that the electricity department should contribute to the rates. The Manchester electricity department had for some years contributed a sum of £30,000 per annum in relief of the rates. If it were proposed that the department should be State controlled, he was sure the inhabitants of the city would offer great opposition to the scheme, unless this rate aid was continued. Great economies would be effected if the linking-up of stations was brought about; it was absurd that municipal boundaries should be insurmountable barriers against such a scheme. Professional jealousy also tended against its adoption. It had been done in several London boroughs, with very great saving. In Lancashire it could easily be arranged by the engineers of the various undertakings, and undoubtedly good would result.

Mr. S. J. WATSON thought that one of the great difficulties of a Joint Board would be that of finance. He suggested that the capital might be found partly by municipal bodies and partly by private enterprise. A further step might be taken to appoint representatives from the local Boards to a Central Board in London, which should possess very wide powers. Not the least matter which such a board would have to deal with would be the conservation of coal supply. It would have power to stop the establishment of any further small generating stations, and also to consider the advisability of continuing existing stations or forcing them to take a supply from some other larger undertaking in the district. When Chairman of the Manchester Section, some five or six years ago, he went carefully into the question of linking-up the different stations, and found that if all the supply undertakings within an 8 or 10-mile radius of the city were coupled up, it would set at liberty for use spare plant to the value of approximately half a million of money. He agreed with Mr. Highfield on the question of perpetuity of tenure; if an order was limited, higher prices must be charged than would be the case if the time was unlimited, owing to the uncertainty as to what would happen at the end of the term.

Mr. C. C. ARCHISON agreed that there should be a Central Electricity Board in London, but its functions should be mainly in the direction of finance and general guidance. There should be some standardisation of systems throughout the whole country; at the present time systems were very varied, and it would be difficult to link up the stations in certain areas owing to the difference in frequencies, and so on. With regard to the profits from municipal stations, he thought that the ratepayers were entitled to a reasonable return from their trading undertakings, but not to the extent some of them had contributed in the past. The friction which might exist between undertakings in connection with the linking-up of systems did not, in his opinion, arise from engineers, but was purely a question of local councils. No doubt in the future it would be necessary to link up certain stations, and the engineers were quite willing to consider such a scheme with interchange of supplies regulated in a manner like the railway clearing-house.

Mr. J. H. WOOD thought the time was ripe to consider the question of linking up. This could be done without a Board, by a meeting of the different authorities. Many of the smaller undertakings had found it necessary to limit their undertakings because they could not enter upon any additional capital expenditure until there was some revenue from the capital already expended. Many consumers were lost in this manner. With regard to coal supplies, a Board on the lines suggested by Mr. Robertson could control both prices and quality. He suggested that a Board might regulate the amount to be paid for labour.

Mr. R. BLACKMORE thought there was no good reason why

the suggested Board should be formed. It had not yet been shown that super-stations could generate more cheaply than a medium-sized station. Linking-up was good, but it was not necessary to bring in Parliament to do it. Tramways had already been linked up, and electricity stations could be linked up similarly.

Mr. J. D. PATON said that engineers should not confine themselves to pure technical electrical engineering, but study mining engineering, in order to deal with the waste coal and future supplies of coal for electric power. They had millions of tons of waste coal which yielded 40 or 50 gallons of oil to the ton, but the colliery owners could not produce this material till it was demanded. The coal which was now estimated as valuable coal would in the near future be relegated to a position of secondary importance. Coal fired for a thermal value only would become a thing of the past, and take a secondary place to coal which would yield a high oil and by-product return.

Mr. ROBERTSON agreed that the high price of coal was a good thing for electricity undertakings for the time being, and even if it continued, but a broader view should be taken. To re-establish their position after the war in the world of commerce, they must have cheap power, and therefore cheap fuel. It was just because of the human element that it would be necessary, in his opinion, to go to Parliament to obtain powers to over-ride those local councils which might not be prepared to come voluntarily into a local linking-up scheme. He had not proposed that uniform prices should be charged in one district or in one undertaking; he had simply said the Local Board should be the authority that would fix the prices for each area or portion of an area. He thought that was a very necessary thing, because if they were introducing a bulk supply to a group, one local authority might fix prices without any reference to the actual cost, or the actual value to the consumer. He did not think an electricity undertaking existed for the purpose of making money to be handed over to the ratepayers who were not possible consumers of electricity, and who would never be called upon to make good any deficiency that might arise. Any surplus or profits should be transferred to the reserve fund, and so prevent the possibility of the ratepayers being asked to make good any deficiency. The linking-up arrangement he suggested was only a temporary one, to meet the difficulty. His own view was that the powers possessed by these Boards should go much further later on, and would ultimately result, he believed, in the nationalisation both of generation and distribution.

AMERICA AND EXPORT TRADE DEVELOPMENT.

IN the proceedings of the last annual convention of the National Commercial Gas Association of America, there appears a report of an address by Dr. E. E. PRATT, Chief of the Bureau of Foreign and Domestic Commerce of the U.S. Department of Commerce, on the subject of export trade development. He said that at the outbreak of the war much was said about America's exceptional opportunities for securing export trade, but he believed that many such statements were unduly optimistic, being made by persons who were inclined to take an exaggerated view of the possible expansion in the foreign field.

One assertion, however—and it might be regarded, after all, as the fundamental one—was absolutely true. The disturbed conditions in Europe did, and still do, give American manufacturers an altogether unusual opening for the building up of foreign trade. But the expectation of immediate returns, of getting a great number of cash orders in foreign countries, was ill-judged and failed, very naturally, of realisation. There was ground for the belief that many exporters thought they had only to go to South America, to Australia, to South Africa, to Japan or China, and pick up the orders overlooked or left behind by the countries that had become involved in the great military conflagration. Such a view was hardly justified. The European war broke up so completely the machinery of the world's traffic and the world's credit that it was impossible for many months to get orders in foreign countries. It was impossible for many months to get the cash for orders that had been taken before or during that time. The chief advantage derivable by American manufacturers from the unprecedented situation that confronted them at the beginning of the war was the chance to lay a solid foundation for future business. That was still true. The opportunity was not so much an affair of present profit as of earnest, judicious building toward a goal which, while it was clearly discernible, could not be grasped at once. And when this end was finally reached, the accomplishment would be valuable and important just in proportion as the preliminary work had been systematic and well done.

The American manufacturer had, in some ways, been slow to seize the advantage that conditions now afforded. Many were hesitating; they were waiting to see what someone else could do; they were reluctant to extend the necessary credit facilities. But, on the other hand, there were many enterprising, far-sighted manufacturers who had gone into the

foreign markets with vigour at this time. They might not all be taking orders; but they were gradually, surely, paving the way for future trade. He knew one manufacturer who had sent out his salesmen (his business diplomats, they might more properly call them) for the purpose of establishing on secure foundations the business in these foreign countries. He knew of manufacturers who had planned extended campaigns for from one to five or ten years—not with the idea of getting immediate sales or of making marked conquests next year, or the year after, but, rather, of attaining an eventual position that would ensure the coming of a notable volume of business into their hands. Some of them might not realise the increase of American trade with the countries that were entirely outside the war zone. They were enjoying, of course, an augmented trade with the neutral European, as well as with the allied nations. There might not, however, be an adequate comprehension of the way in which U.S. trade with South America, for example, had increased. Comparing the four months—June, July, August, and September, of 1913—with the same four months of 1915, U.S. trade with South America had increased 21.5 per cent. That must be regarded as a considerable increase in a large volume of trade. "Our trade with Central America has, unfortunately, not increased. Our trade with Canada has actually decreased by almost 9 per cent. Our trade with British South Africa has increased 12 per cent. Our trade with Asia has increased 50 per cent., and our trade with Australia has increased by the astonishing amount of 77 per cent. These figures convey, more emphatically than any long analysis, a sense of what has happened in the markets that are not in the zone of military operations."

He did not wish to be understood as discouraging the hopes that had been aroused with reference to the Latin American field, but it seemed worth pointing out that there were markets in other countries that were of equal or greater importance. After all, in all of Latin America, including Mexico and the West Indies, there were 75 million people. But in certain other parts of the world there were tremendous populations—populations capable of absorbing vast quantities of goods. Passing over South Africa and Australia, with populations of 6,000,000 and 5,000,000 respectively, he spoke first of India. India had 315,000,000 people. Its imports in 1913-14 amounted to the total of \$594,517,000, of which the United States furnished only \$15,542,000. The value of American products consumed annually in India was less than 4 cents per capita. India had been characterised by a recent writer as "the treasure sink," and to an American commercial traveller it seemed like "a bottomless pit, into which supplies may be sent in an endless stream."

The East Indies had 40,000,000 people; Japan had 53,000,000; China had 350,000,000; and last, but by no means least, Russia had 170,000,000. Some of them were thinking that the people of those countries had not the purchasing power of the South Americans. If an individual average were taken, that was indisputable; but the fact should, nevertheless, be stressed that, in the aggregate, countries like India and China had a genuinely enormous purchasing power. In Australia—a field that in many discussions received comparatively scant attention—the average man bought about 50 dollars' worth of goods from the United States every year.

Russia, in his opinion, was perhaps the most promising market to which American manufacturers could just now look forward. It was a great, but largely undeveloped country. In all Russia there were now only about 46 thousand miles of railways; within the next few years, thousands of miles would be built. Only 20 per cent. of the large cities of Russia had either electric or gas plants. Only a small proportion had such public improvements as sewage and water systems. Russian mines, forests, and mineral resources were relatively undeveloped at the present time.

During the last few years Russia had been importing annually, from all the countries of the world, an average of \$600,000,000 worth of goods. About half that amount, or \$300,000,000, had in the past been sold by Germany. They might decide for themselves whether, after the termination of hostilities, such an amount of goods would continue to be taken from Germany into Russia. Present indications pointed to the probability that the trade would be divided between England and the United States on the west and Japan on the east. A tremendous amount of goods had been flowing from the United States through Germany into Russia. Germany, in fact, had acted as the middleman for most of U.S. Russian trade.

Dr. Pratt next glanced briefly at the methods of entering these markets. To one essential principle they might adhere, and that was that foreign was not basically different from domestic trade. They might reasonably expect to succeed abroad if they employed there the same fundamental principles that they had used in the successful development of their business in the United States. To illustrate this, they might cite an example. Suppose an American manufacturer located in New England were about to develop a new market on the Pacific coast. What would he do? Probably his first move would be to go there himself, looking over the field personally, formulating his impressions of it, determining whether there was likely to be a market. Then, quite probably, he would send out his sales manager for the purpose of acquainting himself with the sales methods of his competitors, and with the idea of testing out the market and ascertaining exactly what kind of products should go there. In the event that he represented a

large corporation, he would send there skilled business investigators, in order that they might actually go to the consumers, find out what competing products were marketed, and gather together the many facts that a large manufacturer would desire before embarking on an undertaking of that kind. He would then be likely to set aside a small advertising appropriation, not so much with the idea of getting immediate business as of seeing whether the market would respond to methods he had used before—whether, in short, his goods would "go." After satisfying himself on these preliminary points, he would send out his salesmen. Most manufacturers would scarcely expect a group of salesmen in a new territory to show a profit at the end of their first trip. If they turned in profits at the end of a second or third trip, or even a fifth trip, the manufacturer would, in most cases, be satisfied. Later, headquarters, or a branch store or distributing warehouse, would be established in the locality, and finally, perhaps, a factory might be established. How did the same manufacturer approach the subject of foreign trade? He probably got together, in the first place, all obtainable books that had to do with the particular market that he contemplated entering. He sent to the Government for publications, and the Department of Commerce could, as a rule, supply him with interesting literature.

Writing to an American Consul, he might secure a list of all the persons in that district who would be likely to take his goods. His next step was to send out circular letters and catalogues of his goods—printed, perhaps, in English. As a result of these efforts, he might get an order. This he filled. Greatly elated at his success in the foreign field, it was quite probable that he might neglect altogether to look up the purchaser's credit rating—a thing he would not fail to do if he were shipping a bill of goods to Tacoma or San Francisco. Perhaps, finally, he became sufficiently resolute to send out a salesman; but almost invariably (and contrary to his usual custom) he would expect that salesman to show a profit at the end of his first trip.

"We have all heard men say: 'There is nothing in this foreign-trade game. I have tried it. I sent out a salesman, and he made no profits, and I am done with it. I am convinced there is nothing in it.' That is emphatically not the way to work up a business in a foreign market. The manufacturer who does business on such principles abroad will fail just as surely as the man whose methods I have previously outlined is certain to succeed in the domestic field. Let me repeat, therefore, the fact that, after all, the same businesslike principles are applicable to the foreign trade as to the trade at home."

Certain modifications were, of course, necessary, but, from the standpoint of general policy, these were of relatively small consequence. A few surface conditions presented new problems; a few obstacles or handicaps must be surmounted; but these things were a matter of detail. In South America, as had frequently been stated, travelling salesmen must possess the qualities of courtesy and politeness; business transactions there rested, in a large measure, on a basis of personal friendship and esteem. And, in addition, the methods were more leisurely; breeziness, hustle, a determination to make a quick sale must yield in those countries to the practice of quietly deferring to the wishes of the buyer. Adjustments, adaptations, must be made in minor matters such as these; the successful exporter and the successful salesman must show a willingness to conform. "But is not the same true, in a less degree, perhaps, of the United States? There are, I think, some sales managers here. Is it not true that you have to do business in different ways in different parts of the United States? Is it not necessary to use different sales methods in New York and in Chicago, in San Francisco and in New Orleans? Before passing on to another phase of commercial life, let me reiterate my conviction that, in so far as your domestic trade methods are sound, logical, and well-considered, they will need no material alterations when brought to bear upon the foreign field."

With respect to co-operative marketing for export, there was really not much that could be said, since information on the subject was more or less limited. The German cartels had been pointed out from time to time as an example of what they ought to do. He thought, however, that there was some misunderstanding as to precisely what the cartel was and what the cartels in Germany were actually doing. As a matter of fact, these were organisations (perhaps the word "pool" would more nearly express their character) of independent manufacturers and, strange as it might seem, of independent consumers. A large proportion of the German cartels were organisations of consumers and not of producers. These had been brought into existence by conditions growing out of the producers' organisations; they therefore found in Germany a peculiar situation, in which organisations of producers were opposing similar organisations of consumers. Some of the German cartels were very loose associations. Some of them merely controlled the conditions of sale; some controlled certain other market conditions; some actually fixed prices; others fixed the proportion of profit or the proportion of the market that was to be allotted to various producers belonging to that cartel.

Only a few of the German cartels had any definite foreign-trade policy, and where such a policy existed it was, in many cases, not well developed. "I think I am justified in saying that Germany has succeeded in foreign trade, not because of her peculiar organisation of industry, not because of the pre-

...of cartels, but rather because every German manufacturer who is in for foreign trade brings to that field an energy and perseverance that compel results. He gets all the facts together and then, with his knowledge to guide him, markets his goods in essentially the same way as in Germany."

Dr. Pratt next referred to the work of the Bureau of Foreign and Domestic Commerce in helping American manufacturers in their efforts to win such trade. The nation got information from a number of sources: First, from the Consuls, of whom there were about 400; second, from the commercial agents, of whom there were about 20. These latter were experts on certain commodities, such, for instance, as boats and shoes, or electrical apparatus, or gas appliances. Then, in the third place, they got information from the commercial attachés, a new service which had been in existence about a year. The information obtained from all these sources was brought together, systematised, and coordinated in Washington at the Bureau of Foreign and Domestic Commerce, whence it was disseminated by correspondence, through their publications, and by means of their district offices, which were located in eight cities. In addition to these eight district offices, the Bureau had co-operating branches in the chambers of commerce in five other cities.

In regard to the commercial attachés, there were ten of these trade diplomats, with headquarters at London, Paris, The Hague (the man assigned to Berlin is temporarily at The Hague), Petrograd, Peking, Melbourne, Santiago, Lima, Rio de Janeiro, and Buenos Aires. These men did not, in any way, duplicate the work of the consuls. The consuls had a comparatively restricted district and were burdened with a tremendous amount of routine work. The attaché, on the contrary, had jurisdiction over an entire country—sometimes two or three, or even five, countries—and his business was to attend to the more general problems, the things that concerned the country as a whole rather than the minute, local features that concerned only a particular district. For example, their commercial attachés at Rio de Janeiro had given almost his entire time to a careful study of the tariff situation. Their commercial attaché in Petrograd had given a portion of his time, among other activities of promotion and investigation, to getting out copyrighted goods. Their commercial attaché at The Hague had given practically his entire time to facilitating the movement of goods, so far as possible, in and out of Holland and Germany. Their commercial attaché at Peking, China, had done a number of things, especially in the way of getting Americans appointed as special advisers to China on such subjects as cotton mills, agriculture, or similar economic matters. Perhaps the most interesting achievement of any of their men was that of their commercial attaché at Paris. "We received an invitation from the King of Spain, coming to us through the Department of State and asking that a commercial man be sent to Madrid. The King desired a conference and exchange of views with respect to commercial relations between Spain and the United States. Our commercial attaché was therefore sent from Paris. In the course of his conversation with the King of Spain, he mentioned to His Majesty the existence of a transport tax on coal—a tax that placed American coal at a serious disadvantage as compared with English coal and, in fact, practically kept our coal out of the Spanish market. His Majesty was much interested and asked many questions. Three weeks later the transport tax on coal was abolished by Royal Decree, and there is now a market in Spain for approximately 3,000,000 tons of American coal a year."

the proper performance by them of their statutory obligations) had been consulted on this letter, and whether such department had given their support. Or, as the alternative, whether the letter in question emanated from some one or other department in the Board of Trade whose interests are entirely alien to the electric supply section, and who, acting independently, are trying thus adroitly to "draw" the industry. It is to be hoped that the engineers had not allowed their innocence to be traded on.

The letter from the Board of Trade may be regarded as a kind of knot in the stretched rope of tug-of-war. On the one side there are the electric supply and gas companies, and on the further side there is, one may surmise, a very astute body of colliery owners and others who have everything to gain by decreasing home consumption (which is under "limited" prices) and increasing the export consumption (which can command fancy prices).

With regard to the Board of Trade circular itself, this has already met with full criticism in the electrical and gas Press. One can only regret that on one of the few occasions when the Board of Trade has woke up from its Rip Van Winkle somnolence its activity should not have been better considered. Anyhow, we await with interest the result of the Institution meeting.

Poly.

Justice to Inventors.

I would like to endorse the very opportune letter written by "Fair Play" and inserted in your issue of May 5th. Unfortunately, inventors cannot hope for any immediate assistance from our Government. The immediate question arising, therefore, is: "What is the best course to adopt at the moment?" I would suggest three initial steps—

1. That every inventor whose British patents are adversely affected by the war should, either directly or through the medium of his patent agent, pay his patent renewal fees under vigorous protest.
2. That inventors should bring their grievance to the notice of their respective trade associations.
3. That trade associations should be invited to co-operate on the subject, and when a fitting time arises they should present a concrete proposal to the Government.

For my part, I have already adopted suggestions (1) and (2), and shall be glad to further joint action and to interest my trade association if the suggestion meets with general approval. In the meantime, inventors are indebted to you, Sir, for allowing this subject to be ventilated in your valued columns.

Inventor.

The Pronunciation of "Ljungström."

I think it would interest a few of us readers of the REVIEW if we had the English pronunciation of the word "Ljungström" as applied to the turbo of that make.

James A. Burns.

Magheramorne, May 13th, 1916

[We sincerely sympathise with our correspondent, and have made inquiries; it is difficult to convey the result to our readers in print, but we understand that a fair approximation to the Swedish pronunciation is given by "Yongstrom." The English pronunciation seems to be a matter of personal taste.—Eds. ELEC. REV.]

The I.E.E. Election.

May I be allowed to say that my sentiments on the matter are identical with those of your correspondent of last week, though I am afraid the course he adopted with his ballot paper may have invalidated it.

Think of a number of years, say, 20. Then can anyone deny that in that long period there would be many more than 20 fresh men to select from; men who deserved and who could act up to the highest position in the Institution?

The Council and the Local Sections seem chiefly to blame in not giving us a new President.

Speaking of Local Sections reminds me that I was once a disgusted member of that at Manchester. It had far less "go" in it than the committee of any sort of club.

There were other things in the ballot paper that were not clear to me, but it showed in black and white that there was only one small body in the whole Institution that had the gumption to put forward an outside candidate for the Council. I voted for him without hesitation.

We have recently been told, officially and numerically, how poor the response is when members are asked to indicate their wishes on voting papers sent them through the post. The conclusion one arrives at from this and other signs is that the majority of I.E.E. members are hopelessly indifferent to things. What else can be said of men who lack the *esprit de corps* to lift a pen, do a little thinking, write a word or two, and spend a halfpenny or a penny on a stamp?

The occasional grumbler (and I am one of them) seem to forget that by co-operation and procedure on regular lines, the carrying out of any desired "reform" if it really had much to recommend it, would be comparatively easy. So perhaps, after all, the Council is not so very much to blame.

W. Perren Maycock.

London, S.E., May 14th, 1916.

CORRESPONDENCE.

Letters received hereafter 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The I.E.E. and a Current Commercial Problem.

It is always very gratifying when the Institution take under their aegis a commercial problem. Their latest essay in this direction had been taken on the recent issue of the Board of Trade circular asking gas and electric light companies to get their consumers to reduce lighting consumptions by 10 per cent. Thereupon, the Institution duly convened a meeting of the engineers of the supply undertakings. We are sorry, however, to have to criticise their method, even at this preliminary stage. The whole question is a commercial one, and, surely, the commercial side should have been adequately represented. Instead of this, it appears to have been composed of the station and other engineers, despite the fact that the Board of Trade letter does not raise any engineering point but one of policy. History in the past has shown that for such questions to be dealt with by station engineers is to invite trouble. It has not yet been made public what corporate action has been decided upon, but one may be pretty certain that the engineers have been "drawn." We must remember that they are up against very strategic opponents.

I should, incidentally, like to know whether those who are responsible for calling this meeting have taken the trouble to ascertain whether the Department of the Board of Trade who are directly responsible for electric supply undertakings (and

The Resistance of a Cube.

There is an error in the demonstration by Mr. Makower, "The Resistance of a Cube," which is not brought out in the communications of Mr. Carter and Mr. Smith in the issue of March 24th.

Mr. Makower is correct in stating that the conduction in the sides of the cube will be made up of six parallel circuits, each consisting of two triangles in series; but he errs in assuming that the stream lines in these triangles will be the same as when these triangles represent quarters of a square with electrodes at two opposite corners.

This may readily be shown by developing the surface of the cube out into a plane, as in the accompanying figure. F represents one electrode and G the other. FCD is one of the triangles referred to, and the stream lines shown are for the

case when it is part of a square. GCD is the triangle in series with it, and it will be noticed that this triangle is reversed with respect to the first. The result is that the line CD is no longer one of equipotential, and the stream lines will not follow the same course as in the case of the square. Hence the resistance cannot be computed on the basis of this analogy. The result is approximately correct, but is not exact.

Of course, it is necessary to consider an electrode with appreciable size, but this may be taken the same for both square and cube.

M. G. Lloyd.

Chicago, U.S.A., April 21st, 1916.

Daylight Saving.

In your first editorial on this subject you referred to having received protests from Mr. Willett and myself against your antagonistic attitude to this measure, and with regard to mine, you expressed astonishment "that one whose profession it is to propagate accurate time service should lend his aid to the destruction of that ideal." I trust, therefore, that you will permit me to reply to the more important points in your two articles.

Greenwich mean time fixes the minutes and seconds only. They remain permanent and universal. I yield to none in my pride in the fountain head of the world's time-keeping, and it was left to me to protest against our lamentable failure to take any share in the work of organising international wireless time service, an undertaking which our country was most competent to perform. Daylight saving takes nothing from the prestige, utility, or permanence of Greenwich mean time, which is the world-wide standard for minutes and seconds. But the position of the hour-hands is variable, is, in fact, already different for each of the 24-hour zones, is fixed by every country for the convenience of its inhabitants, and may be moved backwards or forwards at will to secure the greatest good for the greatest number. A forward movement in the spring is demanded in latitudes like ours, where the inertia of winter habits results in our sleeping many hours behind blinds drawn to keep out the sunlight.

In your current issue you say that the original proposal was optional, and the present one compulsory. There was no more option in the Daylight Saving Bill of 1911 than in today's Summer Time Bill. In both the option is with the individual, who may, if he likes, refuse to conform. It is obvious that few would be so eccentric or stubborn as to exercise this option to their own detriment and vast inconvenience.

Why should we feel this to be "a voluntary self-deception and a slur upon our moral strength" any more than the daily clock alteration on an Atlantic liner? The cause is similar and the object desired is identical. Owing to a change in the hours of daylight relatively to the human time-table, we get out of phase with the sun, and a correction must be made. The one is measured by latitude, due to a change of seasons, and the other is measured by longitude, due to a change in our position.

Denounce, if you like, a calendar based upon hours of uniform length, but unless and until you are prepared to revert to the Roman method of "temporary" hours, i.e., hours of varying length (and, incidentally, to give up the measurement of time, yea, even astronomy itself as an exact science) your only alternative is to pass a Summer Time Bill.

I cannot conceive of any other means whereby man can adopt the estimable habits of the lower creation and vary his time-table from winter to summer with the unanimity demanded by modern civilisation. If you have an alternative we look to you to suggest it rather than to indulge in purely destructive criticism, which, fortunately, cannot now destroy.

It will be no easy task for my diminished staff to alter 5,000 clocks in London alone next Saturday night, but I think it is to the credit of the electrical profession that it has contributed a method by which it can be done comparatively simply and with precision.

F. Hope-Jones, M.I.E.E.

London, E.C., May 15th, 1916.

TRADE STATISTICS OF ITALY.

THE following statement, showing the imports of electrical and similar goods into Italy during the year 1914, is extracted from the recently-issued trade statistics. The figures for 1913 are added for purposes of comparison, and notes of any increases or decreases are given.

THE INTERCONNECTION OF ELECTRICITY SUPPLY UNDERTAKINGS.

We have followed with the keenest interest the recent discussions at the Institution of Electrical Engineers on the proposals put forward by Mr. Ernest T. Williams for the reorganisation of electricity supply in this country, on the bases of centralisation, co-operation, and interconnection, and have cordially welcomed the new spirit which seems to be stirring the dry bones of this exceedingly important branch of the industry. Hitherto, to judge by the actual course of events, the watchword of most undertakers of electricity supply, whether company or municipal, and of most engineers connected with them—but, happily, not all—has been "every man for himself"; the petty jealousies of municipalities and of supply engineers were freely blamed in the Manchester discussion for the failure to secure co-operative working between them, although the fact was clearly recognised that very great advantages could be derived from a policy of interconnection of systems and genuine co-operation, particularly in such densely inhabited industrial areas as those of South Lancashire, Yorkshire, and Birmingham. But there was ample evidence that the national importance of the matter, the changed conditions, and the general awakening of the nation to the imperative necessity of placing efficiency and economy above all minor and local considerations, were bringing about a new attitude of mind towards such questions, and that the time was ripe for action.

We were, therefore, intensely pleased to receive from the Board of Trade a copy of a letter which it has addressed, under date May 25th, to all electric supply undertakings in the United Kingdom, in the following terms:—

The Central Coal and Coke Supplies Committee have had under consideration the increasing difficulty in providing for the supply of coal to important consumers, and have advised the Board of Trade that in view of the possibility of a serious shortage in the near future every practicable economy in consumption should be adopted without delay.

In this connection the Board desire to call attention to the very considerable saving that can be effected by the adoption of arrangements for interconnection and joint working of electric supply undertakings, including interconnection with stations supplying tramways and railways.

The Board are aware of the difficulties involved at the present time, particularly in regard to labour and materials, but they are advised that in many cases the necessary arrangements could be made at once, and they wish, therefore, to urge upon electric supply undertakers the necessity in the national interest of taking immediate steps to avail themselves to the fullest possible extent of the powers which exist for the purpose.

Any application which may be made to the Board of Trade for their approval of such arrangements under the powers conferred on them by the Electric Lighting Act, 1909 (Section 4 Sub-section 3) and the London Electric Supply Acts, 1908 and 1910, will receive their immediate attention.

The Board are prepared to assist as far as possible in cases where difficulty is experienced in securing the agreement of all the parties interested in any proposed scheme, or in arranging the terms and conditions under which it shall be carried out.

The importance of this step can hardly be exaggerated, not only in its bearing upon the conditions which exist in war-time, but also in its effect upon the whole future of electrical engineering in this country. We heartily congratulate the Board upon its prompt action, and upon the intention, which is plainly manifest, to follow up the policy suggested. We would gladly see it go further, and obtain com-

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGREKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 is. 6d.; Canada, £1 is. 10d. (\$5.80). To all other countries, £1 10s.

pulsory powers to enable the Board not merely to "urge upon electric supply undertakers the necessity in the national interest of taking immediate steps," but also to ensure the adoption of its suggestion. This is no time for coaxing and wheedling; what the nation is crying out for is government with a firm hand. We have seen the lamentable results of the former policy in only too many instances; we have seen also how readily and willingly the nation complies with an order backed up with energy and decision. To be effective during the war, the policy of interconnection must be put into force *at once*.

The immediate benefits to be derived from this course chiefly consist in economy of fuel, the expressed purpose of the Board, and the release of stand-by plant to cope with the increased demand for power. These features may at first sight appear to be somewhat conflicting, but a little consideration will show that the small and inefficient power stations can be utilised as a reserve to the large stations equipped with modern economical plant; the latter will be able to supply a greatly increased demand, and yet show a great reduction in the aggregate consumption of fuel. No interference with local management of the distribution of electrical energy is necessary, at any rate for the present, and we feel sure that station engineers, a most patriotic body of men, will heartily support a movement which is shown to be of advantage to the nation, while their private interests can readily be safeguarded, if they feel it to be necessary. We trust that no time will be lost in pressing on with a proposal which we believe to be of the first importance to the nation, to the electrical engineering industry, and to every consumer of light, heat, and power throughout this country.

The Future in Russia.

IN discussing the future of trade in Russia we have on several occasions expressed the opinion that Germany's influence in that and other markets would wane as the financial difficulties within the Central Empires developed, rendering necessary or politic the disposal of securities in electrical and other engineering undertakings. Of course, whether the weakening would be temporary or permanent would depend to some extent upon the ability of German interests to re-purchase the securities after the war, and upon whether they were transferred to friendly hands in neutral lands as a matter of war convenience. Present indications do not suggest that such ability will be very substantial, but there are certain signs that transfers are being made.

Another very important point to which we have also already alluded several times is the need for engineering industrial development in Russia, by Russians, and by nations which are now their Allies. Engineers, at all events, have long recognised that Russia would have been able to withstand the German and Austrian offensive last year with even greater brilliance and effect—indeed, the war might never have come at all—if she had been more advanced as an engineering and industrial nation. We may judge from the many utterances that have been made by responsible statesmen, scientists, engineers, and industrial authorities in Russia, that this aspect of the situation is as keenly appreciated there as it is here. They have a land of vast resources, and they desire to release it from the strangling grip of the Teuton.

Both of the foregoing matters are referred to in a very businesslike interview which "Sergius," of the *Daily Chronicle*, has had with Mr. A. Protopopoff, the vice-president of the Russian Duma, who, we are told, is looked upon as the future Russian Minister of Trade and Commerce. His great desire seems

to be to revolutionise the whole of Russian trade—if he succeeds in revolutionising only a part of it he will have done much to open the way for the development of closer relations with British finance, industry, and commerce. He recognises the need of British capital, says that the desired guarantees and facilities that our capitalists require will be forthcoming, flouts the opinions of those Russian economists who blindly demand a complete control over the capital, and who want only Russian engineers and workmen to be employed, leaving the English capitalist merely a dividend. Mr. Protopopoff says: "Give us English Engineers, English managers, and even English skilled workmen. We will learn from them. We are going to open wide our doors to Allied capital . . . and see that such conditions are created . . . as will facilitate the turnover of capital." Railways will be required on an extensive scale; gold, iron, and coal mining industries clamour for development, and after the war "we shall build up new industries and develop the old ones, and thus emancipate ourselves." It may be that in the readjustment of affairs, when the war is ended, there will not be very much capital free for such purposes immediately. But Mr. Protopopoff will, as time passes, and as the position comes to be tackled, see that finance is but part of the huge problem, and British manufactures will be wanted by the million sterling if the German yoke is to be flung off. His sympathies, we are sure from other comments made in the interview referred to, will lead him to advocate the facilitation of British trade quite as enthusiastically as he now argues for British finance, which is promised a fair return, "perhaps many times greater than the profit on . . . manufactured goods." He praises highly the efforts of his friend, Prince Shahovsky, the present Russian Minister of Trade and Commerce, to bring about closer business relations between the two countries, urges the organising of visits of British business men and experts to Russia, and the setting up of an Official Information Bureau. He is careful to warn British manufacturers and capitalists against throwing themselves haphazardly into Russian enterprises, and in this he is but preaching what we have ourselves long advocated, a policy of unity and co-operation in a strong effort on the part of British electrical and engineering manufacturers to build up a thoroughly sound organisation equal to the immense possibilities of the situation. All efforts to this end may not be as free from set-backs as we might desire, and some appear to be delayed because we are lamentably short of the right type of men to carry these operations through with experience and authority. We trust, however, that some of the financial minds of the British Empire have their attention fixed upon the concessions, electrical and other, the hold upon which Germany is now being driven to loosen. These may be regarded in many cases as key concessions to fit and turn the lock of industry.

German Realisation of Foreign Securities.

IN connection with what we have stated above, we are informed that a movement is in progress in Germany in the direction of taking advantage of the opportunity afforded by the present rate of exchange for disposing of securities held in undertakings in neutral countries, whilst, at the same time, these countries are exhibiting a greater desire to nationalise electrical works. Among the recent transfers may be mentioned the sale by the Frankfurt Lahmeyer Co. of its Wangen electricity works in Switzerland for a sum of about 9,000,000 fcs. (£360,000), and the disposal by the Berlin Electrical Undertakings Co. of shares for 1,136,800 crowns in the Christiania tramways; it is stated that the transaction yielded a good profit, which could not have been obtained in normal times. A further opera-

tion of considerable magnitude relates to the Nuremberg Schuckert Co., which, as stated last week, has succeeded in transferring to a Norwegian syndicate, for a cash payment, its large holding of shares in the Aktieselskabet Hafsund. These, again, are said to have been sold at a large profit, and they represent a total value of about £720,000.

LABOUR AND INDUSTRY.

Rubber. THE rubber market has been of late rather severely depressed, not because of any material deterioration in the outlook as to the future outlet for the commodity, but chiefly in consequence of the fact that the export trade has been seriously handicapped by the difficulties experienced in the way of getting permits for shipment to neutrals, more particularly the United States. There is as yet no indication of any material improvement in that direction, and this naturally continues to prejudice the general demand to an extent which must be expected to keep the warehouse stocks on this side in rather unwieldy proportions. It seems unfortunate that the progress of the industry should be so much hampered by the action of the authorities, the reason for this not being quite clear, although it is suggested that demands for permits were at one time forced to a degree which tended to make the authorities more circumspect, possibly partly because of the persistent tightness of shipping. These adverse conditions are clearly reflected in the Board of Trade Returns for the past month, showing a very big falling off in the quantities dispatched to the United States, the total against the previous year marking a deficit of over 4,300 tons, while it is well under the tonnage accounted for in the same month two years ago. The exports to allied countries were fairly well maintained. As compared with the large shrinkage in the exports, the decrease in the imports was comparatively small and due to a falling off in the shipments from the Near East, probably on account of freight scarcity. The result, therefore, has been an inevitable swelling of the stocks, the existence of which is obviously making itself felt, the home stocks being considerably larger than for some years past. There is no mistaking the fact that export buyers have now still to contend with many difficulties as regards freightage and licences, and until these drawbacks are to some extent remedied, it is hardly likely that the position of spot rubber will mend to any appreciable extent, although arrivals look like being smaller for some time. The total shipped during last month from the Federated Malay States was, according to official returns, only 3,904 tons, against 4,429 tons for the previous month, and 2,777 tons for April last year. The aggregate for the four months amounts to 18,011 tons, which is an increase of about 5,000 tons against last year, and almost double the returns for the same period two years ago. The tendency of prices for weeks past has been most irregular, the depression in spot and near rubber down to 2s. 9d. per lb. (from which a temporary rally ensued of about 3s. per lb.) contrasting sharply with the comparative firmness which has characterised forward rubber, the latter having been invariably maintained at a fair premium due to a well-sustained demand which, however, has been chiefly met by dealers. The estates are apparently still reluctant to take advantage of this satisfactory feature. Dealers have thus been tempted to increase their operations while repurchasing on the spot at a discount some of the rubber sold short forward. For the time being, consumers confine their purchases to near requirements, so that the market is largely in the hands of dealers. The backward attitude of producers has come in for some criticism, for the prices obtainable for forward delivery seem attractive enough. The course of the market to some extent depends on the proportion of the quantities reaching this side unsold.

FOR some years prior to the outbreak of Germany's war upon Civilisation we were deeply absorbed in the domestic questions which were constantly arising in consequence of the progress of British Democracy. Those to whom it falls to write the history of those days will probably record against us that we were so much involved in embittered controversy, and so angrily engaged in internecine struggles, that we were, as to the majority of us, allowed to remain oblivious to the terrible danger that was gathering force, lifting its ugly head, and hardening its mailed fist, in readiness for the great spring forward, striking the blow which should give Germany World Domination. The Enemy happily was unable accurately to estimate the British character and the Oneness of Heart of our Empire, or to foresee the ability of the Allies to act in so grand a spirit of unity and fortitude against the Terror of Europe. The guardian of the Law who enters to interfere in the domestic differences between husband and wife knows from long experience that he is inviting the combined attentions of both parties, who put aside their own comparatively trifling differences in order to visit the full force of their vengeance upon the intruder. Such, in the main, has been the penalty incurred by Germany from the combined forces of British Capital and Labour. At the appointed Day the vast forces of Prussian militarism were let loose with thirst for blood and lust and plunder. Husband and wife flew at the new-comer, their common interests deciding that his intentions were more dangerous than were the internal grievances which brought about the domestic blows. It has been an exhausting struggle extending over nearly two years, but the intruder is kept at bay, and if only the combined effort can be maintained he will be sorry for the intrusion before long—indeed some reports suggest that there is a very deep sorrow already, and that much would be given by Germany and Austria, by Turkey and by Bulgaria, could they see reasonable justification for hopes that they will ever return to the highly favoured state in which they existed before the first shell was fired in August, 1914.

The British and Allied determination, as grim as it is unalterably fixed, is that they never shall so return.

But when the aggressor has been beaten to his knees and permanently defeated, shall we celebrate the Peace by a renewal of our old quarrels between Capital and Labour? We trust not, after all the sacrifice that has been mutually borne by both classes on the fields of blood and slaughter; yet we shall still be a British Democracy—the war has not wiped that out of the national character; our relations will still be those of master and man; and whatever developments may take place altering parties and party politics, there will still be motives and ambitions, purposes and objects, bringing different classes and different minds into conflict. We wish we could agree with those who think that the life and death of the trenches are to have a subduing and a soothing influence which will outlast the very serious difficulties of demobilisation. There are millions for whom the only "trench" during these two years has been the factory at Home, and amongst these a "high wages habit" has been established; and hundreds of thousands, either through disablement or death, or the liking for open-air life, will never return to factory life.

We need to remember that for many years prior to the war the workers were struggling and fighting periodically in individual trades—almost incessantly if we consider all trades together—for concessions from employers, from Capital and from Industry. During the war these workers have been told almost to the point of weariness that they by their efforts are winning the war quite as much as the men with the fighting Forces. Is it to be supposed that they will forget that fact after the war when they renew their claims? Already the Voice of Labour has been letting us know in very clear tones that the fruit of former struggles, what are termed the rights of the worker, the better wages, the shorter hours, the improved conditions, must not be filched from them as a result of the war. Have they not had the definite promises of responsible legislators that they shall not be so robbed? The inevitable economic consequences of the war, the inability of industry to carry all the burdens that it is

sought to impose, the effects of supply and demand upon employment, these and other factors may exert an influence in connection with the fulfilment of those promises when the time comes. But with all the softening influences and all the promises of ministers, human weaknesses will remain, and we shall be guilty of the gravest of errors if we count too much upon the approach of an Industrial Utopia after we are at Peace again, especially remembering that during the last two years, when we have been fighting for our lives against the enemy, there have been frequent rumblings of discontent in Labour circles, and disgraceful unwillingness in some parts of the country to rise to the occasion and increase the output of munitions of war and of ships. Even during the last few weeks our newspapers have been reporting disaffection in many trades, and everybody knows that Labour's eyes have recently been turned somewhat longingly in the direction of Australia and New Zealand, where wages are higher, where pensions are larger and are paid at an earlier age than here. One Labour spokesman has declared that if Labour swallows the Australian policy of Protection it will want these compensations in return. Other Labour men hold that they cannot have such rewards unless the economic position is rectified along Protective lines.

We have, of course, no desire to exaggerate the possibilities of the situation, but manufacturers' associations have not been slow to recognise the importance of facing the Labour problem as far in advance of demobilisation as is practicable. The Government has its committees studying the question, and Labour, through its organisations, is engaged very seriously formulating proposals for securing the position of the working classes after the war. We give below some of the proposals that have been advanced, as we think it most necessary that those interested in industry should keep themselves informed respecting the policies, principles, and aspirations to which certain sections of the workers have announced adherence.

In April the following programme was adopted by what is called the Triple Labour Alliance; this Alliance consists of the Miners' Federation of Great Britain, the National Union of Railwaymen, and the Transport Workers' Federation:—

1. That any departure from Trade Union practices which have been made to accelerate production and distribution shall terminate upon the resumption of peace.
2. That all workers, whether men or women, who have been employed as substitutes shall be on their disemployment, provided with other work at the standard living rates or with full maintenance by the State.
3. That the Government be urged to arrange for the demobilisation of all those who have joined for the duration of the war in such a manner as shall lead to their gradual absorption into their civil occupations.
4. That all men desiring to do so shall be granted extended furlough on full Army pay and separation and billeting allowances in order to recuperate themselves at the end of the war.
5. That a registration bureau be set up with management powers half of which shall be Trade Union representatives appointed by the various Trade Unions with full executive power, in order to deal with the transition stage, and that men who had severed their connection with the Army who cannot procure employment shall be insured full employment by the State.

It will be observed that this Alliance is a very strong one, composed of organisations representing millions of workers whose occupation is vitally necessary for the maintenance of the industrial and ordinary life of the Kingdom. In (1), it sets up a claim for what has been promised under pressure of the most exceptional circumstances. Yet the fact remains that those who gave the promise on behalf of the nation have been loud in their condemnation of trade union practices because they meant limitation of output in the critical periods of war when we have been fighting for our lives and when the maximum effort of the nation was essential. Those who have studied such industrial questions in peace time during the past 10 or 20 years, and feel some anxiety in regard to the industrial conditions that will follow the war, realise that deliberate limitation of output—in other words, "trade union practices"—is as heavy a millstone round the neck of manufacturing industry for peace-time development as it proved to be in the production of munitions of war. It is profoundly hoped that Labour will have seen the error of its ways for itself—we are all learning lessons in practical experience in these trying days, and

Labour, ready as it may be to fight for what it may call its "rights," must be induced to learn the seriousness of its responsibilities in relation to after-the-war production. Items No. 2 to No. 5 in this programme present demands which, of course, do not err on the side of modesty; there is apparently no bottom to the Empire purse! But these are points for the discussion of which the time is hardly ripe. The problem of demobilisation will call for anxious thought from the entire nation—from legislators, from industrial employers, and from labour organisations. To a large extent whatever after-war burdens are imposed will become a tax on industry, and the worker needs to learn that the burdens of industry must inevitably in the long run be passed on to the worker in some form or other, perhaps as unemployment consequent upon restricted business in some trades. At the moment we are not called upon to discuss these demands further; authorities have been appointed to investigate the prospective situation, and their findings will give us a basis for discussion in due course. It is announced that while the big combined organisation referred to has formulated the proposals given above, in other labour circles there is a disposition to investigate separately before adopting a programme. For instance, it is stated that a number of Trade Union leaders have appointed a Special Joint Labour Committee to report on labour problems after the war. It will consist of the following members, representing the organisations named:—

Trade Union Congress.—H. Gosling, W. Thorne, M.P., and C. W. Bowerman, M.P.
Labour Party.—G. J. Wardle, M.P., J. R. Clynes, M.P., and J. R. MacDoald, M.P.
Workers' National Committee.—Robert Smillie, A. Bellamy, and Sidney Webb.
General Federation of Trade Unions.—Three members not yet appointed.

Everything is to be gained by the most exhaustive study of the problems by Labour, especially if while the war lasts, it can bring to its deliberations some of that spirit of the trenches about which we hear so much. It is to be hoped that in such deliberations the questions will not be viewed short-sightedly. The rights and the best interests of Labour will be more permanently safeguarded if the problems of national industry and trade, and their bearing upon employment and unemployment, are carefully and sympathetically studied as a whole. Labour and Capital both need to take a long view in the critical inquiries and negotiations that should lead on to reasonable compromises in the interests of the entire Empire. To advance extravagant demands without due regard to the question of national trade policy, and to the need for protecting ourselves in some way or other against the outside aggressor, if and when he resumes his characteristic trading methods, will be a hindrance to peaceful and satisfactory inquiry.

We are sympathetically drawn by some parts of the programme of the British Workers' National League, whose recent magnificent initiatory meeting at Queen's Hall was addressed by Mr. W. M. Hughes, the Prime Minister of Australia. The avowed objects of this League are:—

1. The application of the War's emphatic lessons (1) that Competition and Private Profit-Seeking lead to Waste, Inefficiency, Fraud, and National Disunion; and (2) that the full Expansion and National Use of National Resources in Peace or War absolutely depend on the National Control of Vital Industries under the joint management of administrative and manual workers in the interests of the whole nation.
2. The establishment on a democratic basis of defences adequate to the Empire's security, by the recognition of every citizen's duty to defend the life of the State. This naturally involves the State's reciprocal duty to guarantee the citizen's right to live—that is, the right to work at a full living wage.
3. The Federation of the British Free States under a governing council, representing all portions of the Empire, for the direction of Imperial and Foreign policy.
4. The modification of our international commercial policy, with a view to the political and economic defence of the British States and their Allies.
5. Educational reform on a national scale to secure greater technical efficiency combined with more democratic general access to knowledge.
6. Drastic agricultural reform to secure the full scientific development of the land in the national interest, with especial regard to the employment of ex-soldiers and sailors.
7. The realisation of free democratic government based on Universal Adult Suffrage, instead of the actual Government by caucus and money-power.

We do not propose to comment upon all the planks in this platform—they do not fall immediately within our industrial scope; but No. 4, relating to the future commercial policy of the British States and their Allies, was the one point upon which the speakers were unanimously emphatic, and the one which the vast audience vociferously cheered again and again. Making full allowance for all the glamour that would be cast around the proceedings by the presence of a Labour Prime Minister from the Antipodes, who had come Home to strike a definite note when so many other voices were weak or silent, we have to say that the definiteness and strength of the speeches of Labour men left no room for doubt about their enthusiasm for an Imperial Labour policy such as Mr. Hughes has been urging all along. To our mind, so far as British Labour Trade policy is concerned, the speech of the chairman, Mr. Hodge, M.P., was as important as that of Mr. Hughes. In brief, both of them recognised that the workman cannot expect to secure higher wages and to realise the ideals of a healthy and virile population unless the manufacturer "knows where he stands." It will help us to understand the importance of this movement, in relation to those of other Labour sections which condemn anything in the nature of an economic war with Germany, if we give the names of the men who are more prominently associated with the League:

Chairman.—A. M. Thompson.

Hon. Sec. and Treasurer.—Victor Fisher.

[To whom all communications should be addressed at 23, Bickingham Street, Adelphi, W.C.]

Assistant Hon. Sec.—Eene Fisher.

Chairman Organisation Committee.—J. A. Seddon.

Vice-Presidents.—Right Hon. W. Abraham, P.C., M.P., Right Hon. W. Crooks, P.C., M.P., Charles Duncan, M.P., John Hodge, M.P., James O'Grady, M.P., C. B. Stanton, M.P., Stephen Walsh, M.P., A. Wilkie, M.P., H. G. Wells.

The Queen's Hall meeting is to be followed by similar big gatherings organised by the League; these are to be held in different centres of the provinces, stimulating or focusing the opinion of Labour.

(To be continued.)

G.E.C. CADET CORPS.

In most of the large and industrial concerns in the country considerable numbers of youths, between the ages of 15 and 18 years, are employed. Many of them have been Boy Scouts, and, if they are given the requisite encouragement, they will take an active part in making themselves fit for military service when they reach the legal age for enlistment. It is, however, desirable that the encouragement take the form of practical support from their

by the company without charge. What might have proved an insuperable difficulty in the formation of the Corps has thus been removed by the generosity of the company.

The first Corps is commanded by Captain E. A. Joyce, who has on his staff First Lieut. A. V. Cannon, and Second Lieut. W. F. Arnold. We reproduce a portrait of these officers herewith. This Cadet Company is attached to the First Cadet Battalion of the Sussex Yeomanry and is 112 strong, consisting of two platoons. Khaki uniform is worn, and both officers and "men" are recognised by the War Office.

The training is given in accordance with the 1914 Infantry Training Regulations, and we understand that the Corps, although

OFFICERS OF THE G.E.C. CADET CORPS.

it has been in existence a comparatively short time, is already displaying marked ability. We gather that the cadets are put through a regular course of shooting once a week at the 10 target range at the Cripplegate Institute. Squad and Company drill is undertaken on Friday evenings at the Institute, and on Saturdays the Corps, by permission of the Inner Temple Gardens' Association, drill in the Temple Gardens, which should prove an ideal ground for the purpose. It will be seen, therefore, that the movement is proceeding upon "regular" lines, and that the training will be of immense value as preparatory work to that which will be undertaken when the Cadets come to be called up.

THE G.E.C. CADET CORPS.

employers, and undoubtedly much good work can be done to establish an active Cadet Corps among the youth of manufacturing undertakings and commercial houses. We learn that Mr. H. Hirst, the chairman of the General Electric Co., Ltd., has instituted the G.E.C. Cadet Corps (attached to the Sussex Yeomanry), which has now been on an active footing for nearly two months, and which, we hear, is already at "full strength."

The uniform and equipment, comprising khaki tunics, breeches, caps, belts, haversacks and puttees, have been supplied to the Corps

More than ordinary interest attaches to the Corps, because it has been brought into existence by the help of the management of the General Electric Co., who inform us that not only is the training of immense value in developing the physique of the lads, but it contributes considerably towards increased efficiency in business by making them take a greater interest in themselves, by accustoming them to discipline, by improving their manners, and last, but not least, by the establishment among them of *esprit de corps*.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Small Humphrey Type Pumps.

We illustrate herewith (fig. 1) an interesting development of the Humphrey gas pump, which, as our readers will remember, was originally designed to deal with water in bulk quantities, to meet the requirements of waterworks and for similar duties.

The new type of pump has been developed for small uses, which are, of course, much more numerous than the large ones, and at present two sizes, with power cylinders of 3 in. and 6 in. diameter respectively, are made. The new pumps work on a two-stroke cycle.

The power cylinder at the top contains a piston, with the piston rod projecting through the top cover and attached to a heavy metal crosshead, circular in shape (shown resting on the cylinder head in our view). This crosshead is connected by side rods to a lower crosshead, which in turn is connected to the pump bucket in the pump at the lower end. The power cylinder has a mechanically operated exhaust valve at its lower end, and, part-way

FIG. 1.—HUMPHREY GAS PUMP.

up, a row of gas and air inlet ports. Assuming the piston to be at the bottom of its stroke, with a compressed gas charge below, on ignition of the charge, the piston, with the crossheads, &c., and pump bucket, is forced up—the bucket forcing out the water above it and drawing in fresh water beneath through a foot valve.

In the power cylinder the upstroke of the piston has compressed a charge of gas and air in the cylinder top and mixing chamber with which the ports communicate. The piston overruns the ports and the compressed charge then enters the cylinder, assisting to drive out the burnt gases through the exhaust valve which has opened in the meantime. The exhaust valve closes and the piston with the weighty parts connected to it falls, compressing the new charge again ready for the next stroke.

It will be noted that the pump movements are gas-cushioned, but as a precaution a corrugated rubber pad is placed on the cylinder head to cushion the falling crosshead if necessary.

The explosive charge is ignited electrically, but under some circumstances the charge may ignite itself; if pre-ignition should occur it would only shorten the working stroke of the pump.

The water ends are made in various sizes to suit the quantity of water to be pumped, which becomes less as the head increases. For instance, the 3-in. pump output varies from 9,200 gals. per hour at 8 ft. head to 575 gallons at 172 ft.; the 6-in. pump output varies from 46,800 gallons an hour at 12 ft. head, to 1,500 gallons

at 500 ft. The 3-in. pump weighs 350 lb. and the 6-in. 1,630 lb. the former consuming approximately 20 cu. ft. of gas or 1 pint of petrol an hour.

"Holdfast" Lamp Guards.

The L.P.S. ELECTRICAL CO., of 18, Adam Street, Strand, W.C., are introducing the patent lamp guard—the "Holdfast"—for glow lamps, shown in fig. 3, consisting of a clamping collar, forming a rigid guard to the socket, from which is suspended a wire cage containing an internal spiral-spring cushion fixing the position of the lamp bulb. Between cushion and guard there is a 1-in. clearance which not only protects the lamp from jars, but keeps it at a safe distance from anything combustible. A special trap lock prevents the unauthorised removal of the lamp. These guards have been in use 11 years and are guaranteed; they are designed for all lamp sizes from small carbon to 1,000-watt pear-shaped metal-filament lamps.

"Verilux" Glass.

"Verilux" is a new three-ply glass, which has recently been placed on the market by The GENERAL ELECTRIC CO., LTD., of London, designed to produce, in combination with tungsten lamps, a close and permanent approximation to daylight. The innermost layer of the glass is a colour-straining medium, the next is a diffusing medium, and the outside layer is of clear glass to provide the necessary "body" or strength. Light transmitted through this glass emerges as a precise imitation of daylight, and is free from glare. There is no restriction on the shape or dimen-

FIG. 2.—B.T.H. 1/2 H.P. MOTOR.

FIG. 3.—"HOLDFAST" LAMP GUARD.

FIG. 4.—PENDANT FITTED WITH SPHERICAL "VERILUX" GLASSWARE.

sions of the globes made for this purpose, but the best results are obtained with the deep bowl or the spherical types (fig. 4), which ensure that practically all the rays are transmitted through the glass.

Owing to the high efficiency of the Osram and Osram-Atmos type lamps, the loss due to absorption by this glass is, for all practical purposes, unimportant, but in any case the commercial value of artificial daylight is so high that a slightly lower efficiency will not affect the popularity of the "Verilux" glass. There are many industries which, for want of such an invention, can be carried on for only a few hours each day during the winter months; the number and variety of such industries is much greater than most people imagine. In domestic and office lighting there is also a field which is worth cultivating.

Small-Power Motors.

The BRITISH THOMSON-HOUSTON CO., LTD., of Rugby, has put on the market a series of motors of very small powers, for which the qualities of cheapness, efficiency, and reliability are claimed. One of them is illustrated in fig. 2; it will be noticed that the field-magnet consists of steel laminations, riveted together, and forming the main frame of the motor, to which the malleable-iron end-shields are bolted. The latter contain the bearings and brushes; the bearings are fitted with grease cups on the underside, arranged for wick lubrication. The figure shows a D.C. motor (type S.D.,

1-H.P., 110 volts), but single-phase motors are also made, very similar in appearance and construction; the sizes range from $\frac{1}{8}$ H.P. to 1 H.P., at 110 and 220 volts, 50 cycles A.C. and D.C. The D.C. machines of type S.D., up to $\frac{1}{8}$ H.P., are shunt-wound, larger sizes compound-wound. From $\frac{1}{8}$ to $\frac{1}{2}$ H.P., both A.C. and D.C. motors are designed with series characteristics, and have commutators; the A.C. motors, type S.A., from $\frac{1}{8}$ to 1 H.P., are of the split-phase induction type, with the primary winding on the rotor, and the secondary on the stator; at full speed the starting winding is automatically cut out of circuit. Carbon brushes are used in all cases, with fixed holders.

Small Shell Inspection Lamp.

MESSRS. WARD & GOLDSTONE, of Sampson Works, Salford, Manchester, are placing on the market a small type of shell inspection lamp specially designed for inspecting small shell interiors. A feature of the lamp is that the guard protecting the bulb is only $\frac{1}{8}$ in. in diameter; a proportionately small bulb is used and is energised from a dry battery, the handle being fitted with a push contact so that current is not wasted when the lamp is not in use.

A long length of flexible is provided connected to the battery; the firm's "Volex" 4-volt batteries give from 80 to 250 hours for intermittent use.

LEGAL.

HILL v. JOHN LYSAGHT, LTD.

In the King's Bench Division, on May 16th and 17th, Mr. Justice Bay and a special jury heard an action brought by Albert Edward Hill, an electrical fitter, against John Lysaght, Ltd., London and Bristol, to recover damages for personal injuries sustained, as it was alleged, through the alleged negligence of a servant of the defendants, who are a firm of ironmasters and engineering contractors. The defendants denied the alleged negligence.

Mr. Vachell K.C., and Mr. S. Duncan were for the plaintiff, and the defendants were represented by Mr. Clavell Salter, K.C., and Mr. R.ynor Goddard.

The case for the plaintiff was that the defendants in July, 1915, were engaged on certain Government constructional work in the eastern counties in connection with a large shed with galvanised iron sides 300 ft. long, 100 ft. broad, and 50 ft. high, the work being very urgent. The task of putting in an electrical installation was in the hands of the firm of G. E. Taylor & Co., and it was by this firm that the plaintiff was actually employed. The plaintiff was employed running metal tubes over the building, electrical wires, and fixing fuseboards. While he was thus engaged working on a high scaffolding, an employé of the defendants, who was higher up, dropped a heavy bolt which struck the plaintiff on the left forearm with great violence, causing a lacerated wound. He suffered from this for a long time and also from nervous troubles consequent on the injury and shock. The plaintiff gave evidence to bear out these statements, and denied that he was warned on behalf of the defendants against working on the electrical fittings while the men were working on the iron girders above. Other employés of Taylor & Co., who were engaged with the plaintiff, deposed that no warning was given by any of defendants' men as to danger overhead.

ARCHIBALD LOWE, the foreman of Taylor & Co., said he always warned his men to look out for others above them, and he had on occasions found his men working elsewhere if they found the ironworkers were too close.

MR. CLAVELL SALTER, K.C., submitted that there was no evidence of negligence against the defendants.

MR. JUSTICE BRAY said that the case was "very near the line," and he would hear the evidence called on behalf of the defence.

MR. SALTER, K.C., in opening the defence, said that the employés of Taylor & Co. were continually warned by the defendants' foreman of the danger of working beneath the men engaged on the iron work, but all the warnings were disregarded. Work of this character was necessarily dangerous, and the dropping of bolts, tools, &c., occurred without negligence. The evidence showed that the plaintiff was not bound to work at this spot; and Taylor's men were continually warned of the danger of working under the men on the ironwork. He asked the jury to say that the claim against the defendants was unfounded, and that the real liability lay on the plaintiff's employers, Taylor & Co., or the insurance company by whom they were insured.

MR. GEO. CARPENTER, defendants' foreman, gave evidence, and, in the result, the jury returned a verdict for the defendants, for whom judgment was entered, with costs.

KNOWLES v. ELECTROLYTIC PLATING APPARATUS CO., LTD.

On May 18th, the Lord Chief Justice, Lord Justice Warrington, and Mr. Justice Lush, heard an appeal respecting the sale of a quantity of nickel anodes for electro-plating. The appeal was from a decision of Mr. Justice Bailhache, at Birmingham Assizes, and the parties to the proceedings were Mr. J. W. Knowles, of Oldbury, and the Electrolytic Plating Apparatus Co., Ltd., of Birmingham.

MR. MADDOCKS, for Mr. Knowles, explained that Messrs. Shaws, Ltd., of Willenhall, sold a number of nickel anodes to Messrs. A. S. Smith & Sons, of Walsall, and they resold them to the Electrolytic Plating Co. The last-named firm sent, at the

request of Messrs. Smith, a cheque for £105 to Messrs. Shaws, and the cheque passed to Mr. Knowles, a debenture-holder of Messrs. Shaws. The Electrolytic Co., finding, as they alleged, that the anodes were of no value, stopped the cheque. Mr. Knowles at once took legal proceedings on the cheque, alleging that having received value for the money the Electrolytic Co. could not legally stop the cheque. The Electrolytic Co., however, counterclaimed for breach of contract with regard to the anodes, but Mr. Knowles contended that having received the articles from A. S. Smith & Sons, the remedy of the Electrolytic Co. was against that firm and not against him or Shaws, Ltd., at all. Mr. Justice Bailhache held for Mr. Knowles on the counterclaim by the Electrolytic Co., and for the last-named company on the claim by Mr. Knowles. Consequently, both parties appealed.

Their Lordships, on Friday, dismissed both appeals, with costs. The Lord Chief Justice said that to succeed Mr. Knowles would have to show that Shaws, Ltd., supplied nickel anodes, whereas it seemed a fact that what they sold to Messrs. Smith was scrap nickel. Consequently, the Electrolytic Co. did not receive value, and were entitled to stop the cheque. On the other hand, to succeed in their counterclaim against Shaws for alleged breach of warranty, the Electrolytic Co. would have to prove that Messrs. Smith bought the nickel as their agents. Seeing that it was a well-known fact that the Electrolytic Co. could only use anodes containing not less than 96 per cent. of nickel, it seemed improbable that Messrs. Smiths had they acted as agents for the Electrolytic Co., would have bought for their principals scrap nickel containing 91 per cent. of nickel. Consequently, Messrs. Shaws could not be sued by the Electrolytic Co. for breach of warranty.

SCOBIE v. L.C.C.

BEFORE MR. JUSTICE BRAY, in the King's Bench Division, on May 18th, a special jury awarded Private Stewart Homer Scobie, a Canadian soldier, £500 damages against the London County Council, Plaintiff, formerly a horse trainer at Saskatchewan, joined the Canadian Expeditionary Force, and was wounded in France. On October 11th, 1915, just before midnight, while crossing the Kennington Road, he was knocked down by one of the defendants' tramway cars, receiving such injuries that his right arm had to be amputated.

MUNITIONS CASES.

AN important ruling was given at a sitting of the Oldham Munitions Tribunal last week. A firm of electrical instrument makers charged an employé with having failed to work regularly and diligently on April 19th and following days. On April 18th the man applied for a leaving certificate, so that he could return to the mill, but his application was unsuccessful. He had not been back to his work since. The man now said he had not been at his work since April 5th, and had been out of work the full six weeks allowed under the Act before he could take another situation. The Chairman (Mr. James Hodgson) consulted with the assessors, and then announced that, in this case, an important point had been raised as to whether a man who left his employment with no intention of returning, was liable to a penalty, in addition to the punishment he voluntarily incurred by the loss of six weeks' wages. It was a point of law, and, accepting the man's statement that he had not worked since April 5th, he held that there had been no infringement of Rule 2, because he was not working on April 19th, the date on which he was charged with having failed to work regularly and diligently. No further penalty could be enforced, or the man would be penalised twice for the same offence. The case was therefore dismissed.

At the same Tribunal an electrical firm charged a youth with having neglected his work. It was stated that the foreman had had nothing but trouble with the youth, and what the latter really wanted was to leave his work and go into the Army. The firm could not commend his conduct, but believing that discipline would do him a great deal of good they were prepared to let him go into the Army. The youth now stated frankly that he had been asking the foreman for months if he would allow him to join the Army, but he had always refused. He was willing to join now. The firm's representative said the youth's conduct had been such that they would not be able to offer him a situation after the war, nor could they guarantee the allowance which they usually paid to dependents. The case was withdrawn, and the youth was sent off with the good wishes of the chairman of the Tribunal and also of the firm's representative.

A Peculiar Line Trouble.—The operator in a sub-station connected with a long-transmission line recently noticed that his lightning arresters were discharging regularly at short intervals. Since it was a clear day, and there was apparently no trouble on the line, he was at a loss to know the cause of the disturbance. The line was, however, inspected, and after going out from the station a distance of 19 miles, it was found that the galvanised-iron ground wire above the line had slackened off and was swinging in the wind. Every few minutes it would swing over within spitting distance of the line and cause a surge which resulted in the discharge through the lightning arresters in the sub-station 19 miles away. This is one example of the peculiar ways in which surges may manifest themselves, and travel along the line.—*Electrical World.*

SERVICE BRANCHES FROM EXTRA-HIGH-TENSION CIRCUITS.

By D. M. MACLEOD, M.I.E.E.

(Abstract of paper read before THE INSTITUTION OF ELECTRICAL ENGINEERS at Glasgow.)

With the rapid growth and development of power supply from central stations generating and delivering alternating current, the problem of an efficient and economical mains lay-out has become of paramount importance. Every method must be tried to reduce to a minimum the outlay involved in feeder and network extensions, compatible with reliability of supply.

The ring-main system of distribution possesses undoubted advantages, one of the most important being that supply can be maintained to all consumers even though a fault should occur at one point on the ring circuit. To achieve the best results from this method of distribution it is essential that some system of balanced protective gear should be installed.

When a supply is required for a large power consumer, there is seldom any question as to its being obtained from or incorporated with the nearest available ring main, even should the consumer's works be situated some distance therefrom, as the importance of the supply on the commercial as well as on the engineering side is such as to justify the capital

- | | |
|---|-----|
| (a) Cost of looping-in ring-main cable, auxiliary cables, and consumer's sub-station equipment | 100 |
| (b) Cost of laying branch cable and auxiliary cables, building and equipping switch-house, and equipping consumer's sub-station | 64 |
| (c) Cost of laying branch cable and auxiliary cables, link box, and equipping consumer's sub-station | 53 |

The percentages are calculated for underground cables in each case. In the case of (a), overhead transmission is not admissible, as the expense of a double line built in accordance with Board of Trade requirements and accepted modern practice would show to very little advantage compared with underground cables laid in a common trench. Overhead transmission is, however, often quite admissible in the case of (b) and (c), and if adopted would make the percentage cost of these two methods still more favourable.

These figures show at once the economy in first cost in using branch services controlled from an extra-high-tension link box at the point of junction. The results achieved with these boxes have been uniformly successful.

Specifications and preliminary sketches clearly defining the functions and conditions to be met, were submitted in 1907 to the principal manufacturing firms throughout this country. At that time the application of link boxes to 11,000-volt circuits was considered to be so daring that one or two firms declined to tender. Fortunately, however, Messrs. Siemens Bros. submitted a design which clearly fulfilled all the requirements of the case, and which provided, in the author's opinion,

FIG. 1.

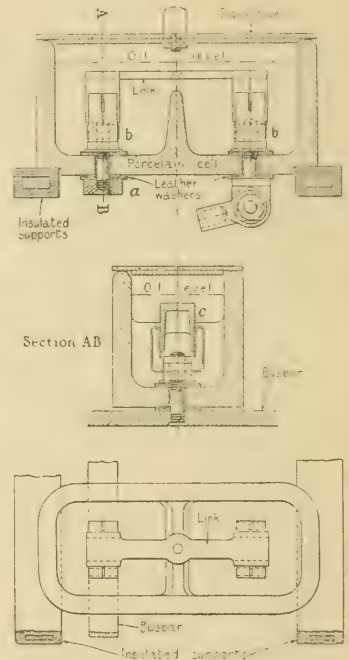

FIG. 2.

expenditure involved in looping-in the ring-main circuit and providing the necessary sub-station and balanced protective equipment.

In some cases, however, a comparatively small supply for an isolated works may be all that is required, or the return to be expected is totally inadequate to justify the heavy outlay that would be entailed in looping-in the ring-main cables. Under these circumstances the supply authority requires to exhaust every possible economical method of distribution in order to fulfil its obligations and ensure, at the same time, an adequate return on the capital employed.

In a number of cases the power supply required is too small to justify the cost of even a single branch with switch-house and consumer's sub-station equipment. Such cases can often be met, however, by the installation in lieu of the switch-house of an extra-high-pressure junction box; this course has been successfully adopted by the author during the past eight years.

The following table gives some indication as to percentage cost of various methods of delivering a supply of, say, 100 kw. to a point distant, let us assume, one mile from the line of route of a ring-main cable, it being understood that the point of supply is so far removed from any transforming station that a low-tension service line is not considered to be economically practicable.

a reasonable margin of safety both as to the insulation of the current-carrying parts and as to the safety of the operator. The design submitted was, subject to a few modifications, the one finally adopted by the power company with which the author is connected.

The general arrangement of the link box is shown in fig. 1. Each main and service cable is brought into the box in such a manner as to leave no doubt in the mind of the operator as to its identity. This very important feature is frequently overlooked in link-box design. All disconnecting boxes should embody in their design their own diagram of connections, thus leaving no doubt as to the route and purpose of each cable entering them.

The link box consists essentially of a rectangular cast-iron box in three portions, so arranged as to facilitate assembling and jointing. The internal fittings consist of a number of porcelain cells, one for each cable core. Details of one of these cells are shown in fig. 2. Through the bottom of the cell pass two studs, one of which is in metallic contact with a bus-bar (a), and the other is directly connected with one of the cores of the cable. To these studs are attached two main contacts, b b, and these again are connected together by means of a removable link c. The porcelain cell is of a suitable depth to provide for the link being immersed in oil. Each cell is provided with a glass cover, and in the centre of

each link is a screwed hole into which the operating rod is screwed for the removal or insertion of a link. These cells are assembled in groups corresponding to the number of phases, and they are embedded in the box compound with which the greater portion of the cast-iron box is filled.

Referring to the cast-iron box itself, the bottom joint passes through the main cable glands, and the faces are machined and fitted throughout. This arrangement provides the maximum of accessibility, in that it allows of all the cable cores being set into position and jointed up before the box is finally assembled, and when this is done nothing remains but carefully to wipe the lead of the cable to the brass glands of the box.

The complete jointing of one of these boxes occupies too much time to permit of all the work being done at the site. Obviously the ring circuit would require to remain open all the time this work was being carried through, and that being so, the risk has to be taken of another section of the main opening under fault conditions, thus endangering supply to a more or less extensive area. This difficulty is got over by jointing into the link box short lengths of cable of the required sectional area. After assembly the box is transported *en bloc* to the required site, where two or more cable jointers make the requisite straight joints in the minimum of time.

These boxes are not intended to break load, but simply to disconnect a line under pressure. In one or two cases of emergency a connection has been both broken and made under load, but the carrying out of this operation demands a cool head and a steady hand, the flash and noise when the circuit is either made or broken under these conditions being considerable.

Special care has in all cases to be taken to eliminate any traces of moisture inside the box, and this is done by means of an exterior vessel containing calcium chloride. This vessel is directly connected with the box by means of a short piece of screwed tubing, so that the chemical can be renewed when required without the necessity of opening the box cover.

In the construction of the box chamber, every care must be taken to exclude surface or drainage water. The chamber therefore usually consists of a shallow pit built of 9-in. brickwork on a 6-in. bed of concrete, this brickwork being surrounded by a 4½-in. brick wall so placed as to leave a space of 1 in. or more between the two walls. This intervening space is filled with bitumen run in hot, and thus ensures a perfectly dry chamber under all climatic conditions. Care has also to be exercised to exclude moisture when opening the box, particularly in damp weather, this operation being carried out under a jointer's tent.

It has been found in practice to be quite feasible to take branch services off sections of cable controlled with balanced protective gear. At first sight it might appear that the taking off of such intermediate services would disturb the static balance in the current-transformer secondary circuits. Theoretically this is undoubtedly the case, but when it is borne in mind that in actual practice the relays employed in connection with a balanced protective system are usually set for operating on a fault current of from 60 to 200 amperes, it will at once be apparent that there is an ample margin within which it is possible to give a branch supply without materially impairing the efficiency of the protective system. Nevertheless, it has been found necessary to install a no-volt release at the supply or consumer's end of such service branches, as otherwise the static balance is liable to be disturbed in the event of any sudden fluctuation of voltage, caused, for example, by a fault on the external circuit.

Supplies given off these service branches are subject to the disadvantage that they are liable to temporary interruption if a fault should occur on that portion of the ring-main circuit off which the branch is tapped. This is, however, not a serious objection, as it is a simple matter to test out, disconnect the faulty section, and restore supply over the sound portion of the ring-main section. Obviously, it is in this connection that the disconnecting links are of special value.

It will be readily understood that in a widely scattered industrial area the field for such devices is fairly extensive. Branches are often extended from time to time for miles, continuing from one point of supply to another, until in the ultimate course of development it is found practicable to reconnect the far end either with another similar branch or with another point on the ring circuit, the branch ultimately becoming part of a subsidiary ring. The original box is then withdrawn and a switch-house substituted in its place. With development carried out in such a manner, it is possible to make each extension on a minimum of capital outlay, the supply network by a process of steady growth being extended over a wider area to the mutual advantage of the industrial community and the supply authority.

One of the chief sources of reliability is simplicity, and the author is a confessed advocate of the single-branch service as the most direct method of securing reasonable freedom from failure for all classes of supplies, except those the magnitude or importance of which makes inclusion on a ring circuit imperative. All such service branches should, in every case, be laid complete with the necessary auxiliary cables for a telephone service and pilot wires, so as to permit of the steady development of the branch in the direction already indicated.

It is, of course, not contended that these link boxes are applicable in every instance, but it is undoubtedly the case

that their use makes it possible to secure business which would otherwise be most difficult to negotiate.

A demand sometimes arises for small lighting and power supplies for farms or residential property along the route of overhead transmission lines. There is a growing tendency to make the granting of wayleave facilities, especially through residential estates, conditional upon the giving of a lighting supply to the owner's house. Where such a condition has been imposed it can be very readily met in the case of a low-tension transmission line, but in the case of an extra-high-tension transmission the solution is not so simple. The author has met the difficulty by using small pole-type transformers. The reliability of transformers of this type has been fairly well established. No effort should be spared to create and develop a demand for electrical energy on the part of the small power consumer. No scheme of electrical power distribution may be considered complete which finds no place in it for the small trader or the ambitious workman who desires to become his own master. Only by such means can an appropriate place be found for electricity in the service of man.

DISCUSSION.

Mr. MITCHELL said he was in complete agreement with the author; the taking of branches off high-tension loops was now recognised as quite good practice. The N.E. Coast system did not use these junction boxes, but a large proportion of the system was on 20,000 volts, and junction boxes would not be so satisfactory at that pressure as they were at 11,000 volts. In Glasgow, following the Clyde Valley Co.'s lead, they had used these junction boxes for some years. They had eight working and another was being put in, and they gave complete satisfaction. They had not had to open these boxes in an emergency during the whole time they had had them in use. In the diagram shown in the paper the positions of the bus-bars were in proper sequence, but he thought the bus-bars on phases one and three should be kept always to the outside of the box for the sake of getting longer bends on the cores to the cable terminal contacts, which would then be towards the inside of the box. With regard to the identification of the bus-bars, he had thought of fixing a piece of porcelain to each bus-bar which would project up through the compound, and so identify the bar; they had not found assembling in a workshop a great success. They could put down a box with all the tails laid out in a country road, but in a crowded thoroughfare this was not possible. They had always to contend with gas and water pipes, and when all the tails were connected they might have to thread underneath these conduits, which subjected the cables to severe strains. He did not quite agree with the author with regard to the time lost in assembling a box *in situ*. It was not necessary to interfere with the loop until they had got the tails laid out; they had the tails which would ultimately connect the loop laid alongside the main cable, and after everything was connected up it was easy to shut down the loop section and make these two joints, and all the time during which the section was dead was that necessary for making the joints. With regard to the earthing of the cables at the box, he thought it was most desirable that facilities should be provided so that that could be done. Say that a fault existed on the branch leading from the box. The links would be drawn in the box on that cable, but the bus-bars would be kept alive. After the faults had been located it was likely that a joint or joints would require to be made, and it was then desirable that the faulty cable should be earthed if possible in the box, and at the other end also. The jointer's mind was at rest if he knew the cable was earthed at both ends. He showed a very simple and safe device which enabled this earth connection to be made in the box. This was done by substituting for the lid of each cell another lid of porcelain with a fitting attached which when the lid was placed in position made contact with the cable terminal contact. The fitting was connected on the outside of the lid by a length of insulated conductor to an earthing stud on the side of the box. The use of this device made the identification of the bus-bars all the more important. Also, the cable terminal contacts must be got at when identifying the phases preparatory to making the joints, and this would be a dangerous proceeding with the bus-bars alive unless the tester was absolutely clear as to the position of the live terminals. The use of this earthing connection enabled the phasing to be carried out in perfect safety. As to the advantages of the use of calcium chloride, his firm had not used that, and had not, so far, had any trouble through not using it. He asked whether the author had had any trouble due to the covers of the cells being made of glass. They had found a number of the glass lids broken, due to temperature change, when they had gone back to the boxes some time after they had been put in place. He thought that in future the glass lid might be replaced with a porcelain lid.

Mr. WM. NALIN said that when he first learned, five years ago, that such boxes were in use he considered that their operation would cause the staff grave concern, but during that period not a single failure had occurred. The author had stated his opinion that "all disconnecting boxes should embody in their design their own diagram of connections." There was no doubt that this was a point of paramount importance, not only in the design of junction boxes, but also in the switchgear lay-outs in the sub-stations. Stonework partitions between feeders should differ considerably from the stonework partitions between the phases of the same feeder;

isolating links should be placed immediately over and under the oil switches they controlled; remote-control bodies should be arranged symmetrically opposite the oil switches, and generally the whole design should be arranged on its own diagram of connections, as the author pointed out.

The CHAIRMAN (Mr. D. A. STARR) said that in a diagram of Canadian transformers shown by Mr. Macleod, these were enclosed with housing around. He did not think there was any Board of Trade regulation which insisted on such enclosure. He had seen thousands of these transformers in Canada for pressures much higher than the 11,000 volts which was used by the Clyde Valley Co., and these transformers erected on poles had no cover or housing whatever.

Mr. J. K. STROTHER recalled some experiences. In 1890 he had to do with laying mains for one or two towns; it was before the days of oil-immersed transformers. They put the transformers in street boxes, and had a good deal of trouble due to dampness. They got over a good deal of the difficulty by using receptacles, and tried calcium chloride and caustic soda, ultimately preferring the latter. The heating of the transformers inside the box rendered it difficult to keep the joints intact, and the joints shown on the screen would never have done. They had to use thick flanges and good jointing material to keep the joints damp-proof. They put a special gage inside to find out the pressure.

Mr. R. A. BROWN asked the size of the pit and the containing box for these transformers.

Mr. H. T. BURTON stated his conviction that the development of the H.T. service lay in the overhead link. When the inconsistencies both of our bye-laws and out legislature were changed, the American system of lattice poles, overhead switching apparatus, and overhead transformers would be as common on our highways and railway lines as telephone lines were at present. Overhead transformers were in more common use in the South than in Scotland, and four years ago he supervised work on a 6,000-volt 50-K.V.A. transformer which was mounted on a four-membered pole without weather protection, and gave satisfactory service.

Mr. MACLEOD, in reply, said he would not like to put forward those boxes for use with 20,000 volts, though he had no doubt that it would be a comparatively easy matter to alter them to suit that pressure. He would adopt the apparatus Mr. Mitchell had brought forward in connection with his work. He had had no experience with the cracking of covers, and could only suggest that the two pieces of glass had been screwed up too tightly. As to the suggestion of the chairman that housing was unnecessary, his experience was that the white porcelain boxes proved too great a temptation to stone-throwing boys when left exposed. The protecting frame was 4 ft. square, and the box chamber was flush with the inside of the frame, the depth being 16 to 18 in. He would have no hesitation in putting in an equipment of pole switchgear provided he was satisfied on the point of design. His view of the Merz-Hunter protection as applied to overhead construction was that it was likely to cause more trouble than it would prevent. In the Merz-Hunter system, where they duplicated conductors they doubled their troubles by doubling their insulators. A common insulator was now being used to meet this objection.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Economy in the Use of Coal.

In your "Notes" of May 12th you refer to the letter issued by the Board of Trade to gas and electric lighting undertakings, calling for their assistance in reducing the household consumption of coal by 10 per cent.

Perhaps it has not occurred to the Board of Trade that a very considerable economy in fuel consumption can be effected by a general change-over from the use of gas to electrical energy for illuminating and power purposes.

The output of gas per ton of coal varies from 10,000 cu. ft. to 13,000 cu. ft., according to quality of coal and the retorts employed. A 66-c.p. burner will consume 4 cu. ft. of gas per hour, therefore one ton of coal will supply light, under the most favourable conditions of plant and fuel, to 3,250 66-c.p. burners.

By employing electricity as the lighting agent, under the best conditions of plant and fuel not more than 3 lb. of coal per unit of energy supplied need be consumed, therefore one ton of coal will produce 747 units of energy, or 747,000 watts, and 11,318 one-watt lamps of 66 c.p. each will give 34 times the light obtainable from 3,250 66-c.p. gas burners; i.e., by using gas for illuminating purposes 34 tons of coal are used to every single ton necessary to produce an equivalent illumination by the use of electrical energy, by which 70 per cent. of fuel can be saved.

By using half-watt lamps the proportion of fuel consumed is one to seven.

But a greater field for economy presents itself in the use of power. 25 cu. ft. of gas per H.P. is a fairly moderate esti-

mate for gas-engine consumption, compared with 746 watts by the use of electrical energy.

One ton of coal will yield 520 H.P.-hrs. by the use of gas and 1,000 H.P.-hrs. by the use of electricity, which shows a saving of approximately 50 per cent. in coal consumption.

Perhaps steps could be taken to bring these facts to the notice of the Board of Trade, with the assurance that every electrical engineer will readily assist the Government to bring about this enormous reduction in coal consumption provided the Government will assist the engineers in obtaining adequate supplies of fuel and machinery to achieve the desired object.

J. Horace Bowden,

Borough Electrical Engineer & Manager.

Electricity Works, Poplar, May 16th, 1916.

Faults in Bitumen Cables.

The opinion of others would be welcome on the following problem. About eight years ago three bitumen cables were drawn into a 3-in. earthenware duct, the conductors being .1 in., .1 in., .075 in. Voltage across others 440 v., continuous current. The positive cables have given trouble, while the negatives have not. In one fault the bitumen had disappeared at the fault, on one side of the cable, for a distance of about 6 in., the copper being green and eaten through. The bitumen was in good condition in other parts, except that the braiding was gone in a few patches. The duct is damp, but not excessively so.

I will be glad to hear from others who have had similar faults as to whether trouble of this kind is liable to spread rapidly or whether it remains local. Also, if it is a good thing to change the polarity of the cables, so that the positive becomes negative and vice versa. Will such a change prolong the life of the cables, or will it bring their life to a sudden termination?

Bitumen.

Decimal Coinage.

Like all who have an eye on England's future I, too, am intensely interested in the decimal question. But why need Mr. C. Thorkelin bother further about the decimal money system? The problem has been solved for some considerable time by those far-seeing people the Esperantists. Their seven-year-old system (recognised by the London Chamber of Commerce) is based on the "Speso," an imaginary coin whose international value is .05s., 1,000 speso = 1 spesilo, the practical unit; which is equivalent to 2s., 2m., 24f., and so forth. The method of pricing catalogues, estimates, &c., is easy in the extreme. The contractor simply quotes in spesilo or decimal fractions thereof, and that figure is comprehensive in all countries.

May I here offer a tip to engineers who are receiving or sending money abroad? Let them send it through the International Esperanto Bank (it is connected with a big London bank, by the way), and their bureau de change losses will go down rapidly. This is not intended as a free advertisement for the bank in question, but a frank exposition of personal experience.

Herewith is enclosed a money table issued by the bank, giving the relative values of the spesilo to various units of monetary systems throughout the world.

I give this information for what it is worth, and hope that others may taste of the benefits which I myself have enjoyed for several years.

I would gladly give inquiries any information or addresses of firms abroad who I know use the system.

Alfred Bridges.

20, Wilsons Road, Hammersmith,
London, W., May 20th, 1916.

[It is interesting to note that the unit adopted by the Esperantists corresponds with that which we have recommended in preference to the franc or mark, namely, 2s., one-tenth of £1.—EDS. ELEC. REV.]

WAR ITEMS.

Exemption Applications.—At Middleton, an electrician appealed for the exemption of two wiremen. One—an apprentice with a mother and sister partially dependent on him—also appealed on domestic grounds, but he was ordered to report. The other man was granted exemption conditional on his remaining in his present occupation.

At Ramsbottom (Lancs.), on May 18th, an appeal was made for a tramway depot foreman, and it was stated that he had been employed at the depot since the local tramway system was commenced. The cars would stop altogether, it was stated, if this man had to go. Exemption list August 1st was granted.

At Chipping Norton, the Recruiting Officer applied for the withdrawal of certificates of exemption held by Mr. W. H. Hellyar (37), manager of the local electricity works, granted under Regulation 48, sec. 6, para. 2B, and Geo. G. Bates (21),

electrical worker with the electricity company. Asked how many men were employed before the war, Mr. Hellyar replied that the number varied from seven or eight down to five. He now had only one other man of experience with Bates, two apprentices, and a Belgian, who assisted. There should be at least two on each shift, but he was now running with only one. There was a lot of mains work he had not been able to touch; in fact, there was work in this respect to occupy two or three months. He was now working with the minimum staff to maintain the private supply of light, and he himself was doing the mains work besides his own. The Tribunal allowed Mr. Hellyar's certificate to remain, but granted the appeal as to Mr. Bates.

Kingston-on-Thames Tribunal has granted exemption until August 31st to the head of the electrical department of W. H. Gaze & Sons, Ltd., who is largely engaged in carrying out installations at various munitions factories.

Margate Tribunal has refused any exemption to a local electrician who claimed to be in a certified occupation.

At Newton Abbot, the Urban Electric Supply Co. applied for exemption for a stoker as being in a certified occupation. The manager said it was impossible to get another man in his place. On a month only being granted, the manager said he should appeal to the County Tribunal.

At Canterbury, Mr. H. E. Philpot, electrical engineer, applied for absolute exemption, and he was given a conditional certificate. He also applied for a wireman, Alfred Fassum, who is engaged on important electrical installations for the Government. Mr. Philpot said that he himself and Fassum had been scheduled for badges, but some delay had occurred in obtaining them. This case was deferred for a month in view of the badges arriving.

At Exeter, on May 16th, Wippell Bros. & Row, engineers, of High Street, appealed for A. E. Wilson, the only qualified electrician left with the firm. Out of the staff of 27, 15 have gone. Exemption was allowed until July 31st.

At Sutton (Surrey), an electrical engineer appealed for his 19-year-old apprentice, whose indentures expire on September 30th, and whose services he desired to retain in order to be able to complete contract work, eight employees having enlisted. The appeal failed.

Beddington and Wallington Tribunal has granted a local electrical engineer, aged 36, exemption until August 31st.

Nuneaton Corporation electricity department appealed for seven members of the staff. Three were temporarily exempted until September 30th; the others were given conditional exemption.

At Oxford, the Electric Light Co. appealed for exemption for Wm. Chas. Coates (26), stoker at the generating station for the public supply of electricity. It was stated that 16 out of the engineering staff of 40 had enlisted. Conditional exemption as being in a certified occupation was granted.

Messrs. Webster & Sons, electricians, Folkestone, have appealed for H. J. Vine, the only engineer left besides the foreman. Four months' conditional exemption was conceded.

Mr. J. W. Darby, an engineer at the Caterham electricity works, has been given conditional exemption. It was stated by the manager, Mr. Howard, that there were only two engineers to work the night and day shifts.

At Torquay, on May 16th, Mr. Nisbett, manager of the Tramway Co., appealed for the chief clerk of the traffic department and an electrical fitter. The latter, it was stated, had been taken away once and placed in Devonport Dockyard, but he was released on an appeal being made. The chief clerk was exempted until September 1st, and the fitter was given conditional exemption.

At the Hastings Tribunal an electric wireman and general electric repairer and an ironmonger's manager were claimed by their employer, who stated that he had tried at the Labour Exchange for other men; over 20, or more than half, of the staff had joined the Colours. The case of the wireman was adjourned for him to be medically examined, and the other was given two months' exemption.

At the Blackpool Tribunal, on May 18th, a discussion took place regarding the employment of four young single men at Blackpool Corporation electricity works. Mr. Dunkerley said Mr. Furness, the borough electrical engineer, had made a statement to him about the men, and had explained that an Inspector from the Ministry of Munitions had been down and made application for badges for them. It was practically certain they would get them, but they had not received them yet. It was decided to ask Mr. Furness to attend and make an explanation at the next meeting of the Tribunal.

At Chatham, on May 16th, the Chatham & District Tramways Co. applied for the exemption of three switchboard attendants and a car fitter. One switchboard attendant was given three months; the other claims were rejected.

Mr. Frank Bailey, electrician, in the employ of the Burnham (Somerset) Electric Supply Co., Ltd., has been given total exemption.

Before the North Devon Appeal Tribunal, on May 17th, Garnish & Lemon, of Barnstable, appealed for C. W. Cockram, electrician. It was stated that a war-serving badge had been obtained, but not yet received. It was claimed that the man was now under the Ministry of Munitions, and beyond the jurisdiction of the Tribunal. The case was adjourned *sine die* provided the badge is received.

The Middlesbrough Tribunal has refused exemption to Wilfrid Heal, electrician at the Grand Opera House, who pleaded that he had a wife, two children, a blind father and crippled mother dependent upon him.

At Oldham, an electrical engineer sought exemption for an electrician and wireman. Prior to the war 10 men were employed, and now there were three only, one of whom was over military age, and another had to report for service in July. Exemption until August was granted on business and domestic grounds. The same Tribunal granted exemption till July 1st to an electrical engineer and contractor with a partner. He urged that his business premises would have to be temporarily closed if he had to go. The employees of the firm had gone into the Army.

At the Walsall Tribunal, on Friday, an electrical instrument maker who applied for exemption, explained that he was engaged in making electrical instruments required by the Government. Before the war 75 per cent. of these instruments were made in Germany. His partner knew nothing about the electrical part of the business, and if he (applicant) had to go it would have to close down. In reply to questions, applicant said there was only one other firm engaged in making these particular instruments. Six months' exemption was granted, and the Chairman of the Tribunal observed that it was a trade which ought to be developed.

At Barnstable, on May 17th, Mr. Frank Bickford, electrical engineer, applying for exemption, stated that he was responsible for the upkeep of over 140 H.P. motors at various factories, his business was solely dependent on his own energies, and the major portion of his capital was in the stock, while he had an extensive fitting business. The Military did not assent, on the ground that there were other electricians available in the town. It was decided that Mr. Bickford, who had been passed by a local doctor for garrison duty only, should be re-examined by the Army Medical Board.

At Rawtenstall, last week, an appeal was made by Mr. Stewart, tramways manager, for the exemption of a switchboard attendant who was unbaged. It was stated that 26 men, some in responsible positions, had left. A badge for this man had not been applied for, because it was thought he was under military age. He was in his present occupation before August last year. The appeal was allowed.

At the Grantown Tribunal, Mr. G. Anderson asked for the exemption of an electrician. Applicant had the contract for the lighting of the town, and the engineer had left with the Territorials at the outbreak of the war.

At the Kingston Tribunal, Messrs. Offer & Sons asked for the exemption of their works foreman, who had charge of all the electrical machinery, and was responsible for setting out the joinery work. He was practically the key of the shop. Exemption granted to August 31st.

At the Aldershot Tribunal, Mr. Vertue, electrical engineer, appealed on his own behalf on the ground that if his men were taken he could not carry on the business. His partner was wholly engaged under the Officer-in-Charge, Electric Light, Aldershot Command, and he could not receive any help from him. Applicant was granted exemption until August 15th. Mr. Vertue also applied on behalf of an employee, aged 32 years, Group 37, electric wireman and fitter, on the ground that if he were taken they could not carry on the business. They were the only firm of electrical engineers in the town, and were responsible to most of the biggest firms in the town engaged on Government work. Exemption until June 15th.

An appeal was made at Drolyden by Messrs. Ashworth and Hadwen for their assistant electrical engineer, Mr. F. Hargreaves. He was allowed until May 31st only.

At Winchester, a firm of electrical engineers appealed for the only wireman left, who does nothing but electrical work. Six months was granted.

A Surbiton electrical engineer who appealed for his apprentice, aged 19, said that he had lost all his men, and it was impossible to replace them owing to the high wages obtained in munition works. No exemption was allowed.

At Southwark, on Tuesday, Samuel Voudson, of Ryan and Voudson, porcelain and stoneware electrical insulator manufacturers, applied for exemption. He was an ironmonger's assistant before the war, but since the war began had started this business with his brother-in-law. The articles which he produced were made entirely in Germany before the war, and since they commenced business they had been inundated with orders for Government departments and private works. He was granted conditional exemption.

Substitutes in Germany.—The annual meeting of the Verein Deutscher Elektrotechniker, which is to be held at Frankfurt-am-Main early next month, is to be mainly devoted to papers on the subject of "Substitutes for Scarce Electrical Engineering Materials, and on Experiences with such Substitutes." In connection with the gathering, an effort is being made to organise an exhibition of all the substitutes that have been brought into use since the commencement of the war, and in order to make it as complete as possible a general invitation to send specimens has been issued to all German electrical engineers.

Dr. Rathenau.—On May 20th the "Times" mentioned the prospect of Dr. Rathenau, of the A.E.G., of Berlin, becoming Minister of Finance in place of Dr. Helfferich, but an Amsterdam report of the following day gives that appointment to Count von Roedern.

Controlled Works.—The number of works now controlled by the Ministry of Munitions is 3,577.

After-the-War Trade.—The "Times" states that the Council of the Association of Chambers of Commerce have passed a resolution expressing the opinion that the Board of Trade Committee on Textile Industries after the war is not sufficiently representative of the large producers.

It is stated that the President of the Board of Trade has appointed Mr. Henry Summers to be an additional member of the Committee recently appointed to consider the position after the war of the iron, steel, and engineering trades.

In the House of Commons Mr. Asquith said that according to his information he could not accept as proved the statement that quantities of goods were being made and stored in Germany and America for the purpose of being dumped in the United Kingdom at the end of the war. The Government's expert advisers failed to find any evidence of this. The question of trade policy after the war was receiving, and would continue to receive, the most careful consideration of the Government.—In reply to Mr. Hunt, who asked: "Can we have any assurance that millions of our own people will not be driven back to the starvation wages of pre-war days?" Mr. Asquith replied: "How can I give such an assurance?" To a later question by Mr. Hunt, asking for an assurance that we should have fair play in our own country and in the Colonies, the Press reports "No answer was given."

Speaking in the House of Commons, in the course of the debate on the second reading of the Finance Bill, Mr. Chamberlain said (according to the *Times* report) we were using up capital for the purposes of the war at a time when neutral countries, happily for themselves saved from the struggle, were making enormous profits at the expense of the belligerents, and were able out of their profits to reorganise, extend, and develop their business. He would not undertake to say what was the exact measure of agreement which might be evolved among the various parties as we set ourselves to the work of reconstruction after the war. He would be a rash man who would undertake to say what were the limits of possible agreement. But one thing was clear—we could not leave the work of reconstruction to chance. There was no section which would maintain that we could pursue after our experience of this war the policy of *laissez faire, laissez aller*. It was common ground among people who were widely divided in the old days that the Government must come in to help, organise, and support, to see that the pivotal industries of the country were to continue to exist, and that industries which were vital, as we had found out, to the country, should not again be allowed to be crushed out, but should be maintained at least in so far as any one of them could be shown to be necessary to the full life and vital strength of the nation. Speaking for himself, he was not at a time like this or in the future going to consider himself bound to the exact measures which he advocated before the war, nor even to a rigid policy which in the circumstances after the war he might not consider the best. It would be a much better thing to get a system which any one of them might regard as imperfect, but which might really form the basis of a national and Imperial policy for our political development hereafter. Any declaration of policy by the Government had better be made at the Paris Conference rather than now, before they had consulted with their Allies, or had their proposals before them. The representatives of the Government at that Conference would go there unbound by any rigid school of economic thought of the one kind or the other—unbound by any specific fiscal policy which they had adopted in this country in the past or which some of them had advocated, in order to see in what way their common interests might be best pursued and strengthened.

Prohibited Exports.—A supplement to the "Board of Trade Journal" for May 18th, which occupies over 100 pages, and is, therefore, larger than the normal issue of the "Journal" itself, brings together in convenient form the complete "Prohibitions of Export in Force in the United Kingdom and in Certain Allied and Neutral Countries." Export firms should find it of considerable assistance to them.

To be Wound Up.—The Board of Trade has ordered to be wound up, under the Trading with the Enemy Amendment Act—

Isaria, Ltd., 208, Tower Bridge Road, London, S.E.—Traders in electric machines, &c. Controller: G. S. Pitt, 140, Leadenhall Street, E.C.

Trading With the Enemy.—The "London Gazette" for May 19th contains further additions to the list of persons or bodies with whom trading is prohibited in Argentina, Brazil, Chile, Netherlands East Indies, Norway, Persia, Peru, and other countries.

Rhodes Scholarships.—It is announced that the trustees at the will of Cecil Rhodes intend to apply for a Bill in Parliament abolishing the Rhodes Scholarships at Oxford allotted to German subjects.

THE ELECTRICITY SUPPLY OF GREAT BRITAIN.

In his reply to the discussion in London on his paper, read before the INSTITUTION OF ELECTRICAL ENGINEERS (reported in the ELECTRICAL REVIEW of April 21st, p. 447), Mr. E. T. WILLIAMS, referring to Mr. Merz's remarks, said he thought the chief reasons why they had not made greater progress towards the ideal in electricity supply were that they had not considered the problem from the standpoint of the country as a whole, and had lacked a central organisation to translate theory into practice and co-ordinate effort. He was convinced that centralisation of plant was the ideal arrangement, and must come sooner or later. Mr. Merz's splendid achievements on the North-East Coast showed something of the possibilities of public electricity supply and the soundness of interconnected power stations with large units, enabling a saving in fuel of 30 to 60 per cent. to be effected. He had come to the conclusion that it was the basis of organisation that required solution, and they should not go to Parliament until they had secured the support of the electrical profession in general and the electricity supply industries in particular. Their densely populated manufacturing districts required large power stations at comparatively short distances apart, rendering interconnection easy and inexpensive; no district in the world, taken as a whole, offered so favourable a field for a cheap and efficient electricity supply, and the remarkable load factor attained on the North-East Coast was due to the interconnection of the stations in that area. In reply to Mr. Chattock, he did not agree with the nationalisation of electricity supply, knowing the disabilities under which Government departments worked. Small economies often meant the difference between success and failure, and it was fallacious to suppose that because a manufacturer's costs for power were only 1 per cent. of the total costs, it was of no importance to reduce the price of energy by 10 per cent. They should be independent of State finance; the proposed Electricity Board should raise money on the security of its assets for the erection of power stations, &c., and would work on a commercial footing, paying interest and sinking fund, but not operating for profit. Mr. Chattock's proposal to replace small stations by a bulk supply at once would raise powerful opposition to the scheme. Powers to grant wayleaves to electrical undertakers should be entrusted to the Board. If they could go to Parliament as a united profession, backed by municipalities and electricity supply companies, with a sound, straightforward proposal, he believed it would soon become law. In answer to Mr. Highfield, he had no intention of proposing to sacrifice the vested interests of either capitalists or engineers. By cheapening the cost of electricity, not only the public, but also the capitalist and engineer, would be benefited. In view of the difficulties incurred, their past achievements were truly remarkable, but the position of the industry was far from what it might be, as exemplified by the success of the North-East Coast system. If they could be sure that the requirements of the country could be met without the Board having operating powers, he would agree that it should be only a controlling board; and if this question of dual powers became an obstacle to agreement, it would be better to give way on the operating question for the sake of unity, and carry through the proposal for an electricity board with controlling powers only. But he believed the interests of present undertakers could be properly safeguarded by the Act of Parliament by which the Board would be created, and the Board could be prevented from operating in competition with any existing undertaking in that undertaker's area; if an undertaking misused its powers the Board could refer the matter to Parliament. If the Board had no operating powers it might mean a serious loss to present undertakers, as well as to agricultural districts which undertakers would not care to supply; moreover, the Board would be unable to carry out pioneer work in the direction of gas-fired boilers, recovery of by-products, &c. Parliamentary control would be ensured by the presence of a Member of Parliament on the Board, who would have to answer for the Board in Parliament; a Government official might possibly be added to the Board as a further link with Parliament. Mr. H. Faraday Proctor's energetic demand to "get a move on" was backed by a large number of electrical engineers. There was a call for action, and the sooner they made their demands known, the sooner the new era would commence. They should avoid widening the scope of the inquiry and keep out any proposal with the word "Ministry" in it. He agreed with Mr. Wordingham that it was important to avoid Government operation in electricity supply; but Parliament would never put extensive powers into the hands of any other organisation than a Government department or a Public Board such as that which he proposed. He was absolutely opposed to anything that would deal unfairly with existing concerns. With regard to Mr. Roles's remarks, he had great sympathy with the interests that he mentioned, and knew it was useless to bring forward a scheme which could not be supported by electrical engineers while remaining loyal to their own interests. But he was satisfied that with extended areas for distribution and an increased demand due to lower costs, the importance of their undertakings would be much greater than at present, and the positions of the engineers would be strengthened and improved. He welcomed Mr. Roles's suggestion of endeavouring to bring into the scheme the smaller stations which would not form part of

the ultimate scheme, in order to avoid the opposition of the engineers and committees or companies controlling them. The new electricity supply era would create such a large demand that consulting and supply engineers, manufacturers, and all connected with the electrical industry would find more openings, the engineers' status would improve, and their services would be at a premium. This home demand would react favourably on exports. On the other hand, if united action were not taken, after the war capital would not be attracted to extend electrical operations, and the electrical industries would be badly affected. The more efficiently and economically they organised the sooner the period of trade depression would be over. The Institution and the technical Press could render the greatest assistance by creating interest in the subject and focusing attention on the main issues, and the engineers of medium and small undertakings could educate their councils to advocate the proposed organisation. The trend of the discussion appeared to be favourable to a scheme on the basis of: interconnection of power stations for security of supply; reduction of costs; conservation of fuel; and co-ordination of control, and the opportunity had arisen to advance a cause of great national importance.

Replying to the discussion at Manchester (reported in the ELECTRICAL REVIEW of May 19th, p. 575), Mr. WILLIAMS pointed out that Mr. Robertson was mistaken in supposing that the proposed bulk supply system would be owned and operated by the State through a Central Board; the country was to be divided into six districts not for supply purposes, but for the purpose of control, an entirely different matter, and it was not proposed to place the control of any one of the districts in the hands of one engineer manager—the control would come under the Board as a whole. The engineer would manage only the property of the Board in his district, and not that of municipalities or companies. Any person, company, or body in the district could present its case directly to the Board if desired. The smaller generating plant would not be superseded until it had fulfilled its economic purpose—that is, until the cost of a bulk supply was less than that of running the plant and meeting the standing charges on it. The Board could withhold its approval for extensions or replacement of obsolete plant, where such a course would not be advantageous, but could not otherwise control the price charged for energy by local authorities or compel them to shut down existing stations. Contrary to Mr. Robertson's view, he held that this was the best possible time to deal with the problem. He welcomed Mr. Robertson's proposal to form subsidiary Boards, but urged the necessity of forming the Central Board first. In reply to Mr. Highfield, he thought it desirable that at no distant date municipalities which possessed powers to purchase the undertakings of companies should be called upon to adopt settled policies, so that there should be no period of uncertainty of tenure. The Board would probably discourage the taking-over of companies' powers by municipalities so long as a cheap supply of electricity was ensured. He did not agree with Ald. Walker that the cost of site was immaterial; no item of cost was immaterial. In reply to Mr. E. K. Scott, the members of the Board would be paid, and would be expected to devote the whole of their time to the work of the Board. If, as Mr. Roles suggested, the Home Office, Board of Trade, or Local Government Board opposed the scheme, the opposition would have to be met, and if it were insuperable he thought they ought to proceed with the Board with whatever powers they could obtain for it, and expand its powers later. He had had the subject of the paper under consideration for many years, and held that the inclusion of the many subsidiary matters touched upon in the discussion would create controversy and delay achievement. They should keep in mind the main issues, and deal with the subject in a businesslike manner. The agreement that something should be done somewhat on the lines suggested was more general than he had anticipated, and the profession would welcome energetic action on the part of the Council of the Institution.

BUSINESS NOTES.

Liquidations.—*Re CEDES ELECTRIC TRACTION CO., LTD.*, 112, Great Portland Street, W.—The creditors and shareholders of this company (in liquidation) met on May 19th, at the Board of Trade Offices, Carey Street, W.C., when a statement of affairs was presented showing unsecured liabilities £14,826 and assets valued at £3,992, after deducting £4,000 to meet the claims of the debenture-holders. The deficiency as regards shareholders is estimated at £47,894. Mr. H. E. Burgess, Official Receiver, reported that the company was formed in 1910, most of the issued capital being held by the Austrian Daimler Motor Co. of Vienna. In 1911 an agreement was entered into, under which, in consideration of certain royalties, the Austrian company granted to this company the sole right to manufacture and sell their electrically-driven motor vehicles. In 1914 the financial position of the company became somewhat difficult, and an arrangement made for it and another business to be taken over by a new company was rendered abortive by the war. The company's business had been carried on at a loss throughout: in 1913 the books showed a loss of £7,000, in 1914 it was £7,395, and in

1915 it amounted to £14,000. The directors attributed the failure of the company to the fact that its resources were too limited to produce on a scale sufficiently large to be remunerative, but, the chairman added, there also appeared to have been some discord between the management in London and that in Vienna. A Receiver had been appointed on behalf of the debenture-holders, and the whole of the assets were in possession of that gentleman. The liquidation was left in the hands of the Official Receiver. Appended is a list of the principal unsecured creditors:—

GENERAL ELECTROLYTIC PARENT CO., LTD.—A meeting is called for June 20th, at Widnes, to hear an account of the winding up from the liquidator.

ACCESSORIES MANUFACTURING CO., LTD.—A meeting is to be held on June 30th, at 8, Queen Street, E.C., to hear an account of winding up from the liquidator, Mr. H. A. McCann.

UNIVERSAL CHEAP CABLES, LTD.—This company is winding up voluntarily with Mr. H. E. Oldham, 30, Bush Lane, E.C., as liquidator. Creditors must send particulars by June 20th.

M. & G. TRUCK AND ENGINEERING CO., LTD.—Creditors should send the usual particulars to the liquidator, Mr. C. Cooper, 30, Moorgate Street, E.C., by June 20th.

Bankruptcy Proceedings.—**A. F. HAWDON**, electrical engineer, Gosforth.—June 5th is the last day for sending proofs for dividend to Mr. C. Woollett, Official Receiver, 30, Mosley Street, Newcastle-on-Tyne.

STEEL BROS., electricians, &c., late of 206, East India Dock Road, E.—A sitting of the London Bankruptcy Court was appointed to be held on Tuesday before Mr. Registrar Linklater for this public examination. An order of adjudication had been made on May 14th, against Sidney Steel, trading as, or a partner in, the firm of Steel Bros. Mr. Egerton S. Grey, Official Receiver, reported that inquiries were proceedings with a view to ascertaining exactly who constituted the firm. The examination was adjourned.

Book Notices.—"Annales des Postes, Télégraphes et Téléphones." Vol. 5. No. 1. March, 1916. Paris: A. Dumas. Price 12 fr.

"Pole and Tower Lines for Electric Power Transmission." By R. D. Coombs. London: Hill Publishing Co. Price 10s. 6d. net.

THE BRADSTREET CO., of London, E.C., have issued a pamphlet giving a summary of the failures in the United States and Canada in 1915, in comparison with those of previous years.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXV. No. 5. May, 1916. New York: The Institute. Price 81.

"The Principles of Apprentice Training." By A. P. M. Fleming and J. G. Pearce. London: Longmans, Green & Co. Price 3s. 6d. net.

Trade Announcements.—**MESSRS. IKIN & EADS, LTD.**, announce that owing to the demand for their Qsead electric fires, they have formed a separate company to control their electric heating department, which will be known in future as Qsead, Ltd., 47-67, Marylebone Lane, London, W. Telephone: "Mayfair 3582."

Catalogues and Lists.—**MESSRS. SCHOLEY & CO., LTD.**, 56, Victoria Street, London, S.W.—20-page illustrated pamphlet entitled "The Economical Production of Steam," and giving an account of the principal features of the Taylor mechanical stoker and the Copes feed-water regulator.

THE STENTOR ELECTRIC MANUFACTURING CO. (INC.), New York.—12-page pamphlet containing an illustrated description of the Stentor loud-speaking telephone equipment.

Private Arrangements.—**B. T. GARDNER & CO., LTD.**, electrical engineers, 20, Bennett Street, Blackfriars.—A meeting of creditors was held on Monday, at Balfour House, E.C. The company had passed resolutions in favour of voluntary liquidation, and had appointed Mr. G. E. Corfield to act as liquidator. The statement of affairs presented showed liabilities of £199, and net assets of £22, or a deficiency of £177. Mr. Osborne stated that the company was formed a few years ago to take over the business which had previously been carried on by Mr. B. T. Gardner. A balance-sheet prepared in December, 1915, showed a loss on trading of £186. The business had since been continued, and further losses made. It was decided to confirm the liquidation of the company with Mr. Corfield as liquidator.

LIGHTING AND POWER NOTES.

Argentina.—The electric power station and the public water supply service of the town of 25 de Mayo (Province of Buenos Aires) have been acquired by the *Compania Americana de Luz y Traction de Buenos Aires*, whose president is *Senor Juan Carlosio*.—*Review of the River Plate.*

Bury.—**PRICE INCREASE.**—It is proposed to increase the price of electric current for private and public lighting, and tramways by a further 5 per cent., and for power and heating by 10 per cent.

Canterbury.—**PRICE INCREASE.**—The T.C. has decided to advance the price of current for lighting by 4d. per unit. This is on account of the Daylight Saving Act. It is computed that the extra halfpenny will convert a prospective deficit of £200 into the customary profit of £600.

Continental.—**ITALY.**—"The Utilisation of Hydraulic Power in Italy" was recently the theme of an interesting address by engineer *Del Buono*, before the *Associazione Elettrotecnica Italiana*. In the view of the speaker, a new era is opening for Italy in this direction. Modern history had its start with the use of steam, and this occurred in countries rich in coal, whence their greater progress. Water-generated power had, however, many advantages, and estimates gave from 3 to 4 million H.P. as the Italian total available. This consumption might be considerably increased by the use of power by intermittent industries. The aggregate power of the installations actually at work was about 1 million H.P., and the equipments might be truly described as technically perfect. The problem of the transmission of energy to a distance, so far as Italy was concerned, might also be said to be completely solved in practice, it now being possible to transmit energy to a distance of from 400 to 500 km. But the utilisation of Italian power stations was far from being complete, so long as the plants were not used to their full capacity, and for the whole of the day—defects which might be remedied, on the one hand, by the use of storage reservoirs, and, on the other, by the creation of industries to utilise the surplus energy.

The extension of hydro-electric plants did not imply the elimination of the use of coal (of which some 10 million tons were imported yearly) for heating purposes, for which it was generally more suitable than electrical energy; but it was desirable to restrict its use as far as possible, as also to cultivate the national reserves of coal.

Of Italy's production of upwards of 1,600,000 H.P. of motive power, 40 per cent. was thermal in origin, but might be displaced by hydro-electric power, involving an appreciable saving in cost. The development of electric traction had hardly begun, some 348 km. only of the 16,000 km. in operation being electrified. The realisation of the Government scheme for the electrification of 2,000 km. more would call for about 300,000 H.P. Electric traction should also have a large development in connection with light railways and tramways. Furthermore, the electrochemical and metallurgical industries claimed attention with regard to the production of metal and the fixation of atmospheric nitrogen; the former as the base of all industry, and the latter as valuable for the development, in general, of agriculture, and, in particular, the intense cultivation of grain. An additional $\frac{1}{4}$ million H.P. employed would give such life to the iron, brass and zinc industries as to render Italy independent of the foreigner, while providing nitrates in the quantity needed by Italian agriculture.—*L'Elettrotecnica.*

At a recent meeting in Turin an influential Committee was formed to foster the movement in favour of the utilisation of the water power available in the Province of Piedmont, in connection with the supply of electrical energy for lighting and power purposes.

Croydon.—**PRICE INCREASE.**—The T.C. has decided to add 10 per cent. to all accounts for lighting, heating and power supplies, as and from the June meter readings. A similar percentage is to be added to the public lighting account, and the tramways will be charged an increase of 4d. per unit on all units above 10 millions. The Electricity Committee reported that, having regard to the loss (£3,600) on the past year's working of the undertaking, it had no alternative but to recommend the increase. Part of the loss, however, had been made up by the tramway department, thus reducing the loss on the year to approximately £800. There would probably be an increase of £6,000 in the cost of coal and materials during the current year, so that unless the charges were revised, there would be a large deficit at the end of the 12 months.

Dublin.—**DAMAGED ARC LAMPS.**—At a meeting of the Electricity Supply Committee details were submitted of the damage caused to the arc lighting system during the recent insurrectionary troubles. Most of the damage was done, apparently, by rifle fire, and in the majority of instances the lamps were beyond repair. The total cost of making good this class of damage was estimated at £1,050. It was reported that the electric lighting accounts of consumers whose premises had been destroyed by fire amounted, for the past 12 months, to £8,072. A letter was read from the B. of T. asking that a notification be issued to consumers urging the necessity of economy in the use of electric light, as a reduction of the coal supply to the generating station at the Pigeon House might have to be made.

Fleetwood.—The Blackpool Building Trades Employers' Association has written to the Electricity Committee respecting the carrying out of private work by the employees in the electricity department. The Committee has decided to take no action in the matter.

Heston and Isleworth.—**SUGGESTED PRICE INCREASE.**

—The L.G.B. auditor in his report upon the electricity undertaking, states that the year's working, after allowing for all charges has resulted in a deficiency of £1,050, which, with £938 brought forward from the previous year, makes a total deficiency, at March 31st, 1916, of £1,988. The electrical engineer reported on the question of enforcing the minimum legal charge. The minimum statutory charge the Council was entitled to was 13s. 4d. per quarter, i.e., 20 units at 8d. Last year they had 70 accounts under 6s. each. In view of a further decrease in the use of current consequent on the Daylight Saving scheme, the losses in revenue were likely to increase, and he suggested an entire revision of prices.

Heywood.—**YEAR'S WORKING.**—There was a loss of £1,052 on the working of the Corporation electricity undertaking during the past year, including £112 disallowed by the L.G.B. some time ago. In the previous year there was a loss of £972.

Hornsey.—In the course of a report upon the question of a reduction in the quantity of electricity now being consumed in the darkened street lamps, the borough engineer stated, as regards arc lamps, of which there are 68, that the provision of small side-arm lights for post-midnight hours had enabled the arcs to be dispensed with. They used only 36 pairs of side-lights, in which the consumption of current per lamp had been reduced by one-half. The present cost of current consumed was £55 a year, as compared with £903 under normal conditions.

Hull.—**FEMALE METER READERS.**—The Corporation Electricity Committee has decided, on account of the depletion of the meter staff, to engage women meter readers at the same wages as paid to the men.

India.—On April 8th the Simla municipality took over the new generating plant. On the evening of the 19th the demand on the power station bus-bars was very nearly equal to the full installed capacity of the old plant, i.e., 790 K.V.A.—*Indian Engineering.*

Keighley.—**REVISED DISCOUNTS.**—The Electricity Committee has recommended the laying of a cable to the new hospital at Morton Banks, at a cost of £475. It is also proposed that as from April 1st the discount on accounts for electricity supplied otherwise than under sealed agreement be reduced from 5 to 2½ per cent.

London.—**BETHNAL GREEN.**—The B.C. has decided to appoint Mr. H. W. Couzens as consulting engineer for its electricity undertaking until March, 1920, at an annual fee of 200 guineas plus 5 per cent. on capital expenditure.

ISLINGTON.—The B.C. proposes to apply to the L.C.C. for sanction to the borrowing of a further sum of £1,500 to cover the additional cost of mains, which was estimated in May, 1914, at £7,564, and subsequently revised at £9,076 in July last.

The City Corporation has been informed that the B. of T. has refused the application of the Charing Cross E.S. Co. for an increase in its charges for electricity of 10 per cent.

Rawtenstall.—**PROPOSED LINKING-UP SCHEME.**—At the meeting of the T.C. last week the borough electrical engineer reported that a scheme was being considered for linking up, where possible, the electric power stations in the Lancashire area with a view to economy and the placing of local authorities in a better position as regards electricity supply.

The T.C. has approved of draft agreement for the supply of electricity to Haslingden.

Ripon.—**PROPOSED E.L. SCHEME.**—A movement has been started to form a syndicate for the supply of electric light to the city, and it has been decided to approach the Corporation to obtain its support in an application for lighting powers.

At the inaugural meeting Mr. Charles Pallan, of Bradford, explained a scheme pointing out that if the project was to materialise by the autumn of 1918, a move must be made now.

Mr. F. Stockton Goward remarked upon the difficulty of raising the required capital locally.

Rochdale.—The dispute between Tyre Yarns, Ltd., and the Electricity Committee as to the interpretation of certain parts of the agreement between the two respecting the supply of current to the mills of Tyre Yarns, was again before the Committee last week. The firm has asked that the matter be referred to arbitration by the B. of T., and the Works Sub-Committee is to report on the request.

With reference to the proposal to borrow £10,000 for electricity works extensions, a deputation has been appointed by the Committee to interview officials of the L.G.B. on the matter.

Tottenham.—The North Metropolitan Electric Power Supply Co. is prepared to make an allowance to the U.D.C. of £139 in respect of public lamps not used during the past quarter. The General Purposes Committee is to ascertain whether this includes an allowance for the December quarter last.

Tynemouth.—The Electricity Committee has decided to adopt the revised wiring rules of the Institution of Electrical Engineers, and to request the local wiring contractors to conform thereto in future.

West Ham.—**LOAN SANCTION.**—The L.G.B. has sanctioned the borrowing by the Corporation of the following amounts for the purposes of the electricity undertaking:—£3,000 for general mains and cables, £5,400 for feeder cables, £330 for switchgear, £300 for protection gear, £5,000 for substations, transformers and switchgear, £450 for wet-air filter, and £3,000 for additional connection to water mains—£14,850 in all. The total amount applied for was £26,775, but the amount granted were for the more urgent and important items. The offer of the makers of the suction ash-plant at the generating station for altering and replacing certain portions, is recommended for acceptance.

Willesden.—The North Metropolitan Electric Power Supply Co. has given notice of its intention to extend the mains from Taylor's Lane to Wood Green. The Electricity Committee has agreed to supply energy to Messrs. F. E. Berwick & Co. for a period of three years, and the L.G.B. has sanctioned the borrowing of £500 for this purpose. The Commissioners of Inland Revenue have agreed to a reduced assessment in respect of the accounts of the electricity undertaking for the year 1914-15, which will result in a saving of £104.

TRAMWAY AND RAILWAY NOTES.

Australia.—An order made by the Victorian authorities authorises the Prahran-Malvern Tramways Trust to construct an electric tramway from Kew to Malvern.—*Board of Trade Journal.*

Belfast.—At a special meeting of the Tramways Committee held last week, it was intimated that 42 applications had been received for the post of general manager of the Corporation's tramway system.

Blackpool.—**FEMALE LABOUR.**—The Watch Committee was informed that the Blackpool, St. Anne's and Lytham Tramways Co. were proposing to employ women drivers; the Committee expressed its disapproval, holding that there were sufficient men over military age and discharged soldiers who were competent to do the work.

An exciting incident occurred last week on a Corporation car, when a controller was completely burnt out, and the fire was also severely scorched by the flames before the trolley could be disconnected from the overhead wire.

Continental.—**PORTUGAL.**—The municipal authorities of Guimaraes are authorised to contract a loan of about £70,000 to be devoted to certain public works, including the installation of an electric tramway system between Braga and Guimaraes.—*Board of Trade Journal.*

SPAIN.—It is under consideration to employ electric traction for the express trains between Madrid and Valencia, whereby the journey will be made in five hours, with a single stop at Cuenca. The Madrid station will be underground, situated in the Calle de Montalban, fronting the Prado, on a site, however, already fixed upon by the Government to build the Ministerio de Marina. If this railway can be included among the secondary and strategic lines, its construction may be begun within a year, and in six years' time, says *Industria e Intenciones*, it will be in working order.

Dublin.—The tramway system is now running as usual; the rebuilding of Sackville Street, in which several important parts of the system run, including a couple of junctions and a terminus, may lead to some important changes of the system in that particular area.

East Ham.—**FEMALE LABOUR.**—The T.C. is recommended to authorise the tramway manager to employ women as car conductors in the event of his not being able otherwise to fill vacancies.

Huddersfield.—**YEAR'S WORKING.**—On the working of the Corporation tramways during the past year, there was a gross surplus of £63,229, and a net surplus of £13,014.

London.—**WANDSWORTH.**—The Town Clerk has been directed to call attention of the L.C.C. to the dangerous condition of the tramway rails in Upper Tooting Road, Tooting High Street and Garratt Lane.

Nottingham.—**COLLISION.**—On Saturday evening two cars on the Sherwood Rise section of the Corporation tramways came into collision, causing serious injury to one driver, while many of the 17 passengers received minor injuries. Both the car fronts were smashed, and much of the damage was due to broken glass falling amongst the passengers.

Salford.—**ESTIMATED SURPLUSES.**—Ald. Jenkins (chairman of the Finance Committee), in his annual statement on the coming financial year, said the Tramways Committee promised £18,000 in aid of the rates, or £4,000 less than during the past year, and the Electricity Committee promised £6,500, or £3,000 more than was promised twelve months ago.

Sheffield.—**FEMALE DRIVERS.**—At the Amalgamated Association of Tramway and Vehicle Workers' annual conference, a resolution was passed protesting against the employment of women drivers, the conference declaring that it would not allow it to come to pass except under the gravest national emergency.—*Sheffield Independent.*

U.S.A.—**LARGE RAILWAY TURBINE SET.**—Some further data concerning the 35,000-kw. turbine set for the South Boston station of the Boston Elevated Railway (to which we referred on page 398), appeared in a recent issue of the *Electric Railway Journal*. The set, which is to be built by the General Electric Co. (U.S.A.), is to operate on 200 lb. steam pressure and 200° F. superheat, and run at 1,500 R.P.M.; it will have a capacity of 42,500 kw. for two hours. The steam guarantee for the turbine at 200 lb., 1,500 R.P.M. and 1 in. back pressure, is as follows: 10,000 kw., 12 1/2 lb. per sq. in.; 15,000 kw., 11 3/8 lb.; 20,000 kw., 10 85 lb.; 25,000 kw., 10 65 lb.; 35,000 kw., 10 95 lb. For each 10 lb. per sq. in. increase or decrease in steam pressure the steam consumption is to decrease or increase by 1 per cent. from 185 lb. to 210 lb. per sq. in., and for each 10° increase or decrease in steam temperature between 175° and 225° F. superheat, the steam consumption will vary 0.5 per cent. At 2 in. absolute back pressure the guaranteed steam consumption per kw.-hour is as follows: 10,000 kw., 13 2/3 lb.; 15,000 kw., 12 3/8 lb.; 20,000 kw., 11 5/8 lb.; 25,000 kw., 11 60 lb.; 35,000 kw., 11 90 lb. An 18-in. steam pipe will be required for the unit, with a 10 ft. x 16 ft. exhaust. The generator will be a two-pole machine delivering 25 cycle three-phase energy at 13,200 volts pressure. Its guaranteed commercial efficiency is 97 per cent. at one-quarter load; 98.25 per cent. at half; 98.75 per cent. at three-quarter, and 99 per cent. at full load, not including friction and windage—roughly, 250 kw. With air at 40° C. the maximum armature temperature is not to exceed 100° C. at 35,000 kw. continuously, or 125° C. at 42,500 kw. for two hours. With full load 70,000 cu. ft. of air at 40° C. per min. will be required for ventilation.

York.—**FEMALE DRIVERS.**—At a meeting of the Electricity and Tramways Committee last week, it was reported that in view of the extension of the system, it would be necessary to engage from six to eight female drivers. A motion that no women drivers should be employed was not seconded, and the recommendation will come before the City Council. Female conductors have been employed for some time, but the male staff has been considerably perturbed over the proposal to employ women drivers.

TELEGRAPH AND TELEPHONE NOTES.

Spain.—A public wireless telegraph service has recently been inaugurated between Spain and Germany: the receiving and transmission stations are at Aranjuez and Königswinterhausen respectively, and the charge is 2½d. per word.

The Telephone Service.—The P.O. Telephone Department has informed the Bromley Guardian that, owing to the shortage of staff and the havoc caused to wires by the recent storms, it is unable to entertain for the present orders for new installation work.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—**SYDNEY.**—June 20th. Municipal Council. Two-ton electric lorry. City Surveyor, Town Hall.
PERTH.—August 16th. P.M.G. Telegraph and measuring instruments. Schedule No. 498, W.A.*

Barking.—June 9th. U.D.C. Six or twelve months' supply of coal, slack or beans. Engineer and Manager, Electricity Works.

Dewsbury.—May 31st. Twelve months' supply (about 2,500 tons) of steam coal for the electricity works. Specifications from Mr. R. H. Campion, Borough Electrical Engineer.

Dublin.—May 30th. Electricity Supply Committee. Cast-iron exhaust pipes and supports for 1,500 kw. Ballis engine. See "Official Notices" to-day.

Fleetwood.—June 3rd. U.D.C. Rough slack coal for 12 months (2,000 tons) for the electricity works. Mr. A. Cottam, Clerk.

Liverpool.—May 31st. Liverpool Overhead Railway. Twelve months' supply of electrical fittings. Particulars from General Manager, 31, James Street.

London.—May 30th. Metropolitan Asylums Board. Electricians' ironmongery and general stores for 12 months. Mr. T. D. Mann, Clerk.

ST. PANCRAS.—Steam coal for 12 months for the Electricity Department. Borough Electrical Engineer.

Manchester.—May 26th. Electricity Committee. Stores for one year. Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall.

June 7th. Electricity Committee. Electric capstan for Stuart Street station. See "Official Notices" to-day.

New Zealand.—June 23rd. Oamaru Borough Council. Overhead mains and street-lighting equipment (Contract No. 2); power-station equipment (Pelton wheels, alternators, &c.) (Contract No. 3); service meters (Contract No. 4); line transformers and accessories (Contract No. 5).*

PAHIATUA.—July 10th. Borough Council. Overhead wires, poles, street lamps, gas engines, producers, dynamos, auxiliary apparatus and accumulators. Specifications from Borough Offices or Mr. E. J. Fenn, Consulting Engineer, Auckland.*

Swindon.—May 30th. Corporation. Steam coal for the electricity works. See "Official Notices" May 12th.

Wigan.—May 31st. Extension to boiler house at electricity works. Specifications, Electrical Engineer's office, Wigan.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

London.—L.C.C. Traction glow-lamps for the Tramways Department: British Westinghouse Co., Ltd.

Maidstone.—B. of G. Renewal and repairs of internal telephone system: Oswald Jones & Co.

Meter Contracts.—Messrs. Chamberlain & Hookham, Ltd., have received contracts for meters for the ensuing 12 months for Southampton and Falkirk.

Rawtenstall.—T.C. Accepted tenders for cable and apparatus for supply of electricity to Haslingden:—

British Westinghouse Co., Ltd.—Transformer and switch panel.

W. T. Glover & Co., Ltd.—Cable.

Oates & Green, Ltd.—Conduits.

British Thomson-Houston Co., Ltd.—Switchgear.

Tynemouth.—Electricity Committee. 220 yards of three-core cable: Macintosh Cable Co.

Worthing.—B.C. A year's supply of 3 and 5-ampere electricity meters: The Electrical Apparatus Co., Ltd.

FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Friday, May 26th. At 5.30 p.m. At Albemarle Street, Piccadilly. N. Lecture on "X-rays," by Prof. C. G. Barkla, F.R.S.

Tuesday, May 30th. At 9 p.m. Lecture on "Optical Research and Chemical Progress," by Dr. T. M. Lowry, F.R.S.

Physical Society of London.—Friday, May 26th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Ordinary scientific meeting.

Association of Supervising Electricians.—Tuesday, May 30th. At 7.15 p.m. At St. Bride's Institute, Bride Lane, E.C. Paper on "Internal Combustion-driven Electrical Sets," by Mr. W. A. Tooke.

Chemical Society.—Thursday, June 1st. At 8.30 p.m. At Burlington House, Piccadilly, W. Ordinary scientific meeting.

Royal Society of Arts.—Thursday, June 1st. At 1.30 p.m. At John Street, Adelphi. Paper on "The Work of the Imperial Institute for India," by Prof. W. R. Dunstan, F.R.S.

NOTES.

Effect of Imperfect Dielectrics in the Field of a Radiotelegraphic Antenna.—In Scientific Paper No. 269 of the Bureau of Standards, Mr. John M. Miller deals with the variation of the resistance of an antenna with the wave length of the oscillation. Starting from the wave length corresponding to the fundamental of the antenna, the equivalent resistance of the antenna rapidly decreases with increasing wave length, and reaches a minimum; as the wave length is still further increased, the resistance rises again, but in a linear manner. The decrease in resistance is explained by a decrease in the energy radiated in the form of electromagnetic waves as the wave length increases; this so-called radiation resistance varies, as it should, inversely as the square of the wave length. It has been difficult, however, to

account for the linear increase which takes place at the longer wave lengths.

A recent paper by Austin pointed out the similarity in the linear increase in resistance of an antenna at long wave lengths with the behaviour of an absorbing condenser. The fact that in the curves which he had obtained for ship stations the rise in resistance was less marked than for land stations led him to believe that the absorption was probably caused by the ground acting as an imperfect dielectric. The measurements described in this paper verify Austin's hypothesis that the effect is caused by dielectric absorption, but do not confirm the supposition that the absorbing dielectric in question is the ground.

The observed large effect upon the absorption of variable air condensers brought about by the poor dielectric properties of small amounts of insulators in the electric field suggested to the author that the absorption in antennas was likewise caused by the presence of poor dielectrics in the field of the antenna. Experiments were accordingly carried out, and proved that in the design of an antenna it is a matter of importance to keep the dielectric absorption of the antenna, regarded as a condenser, as low as possible in order to minimise the waste of energy in the antenna, and so improve its efficiency as a radiator. The capacity through wooden masts, trees, buildings, insulators, &c., must be made extremely small in comparison to the capacity of the antenna through unobstructed air. In other words, the electrostatic field of force set up by the oscillating electric charges should not be occupied by imperfect dielectrics, and especially so where the electric force is intense. One important feature of design is to cover the interior walls of rooms into which the leads to the antenna run with grounded metal screens.

Electric Steel in Italy.—Five of the steel works in Italy are now provided with electric furnaces, the total number of the latter being 13. According to *Metalurgia Italiana*, the production amounts to 78 tons per day of 24 hours, the quantity of electrical power required being 6,800 kW.

Chief Technical Assistants' Association.—Owing to the war, it was thought advisable that the annual dinner of this Association should not be held, and an informal gathering of the members took place on Thursday evening, 18th inst., at the Villa Villa Restaurant. Advantage was taken of the occasion to present Mr. MacAlister, the hon. secretary, on behalf of the members, with a handsome rose bowl, as a token of their appreciation of the work which he has put into the launching and organising of the Association. The presentation was made by the chairman, Mr. J. T. Baron. In replying, the hon. secretary stated that as they had now reached practically the maximum of their membership, owing to the limited field from which their members could be obtained, it was hoped that the members would continue, as during the past 12 months, to contribute to the general welfare of the Association by further discussions on technical matters; and although by present arrangements a large number of subjects were down for discussion, these by no means exhausted the field which was open, and of which it was hoped all members would avail themselves. The following members supported the chairman and contributed towards the evening's success:—Messrs. Young, Bradshaw, Mason, Parker, Howell, Gregory, Thompson, and Manly.

Lay-Outs for Car Sheds.—Mr. N. L. Sanow, in an article in the *Electric Railway Journal*, gives some data resulting from an investigation with a view to finding what arrangement of track would call for the least number of car movements over switch, mate and frog in electric railway work when one car was passed to each of the branch tracks, as, for instance, at the entrance of a depot. The life of a piece of special work is practically dependent on the number of movements across it, and any system which reduces the number will result in reduced maintenance. The author concludes that in place of the plain "ladder" track from which each diverging track turns off individually, it is better to arrange the branch tracks in groups of two or three or more, each group connected by a single branch-off to the principal ladder track. The saving in movements increases rapidly with the number of tracks in the lay-out, and exceeds 50 per cent. for equipments of moderate size.

Large U.S.A. Turbine Plant.—The Narragansett Electric Lighting Co., of Providence, R.I., has decided to install a 45,000-kw. turbine set at its South Street station, which will be of the Westinghouse cross-compound type similar to, but larger than, the units in operation at the Seventy-Fourth Street station of the New York Interborough Co., which have been described in our pages. The machine is to be capable of carrying a short-period load of 50,000 kW., and will operate at its most efficient rating on 11½ lb. steam per kW.-hr. The set comprises a high-pressure turbine of the reaction type, to operate on steam at 175 lb. and 100° F. superheat, direct-coupled to a four-pole generator running at 1,800 R.P.M. The H.P. turbine exhausts into a low-pressure turbine alongside, which is coupled to a six-pole generator running at 1,200 R.P.M. Both generators will deliver three-phase 60-cycle current at 12,000 volts, and will have an independent exciter. The L.P. turbine is of the double-flow type, each end exhausting into a separate jet condenser of the Westinghouse-Le Blanc low-head type, said to be the largest jet condensers constructed. The plant will require 18,000,000 lb. of circulating water an hour, when maintaining a 28-in. vacuum with water at 70° F.

The complete turbine set will measure 46 ft. 9 in. in length by 37 ft. in width, representing 26 kW. per sq. ft. of floor space.—*Power.*

Inquiries.—Makers of the "New Pacific" and "Empire" electric carpet sweepers are asked for.

Seats for Lift Attendants.—The Home Secretary desires to call the attention of occupiers and managers of business premises who have taken on, or may be taking on, women and girls to act as lift attendants, to the need which exists in certain circumstances for allowing the attendants facilities for resting in the intervals of work. There is a growing tendency, with a view to increasing the passenger accommodation, to make lifts without seats, and it has been represented to him that in busy establishments, where the lifts are running very frequently during certain hours, a considerable strain is placed upon the attendants, if the work is carried on without any opportunity of sitting down during such intervals as may occur. He would urge the provision of an attendant's seat when other sitting accommodation is not available, and in specially heavy cases where work is practically continuous, would recommend that one or two short intervals should be allowed for purposes of rest. A convenient form of seat, which is now being provided in some new lifts, consists of a wooden flap which closes flat against the side of the lift when not in use.

Fatality.—An inquest was held at Old Hill, on Friday, respecting the death of a lad named Humphreys (15), formerly in the employ of Barton, Dekingpole & Co. The evidence showed that the lad was helping to put on a belt, for which purpose he was hanging on to a beam in a stooping position, when he accidentally fell down as the result of an electric shock through coming in contact with an exposed electric wire. The medical evidence attributed death to the arresting of the heart's action by shock caused by electricity, and a verdict of "Accidental death" was returned, the jury exonerating the manager of the works from all blame.

Reforms in Education.—The executive of the Association of Education Committees has agreed to ask the forthcoming Conference to demand the immediate appointment of a Royal Commission on Education. The feeling of the members is that the educational system of the country will require much amendment to meet the struggle for supremacy after the war, and that a Commission should get to work at once, so that its recommendations will be ready to put in operation at the earliest possible moment. The Association represents the urban authorities of England and Wales.

The City Corporation has decided that the City of London Schools' Committee shall inquire into the syllabus of teaching at the City of London School for Boys, whether the chemistry teaching is adequate for modern requirements; and also as to the advisability of adding an engineering class to the course of instruction.—*The Times*.

Organised Science.—At the annual meeting of the British Science Guild last week, Sir Wm. Mather, the President, said that if the warnings of the founder of the Guild, Sir Norman Lockyer, had been heeded, we should have been in a far better position to carry on the war; it was at last being recognised that the organisation of science was indispensable to the prosperity of the nation. Mr. Andrew Fisher, High Commissioner for Australia, explained the constitution of the National Institute of Science and Industry in Australia, of which we gave particulars in our last issue. Moving a vote of thanks to Mr. Fisher, Surgeon-General Sir Alfred Keogh remarked that we had as able scientific men as any in Europe, who also had the invaluable quality of initiative. Dr. R. M. Walsley, in seconding the motion, advocated strong efforts to re-establish British ascendancy in technical optics.

German Chemical Combine.—A new combine in the German chemical industry, which has been formed for a period of 50 years, is stated to be essentially a consequence of the war; it was felt that a syndication of the German chemical industry was necessary if the industry was to maintain its world-wide pre-eminence, more especially in regard to dyes. The new combine is stated to have a larger capital than any other existing German syndicate—namely, 225,800,000 marks. Its members are:—Badische Anilin und Soda Fabrik, Farben Fabriken Bayer, Aktiengesellschaft für Anilin-Fabrikation, Farbwerke Höchst, Leopold Cassella, Kalle and Co., and Chemische Fabriken Weilerter-Meer.

The Output of Coal.—At the suggestion of the Government, representatives of the coalowners and the Executive Committee of the Miners' Federation of Great Britain met in London last week to devise some scheme to stimulate the production of coal, which has fallen off in consequence of the withdrawal of labour for military service. The following resolution was unanimously adopted:—"In regard to absenteeism, this meeting agrees to the matter being referred to the districts on the distinct understanding that committees will be at once set up in the districts to provide and put into operation effective machinery to secure the attendance of all workmen employed to the fullest possible extent, and to inquire into the circumstances of workmen employed in the mines not being provided with work whenever they present themselves, the intention being to secure, as far as possible, the output of coal necessary for the country's needs." The joint meeting was adjourned to June 22nd to receive reports from the districts. The question of the suspension of the Eight Hours Act and the working of one hour extra per day for 60 days a year was also adjourned to the same date. It was decided to recommend to the several districts that the holidays should be curtailed, as far as possible, in the national interest, in order to increase the output of coal.—*Morning Post*.

Appointments Vacant.—Shift engineer (32s. 6d.), for the Holyhead U.D.C. electricity department. See our advertisement pages.

Rubber from Vodka.—The absolute prohibition of the drinking of spirituous liquors in Russia left a stock of nearly 7 million hectolitres of vodka available for other uses, and the Russian Government initiated researches with a view to finding industrial applications for it. A Moscow chemist named Ostromyslenski is reported to have found employment for it in the manufacture of synthetic rubber from butadienes obtained from oil-gas, and it is said that the Government has decided to erect a large factory for the purpose.

Electric Equipment of the Phoenix Assurance Co.'s Building.—With reference to our description of the above in the ELECTRICAL REVIEW of May 5th last, we understand that the electric fires which are in use are of the "Revo" type, supplied by the Cable Accessories Co., Ltd., of Tivdale, Staffs.

Large American Sign.—An unusually large electrical sign has recently been erected outside the premises of the Travellers' Insurance Co. at Hartford, Conn., U.S.A. The sign, which consists of the single word "Travellers", is 120 ft. long, with 9 ft. letters, and is stated to be readily legible at a distance of three miles.

German Cartels.—Prof. Hauser, in a recent communication to the *Bulletin* of the Société d'Encouragement pour l'Industrie Nationale, explains the part played by "cartels" in Germany's economic expansion. The "cartel," he says, cannot be defined as a form of industrial concentration, for a "trust" is also a form of concentration; but while a trust is the absorption of a number of enterprises by the strongest, as a brutal application of the struggle for existence, the cartel is a federative organisation which allows of the subsistence of individual enterprises. These enterprises merely renounce, on entry into a syndicate or cartel, a determinate part of their industrial or commercial autonomy. Juridically, a cartel is a joint-stock company among a number of producers, for the sale in common of the generality, or certain categories, of their products. Not every industry, and in a single industry, not all the products, are susceptible of subjection to the syndicate rule. A type of syndicate product is coal, and the Rhine-Westphalian syndicate in 1908 absorbed 98·7 per cent. of the total production of that basin; but for a cartel to succeed it is not enough that the product, for which it is created, should be subjected to the syndicate rule: it requires in addition, among the members forming it, a remarkable development of the spirit of association. Hence, as M. Hauser points out, foreign countries contemplating the introduction of this German trade method must take note of the actual conditions under which the German cartels work—the iron discipline which reigns among those consenting to be subject to it. The cartel, at least as it exists in Germany, is a specifically German institution; there are cartels in other countries, but they only remotely resemble those of Germany. It is a noteworthy fact that the cartel, if it has lately served to favour exportation, was never conceived with that object; its primitive object was to struggle against over-production; but while permitting the syndicate producers to maintain prices on the home market, it also allowed them to export at prices defying foreign competition, their surplus product not consumed at home. It was between 1880 and 1885 that the German cartels began this exploitation policy, this policy of "dumping" which, by the way, is not a German invention, as is sufficiently shown by its name, and which consists in setting up two prices for the same product, or two scales of prices—a high price for the home market, and lower prices, varying with requirements, for foreign markets. This policy of dumping is, moreover, not without inconveniences, and M. Hauser gives several examples. In 1903, a big English shipbuilding company increased its exports to Germany by being able to buy German iron 30 per cent. below the cost of English iron. Belgium and Holland also exported into Germany nails and iron wire made with German iron. Facts such as these gave rise in Germany to vigorous opposition against the cartels. The inquiry, which took place in 1905 in consequence, resulted, however, in favour of the cartel, but with the stipulation that the latter consented to a reduction in home prices in favour of the German manufacturer exporting products. It was this new policy which the cartels had already begun to apply, which enabled Germany to oust, often completely, all competition in foreign markets, and to hinder the development of national industries in certain countries, such as Italy. With their system of premiums on exportation in all branches of industry, the Germans were able completely to strangle competition in foreign markets, and Government orders, and those of companies controlled by them mechanically, directly or indirectly, reverted to the German houses; it was in this way that, at the end of the crisis in 1906, French railway companies alone were customers for one-third of the German exports of locomotives. On the international board, says M. Hauser, the dice played by Germany were loaded, and it is foolish, under these conditions, to talk of "fair play" with so tricky a player. Steps should rather be taken to counteract and destroy the disloyal procedures of German cartels. Among means which are available to this end, M. Hauser commends those of the Canadian Government as the best. This stipulates that in case of sales below the prices of the country of origin, a double import-tax is levied—first the normal tax, based on the value of the invoice, and then a special tax, equal to the difference between the invoice price and the normal price. Arrangements such as these, M. Hauser thinks, the Allies should agree among themselves uniformly to enforce.—*La Revue Electrique*.

U.S. Production of Copper for 1916.—If the present rate of production is maintained, the U.S. refinery production of copper for the 12 months of 1916 will for the first time on record exceed 2,000,000,000 lb. The estimated figure for the year is 2,096,875,000 lb., an increase of 49,875,000 lb. over 1915, or 27 per cent. Five producers will be responsible for 78 per cent. of this increase. Never before in the history of the industry has the increase in any one year exceeded 150,000,000 lb.

In the face of an unprecedented outpouring of the metal, sales of hundreds of millions of pounds are being made to eager buyers for delivery up to the end of the year at 27½ cents. This is the figure understood to be the price to be paid for the 300,000,000-lb. order just closed with the British Government.

Not in any year since 1873 has copper sold above 26½ cents.

The copper producers would seem to be assured of a gross business this year of at least \$524,000,000, and this assumes an average price of only 25 cents per lb. If an average of 27 cents is received, the producers stand to sell their product for \$565,920,000. Such is the boom conferred by the European war. The full import of these figures is appreciated when placed beside the gross value of \$288,220,000 for the 1915 production and \$205,066,000 for 1914.—*Boston News Bureau.*

Italian Coal Resources.—Although Italy is endowed with water power available for hydro-electric purposes in excess of many European countries, the need for coal for steam-driven electric generating plants is pressing, in order to supplement the hydro-electric plants in the drier seasons of the year. Hitherto coal has been mostly imported, principally from England or Germany. Now, however, an attempt is to be made to explore and develop such deposits of coal—chiefly anthracite and lignite—as the country may possess. Prof. Novarese, head of the Royal Mining Corporation, states that there are extensive deposits of various kinds of useful coal in the peninsula, and a recent Government decree makes provisions to facilitate the search and winning of the home article. Prof. Novarese is of opinion that the Italian deposits could be made to yield 1,000,000 tons of fuel yearly, for electric stations, and even if of a quality somewhat inferior to the imported article, the present enhancement of the price of the latter would more than compensate for any deficiencies of the Italian fuel.

Late Legal.—FALK, STADELMANN & CO., LTD., v. THE GENERAL CABLE MANUFACTURING CO.—Before a Divisional Court of the King's Bench Division, presided over by Mr. Justice Lush, an application was made on Wednesday regarding a new trial of this action, to recover in respect of certain Swiss electrical cable.

Mr. Clavell Salter, K.C., for the plaintiffs, said that a Divisional Court had heard an appeal from the County Court in this case, and had ordered a new trial, and a question had arisen as to whether it was intended that the new trial should be limited to certain issues. The goods were electrical cables, and defendants said there was a *force majeure* clause, and the contract was impossible because of the war. The County Court Judge found there was no *force majeure* clause in the contract, but he did not consider whether there was in fact *force majeure*. The question of impossibility he decided in favour of the plaintiffs, and he then assessed the damages. The Divisional Court took the view that the Judge did not properly determine if there was a *force majeure* term in the contract, but that the question of impossibility had been rightly decided, and at the new trial it would not be necessary to further consider the latter question. The order had been drawn up for "a new trial," without any such limitation, and as this litigation had proved costly, his clients were most anxious that the second trial should be of limited scope as directed by the Divisional Court. The only point was whether there was power to amend the order that had been drawn up.

Mr. C. Johnson, for the other side, said that the evidence must be the same again whatever happened, because evidence that would go to show that the contract was impossible of performance would also apply to the question whether there had been prevention by *force majeure* from the carrying out of their obligations. This was the third attempt made to limit the right of his clients to a new trial.

Mr. Justice Lush said that, while sympathising with the position of the plaintiffs, they could not alter the order that had been made for a new trial of the case. They ordered that the costs of the application should be costs in the cause.

Tests of Fire Extinguishers.—We have received from the Home Office the report of a Committee appointed to conduct experiments with a view to ascertaining the value of dry-powder fire extinguishers for coping with fires such as are caused by bombs. The tests showed that the dry powders checked the fire, but the application of buckets of water was far more effective in confining the fire to the immediate neighbourhood of the bomb, and eventually extinguishing the fire. A jet of water from a liquid extinguisher was still more effective, but only extinguishers of reliable make should be used. The Committee concludes that a plentiful supply of water is by far the best extinguishing agent, and that dry-powder extinguishers are practically useless for controlling fires caused by bombs. A small hose of ¾ in. diameter, similar to garden hose, with a nozzle of ½ in. diameter (internal), supplied with water at a pressure of 45 lb. per square inch, and discharging at the rate of six gallons per minute, extinguished a bomb fire which had been allowed to mature for three minutes; and at the end of six minutes from ignition of the bomb, the fire was completely out.

These conclusions are in accord with the recommendations of the British Fire Prevention Committee, which we published in our issue of May 28th, 1915.

The Inefficiency of German Electrical Machinery.

With reference to our recent leading article on "The Deceitfulness of the Low-st Tender" (ELEC. REV., May 5th, 1916), we observe from the *B. of T. Journal* that his Majesty's Consuls in China have not been slow to take advantage of the opportunity which has been afforded by Mr. Aldridge's report on the troubles experienced with German turbo-alternators and other plant provided for the Shanghai municipal electricity works, to give assistance to British electrical manufacturers. The fullest publicity will doubtless be given to this important matter in China in circles where German cheapness has long been little short of a scandal. German damping of electric motors, &c., in the Chinese market at ridiculously low prices has been one of the difficulties that our firms have long had to face, and object lessons of the Shanghai kind should have a very healthy effect, and go a good way to defeat the methods which German works were continually employing in China before the war. The beneficial effect of the tribute paid to British manufacturers, in contrast to German, will not be limited to that market. It is one of those examples which might fairly and legitimately be turned to profitable account in all colonial and foreign markets where the under-cutting weapon of the Teuton has been so ruinously employed for the purpose of stifling British and other trading efforts. But have the British electrical manufacturers any efficiently organised means for ensuring that the industry shall reap all the good that widespread and discriminating circulation of the facts of the case should bring?

Increased Loom Production Due to Motor-Drive.

Investigations have been conducted in a New England worsted mill, to determine the actual extent of possible benefits by the substitution of electric motors for the existing mechanical drive. The mill contains 48 looms, which are run at a load factor of 62 per cent., and a speed which varies over 11 per cent., due to the irregularities of mechanical driving. The looms operate at an average of 105 picks per minute, and on a 59-hour week, yield 119 yards of cloth per loom. Tests show that with the installation of group-motor drive an average of 112 picks per minute can be obtained, with a load factor of 72 per cent. The resulting output would then be 147 yards per loom per week, or a gain of 28 yards per loom. The selling price of the cloth is \$1.50 per yard, so that the total value of the increased product is \$2,016 per week for the 48 looms for a 50-week year, and, taking 5 per cent. of the selling price as the profit, this equals \$5,040. The cost of making the change, which involves the purchase of six motors, aggregating 46 H.P. connected load, was estimated at \$1,100. On this basis the electric drive would pay for itself in less than three months. *Electrical World.*

Lights on Vehicles.—The recent order of the Secretary of State prescribes the use of three lamps on vehicles, two in front, white, and one at the rear, red. From June 1st the police will be instructed to enforce the law in all cases where a contravention is observed.

A High-Head Turbine Plant.—For a long time the record for height of head has been held by the power station of Vouvy, in Valais, France, with a fall of 9.7 metres; it passed to the works of Orli, in the Eastern Pyrenees, where the head was 6 m. greater, but has now been far exceeded by the Folly station, which, 500 m. above the sea-level, is fed by a lake at an altitude of 2,140 m., giving a head of 1,640 m., or 5,380 feet. Prof. R. Nesper, of Lausanne, states that the pressure conduit is 4,625 m. in total length, of which 2,300 m. has a diameter of 600 mm. (24 in.), and the remainder, 500 mm. (20 in.). The walls of the tube vary from 6 to 43 mm. (¼ to 1½ in.) in thickness; up to 34 mm. the conduit is welded sheet, the rest being of weldless steel. With the exception of about 870 m. which is in tunnel, the pipe is buried in a trench 1 to 1½ m. deep throughout its length; no expansion joints are provided, and it is anchored at only one point—where it enters the works. The runner of the turbine, of the Pelton type, has a mean diameter of 3,550 mm. (140 in.) and consists of a disk of Siemens-Martin steel, weighing about 7,100 kg. (7 tons), and carrying 64 buckets. The jet is 34 mm. (1¾ in.) in diameter. The runner is carried on a steel shaft with journals 200 and 240 mm. (7½ and 9½ in.) in diameter, directly coupled to the alternator and running at a speed of 600 R.P.M.

The buckets are attached to the rim of the disk by a special method, patented in Switzerland by Léon Dufour; they are of pressed Siemens-Martin steel, and weigh 11½ kg. (25 lb.) each.

The turbine is provided with an automatic regulator, which actuates a deflecting plate as well as the needle of the jet, the former acting quickly to take the load off the runner, and the latter more slowly, to prevent excessive pressure in the pipe line. A special arrangement is provided in the discharge pipe to cushion the jet when thus deflected, consisting of a cast-iron chamber followed by a converging steel casing leading to a horizontal pipe 1,300 mm. (51 in.) in diameter and 9 m. (29½ ft.) long, which is partly closed at the outer end, so that it always contains a quantity of water. This water receives the deflected jet, and absorbs the blow without injury to the walls of the passage; the device has proved quite satisfactory. The velocity of the jet at the needle valve is about 175 m. (574 ft.) per second, but at the outlet of the damping pipe its speed is reduced to a harmless value. Even under working conditions, the velocity of the water leaving the buckets is 30 to 40 m. per second, which, without such special provision would damage the masonry.—*La Revue Electrique.*

Institution and Lecture Notes.—Institution of Electrical Engineers.—A special meeting to consider the resolution to exclude alien enemies from membership of the Institution to be held yesterday.

At the annual general meeting held on the 11th inst., the report of the Council and the statement of accounts were presented and adopted.

The result of the election of Council for the next Session was announced, as follows:—

President: Mr. C. P. Sparks.
Vice-Presidents: Messrs. R. A. Chattock,* R. T. Smith, C. H. Wordingham,* and Dr. A. Russell.
Hon. Treasurer: Mr. J. E. Kingsbury.
Ordinary Members of Council: Messrs. W. A. Chamen, J. Christie, H. Dickinson, Prof. T. Mather, Messrs. G. H. Nisbett,* G. W. Partridge, W. H. Patchell, W. L. Preece,* H. F. Proctor, G. S. Ram, R. J. Wallis-Jones, W. B. Woodhouse.
Associate Members: Messrs. F. W. Crawter,* H. H. Harrison,* W. R. Rawlings.*
Associates:—Messrs. J. O. Callender,* J. Devonshire,* J. Hunter Gay.
* Elected.

The President announced that the Willans Premium had been awarded to Dr. S. Z. de Ferranti, for his Presidential address in 1910.

University College, London.—Lecturing, on May 15th, on the manufacture of nitrates from the air by electric power, Mr. E. K. Scott gave three reasons why the war broke out when it did: Germany's new-found ability to dispense with Chile nitrates; the perfection to which Zepplins had been brought; and the gyro compass for submarines. He dealt mainly with the direct electrical method of fixation of nitrogen, and demonstrated the importance of the compounds of nitrogen in the manufacture of explosives, in agriculture, and in the production of aniline dyes.

Volunteer Notes.—1ST LONDON ENGINEER VOLUNTEERS.—Orders for the week by Lieut.-Col. C. B. Clay, V.D., Commanding.

Monday, May 29th.—Technical for Sections 1 and 2, No. 3 Company, 46 Regency Street, S.W.; Squad and Platoon Drill, Sections 3 and 4, No. 3 Company; Signalling Class and Recruits.
Tuesday, May 30th.—School of Arms, 6 to 7; lecture, Mr. J. Roberts, "Water Supply," 7.15; Recruits, 7.15 to 8.15, Archbishop's Park.

Wednesday, May 31st.—Platoon Drill, No. 3 Platoon, No. 1 Company.

Thursday, June 1st.—Platoon Drill, No. 7 Platoon, No. 2 Company; Shooting for Sections 1 and 2, No. 3 Company, Miniature Range; Recruits, 5.45 to 7.45; Instructional Class, 5.45.

Friday, June 2nd.—Technical for Sections 3 and 4, No. 3 Company, 46 Regency Street, S.W.; Squad and Platoon Drill, Sections 1 and 2, No. 3 Company.

Saturday, June 3rd.—Company Commander Fleming's Instructional Parade, 2.30.

Sunday, June 4th.—Entrenching duties: Parade, Victoria Station (S.E. & C. Railway Booking Office), 8.35 a.m. Uniforms, haversacks and water-bottles. Mid-day rations to be carried. Railway vouchers will be provided.

Musketry.—For Nos. 1 and 2 Companies, see Notice and Tables A and B, at H.Q. quarters.

Notice.—Unless otherwise indicated, all drills, &c., will take place at Chester House.

MACLEOD YEARSLEY, Adjutant.

3RD BATT. (OLD BODS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, May 25th, 1916:—

Week-End Parades.—Saturday.—The Battalion will Parade at Baker Street Station, at 2.30 p.m., and proceed by train to Wembley Park for Ceremonial Drill under the Commandant. Members who have their tunics at their tailors may attend.

Sunday.—The Battalion will Parade at Liverpool Street Station (Low Level entrance, G.E.R.), at 9.30 a.m., and proceed by train for Entrenching duties.

Musketry.—Inter-Battalion Cup Competition. A practice match has been arranged to be shot at Bisley on Sunday next, the 28th inst., between selected teams. Targets will be available for other members who attend. Members to report to Sergeant Burmester, at 10.5 a.m., Platform 6, Waterloo Station.

A. G. JOINER, Major and Adjutant, O.B.C.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

General.—Mr. AUGUST ECKSTEIN, electrical engineer, of Fallowfield, who was born in Bavaria before it became part of the German Empire, but has been permanently resident in England since 1887, was denationalised in 1888, and has been a naturalised British subject since 1894, has assumed the name of Arthur Erskine.

Mr. D. E. Ross has been gazetted second-lieutenant in the Tyne Electrical Engineers, R.E. He has been on dispatch riding in France for about a year.

The Times states that the curators of Edinburgh University on Monday appointed Sir JAMES ALFRED EWING, Director of Naval Education, Principal in the room of the late Sir William Turner.

Councillor C. ATKINSON has been re-appointed chairman of the Fleetwood Electricity Committee.

Roll of Honour.—Intelligence has reached Rugby of the deaths in action of five former employés of the British Thomson-Houston Co., Ltd. Rifleman E. FRANKLIN, of the Rifle Brigade, who was in the winding department, has died of wounds received on April 12th; Private R. DAVIS, of the Oxon and Bucks Light Infantry, has been killed by a trench mortar; Bombardier E. COX, of the Rugby Howitzer Battery, formerly a charge-hand in the turbine department, has been killed by shrapnel; Private B. BLAKE, of the Wiltshire Regiment, who was in the purchasing department, is reported killed in action, after being missing since June 16th last; and Lance-Corporal J. T. GURNEY, of the Royal Warwickshire Regiment, reported missing since April 21st, 1915, is now listed as dead.

The death in action is reported of Private J. JEFFRIES, of a Shropshire Regiment, who was an employé at Darwen Corporation electricity works.

Private J. H. DORBER, of the South Lancashire Regiment, formerly employed by the Osram Lamp Co., at Manchester, has been killed in action.

Private RICHARD SILCOCK, of the Canadians, who has been killed in action, was formerly employed at the works of the Chloride Electrical Storage Co., Clifton Junction.

Captain GERARD R. FLEMING, Scottish Rifles, who has been wounded, was, before joining the Army, in the employment of Messrs. Wm. McGeech & Co., of Glasgow.

Rifleman JOHN BARKER, Royal Irish Rifles, formerly employed at the British Westinghouse Works, Trafford Park, who was previously reported missing, is now officially reported killed. Another former worker at the Westinghouse Works, Sergeant E. MURRAY, of the Loyal North Lancashires, has been killed. Private ARTHUR ETTERICK, of the Black Watch, who has died from wounds, was also employed prior to enlistment at the British Westinghouse Works, Trafford Park.

Lance-Corporal R. QUINN, of the Manchester Regiment, formerly employed by Messrs. Hans Renold, Ltd., has been killed in action.

Corporal ELIJAH BAUGH, before the war employed as an electrical fitter by the General Electric Co., Ltd., Salford, has been seriously wounded in action.

The death in action is reported of Sergeant R. W. WOODS, Loyal North Lancashire Regiment, who was formerly employed at Messrs. Dick, Kerr & Co.'s works, at Preston.

Obituary.—Mr. R. W. TWEEDY.—The death has occurred of Mr. Robert Wilkinson Tweedy, chairman of Messrs. Tyler and Co., Ltd., electrical and general engineers, Denton Holm, Carlisle, and Dalton, London. Deceased, who was 69 years of age, entered the business of his father at Carlisle, of which he ultimately became sole proprietor. On amalgamation with Messrs. Tyler & Co., 16 or 17 years ago, he became local managing director, and subsequently was elected chairman of the company. He had served on the Carlisle City Council and Cumberland County Council.

SIR CORBET WOODALL.—We regret to record the death of Sir Corbet Woodall, governor of the Gas Light & Coke Co., at the age of 75 years.

HERR F. GNAUTH.—The death has occurred, at the age of 63 years, of Herr F. Gnauth, the general director of the Felten & Guilleaume Carlswerk Gesellschaft, of Mulheim, Cologne.

NEW COMPANIES REGISTERED.

F. J. Shenton & Co., Ltd. (143,861).—This company was registered on May 17th, with a capital of £3,400 in £1 shares (10,000 ord. and 1,500 "B" st.), to carry on the business of munition makers, electrical, telephone, telegraph, mechanical, and general engineers and merchants, electricians, electroplaters, fitters, millwrights, founders, stampers, galvanisers, jappanners, annealers, enamellers, painters, &c. The subscribers (with one share each) are: W. A. Barber, 51, Panshurst Road, Thornton Heath, Surrey, clerk; J. A. Matthews, 38, Lambton Road, Hornsey Rise, N. clerk. Private company. The number of directors is not to be less than two or more than five; the first are F. J. Shenton (managing director) and E. H. Smith (chairman). In the event of the decease of the said E. H. Smith, his father, L. J. Smith, or failing him, the personal representatives of the said E. H. Smith, shall have the right to appoint a director in his place. Remuneration of E. H. Smith, £50 per annum; of managing director, as fixed by agreement; of other directors, as fixed by the company. Registered office: 284, Queen's Road, Peckham, S.E.

Quead, Ltd. (143,850).—This company was registered on May 15th, with a capital of £7,000 in £1 shares, to take over the business of vendors and manufacturers of gas and electric stoves, heat lamps, and apparatus and appliances relating thereto carried on by F. Eads and R. J. Quinlan, at 47, Marylebone Lane, W., as Eads & Quinlan. The subscribers (with one share each) are: F. Eads, 47, Marylebone Lane, W., manufacturer of electric fires, &c.; F. L. Wright, 66, Windermere Road, Ealing, W., eng.

near: R. I. Quinton, 47, Marylebone Lane, W., engineer. Private company. The number of directors is not to be less than two or more than five; the first are: F. Lark, permanent; H. L. Wright, and R. I. Quinton. Qualifications: £2,000 shares. Secretary: H. Middleton. Registered office: 47, Marylebone Lane, W.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Lamplough & Sons, Ltd.—Mortgage, created by Receiver, dated May 16th, 1916, to secure £21,200, charged on the company's undertaking all property, present and future, including uncalled capital. Holder: H. E. Taylor, 35, Church Road, Richmond, Surrey.

CITY NOTES.

United River Plate Telephone Co., Ltd.

The gross earnings of the company for 1915 amounted to £641,581, whilst the gross maintenance and other charges in Argentina and London were £147,810, leaving the profit for the year at £193,771. Deducting interest on debenture stock, preference dividend for the year, and the interim ordinary dividend, and adding £6,563 brought forward, £128,234 remains. Of this, £2,000 has been put to the staff provident fund, £20,000 to the reserve fund, £19,000 to depreciation of securities account, and a final dividend of 5s. per share on the ordinary shares, making 8 per cent. for the year, free of income-tax, absorbs £81,000, leaving £46,234 to carry forward. Annual meeting: May 30th.

Anglo-Portuguese Telephone Co., Ltd.

the previous year, and expended £54,037, as against £44,875, and the gross profit was £27,886. The commercial and financial situation in Portugal was no better than one would expect it to be after the political turmoil prevailing throughout the country during recent years, and it was not easy under such circumstances to explain the steady growth of this company's business, unless it were due to their excellent service, combined with a moderate tariff. The number of subscribers increased during the year by 10½ per cent., and the gross revenue by 14 per cent. Unfortunately, however, the net profit showed little advance on that of the previous year, owing partly to the increased cost of labour and material and in greater measure to the loss on exchange. The Lisbon exchange on London was now only 34d. per escudo, a fall of about 20 per cent. in less than two years, and that it was not worse was due to the fact that imports into Portugal had practically ceased, and that the Brazilians and rich Portuguese, who formerly spent most of their time in Paris or Biarritz, were obliged now, on account of the war, to take up their residence and spend their money in Lisbon or Oporto. How they were to meet the steadily increasing cost of labour and material was not quite clear. The Portuguese railways, both private and State-owned, had solved the problem by an increase of 10 per cent. in their tariff, and if such a step could be justified in the case of native enterprises it should be still more allowable in the case of foreign companies, which had to send their profits out of the country. He feared, however, any such increase on their part would be resented by the public, and therefore was out of the question. Capital expenditure during the year was lower than for some years past. In normal times this would be no subject for congratulation, because the constant aim of a telephone company was to enlarge the scope of its operations, and that, of course, could only be done by liberal capital expenditure. But under existing conditions, when Treasury sanction for new issues was difficult to obtain, it was perhaps as well that capital requirements were, if only temporarily, on a moderate scale. This provision of working capital was a question that did not leave them altogether free from anxiety, because there must be no slackening of effort to meet the requirements of an ever-growing telephone public. At the present time the business was expanding at an unprecedented rate, and scarcely had they got their new exchange at Lisbon into working order than they were confronted with the possible necessity of further extensions. How much longer they could defer the opening of a new exchange at Oporto he did not know. For the time being the policy of the board was to restrict new work as far as possible to the actual bringing in of subscribers, but the present rate of progress could not be maintained without an adequate increase in the capacity of the exchanges and of the cable routes. Having regard to all the circumstances, it was scarcely probable that normal capital requirements would henceforth be under £20,000 a year, and the tendency would be to increase rather than to fall away. Should they be called upon to extend the area of their operations beyond Lisbon and Oporto, this estimate might be considerably increased. As in the past, they would hope to meet this expenditure largely out of surplus or undivided earnings, but the

continued rise in the Lisbon exchange was making serious inroads on the profit and loss account, and the diminished surplus, if they were to maintain their normal rate of dividend, would necessitate raising some, at all events, of the requisite funds by an increase of capital in one shape or another. Fortunately their present financial position was quite satisfactory, and, subject to the absence of any turn for the worse in the military situation, they could see their way ahead for well over a year.

Electric Construction Co., Ltd.

The net profit for 1915, after providing £6,648 for debenture interest and £7,500 for depreciation, is £43,241, plus £7,471 brought forward. After paying 7 per cent. on the preference shares, and 7½ per cent. on the ordinary for the year, £12,664 is to be put to general reserve fund (making it £50,000), leaving £16,889 to be carried forward, subject to excess profits duty and assessment under Munitions of War Act, 1915. The works were declared controlled in August last. Notwithstanding the very high price of materials and an all-round increase in the cost of manufacturing, the net profits for the year were satisfactory. The improved results are due principally to a larger volume of orders having been handled through the unremitting efforts of the staff and workmen. Unexecuted orders at the beginning of the new financial year exceeded those on hand a year ago. Annual meeting: May 30th.

Shanghai Electric Construction Co., Ltd.

At the annual meeting, held in London on May 19th, the chairman said that the falling off in receipts referred to a year ago continued until the early autumn, when a marked improvement took place, and in the later months of the year nearly all the loss was recovered. The receipts for 1916 had so far continued on the same improved basis, and the position was now certainly hopeful. The trade of Shanghai also improved during the second half of the year, and the company had benefited by this, and by an increasing influx of natives into the Settlement in consequence of the disturbances in China. The gross traffic receipts were £117,975, less £31,707 for loss by native copper coinage, leaving effective receipts of £86,268, which was practically the same as in 1914. After deducting the working expenses in Shanghai, an operating profit remains of £55,008, as compared with £35,892 in 1914. After paying the 7 per cent. dividend, £1,387 was to be carried forward. The expenditure on construction account was £12,567, about £10,000 less than last year, chiefly for 10 new motor cars, temporary overhead feeder cables, land for sub-stations, buildings, etc. The power expenses had been reduced from £9,814 to £8,684, and had been brought down to 2.97 cents per car mile against 6.15 in 1909, the average cost per unit being 3.10 cents. A further reduction per unit was looked for when the Council had completed its new Riverside station, when the company would be able to do away with the overhead feeder cables which were put in to replace the original underground cables, which had proved unsatisfactory in many instances. The overhead cables were purchased on favourable conditions, and the materials at to-day's prices could be sold on terms that would go a long way to cover the original cost. In 1915 they carried nearly 60 millions of passengers, against 11½ millions in 1909, and during the first three months of this year they had carried 15½ millions, or at the rate of 62 millions per annum. As they anticipated that this increase would be maintained, they had applied to the Municipal Council for permission to introduce 15 new trailers. Notwithstanding the assurances given to the Diplomatic body in Peking by the Chinese Minister of Finance, the depreciation of native copper coins had been accentuated, and the ratio of loss to gross receipts had been increased to 28.58 per cent.—9.91 per cent. on the share capital, as compared with 20.04 per cent. in 1914, and the loss for the year was £38,038, against £25,880 in 1914. At present there were good reasons for believing that the depreciation would be arrested at no distant date, and should this charge on the receipts be minimised or eliminated altogether, it was obvious that their account would in future be very materially improved. The rise in the silver exchange was also greatly to their advantage. In regard to railless traction, the Fokier new roadway had been completed in cement concrete, and the company's railless service was resumed on July 7th, and the weight of the cars being reduced to meet the Council's requirements. The cars so altered had operated most successfully on the smooth surface, and since the opening to December 31st they had carried 1,439,804 passengers, run 49,753 car miles, and collected a gross revenue of \$19,347.49, which, after deducting loss on native coinage, working expenses and depreciation, had paid over 6 per cent. per annum on the capital employed. The route (less than ½ mile) was too short to get the full benefit of the seven cars available, which the popularity of the service and the success of the experiment should justify. They were looking forward for opportunities to expand this form of traction at no distant date, as it was proved to be well suited to the narrow streets and to the requirements of the population. They also hoped that when the war was over and the disturbances in China had ceased, the inquiries made as to starting tramways in other townships in the interior might lead to the company being invited to take an interest in such schemes, as their experience should certainly be useful to those concerned in any such new undertakings in China. Mr. Doran,

a useful member of the staff, came home on leave to join the Army, and the deputy general manager, Mr. Smeaton, was home on leave for medical treatment. Thanks were due to the local board and to Mr. McColl. Owing to the death of General Thys last year, and to the enforced absence of M. Franquini, M. le Chevalier Edmond Carton de Wiart had been invited to represent the large Belgian interest in the company.

For 1915 the gross receipts were £2,709,616, less working expenses (which include £120,000 carried to depreciation renewals reserve, in addition to £265,692 expended on ordinary maintenance) £1,786,740, leaving £922,876. After adding interest on investments and deposits and transfer fees, £45,637, and £96,409 brought forward, the amount is £1,064,922. Interest and charges, absorbing £970,802, are made up as follows:—Annuity to City of Buenos Aires Tramways Co. (1904), Ltd., £70,000, 4 per cent., $\frac{1}{2}$ per cent., and 5 per cent. debenture stock interest, sinking fund for redemption of debenture and share capital, and $\frac{5}{8}$ per cent. dividend on the first and second preference. The balance forward is £94,120. During the year there was a further fall in receipts of £141,360, but by the exercise of strenuous economies the expenditure was reduced by £94,250, and it "now probably represents the minimum compatible with efficiency," while the position is aggravated by the continuous rise in the cost of fuel, upon which the price paid for electric current is based. Having regard to the difficulty of forecasting the results of the present year, the directors are unable to recommend the payment of a dividend on the ordinary shares. The balance at the credit of the profit and loss account, £94,120, has accordingly been carried forward. The general manager, Mr. G. Pedrali, in a most exhaustive report, shows how building operations in the city of Buenos Aires came to an almost complete standstill, immigration was reduced to a minimum, and the population fell. The traffic suffered more even than in 1914. The passengers carried were approximately 317 millions, a decrease of 4.5 per cent. This includes 304 millions of subway passengers (an increase of 7.1 per cent.). The car km. run were 814 millions, a decrease of .09 per cent. The surface receipts decreased by 6.7 per cent., and those for the subway increased by 7.1 per cent. During the year 64 new cars received from Preston were delivered to traffic. The number of motor-cars has increased from 1,768 to 1,800, the convertible trailers from 407 to 426, and the motor trolleys from 49 to 55. Details are given of the number of breakdowns of cars and of electrical equipments, also particulars concerning the maintenance of the overhead system, cables, permanent way, and buildings. A reduction of 6 per cent. has been effected in average consumption of the subway cars. The electric current used for traction has diminished by 1,105,469 kw.-hrs., and the figures per car km. run show a continued decrease. The average cost of current per kw.-hr. for traction increased from 1.431d. to 1.544d., or 7.9 per cent. Coal cost considerably more than in 1914, and but for a favourable petroleum contract the 1915 figures would have been exceeded. North American coal was largely used, three cargoes only of Welsh coal having been received in the early part of the year. The North American coal does not give such good results as best Cardiff. Petroleum has given excellent results as regards consumption per kw.-hr. The kw.-hr. of current produced required, before the war period, 884 grammes of best Cardiff coal. During 1915, owing to the use of petroleum, this figure was never reached until December, when North American coal alone was used, when the consumption was 959 grammes for every kw.-hr. of current generated, which added over 8 per cent. to the price of current. The company will be prejudiced greatly if North American coal continues to give inferior results, taking both cost and production of current into consideration. The increased cost of current has added largely to the working expenditure. The amount paid to the D.U.E.G. in 1915 for energy was £255,574. If prices of fuel had been at the normal conditions in accordance with the base price in the contract, i.e., less than 7.75 gold per ton, the cost would have been £289,253, so that the difference added to working expenditure amounted in 1915 to £66,321. Mr. Pedrali closes his report with a reference to prospects as follows:—

Never has it been more difficult to form an idea as to what the year may bring about, or the effect, either directly or indirectly, that the state of European affairs will have on our receipts. There is little doubt that no improvement on a large scale can be anticipated. Should things continue as at present, I should say that a very gradual and hardly perceptible increase will take place, but there are nowadays so many factors which may affect us at a moment's notice that this opinion must be accepted as absolutely precarious. Expenses have been cut down to the utmost limit in every department, but where we are quite unable to form an estimate of expenditure is in the expense of electric current. The price of coal and other fuel has reached such unheard-of prices (nearly three times the normal), and the outlook is so extremely obscure that I am afraid our profit for the year will be very gravely affected by this state of affairs.

The annual meeting took place yesterday.

Swiss Electrical Companies.

The directors of the *Gotthardwerke, A.G. für Elektrochemische Industrie*, of Bodio, state that the works were occupied to the limit of their capacity in 1915, and they propose a dividend of 10 per cent., as against a rate of 8 per cent. in 1914.

The *Elektrizitäts-Gesellschaft Baden*, in which the firm of Brown-Boveri is interested, reports net profits of £4,900 for 1915, as against £3,600 in the previous year. It is proposed to distribute 64 per cent., as compared with 53 per cent. in 1914.

The *Motor A.G. für Angewandte Elektrizität, of Baden*, which owns generating stations, and is also interested in supply works, in various countries, records net profits of £87,000 for 1915, as contrasted with £99,000 in the preceding year. The directors recommend a dividend at the rate of 7 per cent. on the ordinary share capital of £1,200,000, being the same rate as in each of the three preceding years.

Anchor Cable Co., Ltd.—The report for 1915 states that the profit, after making provision for war taxes and contingencies, amounted to £47,251, plus £32,129 brought forward. Interest on debenture stock absorbs £2,250, depreciation £20,000, written off investments £107, leaving an available balance of £57,023, which it is proposed to deal with as follows:—Dividend of 20 per cent. on the shares £13,000, carrying forward £44,023.

STOCKS AND SHARES.

TUESDAY EVENING.

Stock Exchange markets have further developed the accession of strength to which we have drawn attention in our last two issues. Various reasons are ascribed for the substantial buying now in progress. Some people put it down to rumours of peace and consequent eagerness on the part of investors to get in before the expected peace boomlet starts. Others say that the buying is simply employment of capital which is being made out of munitions and war-work generally. Possibly both reasons contribute to the robustness of investment markets as a whole—a strength which is led by Consols and which permeates practically everything of an investment nature.

The spectacular event of the week is a rise of over 20 points in a day in Cities Services common shares. The company has just issued its annual report to April 30th last, showing a remarkable expansion in profits; and Montreal vied with New York in competing for shares. Another feature of the week is a spurt in Brazilian Traction common shares, which carried the price from 56½ to 64½, with hardly a break. The motive power here, also, was New York buying, with the Rio exchange up to 12 9/16d. to back it. The Home Railway market is good, with further recoveries in the Undergrounds; and amongst the industrial descriptions, manufacturing shares stand out with noticeable firmness.

It is something of an anti-climax to go on to remark that home electricity shares are inclining rather to the dull side. County of London preference and Westminster ordinary are both easier. The only improvement in the list is one of 1/16 secured by the London Electric shares; and the market explanation of the dulness of this section naturally falls back upon the Daylight Saving Bill as responsible for holding back orders which might otherwise have come in. The tone, notwithstanding these two small falls, is quite good; and any resumption of demand for the shares would put up prices smartly enough.

Another dull spot in the following price lists is that for Anglo-Argentine Tramway shares. The report of the company elaborates the reasons for the directors' decision not to recommend the payment of a dividend on the ordinary shares. The continuous rise in the cost of fuel is the principal difficulty; and the directors state that expenditure has been reduced until it now probably represents the minimum compatible with efficiency. The meeting was fixed for the Thursday in this week.

Central London assented ordinary stock, after being stagnant literally for months, suddenly developed strength and rose 2½ to 70, with very little stock to supply the buyers. District ordinary gained 4, and Underground Electric income bonds held their previous good rise. The Home Railway market is good in all its sections. Removal of the minima from the prior-charge stocks has brought in more buyers than sellers; and instead of the expected flood of stock, the market is astonished to find that there is little supply to meet the considerable demand. Nor is this the case in London only, for correspondents of ours report that the same conditions prevail in the Glasgow Stock Exchange, while from some of the other important provincial centres there are insistent inquiries for the offer of reasonably-priced stock.

It is in the telegraph market that the principal strength is shown. The Eastern group is again favoured; there are rises in "China" shares, Eastern ordinary, Globes, and Western shares. The American section is also decidedly better on the week. Anglo-American Telegraph deferred is up to 22, a rise of 8; and the preferred stock has at last gone over par. American railway shares enjoyed a boom on their own account; and almost everything connected with the States is held in high favour.

West India and Panama shares recovered 1s. 6d. to 19s., support being rendered on the assumption that the directors had done the wisest thing in passing the dividend, and so laying the foundation for a better year next time. United River Plate Telephones rose another ½ on the issue of the report, which makes pleasant reading for the proprietors. Marconis improved to 44s. 6d., and there has been a little

business in Americans on the basis of 14s., though in others of the group there has not been much alteration.

One important feature of the week is the announcement of a working agreement between Brunner, Mond & Co. and the Castner-Kellner Alkali Co. The secret had been very well kept, and the news of the *rapprochement* caused a sharp rise in the shares of both companies, Castner-Kellners gaining $\frac{1}{2}$ at 3 7/16. Electric Constructors put on 6d. to 17s., the report being even more satisfactory than the dividend announcement had led the market to expect. Callenders are nominally unchanged at 11 $\frac{1}{2}$, but there are very few shares about, and the company's report, which came out a few days ago, shows the undertaking to occupy a very strong position.

The news from Mexico does not greatly encourage activity in the stocks and shares connected with the country. At the same time, however, with such rapid rises taking place in the prices of stocks in companies that operate in North and South America, there is more disposition to look kindly upon the Mexican utilities, with the result that the 5 per cent bonds of the Tramways and the Mexican Light and Power concerns have each a rise of a point to their credit.

In the armament group there is no change from the previous quietude, but the rubber market continues to improve. Although the price of the raw material hangs back, buyers are once more pressing in to take advantage of the slightly lower prices than those which ruled a few weeks ago. At the same time, the excitement which then characterised the market is not so evident, thanks, of course, to the spread of public interest to so many other sections of the industrial market.

c Thos. Bolton & Sons, Ltd.	h Edward Tilt & Co.
d Frederick Smith & Co.	i Bolling & Lowe.
e F. Wiggins & Sons.	l Richard Johnson & Nephew, Ltd.
f India-Rubber, Gutta-Percha and	n P. Ormiston & Sons.
Telegraph Works Co., Ltd.	r W. F. Dennis & Co.

Mirrlees, Bickerton & Day, Ltd.—The report for the year ended March 31st states that the net profit, after providing for depreciation and directors' fees, is £16,101, which, with £1,730 brought forward, makes £17,831. Dividend at the rate of 7 $\frac{1}{2}$ per cent., less tax, on the ordinary share capital; £5,000 to reserve; £2,037 carried forward.—*Financial Times*.

West African Telegraph Co., Ltd.—The net profit for 1915, including £633 brought forward, is £25,347. £13,000 has been transferred to general reserve, and a further dividend of 2 per cent., making 4 per cent. for the year, is recommended, carrying forward £991.

Reduction of Capital.—**Robt. W. Blackwell & Co., Ltd.**—A petition for reducing the capital from £250,000 to £50,000, by cancelling capital which has been lost or is unrepresented by available assets, is to be heard on May 30th.

Great Northern Telegraph Co., Ltd., of Denmark.—The receipts for 1915 were £968,589, and the expenditure was £277,461. Dividends and bonus proposed aggregate 22 per cent. for the year, leaving £76,406 to be carried forward.

Cleveland & Durham County Electric Power Co.—The *London Gazette* of May 23rd contains the full statement of capital expenditure and revenue of this company for the year ended December, 1915.

Bombay Electric Supply & Tramways Co., Ltd.—The directors recommend a dividend on the ordinary shares at the rate of 7 per cent. for the year ended December 31st, 1915.

Castner-Kellner Alkali Co., Ltd.—Interim dividend, 9 per cent. for the six months ended March 31st.

Adelaide Electric Supply Co., Ltd.—Interim dividend 5 per cent., free of tax, on the ordinary shares.

Doulton & Co., Ltd.—Dividend 5 per cent., less tax, on the preference shares for year 1914.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING APRIL, 1916.

THE April returns of electrical export and import business, which we tabulate below, show as regards the former a general falling-off in values, while the total of the latter shows a very considerable increase.

The exports, which in March were valued at £432,396, fell in value to £353,266 in April, the decrease in the total being mainly attributable to the falling-off in the machinery, cable, telegraph and telephone exports, while only in three sections were minor increases in value recorded.

On the other hand, the imports, which in March reached a total value of only £196,251, in April amounted to £256,099. This considerable increase is due to the greater value, particularly of machinery, of telephonic and telegraphic material—which more

than doubled the March values—and of glow lamps, which were imported into this country.

Battery imports were also in advance of the previous month's value, while carbon and cable imports were on a reduced scale.

The re-exports for the month were valued at £15,391, as compared with £17,383 in March.

India, as usual, was our best market during the month, while the Australian States and France were also prominent customers.

Of the importers, the United States naturally heads the list, with a total of £175,060—largely machinery and telephonic material; Holland occupies a prominent second place, due to her sending us nearly £35,000 worth of glow lamps—a record amount, last month's figure being £21,600 worth. Business with the Scandinavian countries also was on a larger scale.

Registered Exports of British and Irish Electrical Goods from the United Kingdom.

TOTAL EXPORTS: £353,266

TOTAL RE-EXPORTS: £15,391

TOTAL IMPORTS: £256,099

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

THE SHILDON-NEWPORT RAILWAY ELECTRIFICATION.

THE North-Eastern Railway Co. was one of the first of our great railway companies to adopt electric traction, having as far back as 1904 successfully applied electrical operation to their Newcastle and Tyneside suburban traffic. Once more this company has acted as a pioneer of electric traction in applying it to heavy freight haulage on the Shildon-Newport line, on which electric working was first started on July 1st, 1915.

Following a report by Messrs. Merz & McLellan, the company's consulting electrical engineers, the Shildon-Newport route was selected for trial as being an important freight line, dealing almost exclusively with heavy mineral traffic.

Some historical interest attaches to this selection, since the track runs over a portion of the original Stockton to Darlington railway, the first public railway on which steam locomotives were used for conveying passengers and goods.

Beyond the usual considerations affecting the decision to apply electric traction to such a line, a special factor which differentiated the North-Eastern Railway lines from others in the United Kingdom was the ample supply of cheap electrical energy available from the systems of the existing power companies, and this fact, obviating the necessity for a large capital expenditure by the railway

(fig. 1); considerable portions of the sidings at both ends are also electrified, so that, including the sidings, about 50 miles of single track are equipped for electric working.

FIG. 1.—ROUTE PLAN OF THE SHILDON-NEWPORT ELECTRIC RAILWAY.

FIG. 2.—PROFILE OF THE SHILDON-NEWPORT LINE.

FIG. 3.—NORTH-EASTERN ELECTRIC FREIGHT LOCOMOTIVE AND TRAIN.

company on power-station plant, had an important bearing on the whole scheme.

The electrified line, between 18 and 19 miles long, connects the mineral sidings at Shildon with the Erimus siding at Newport, near Middlesbrough

The general gradient, fig. 2, is in favour of the laden traffic, the steepest gradient being 1 in 103. The line carries the heavy mineral traffic from the South-West Durham coalfields to the Middlesbrough district, supplying the large number of blast furnaces

and iron works concentrated there. On the return journey, the load consists mainly of empty wagons returned to Shildon sidings.

It was decided to adopt the high-tension direct-current system, current being supplied to the locomotives through overhead contact wires at a pres-

sure of 1,500 volts from the two rotary-converter sub-stations described later.

The normal span between the steel structures is

FIGS. 4 AND 5.—TYPICAL VIEWS OF OVERHEAD CONSTRUCTION TENSIONING STRUCTURE IN L.H. VIEW.

sure of 1,500 volts from the two rotary-converter sub-stations described later.

The overhead track equipment was carried out by Messrs. Siemens Bros. Dynamo Works, under the supervision of the railway company's then chief engineer, Mr. C. A. Harrison.

The overhead contact wires on the main portions

110 yds., but on curves and sidings they are placed at lesser intervals, depending on the conditions existing.

The normal height of the contact wire from rail level is 16 ft. 6 in., but at level crossings this is increased to 18 ft. 6 in., and under some of the low bridges, of which there are a large number on this

FIG. 6.—VIEW SHOWING TERMINAL ARRANGEMENT OF OVERHEAD CONSTRUCTION.

of the track consist of two .155 sq. in. section hard-drawn copper conductors, but on certain portions of the sidings where the loads are not so heavy, a single contact wire only is used.

The wires are supported by a solid steel auxiliary catenary wire, to which they are attached by sliding clips. This auxiliary catenary is, in turn, suspended

route, the height from the rail level is reduced, the minimum height being about 13 ft. 8 in.

Two auxiliary overhead stranded-copper feeder wires, each of .194 sq. in. section, are connected in parallel with the main contact wires at frequent intervals, to increase the conductivity of the overhead equipment.

Each steel structure carries a pair of insulated steadying arms, pivotted in all directions and attached to the contact wires by means of clips, their purpose being to fix the position of the contact wire relatively to the track. The contact wires are staggered in the usual way to prevent undue wearing of the bow collectors.

The general types of steel structure carrying the wires over the track can be seen in our views.

These all-steel structures are bonded to the run-

ning rails by means of a hard-copper bond of No. .08 sq. in. section, and any steel structures carrying signals, which are in proximity to the electrical equipment, are also similarly bonded to the running rails.

In order to limit, as far as possible, the sag of the contact wires due to temperature variation, automatic tensioning was adopted, the tensioning points being approximately 1,100 yds. apart.

Two of these structures are placed 65 yds. apart at the end of each tension length, the wires from the opposite lengths overlapping by this amount. The end of each contact wire is raised at the tensioning structure to which it is fixed, to a height of about 18 in. clear of the normal level at that point, so that the locomotive bows ride gently and without shock from one tensioning length on to the next.

The contact wires are anchored to the auxiliary catenary wire at a point two-thirds of the distance along each tensioning length in the running direction.

The tensioning weights are slung in the centre of the mast structure by chains passing over pulleys attached to the contact wire. A normal tension of about one ton is maintained by this means in the double contact wire. The auxiliary catenary wire is in all cases anchored off to the lower girder of the tensioning structure, but the main catenary is continuous, except at tensioning points at which section switches are fitted. At the latter points, the main catenary is also anchored off, but to the top girder.

On some of the sidings where only shunting work is done a single contact wire is used over each track, with ordinary tramway span wire construction.

On some of the marshalling and reception sidings,

which are not equipped throughout and on which it is only necessary for the overhead construction to permit of the locomotives entering to pick up their load, the wires are terminated as shown in fig. 6.

Danger boards are fitted beyond which electric locomotives should not pass, but if by any chance they should over-run these, the terminal construction is such that no damage would be done to the bow collectors or to the overhead track.

At some of the low bridges it is possible to carry the main catenary wire through the bridge, but at most of them it is necessary to anchor it off to the bridge. In these cases, to obtain sufficient clearance, the contact wires, with the auxiliary catenary, are brought towards the centre of the bridge, and in order to prevent the edge of the bow collector from striking the bridge a guard wire is fitted.

The track is sectioned on the normal length at intervals of about 2½ miles, and considerably more frequently on sidings. Section points are arranged to occur in most cases at tensioning points, so as to avoid the use of section insulators.

Fig. 10 shows the type of section switch adopted, fitted with a horn-break arrangement, and operated by levers in the signal cabin.

Fig. 9 is a view of five section switches fitted on a girder.

As the train-control system of working is in use on this route, the signal cabins are connected by telephone with a central control office situated at Newport, and the handling of these switches is directed from the same point.

In certain positions, where it was impossible to avoid their use, section insulators are fitted, of the type shown in fig. 8. The track rails are suitably bonded at the joints and cross bonded between rails with stranded-copper bonds.

FIG. 7.—SECTION OF LINE WITH CANTILEVER OVERHEAD CONSTRUCTION.

FIG. 8.—DETAIL VIEW OF SECTION INSULATOR.

The freight locomotives were designed and built at the N.E.R. locomotive works at Darlington, the electrical equipment being supplied and fitted by Messrs. Siemens Bros. Dynamo Works, Ltd. They are designed to haul trains weighing 1,400 tons at a speed of not less than 25 miles per hour on the level; a locomotive and train are shown in fig. 3.

The work was carried out under the direct supervision of the chief mechanical engineer, Mr. Vincent L. Raven.

The engine may be described as an articulated truck locomotive in which the tractive effort is transmitted through the truck frames.

The cab, with sloping ends, is supported on the centre of each truck by strong steel castings, which embody the centre pin bearings and side rubbing sur-

FIG. 9.—VIEW OF GANTRY WITH SECTION SWITCHES.

faces in one casting. The centre pin at No. 1 end is a good working fit in its bearings on the centre of the transom. At No. 2 end provision is made for creeping up of the trucks when passing round curves, but no allowance for movement transversely.

The trucks are securely held together by means of a draw-bar and spring, which can be adjusted (the compression of spring being $\frac{3}{8}$ in. per 7-ton load)

FIG. 10.—DETAIL VIEW OF SECTION SWITCH.

to act as a connection between the two trucks. This spring cannot be subjected to heavy compression, resulting from buffing action, as the buffer part of the coupling between trucks receives the buffing stresses directly through the truck frames without subjecting the centre pins and platform to any stress

other than that due to the weight of the cab apparatus on them.

The sloping ends are partitioned off from the cab and contain the resistances, contactors, motor cut-out switches, multiple cut-out switches, and all high-tension electrical apparatus. Entrance to each sloping end can be obtained through doors which are normally locked.

The bow collectors on the roof of the cab are raised and maintained in connection with the contact wire by compressed air. A cock is fitted in the air system, the removable handle of which forms the key of the doors mentioned. This handle is so arranged that it can only be removed when the cock is in the exhaust position, so that it is impossible to open the doors of the sloping ends while the bows are in contact with the overhead wire.

In the cab two master controllers are fitted, one at each end. The cab also contains auxiliary switches for controlling the air compressor and the two dynamotors described later, and for lighting and heating. It also contains the control valves for the Westinghouse brake and for air sanding. In the centre of the cab there is a vertical hand wheel for the hand-brake.

The dynamotors are securely fixed to the floor, the switches, &c., being fixed on the sides of the cab and weather boards.

(To be continued.)

Training Electrical Housewives.—So that the housewives of to-morrow will have a clear knowledge and understanding of the various and important uses of electricity in the modern household, the Domestic Science Department of the Washington Irving High School, New York City, maintains a thorough course in electric household appliances. There are 800 girls enrolled in the Department, of which Miss Florence Willard is the head. Among other electric appliances which were installed under the supervision of the Heating Bureau of the New York Edison Co., are more than 20 electric flat irons, electrical percolators, chafing dishes, tea kettles, toasters, and grills. Some women shrank from touching anything electrical, for fear of a shock. It is the plan of E. C. Zabrickie, principal of the school, by means of this course in the domestic uses of electricity, to dispel for ever these false and ridiculous notions from the minds of the future generations of house-keepers, and teach them that electricity is their friend and servant.—*Elec. Rev. and Western Electrician.*

Protecting Canadian Power Plants.—So great is the fear that the big Canadian power plants at Niagara Falls, Ont., will be destroyed and otherwise crippled by German secret agents, that the Dominion authorities have ordered the erection of barbed-wire entanglements along part of the frontier of Canada in the vicinity of the electric generating plants. The present armed guard has been greatly increased by the arrival of additional troops from near by concentration camps. The area of the Victoria National Park about the plant has been closed to the public. Arc lamps have been erected to illuminate the fence at night, and the cars of the Great Gorge R. R. Railway, which passes close to the power house, while making the loop in the vicinity of the Canadian Horse Shoe Falls, are escorted through the enclosures under armed guard.—*Electrical World.*

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

RUSSIA.—A decree dated April 1st has been issued by the Minister of Finance temporarily establishing regulations under which Customs duties must be paid on clearance of goods, not later than six months after deposit at the Port of Petrograd Custom House and two months at the Finnish Railway Station Custom House, counting from the day of the acceptance of the goods within the control of the Customs authorities.

FRENCH COLONIES.—A decree dated April 19th of the Minister for the Colonies prohibits the exportation of zinc ore to any destination except under special authorisation.

GREECE.—The exportation of searchlights and parts thereof is prohibited by Ministerial Order published on April 6th.

BRAZIL.—A revised tariff of fees to be charged by Brazilian Consular Officers has been established by a decree, dated February 23rd, to take effect as from April 1st. The full tariff, including also the instructions for the levying of the fees, may be consulted at the Commercial Intelligence Branch of the Board of Trade.

DENMARK.—Telegraphic information has been received at the Foreign Office that the exportation of platinum and platinum wire has been prohibited.

PORTUGAL.—By a decree dated April 29th the exportation and re-exportation to foreign countries of wire and cables for electric light installations is absolutely prohibited. The decree also provides for the payment of a surtax, in addition to the ordinary export duty, on the following among other articles:—

	Rate of surtax.
Copper ore and precipitate	3 per cent. <i>ad valorem</i> .
Tin and tin ore	16 escudos per metric ton.
Wolfram	180 escudos per metric ton.
Other ores not specified	3 per cent. <i>ad valorem</i> .
Metals in the rough, in bars, in wire or scrap, and their alloys	50 per cent. <i>ad valorem</i> .
Wares of antimony, lead, copper, tin, zinc, and their alloys	50 per cent. <i>ad valorem</i> .

These articles may not be exported to foreign countries except under authority issued by the Ministry of Finance, based upon special reasons of an international character resulting from the state of war.

MEXICO.—A decree dated Feb. 20th, published in *El Constitucionalista* for March 10th, amends previous decrees respecting the export duties on Mexican produce and the suspension and reduction of Customs duties on various articles imported into Mexico. Full particulars of the revised duties are available at the Commercial Intelligence Branch of the Board of Trade.

New Electric Signal Lamp.—Mr. E. G. Fischer, Chief of the Instrument Section of the Coast and Geodetic Survey, Department of Commerce, has just completed the design and construction of a signal lamp, which will be used during the coming summer in the mountainous regions of Idaho and Oregon on primary triangulation, where the distance between stations is frequently as much as 100 miles. This lamp has been tested by the Bureau of Standards, and shown to be more than 150 times as powerful as the acetylene signal lamps, which have been used for a number of years by the Survey. These acetylene lamps have been observed with the telescope over lines more than 120 miles in length. The new lamp is an electric one, with a specially designed filament, and the energy is derived from ordinary dry cells. While no tests have been made in the field with the new lamp, it is expected that ordinary haze or smoke will seldom prevent observations.—*U.S.A. Commerce Reports.*

ELECTRIC FREIGHT HAULAGE.

THE description, which we conclude in the present issue, of the electrification of the North-Eastern Railway Co.'s mineral route from Shildon to Newport, near Middlesbrough, records the first real step towards the introduction of electric traction for heavy goods service on our railways, and on a practical scale.

The work of conversion has been in progress for some time, and sufficient experience has been obtained to demonstrate the technical success of what must presumably still be termed "the experiment," inasmuch as no pronouncement has yet been made as to the actual, or expected, commercial result of the conversion.

We trust that in this instance, the North-Eastern Railway Co.—to whom, and to the consulting electrical engineers for the work, Messrs. Merz and McLellan, we tender our congratulations—will see fit to depart from the traditional railway habit of secrecy, and publish, when available, such information as to the working of the line, as will indicate its success or otherwise to the public. It is essential that public opinion should be influenced, if possible, favourably towards the development of electric railway traction generally, for it is not often realised that a very large percentage of the public is either directly or indirectly interested financially in the railways, and that the investing public may ultimately decide the question of railway electrification on any extensive scale.

There are probably many other mineral lines in this country with characteristics similar to those of the Newport-Shildon line, for which, in the event of the latter proving successful, electrification may be considered; moreover, there are trunk lines in populous districts carrying heavy passenger and goods traffic, for which, to meet the growth of traffic in the near future, electrification must be considered as an alternative to purchasing property at an exorbitant price for widenings and perpetuating steam traction.

There is another aspect of the question which needs little emphasis at the present time, *i.e.*, the urgent necessity of making the utmost of our resources, engineering or otherwise, after the war; and, were this the sole consideration, there is little doubt that a very large percentage of our steam locomotives could be profitably relegated to the scrap heap, or otherwise disposed of, and electric traction substituted.

Such, at least, can be deduced from the statement made regarding the electrical operation of the heavy freight and passenger service on the first 115 miles of the Chicago, Milwaukee and St. Paul Railway to be converted to electric traction, and from our own experience in suburban railway electrification. Although this railway doubtless operates under conditions which have no exact counterpart in this country, the statement of Mr. Goodnow,* assistant to the president of the line, is sufficiently indicative of possibilities in other directions to deserve close attention on this side. For instance, he mentioned that one electric locomotive was taking the place of four steam locomotives, and promised eventually to supplant an even larger proportion of steam power. Moreover, the electric locomotive handled its tonnage at 15 to 16 miles per hour, as against 8 or 9 miles per hour by steam traction; also the mileage of the heavy trains drawn by electric locomotives was 200 in 24 hours, as compared with 114 miles by steam locomotives. On the 115 miles of line operated electrically, 24 heavy steam locomotives had been released by nine electric locomotives, and it was estimated roughly that locomotive repair costs would be halved.

1916 EDITION

READY.

H. ALABASTER, GATEHOUSE & CO.,
4, Ludgate Hill, London, E.C.

An earlier statement in regard to the electrification of this line was that a return of 20 per cent. per annum was anticipated on the expenditure, due to the saving in fuel and in mechanical upkeep, increased hauling capacity, and the maintenance of speed schedules.

This railway, of course, operates in mountainous country, and the results of its working, obtained on an extensive scale for the first time, confirm the expectations of American engineers, based on smaller schemes of the same kind actually working. But it is not only for the operation of heavy traffic on mountain divisions that American railway engineers are turning to electric traction. We published recently some particulars of the West Side Improvement in New York city, in connection with which the New York Central Railroad proposes to electrify its 12-mile freight entrance to the city, at a cost of some £10,000,000.

There are four important freight yards on the route, and the trains will be hauled electrically from New York to Croton, the northern end of the company's electric zone, a distance of 34 miles.

The carrying out and operation of this scheme, if approved, will be watched with the greatest interest, although its success, in view of past experience, can scarcely be doubted.

The Shildon-Newport electrification is a comparatively minor affair in comparison with the two American projects just referred to, but its successful operation will, nevertheless, help to turn the scales when more important schemes are under consideration, and it may incidentally assist towards a solution of the exceedingly knotty problem of the system to be adopted, our inability to arrive at any definite decision in regard to which has undoubtedly hampered projects of this kind in the past.

British railway working, to give it its due, has attained a high, and probably in practice a limiting, standard of efficiency under its operating conditions; but times change, and although our railways, as a whole, cannot be accused of any great eagerness to change with them, it will probably require the strongest of arguments to justify the continuance of present methods, if the higher standard which our national welfare demands in the future can be realised by the introduction of electric traction.

through the initiatory stages, as a rule each operative is trained to do a particular class of work; no attempt is made to achieve the impossible and to turn out all-round mechanics in six weeks, but no difficulty is found in teaching a worker to *do one thing thoroughly well* in that period. Those who show special aptitude for the work are further trained on a broader basis, as tool setters on lathes, milling machines, &c., and as gauge-makers; a number are taught lead-burning, and some women tracers have been trained. In London alone over 3,000 certificated workers have been trained since July last year, of whom 2,700 are known to have entered factories or H.M. Forces; over 300 firms have been supplied with operatives, and a number of firms not only ask for them, but actually supply special machine tools for the pupils to be trained upon. It is obvious that by obtaining workers from these schools, the employers not only are sure that the operatives will immediately fall into the routine of their shops and commence commercial production right off the mark, but also are relieved of the necessity of setting apart a portion of their valuable machinery and space, and providing skilled instructors, for the purpose of training them from the raw material. Shop methods are adhered to as closely as possible, and in some cases items such as shell bases are manufactured in the schools on commercial lines and supplied to munition makers.

Turning from the school to the workshop, the factory which we inspected was crammed with plant for the production of shell cases, working at full pressure, and was "manned" largely by women; most of the operatives had been trained at the L.C.C. schools, and carried out their duties with ability and industry which left nothing to be desired. In this class of work there is no room for carelessness or incompetence; every individual shell case has to pass inspection at various stages in its manufacture, and bad work cannot escape detection. It is obvious, therefore, that the work which is done by these trained operatives is well done; and it is done quickly. We left the place deeply impressed with the undeniable success of the new system, and marvelling not a little at the extraordinary revelations to which the war has given rise, as to the degree of skill and the time required for the performance of repetitive machining operations.

Training Munition Workers.

ON Monday last, by the courtesy of the Ministry of Munitions, we were enabled to inspect one of the 64 schools which have been established by the Ministry for the purpose of training unskilled persons for service in factories making munitions of war; we afterwards visited one of these factories, which is staffed almost entirely with operatives trained at these schools, in order to see them actually at work. It was exceedingly interesting to see men and women differing most widely in age, figure, and class, busily engaged in qualifying themselves for employment on the engineering side of the war, in a large hall formerly the pride of a London County Council School of Building, but now filled with machine tools, shafting, and benches, and humming with activity and zeal.

We cannot withhold a tribute of congratulation from the instructors who laid out the plans and themselves erected the steel framework to carry the countershafts, fixed the machines, and organised an excellent course of training for the "students," the majority of whom were innocent of the least acquaintance with the most rudimentary mechanical operations. A brief account of the equipment of the school and of the methods of instruction adopted is given elsewhere in this issue; here we need only say that from a personal examination of the system, and of the work done by the pupils, we can testify to the excellence of the results attained, and can cordially recommend the students to employers in need of semi-skilled labour for the manufacture of munitions. It is worthy of note that after passing

In our "Notes" to-day will be found an important item on this subject, received whilst we were going to press; we commend it to the attention of all station engineers.

Copper.

THERE has been a rather startling transformation scene in the copper outlook, as may be gathered from the rapid downward movement which has taken place in prices within the last ten days or so. The break originated in the standard market, the price of which has already come down by no less than over £25 a ton, while the value of electrolytic copper has been affected by about £10 a ton. Such big fluctuations in so short a space of time have hardly ever been witnessed, but they must, of course, be regarded as the inevitable outcome of a dangerously inflated level of values following upon a decided lull in the demand, which has not unnaturally set a good many people thinking that the height of the "big war boom" has at last been seen. Indeed, there does not seem to be much doubt on that point, although it is only correct to point out that so far the American copper magnates have not made the least attempt to test the market, and have, as a matter of fact, not modified their limits. The collapse in the price of standard copper has aroused the more astonishment considering the prohibition

of speculative dealings under the Defence of the Realm Act, but it none the less betokens the swift change in sentiment wrought by an absence of demand alongside of the persistent talk of peace in the foreign Press. American news has been rather adverse for some little time past, which for one thing has had a disturbing effect. The forcing up of prices in recent months was entirely the result of the huge orders placed by Allied Governments for munitions over the whole of this year, which orders may aggregate not far short of a quarter of a million tons. Copper producers have really no reason to feel very apprehensive as to developments in the near future, for they will still be reaping huge profits against their deliveries for months to come, nor may they feel much inclined to re-enter the market for some time yet.

Meanwhile, second-hand copper appears to exist across the Atlantic in fair quantities, and should sales be pressed, prices may fall a good deal further. Should the moderate surplus held speculatively, however, be cleared off the market by the filling of additional needs, this may have a steadying effect and enable the American magnates to retain control of the market, although there is not much doubt that, with a fast increasing production, some surplus in first hands is bound to arise at no distant date. Therefore, it is generally inferred that, sooner or later, American producers must take action to regulate prices on a less extravagant basis, in order to guard against severe disturbances later on, when peace conditions are restored. Admittedly, the outlook is very obscure, while the war demand for the time being, at any rate, has been fully satisfied. In America, consumption has been on a huge scale for some months past, but there is ground for believing that it has seen its best, while the special orders placed last year for export in connection with munitions are now being worked off, which must lead to some contraction in the meltings on the part of American manufacturers, and thus make room for an increasing exportable surplus of refined copper. Reserve supplies on this side are still badly depleted, but this is no longer being felt in view of the stagnant demand, and, given easier freight conditions, some increase in current supplies may be pretty safely looked for. The policy of consumers is now obviously to confine their purchases strictly to urgent needs.

Water-Power in Spain. THE comparative scarcity of coal in Spain, which in the past has depended largely upon imports for meeting the requirements of the railways, industries, city lighting, shipping, &c., has resulted in attention being again directed to the waterfalls existing in that country, with a view to the production of electrical energy on a considerably larger scale than is the case at present, so as to render the country more independent of supplies of coal from abroad. It is estimated that the water-courses would be able to yield 5,000,000 H.P., and that a further large amount could be obtained by utilising the mountain torrents. It is urged that the railways should be operated by electricity, the works and factories be driven by it, the industrial furnaces be electrical, and the public and domestic lighting also be provided by means of the same agency. The reasons why such work has not been carried out are declared to lie in the negligence and lack of precision on the part of the governing authorities and the lack of initiative and of industrial understanding of Spanish capitalists. It is held that the native agricultural industry was saved from disaster by the Copta irrigation policy, and it is suggested that if a similar policy were adopted in the case of the utilisation of water powers for electrical purposes it would be possible to raise the position of Spain to the level of the great industrial nations.

LABOUR AND INDUSTRY.

(Continued from page 585.)

MR. HODGE, M.P., who presided at the meeting of the British Workers' National League, is the late acting chairman of the Parliamentary Labour Party, and he was as definite as Mr. Hughes in his pronouncement of policy. So also were Stephen Walsh, M.P., Will Crooks, P.C., M.P., and J. A. Seddon. Mr. Hodge, as a Labour leader, recognises, as everybody else must do, that there will be great changes when peace comes, and we must prepare to take time by the forelock. There was no attack on Capital, none of that spirit which will demand what it regards as its due reward, indifferent as to the ability to give it. Here was Labour asking that more money should be spent on scientific research and on technical and other education. The workers had been crying in the past for a minimum wage, but now they were told that, if they were able to think, they must see that they could not have a minimum wage unless they gave the employer protection against the sweated goods of Germany or any other country. They had to bring the cold logic of reason to the economic problem. This was the line along which Labour was going—such the goal that it had in view. They did not want "economic war"—they wanted fair play. "The open door for an open door, but not an open door against a shut one." With such sentiments Mr. Hodge introduced Mr. Hughes, the Australian Prime Minister, acknowledging at the same time the lead which Australia had given in Labour legislation. Mr. Hughes delivered one of his thorough-going and characteristic speeches, covering much ground which is by now familiar to those who have followed his doings. One or two points will suffice to show the advice that he vouchsafes to British Labour at this critical emergency. The war means life or death to Labour. If Germany were to win, good-bye to all chance of Labour realising its ideals, for all its opportunities rested upon the foundations of those free institutions which Englishmen enjoyed and Germans did not. The war was a struggle for these free institutions . . . the people must win the war . . . or they must lose all those privileges of freedom for which their fathers had fought and died. He repeated that the war meant everything to Labour. Labour had set itself to improve the conditions of the masses; it had organised itself to that end. Nationally, we must organise to retain the fruits of victory. Industrially we must organise, for successful industry was impossible without organisation and co-ordination when competing against the most efficiently organised industries of the world. Every industry would not require the same treatment—some might not require help of any kind, others must have it. We must see that our raw material resources were developed and controlled as British industries—must make new industries, and develop some that already existed. After covering this familiar ground, Mr. Hughes developed his ideas to show how these matters were related to the well-being of Labour. He said that the conditions under the new régime must be such as would ensure a healthy and virile population, and this was to be arrived at by the payment of a reasonable wage to enable a man to bring up a family in a manner compatible with British greatness. Nothing short of that would serve, and the organisation of British industry could do it. "If the British employer is to give fair and reasonable wages he must know where he is. He must be aided in the foreign market. We have to consider the question as a whole, and not in parts. . . . We shall be faced with infinitely greater problems after the war. If we do not want to see industrial chaos and unemployment in the land we must act, and act now. Are these millions of men going to be employed again if we open our doors to the enemy, and allow her to dump her goods into our markets?" He argued for Protection as a measure of safety for the nation. Many more utterances of an equally energetic and spirited nature fell from Mr. Hughes's lips as he gave the new Labour movement its send-off. The argument is not new, but the times are changed, and we print the foregoing review because we feel that the League represents what may be expected to become a strong movement in the coming months and years, for the problems of the industrial world

bid fair to become so great that the workers will be more keenly interested in such matters, especially as the horrors of German methods in warfare have aroused within them such feelings of repugnance against German goods, that they will not want them to be admitted unhindered, whether they are cheap or not. We need not refer further to the proceedings at the Queen's Hall, except to briefly indicate two points from other Labour speeches which show how the wind blows in these changing days. Mr. Stephen Walsh, M.P., said he had been a Socialist ever since he could remember: he was early orphaned, and owed his all to the State which had brought him up, educated him and given him his chance; he had yet to learn that in a time of great emergency a Socialist should not stand by the State to which he was a debtor. This naturally reminded us of the pre-war talks of war being prevented by Labour in all countries concerned "downing their tools" by international understanding between the workers when the call to arms was given. We have since seen Nationalism prevail against Internationalism; the Socialists of England and of France, and of Germany too, have leaped to the help of the land of their birth. It may yet lie with the Socialists of Germany to displace that nostrum "Kultur" and introduce a true culture based upon Democratic civilisation—who can say? How does this bear upon the Labour problem? Does it not suggest that the British Socialist-Patriot who feels it his bounden duty to stand by the State in military emergency will also be prepared for the policy of protecting his own kith and kin against aggressors when the economic emergency arises? Are not the State and Industry practically interlocked or intermeshed? Do not industrial security and prosperity assist to ensure national security and prosperity? The second point arises from an effective remark made by Mr. Will Crooks, whom Labour, in many of its parts, loves and follows: "Hundreds of Belgian young women—all single—at a railway terminus—in terror, ready to flee before the Huns. A soothing voice: 'Don't be afraid—they don't make war on women!' The Huns came—the women disappeared—they've never been heard of since. Can yer buy from Germany again as yer did before, after that sort of thing?" In these and other ways are we permitted to see what is working in the mind of Labour. We make no deductions—they are not necessary; we merely record the bare signs of the times. Labour is to-day more against the enemy than against Capital in its own country. Will it remain so when wages fall and we are merely master and man again? That is an all-important question for us all; but at present the same sentiments of patriotism and of horror possess capitalists, and who shall say that they may not yet be found to form one of the strong ties of common interest between Capital and Labour, which may strengthen our feet and assist us as we feel our way along towards industrial harmony? Perhaps they are not sentiments that will be permanently healing or reconciling, but they may tide us over the first critical period. Everybody seems now to recognise that Labour has been antagonised in the past by a deplorable suspicion of Capital, and that Capital has had to be continually on its defence because Labour has made exaggerated demands in a regrettable spirit, and with apparently little regard to such elementary considerations as the sanctity of contracts, and the burdens that a business could carry and still survive against foreign competition. The new teaching that, unless the master knows where he stands, the labourer cannot very well have his demands satisfied, will probably be listened to with sympathetic ears, and may serve to prevent a renewal of that spirit of suspicion where, as in so many cases, it has had no justification in fact.

Returning now to the general question, we observe that Mr. W. A. Appleton, the secretary of the General Federation of Trade Unions, whose representatives to the Special Joint Labour Committee, as stated last week, have not yet been appointed, has been expressing his views on the situation. He holds that it is of profound importance that Trade Unions should decide at once what they want; how far their wants are within the bounds of possibility; and then what kind of organisation should be set up, and how much money is needed, to win through. He, too, sees that during the period of industrial and commercial readjustments which will follow the signing of peace, the fate of movements as well as

nations, will be decided. "Trade Unionism must not depend upon promises, or hope to receive preferential treatment; it will secure just what it is strong enough to take—that, and nothing more. Such a statement does not imply criticism or any charge of breach of faith; it is just a statement of fact, and is based upon historical and economic experience."

Of course, those who know anything about Labour organisations and Labour gatherings know that it is not customary amid such surroundings to mince matters, or to clothe one's sentiments in over-courteous dress; a spade is sometimes called a spade, and, even under stress of conditions, a sanguinary shovel. But hard words break no bones, though they do sometimes stir up bad blood. In this case, all that Mr. Appleton is doing is telling Trade Unionism that it must be as strong as it possibly can, or, when Labour wrestles for its rights, it will not rend them from Capital. He is saying no more to Labour than many have said to the employers:—If you would be equal to the coming emergency, you will need to consolidate your forces. As Mr. Hughes says: "Organise, or you cannot win." Masters must have a solid organisation to negotiate with organised Labour, as well as to compete with the Enemy. If they are not so organised, how will they be able to represent national industries in the presence of a Government which, after the war, is bound to give ear to the counsels of Labour, which it has so often told is doing so much to win the war? In the past Labour has won much because it has been organised—better organised than have the manufacturing interests of the Empire. What will be the true strength of Trade Unionism after the war? Will it represent the workers *en masse*? Do we not observe differences of policy among different sections; are there not already different sections, some of which appear to regard the coming emergency as one in which they can parade their Utopian ideals, while others base their demands upon facts? Is there not just a possibility of Ideal and Fact once again coming into collision, even within the ranks of Labour itself? The last thing in the world that can be detected at the moment is any uniformity of policy on the part of the great forces of Labour of the United Kingdom. Things are very much in a state of flux, and such programmes as we summarised last week will, doubtless, undergo a good deal of revision as the Trade Unions, in the words of Mr. Appleton, come to decide "how far their wants are within the bounds of possibility." Perhaps, all the at present diverse sections of Labour will yet consolidate in one organisation. We believe that individually the manufacturer prefers to deal with a Trade Union rather than with disorganised employés; and probably it would be more satisfactory for strongly and efficiently organised Labour to negotiate, as occasion arises, with strongly and efficiently organised employers. But whatever may be the developments along these lines, if the workers, as a whole, can be induced by propaganda, by the Press, and by meetings, to look calmly, fairly, and squarely into "how far their wants are within the bounds of possibility" as "after the war" possibilities develop, we believe that they will feel that there will be as much as the nation and the Allies can do to deal with the serious facts in a practical way, and to relinquish, at any rate for a time, the grand ideals to which we never can attain save by a gradual evolutionary process.

(To be continued.)

BATTERY ROOMS.

By GEO. R. ARCHDEACON, A.M.I.E.E.

NOTHING in the whole scheme of things electrical seems to receive such scant attention as the design of battery rooms. The care bestowed on the battery itself is generally just about the minimum required to keep it running, but the care bestowed upon the building in which it is intended to install it seems to be, if possible, even less. First of all, the author intends to draw attention to the faults most prevalent in the design and situation of battery rooms. This subject lends itself to three sub-divisions—*i.e.*,

central station battery rooms; workshop battery rooms; house lighting battery rooms.

In a central station, one would naturally suppose that the technically trained men usually employed therein would so direct things that the building wherein it was intended to install an important section of the plant, costing anything from £1,000 to £15,000, would be as free from errors as it was possible to arrange. Yet even here one finds the most haphazard methods, and the most casual attention paid to the situation of this most important item.

To quote a few instances of the neglect in this direction, the author can point to a central station wherein the battery room is located so close to the boiler house, that steam, ashes, dust, &c., penetrate the crevices of the doors and windows to such an extent, that the floor of the battery room is covered with dust and dirt unless swilled out twice a week.

Another instance. In this case it is necessary to squeeze sideways past the main coal-bunkers to get to the battery-room door. This room is situated under a fitting-shop, and the tops of the windows come on the level with the top of the coal-bunker. If by any chance the windows are opened to ventilate the room—well! the author leaves the result to the reader's imagination.

In another instance, the main doors of the battery room are situated within some 12 ft. of the ash conveyor. In several cases the battery room has been constructed over the economisers (presumably to keep them warm).

All these obvious errors are repeated, and will doubtless continue to be repeated in dozens of stations, until the central station engineer is converted from his present feelings of doubt and suspicion towards the storage battery, which he so frequently regards as some weird chemical contrivance which is frightfully "messy" to handle, possessing a most potent faculty for destroying his clothes, yet of unquestionable value in coming to his assistance when his pet favourites have refused duty and failed him in his hour of need.

Not until the central station engineer ceases to look upon the storage battery as a mere appendage to his generating plant (a sort of necessary evil), will he trouble to interest himself more in its welfare.

Workshop battery rooms, with few exceptions, suffer from most of the defects of design and situation already enumerated, the bad lighting arrangements being especially noticeable.

Usually the space occupied by the battery room is considered "unproductive"; therefore it is cut down to the smallest proportions, and is so cramped as to prevent the attendant working in comfort; this naturally reacts on the amount of attention the battery receives.

House lighting battery rooms in the main are in a deplorable state of chaos. With few exceptions most of these battery rooms seem to have been fitted up with the special object of being unsuitable. They are fixed in stables, hay-lofts, greenhouses, cellars, &c., in fact, anywhere where they are out of sight. Badly lit, cramped, damp, dusty, up rickety stairs, down dark passages, complete with all the bad features, and with never a good one to recommend them.

Having briefly pointed out the grave errors found so frequently in the design and situation of battery rooms, the author intends to offer a few suggestions and hints which may assist some engineer who is considering the adoption of a storage battery, and has not yet decided where it shall be placed.

The battery room should be lofty, situated (where possible) in an open space where it will have access to the wind in all directions. Glass is cheaper than bricks, and a good light is preferable to a bad one, so let there be plenty of windows.

Attention must be paid to the ventilation of the room. Unless this is quite adequate, it will be impossible to work in the battery room during prolonged periods of charging. Three to six cowl ventilators (according to size of roof) should provide a sufficient means of exit for acid fumes, &c. The doors should be of ample proportions to admit freely carboys, new cells, boxes, &c., which from time to time may be required.

All necessary precautions must be taken against the possibility of bits of lime, plaster, dirt, &c., falling from the

walls or ceiling into the cells. One of the most substantial, and, at the same time, pleasing results, will be obtained by having the ceiling and walls entirely finished off with concrete, instead of plaster.

If it is proposed to have a flat roof, this can be entirely covered in sheet-lead, upon which should be spread a thin layer of concrete; bitumen is then poured over the whole to finish off. This appears to afford excellent results, and few complaints of leakage are ever made if the job is well carried out.

The author's objection to this method is based upon the very slow drainage; whatever precautions are taken, a flat roof of fairly large area will hold up sufficient water to find a weak spot sooner or later, and then penetrate. A well-slatted steep roof, in the writer's opinion, gives the maximum protection against inclement weather.

One of the most satisfactory designs that has come to the author's notice is in the form of a saw-tooth roof, the steeper side consisting of long glass panels, for preference facing towards the north, and thereby preventing too much direct sunlight from entering the battery room, and so increasing the temperature beyond 60° F. This roof may be supported entirely upon wooden side and cross beams. Of course, all woodwork must be treated with two or three coats of acid-resisting paint.

The floor of the battery room may be covered with acid-resisting tiles, with tiled gutters running down the sides of each row of cells; or, if preferred, the floor to the depth of 2 in. can be of rock-asphalt, having a whaleback form to drain down to the gutters. In any case, however, to get a good level surface, about 12 in. of cement concrete should form the foundation for any construction it is intended to employ.

The cells should be erected in single tiers only. Double tiers, whilst saving space, do not add to the comfort of those whose duty it is to work the battery; and the personal element must never for a moment be lost sight of. With this point in view and having regard to the increase in working speed of the attendant, the author would advise in the lay-out of a large battery of, say, 250 cells, an arrangement as follows:—One single tier, single row, 3 ft. from wall; one single tier, double row, down centre of room; one single tier, single row, 3 ft. from wall. Space on both sides of double row 4 ft. 6 in.

It is an advantage to make an alley-way across each row of cells half-way down, leaving elbow room and head room with the connections.

This item will be well appreciated when some special cell is in need of attention, as to have to walk the whole length of the battery-room every time one wishes to look at the hydrometer is not only fatiguing, but intensely provoking.

It is a great convenience to have two or three taps with hose connectors fitted at various points of the room, also a sink should be fitted wherein the attendant can wash boxes, sections, gloves, &c.

Attention should be paid to the electric lighting. A high standard of illumination should always be the rule, thereby considerably reducing the errors in hydrometer readings. A desk should always be provided, so that the records, thermometers, hydrometers, inspection lamps, cell voltmeter, &c., can be kept close to hand; this also saves time and temper, and will improve the legibility of the written records.

Inasmuch as badly designed and badly situated battery-rooms do in a very great measure react upon the performance of the battery, one can only wonder why the manufacturers do not include a department for the design and building of battery rooms. This, under careful management or a system of sub-contracting, could doubtless be made into a profitable feature of their business. In any case the ideal conditions it would assure would undoubtedly redound to the credit of the battery, whose successful operation so materially affects the manufacturer.

In conclusion, the author again strongly emphasises the following points in battery-room design:—Assure thorough ventilation; keep out all dust and dirt; arrange for ample but equal distribution of light; provide sufficient working space. Remember that the ideal temperature is 60° F.; therefore construct the battery room so that it rarely exceeds 65° F.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

"Atmos" Street Lamps.

The accompanying view, fig. 1, illustrates the "Boro" type of lantern, containing an Osram "Atmos" type lamp of 300 or 500 watts, installed for the Kensington Borough Council on existing arc lamp-posts. The outside dimensions of this lantern are equivalent to those of the arc lamps displaced; the lantern contains an automatic cut-out and substitutional resistance to enable any number of lamps to be run in series. This resistance and

FIG. 1.—LAMP POST IN KENSINGTON HIGH STREET, WITH OSRAM "ATMOS" LAMP IN "BORO" LANTERN.

cut-out are completely wired and connected up to the two terminals in the top crown. Special care has been taken to provide adequate ventilation. The lantern itself is made of vitreous enamelled steel, to withstand all weather conditions; and the globe and reflector, which are fixed together, are hinged and held by fly-nuts, so that they may be readily swung clear for cleaning or for replacing the lamp. The "Boro" lantern is one of the various types manufactured by THE GENERAL ELECTRIC CO., LTD., of London.

A New Ignition Magneto.

A new ignition magneto (figs. 2—4) for use on petrol motor cars, which embodies a number of interesting features, has recently been brought out by the Ziola Engineering Co. of America, of Madison, Wis., U.S.A. The machine, which is really a high-tension generator, has a soft laminated field throughout; the high-tension winding instead of being wound on the armature, is wound on a stationary side of the field on one spool, thereby increasing its insulation and making it possible to produce a higher voltage without taking chances in the leakage of the current. A very small amount of current from a battery is conducted into the winding of the rotor, which, while revolving, induces current in the high-voltage section. There is also a special winding in the stationary part of the field, which makes the inductive action uniform throughout the entire stator. By revolving the armature the magnetic circuit is continuously being broken, and thus alternating current of high intensity is induced in the high-tension

running. It is designed for use on cars provided with an electric engine starter and a storage battery; when it is desired to employ the magneto to generate a spark without the intervention of a battery, a pair of permanent magnets can be added, these being excited with electric current during the whole of the time the engine is running. In other words, the magnetism will build up with the running of the engine, and the spark from the generator will not depend on the permanency of the magnetism.

Both types of the new magneto are provided with either a stationary or a movable distributor, in order to meet the varying ideas of car manufacturers, some of whom prefer fixed ignition, while others prefer variable ignition. Finally, it may be mentioned that the Ziola magneto is of the closed-circuit type, and that the magnetic leakage is claimed to be very low.

Measuring the Height of Acid in Tanks.

The method generally employed for determining the depth of acid in a tank consists of lowering an iron rod into the tank until it reaches bottom and then measuring the liquid depth on the rod. This method is crude and cumbersome. Mr. M. M. Samuels has worked out an electrical device for the purpose, several of which have now been in operation successfully for about a year. Two platinum wires are sealed into small glass tubes approximately 2 in. long. About $\frac{1}{4}$ in. of the wires projects at the bottom of the glass tubes for contacts, and insulated leads are attached to the top ends of the wires. These glass tubes are inserted in a $\frac{1}{2}$ in. iron conduit, which is then completely filled with paraffin. A lamp suitably protected by a wire guard is mounted on top of the pipe, and a flexible two-conductor deck cable is brought out from the side of the pipe with a strong marine plug attached to its end. A receptacle box furnishing alternating current and mounted on the tank, or near it, serves as the source of energy. When the outfit is inserted in the tank, the lamp lights up as soon as the platinum contacts touch the acid. The height of the acid can be read directly on a wooden scale attached to the rod.

The valve for feeding the acid tank is very often a great distance away from the tanks, and the man operating the tanks has no way of telling when they are filled up to proper depth. A signboard was therefore installed near the valves, with one lamp for each tank connected in parallel with the lamp on the measuring rod. As soon as the tank is full the lamp on the signboard will light up. For this purpose the plug has to be of the three-contact type and the cable made with three conductors. Bells can easily be added to the system to indicate either when the tank is full or when it is empty.—*Electrical World*.

"Trolley Shoe" for Tramways.

Our contemporary, the *Electric Railway Journal*, describes a trolley shoe with a renewable steel contactor instead of a wheel, which, it is claimed, will run from 7,000 to 10,000 miles, and has

FIG. 5.—TRAMWAY TROLLEY SHOE.

FIG. 2.—DISTRIBUTING DEVICE. FIG. 3.—ZIOLA MAGNETO. FIG. 4.—WIRING DIAGRAM.

winding. This type of high-tension generator does not depend upon stationary magnets, but builds up its own magnetism while

been put on the market by the UTILITY SPECIALITIES CO., LTD., of Boston, Mass. The trolley harp is fitted with an oval-shaped

FIG. 6.—ROCKER AND SPRING FOR TROLLEY SHOE.

shoe, pivoted and fitted with a strong spring, so that the contactor automatically assumes contact with the wire, regardless of the angle. It is claimed that the increased area, combined with the sliding contact, eliminates arcing, and that the shoe runs cool. The shoe has been found particularly adapted for use on heavy locomotives and high-speed cars. No lubricant is required, and the contactor is of special steel.

High-Tension Draw-Out Cubicles.

Fig. 7 shows a five-panel board for 3,900 volts, three-phase, of the draw-out cubicle type, designed and manufactured by MESSRS. JOHNSON & PHILLIPS, LTD., Charlton, S.E.

The board consists primarily of a sheet steel shell which contains the bus-bars, cable boxes and fixed contacts. The control apparatus for each cubicle is mounted in trucks, one for each circuit, these trucks, which run on wheels fitted with ball bearings, being made up of stout angle irons with sheet steel fronts.

Owing to the special construction, it is an easy matter to push in or pull out the trucks, and when any cleaning or repairs are necessary the truck can be wheeled away from the board and attended to in perfect safety.

In order to avoid the danger of pulling out the truck when current is on, a special interlocking device is fitted so that the oil-switch must be open-circuited first. The connections to synchroscopes or voltmeters are made by a system of pilot wires running behind the sheet steel front of each truck and the continuity of these pilot wires is maintained by small removable links on the front between each truck. This type of gear is very suitable for confined situations, as it can be placed close to a wall.

Great care is taken in the alignment of each truck so that the electrical contact between it and the bus-bar does not deteriorate by frequent removals of the truck.

This type of gear has been installed in many works and collieries

FIG. 7.—H.T. DRAW-OUT CUBICLE SWITCHGEAR.

in this country, and is well worth consideration for pressures of 2,000 to 11,000 volts where the space is limited and the greatest safety in operation is desired.

Mayfield's Sound Augmenter.

MR. C. MAYFIELD, of 31, Red Lion Street, London, W.C., has sent us particulars of a sound augmenter which he has devised, consisting of a special attachment, entirely self-contained, and electrically connected, for clipping on any ordinary telephone receiver, or, in the case of phonographs, gramophones, &c., to the sound tube leaving the sound box; we are informed that it augments inaudible, or almost inaudible, sounds to such a degree that, in the case of ordinary telephone receivers, the sound or speech can be heard a dozen feet away from the telephone.

The device consists of a special microphone, sensitive to such a degree as to respond to sounds inaudible to the human ear, yet capable of carrying heavy currents and so reproducing sound by the aid of an ordinary Bell receiver, augmented in volume sufficiently to fill a large hall if necessary.

The essential features of the microphone comprise a circular elastic disk, covered with an electrolytic deposit of iron, from the periphery of which, electrically connected, radiate a number of elastic cords covered with metallic filings electrically in contact; the number of these cords and their diameters vary with the size of microphone and the current it is intended to carry. These cords are electrically connected to two half-plates of brass, whose distance apart can be adjusted by screw tension. The microphone is fitted in a small adapter which can be clipped in a moment on any ordinary telephone receiver, and is self-contained and electrically connected, requiring no interference with the telephone instrument, which, of course, would not be permitted by the authorities. The action of the instrument in the case of the ordinary telephone receiver, is as follows: the faint sound is at once responded to by the delicate disk, which vibrates, setting up vibration of the elastic cords, which vary the resistance in a small dry battery and telephone receiver circuit (self-contained), and the sound is reproduced, augmented in volume to a degree depending upon the size of the microphone and the current used.

In the case of an ordinary telephone receiver the clip attachment will give audible speech 12 ft. from the telephone, and in the case of large apparatus with a specially constructed receiver and microphone, with currents of 3-12 amps., will yield sound sufficient to fill a large hall.

An essential principle of the apparatus is that when no sound is passing through the telephone receiver, the local microphone repeating battery shall be automatically switched out of circuit by the action of the microphone itself; the instant sound affects the diaphragm, current passes to the augmentor. The small instrument for clipping on an ordinary telephone receiver is entirely self-contained, measures only a trifle over 3 in. in dia., weighs under 4 oz., and can be clipped on a receiver in a few seconds. There is then, we understand, no need to hold the receiver to the ear; laid on the table, the sound or speech will be heard clearly in any part of the room.

Preparations are being made to place the attachment on the market at a very low price, and agents will be appointed all over the country.

THE STRUCTURE OF METALS.

AT the May meeting of the FARADAY SOCIETY a group of papers was discussed bearing on various physico-chemical problems in connection with the structure and properties of metals. Two of these were by MR. F. C. THOMPSON, of the University of Sheffield, to whom the PRESIDENT, SIR ROBERT HADFIELD, offered a prize of £50 as an incentive to him to continue his researches and present them to the Faraday Society, and further as an expression of his appreciation of the valuable work being done under DR. ARNOLD in the Department of Applied Science at Sheffield University.

The first of Mr. Thompson's papers dealt with "The Properties of Solid Solutions of Metals and of Intermetallic Compounds." In this suggestive hypothesis is put forward to explain the improvement in physical qualities—hardness, ductility, high electrical resistance, and so forth—that results when two metals are alloyed in such a way as to form solid solutions. It is an established fact that all the industrially useful alloys, the brasses, bronzes, nickel-silvers, strong aluminium alloys, even hardened steel, consist largely of one or more solid solutions; when metals combine to form definite intermetallic compounds, such alloys are generally useless for practical purposes. Now it is well known that metals may be considerably hardened by subjecting them to a state of strain, such as happens when they are rolled, hammered, or drawn. Mr. Thompson supposes that a similar state of strain is set up in solid solutions, and this is the cause of their superior properties. Whence arises this internal strain? The atoms of a metal, like those of any other crystal, are arranged in space with perfect regularity. In the case of an element A, to which a second B, which passes into a solid solution, is added, the atoms of A in the space-lattice are replaced progressively by those of B, and the lattice passes imperceptibly from that of one pure element to that of the other. This atomic replacement must react on the physical properties, and if the atom of A occupies a greater volume than that of B, there results an expansion of A and a contraction of B in the act of crystallising together. The resulting distortion gives rise to elastic strains, and it is to these that Mr. Thompson ascribes the increased hardness of this class of alloy. The strain will be greatest when half the atoms have been replaced by others, and it is considered valuable evidence in support of the theory that in the gold-silver and gold-copper alloys, which form a continuous series of solid solutions, the maximum hardness is found in the 50 per cent. alloys. Now that the Bragg's method of determining the space-lattice of crystals is available, a ready method of testing Mr. Thompson's suggestive theory presents itself, and it is hoped that it may be possible to isolate good crystals of, say, the gold-silver series, and apply to them the X-ray spectrometer.

Mr. Thompson's second paper gave a résumé of recent studies, here and on the Continent, on the "Annealing of Metals." This work is based on the views and experiments of Beilby, Ewing, and Rosenhain, who have shown that work-hardening in metals consists in, first, the internal shearing of the crystals along the planes of slip; and, secondly, the conversion near those cleavage planes of crystalline substance into a hard amorphous inter-crystalline cement. This cement is not only itself extremely hard, but it is also essentially the seat of the internal stresses. Reheating or annealing has the effect of recrystallising the amorphous modification. There is an essential difference between the annealing of steel and that of alloys like brass or nickel-silver. In the former case the object is to refine a coarse-grain size resulting from previous exposure to high temperature, and it is essential to maintain the elastic limit as high as possible. In the latter the very reverse is aimed at. The object of annealing is to render the metal capable of again receiving changes in shape, and hence the process is designed to lower the elastic limit as much as possible, for mechanical work spent within the limits of elasticity is obviously useless. Mr. Thompson's paper, which is well worth careful study, after following in some detail the course of the annealing process in hard-worked copper, brass, and nickel-silver, deals finally with the influence of the temperature—here "burn-

ing" is a factor to be considered—of the duration of annealing, and of impurities.

An allied subject was discussed by MR. ZAY JEFFRIES in a paper sent in from Cleveland, U.S.A., on "Grain-size Measurements in Metals and the Importance of such Information." The counting of the number of grains in a unit area, or, better, unit volume, of a metal affords a ready means of indicating many of its physical properties, such as tensile strength, hardness, elastic limit, life under vibration, or even corrosion, and it is a method which deserves more attention from engineers than it has so far received. The value of such information is largely comparative, and it has to be taken in correlation with other physical properties, but it has the great advantage over mechanical tests, of not introducing any deformation into the specimen under examination. Unfortunately, in many metals, hardened steels for example, the grain is so fine as to defy measurement, unless again Prof. Bragg's wonderful X-ray instrument can be employed, as was suggested in the course of the discussion. Sir Robert Hadfield mentioned that whereas a 0.58 carbon steel as forged and annealed contained 4,500 grains per sq. in., the number rose to 333,000 when the steel was water-quenched and reheated. Mr. Jeffries has devised an improved rapid, convenient, and accurate method of counting grains. This consists in counting those completely included, and partly included, in the circular portion of an image of the specimen of standard magnification, and by means of an empirical formula determining therefrom the equivalent number of whole grains in the standard area.

Two papers on aluminium were presented: one by DR. F. J. BRISLEE, on "The Changes in Specific Heat of Hard and Soft Aluminium," and the other by DR. R. SELIGMAN and MR. PERCY WILLIAMS, on the "Annealing of Aluminium."

Dr. Brislee has previously shown that the density of aluminium decreases with mechanical work. The tensile strength increases, but with a great deal of work the metal becomes exceedingly brittle. These changes are explained by an allotropic change of state, from a crystalline to an amorphous form, such as Prof. Ernst Cohen, of Utrecht, has shown to take place in so many other metals. The differences in specific heat noted support this theory, and they indicate the important fact that the amorphous phase begins to change into the crystalline even at 100° C. Dr. J. A. HARKER, in the discussion, urged the importance of making more studies on the properties of metals at high temperatures. The melting point, and not room temperature, should be taken as the starting point. Dr. Seligman and Mr. Williams found that hard-worked aluminium which had been heated for 10 hours at 125° C. was less readily soluble in nitric acid than the same metal before heating, but that if the heating were continued for 80 hours, this comparative immunity from attack disappeared. Further, metal freshly annealed at 440° C. was less readily attacked than it was after 10 days' standing. These results, too, would seem to be explicable on the theory of allotropic modifications.

A paper by MR. ENIL HATSCHEK on "The Theory of Gels as Systems of Two Liquid Phases" shows that this accepted theory of the constitution of gels breaks down on mathematical analysis. Mr. Hatschek himself conceives gels as of an ultimate crystalline structure, with the crystals thinned and filled with liquid.

The meeting concluded with the consideration of a paper sent from the University of Melbourne, by MR. E. J. HARTUNG, "A Contribution to the Theory of Solution."

ELECTRO-PLATING.

A PAPER by PROF. F. C. MATHERS, E. H. STUART and E. G. STURDEVANT on nickel plating, read before the AMERICAN ELECTRO-CHEMICAL SOCIETY, gives an account of an extended research, the chief results of which are as follows:—

The purest nickel anodes obtainable should be used. Strips of electrolytic nickel cathodes, 98.8 per cent. pure, used directly as anodes, dissolve irregularly and with pitting, but no impurities are introduced into the bath. Very much of the trouble with badly coloured deposits and with sludge is caused by the iron from impure anodes. The addition of 2 per cent. of magnesium or nickel chloride makes the anode corrosion approximately theoretical. The nickel anodes, supported by lead hooks, may be completely immersed in the solution, thereby greatly reducing the amount of scrap metal from the anodes. The anodes should be placed in bags in order to catch loosened particles, which cause pitting if they reach the cathode.

The addition of 0.2 to 0.3 per cent. of ammonium citrate keeps the solution clear and free from sludge, whereby a shallower tank and a less volume of solution may be used. The bath should be stirred or mixed thoroughly at intervals, but not within 8 to 10 hours of the time of using if any solid particles from the anodes are present.

The greater the ratio of nickel sulphate to nickel-ammonium sulphate the brighter and more shiny the deposit. The more acid the solution (to the point of acidity to Congo red) the more shiny the deposits. Boric acid increases the current that can be used without blackening or burning the deposit.

The following bath seemed to be the best: nickel-ammonium sulphate 4 per cent., nickel sulphate 10 to 14 per cent., boric acid 1 to 3 per cent., magnesium chloride 2 per cent., and ammonium citrate 0.2 to 0.3 per cent. A current density of 1.6 amp. per square decimeter (14.8 amp. per square foot) which plates a thickness of 0.0025 cm. (0.001 in.) in 125 hours may be used.

A paper by DR. OLIVER P. WATTS on rapid nickel plating sums up the advantages of a hot over a cold nickel solution as follows:—

Heating from 25° to 70° C. lessens the resistance of the solution one-half. The current density may be increased two-and-a-half to three-fold. The current efficiency, if less than 100 per cent. in the cold solution, is raised. Anode corrosion is greatly improved, and higher current densities may be used at the anode as well as at the cathode. The deposit is superior to ordinary nickel plate in toughness and freedom from peeling.

In the solution tested, plating may be done at 200 to 300 amp. per square foot, at which rate the same amount of metal is deposited in five minutes as requires one-and-a-half hours in the "rapid solutions" now in use at 10 amp. per square foot.

PROF. FRANK C. MATHERS and JOHN R. KUBLER, in a paper on the electro-deposition of silver from silver nitrate solutions, state that in their experiments the ordinary addition agents such as glue, peptone, clove oil, aloin, &c., were found to be either without appreciable effect or to prevent only partially the formation of crystals, and in no case was a thick, smooth deposit obtained.

Tartaric acid is the most effective substance for producing solid, firm deposits of silver from the ordinary silver refining bath containing silver nitrate and nitric acid. A good composition of the bath is 3 per cent. each of silver as silver nitrate, nitric acid, and tartaric acid. The further addition of 0.01 per cent. of glue twice daily makes the deposit much smoother and of a darker, more shiny colour.

A current density of 22.4 amp. per sq. ft. in a vigorously stirred bath gave a firm, smooth deposit which was a little heavy on the edges. In a bath only gently mixed or stirred, 7.4 amp. per sq. ft. gave the best results.

The deposit is brittle, hence it is of no value in plating.—*Met. and Chem. Engineering.*

INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

THE recent Indian budget imposed a Customs duty of 2½ per cent on all imported material above and beyond the duties levied hitherto. For instance, prime movers such as engines, motors, dynamos and electric fans, which were free of duty before, now carry a duty of 2½ per cent.; and such goods as copper wire and switchboards, which previously carried a duty of 5 per cent., now pay 7½ per cent. It is but a small increase and will, of course, be borne by the customer, and it is not anticipated that turnover will, to any extent, be influenced. The Indian Tariff Act of 1894 safeguards the importer on contracts made prior to the imposition of this new duty.

There is what may almost be called a fan famine in India just now. Prices have gone up about 33½ per cent., and Government are buying up all the fans obtainable. Several consignments of this very necessary commodity have gone down in various sunken boats. English-made fans are scarcely to be had; and American and Italian fans are particularly slow of delivery, although big stocks are on order for long periods.

Small self-contained oil-driven electric sets are also at a premium, and good prices are being obtained by firms who are fortunate enough to possess any. The military authorities are buying up all available stocks in this line.

LEGAL.

PROLONGATION OF PATENT REFUSED.

MR. JUSTICE SARGANT, in the Chancery Division, gave his reserved judgment in the petition tried by him a week or two ago, which was presented by Rowe Bros. & Co., Ltd. of Runcorn Lead Works, and Mr. George Vincent Barton, of Liverpool, the inventor of improvements in the production of litharge. The petitioners asked for the prolongation of a patent granted in 1902 for the process.

HIS LORDSHIP said the applicants had embarked large sums in the enterprise, but had been hampered by low prices and other causes, and they had made considerable losses in the working of the process. It was only recently that they had begun to make up some part of the loss, and there seemed to be a reasonable prospect of success in the future. On the question of degree of inventive merit, he could see nothing exceptional in it, and it had a limited scope, being merely an improvement, or improvements. If the process proved to be really valuable in the future, when worked on a large scale, the petitioners would have a start over competitors in the matter of building the new works necessary, and he was glad to say, they would not go unremunerated. (It was stated at the hearing that the petitioners had acquired land at Liverpool for the building of larger works, and that the Government had assisted them to obtain the necessary materials.) But, on the whole, he had come to the conclusion that the petition fell short of the standard required to justify the prolongation of the patent, and the application must therefore be refused.

MUNITION CASES.

At the Oldham Munitions Court, last week, an armature winder employed in the Oldham tramway department, applied for a certificate enabling him to leave his present employment to take a position with a northern munition firm. He stated that he only took on his present employment while waiting for a place in a munition works, and when he got the offer of such a post, his leaving certificate was refused. He admitted that when he accepted the position in the tramway department he did so on the understanding that it would be a permanent one: he had been there only six weeks. For the tramway department, it was submitted that the man had been employed indirectly on munition work, and he could not be spared. The application for a leaving certificate was refused.

At the Glasgow Munitions Tribunal Appeal Court, John Reid, an electrician, who had been in the Army and discharged because of wounds, complained that he was dismissed from his employment with Alex. Anderson, electrical engineer, Glasgow, at three hours' notice. The Glasgow Munitions Tribunal held that Reid was entitled to 10s. compensation. His appeal now was based on the argument that 10s. was an insufficient award. Under the Act he was entitled to a week's notice or compensation to the extent of £5, and he maintained that he was entitled to receive £5. Lord Dwyer pointed out that £5 was the maximum, and the Tribunal was entitled on the facts before it to award what was considered fair. He dismissed the appeal.

THE TRAINING OF MUNITION WORKERS.

The extraordinary demand for labour to carry on the production of munitions of war on a colossal scale has led to the employment of hundreds of thousands of men and women in mechanical workshops who had no knowledge whatever of the processes which they were destined to conduct. These persons have had to be trained in the workshops at a considerable cost in space, plant, staff, and time, and many having proved unfit for the work, the expense incurred in training them has been worse than wasted. Obviously it were far better that the necessary training should be imparted to the candidates for such employment before their admission to the factories, thus reducing the loss and waste to a minimum, and saving the wages that would otherwise have to be paid to them whilst on probation. The Ministry of Munitions, therefore, obtained the assistance of the authorities in charge of secondary education—which was willingly given—and established 64 training centres throughout the country at which persons who desired to enter munition works could be trained free of cost. In London the normal course is six weeks, six days a week, four hours a day, 144 hours in all.

The general course consists of simple exercises in bench and vice work, and turning, drilling, and milling, the purpose being to give to the student an elementary "machine sense," and some preliminary idea of engineering factory conditions. In cases where definite "orders" can be obtained from employers, efforts are made to specialise the training, as far as the equipment of the schools allows, on the exact lines of the work which will have to be done in the factory. It is not pretended that a mechanic can be trained in so short a period, but, having regard to the necessity for introducing large numbers of outsiders into machine shops, the training is a valuable stage in the process.

Students who show aptitude for engineering work, and promise of becoming useful otherwise than as mere operators, are given special instruction to fit them for particular work. Large numbers of men and women have been trained in this way as shapers, slotters, drillers, and even as tool-setters and gauge-makers.

The general effect of the training scheme is to introduce a large body of persons from the professions and numerous other trades and occupations, thus helping to supply the increasing demand for labour. Approximately 18,000 men and women have been so trained, the majority of whom would probably not have entered munition works without some such preliminary instruction.

The training scheme has also had the effect of demonstrating the possibilities of unskilled labour, and many employers have been induced to inaugurate training in their own factories. By carefully selecting suitable workmen, by more closely dissecting operations, and by a greater degree of specialisation, it has been found possible to provide tool-setters, tool-makers, and charge-hands from the ranks of the unskilled. This is the only way in which the urgent demand for skilled workers can be met.

At a London County Council "School of Building," which was inspected on Monday last by a few representatives of the technical Press, a large hall has been equipped with benches, machine tools, &c., for this purpose by teachers drawn from the various L.C.C. technical schools, the Ministry of Munitions facilitating the purchase of plant, whilst in some cases special machines have been supplied by manufacturers who wished to have operators trained to work them. The school has accommodation for 100 pupils, and the work is carried on in three shifts—9 a.m. to 1 p.m., 2 to 6 p.m., and 6.30 to 10.30 p.m., six days a week—each pupil being required to attend for four hours a day. Some of the training centres are

set apart for gauge-making, and here the pupils work 44 hours per week. A double teaching-staff is provided, the members working 36 hours a week.

The hall measures 150 ft. x 70 ft., and is laid out complete with the necessary offices, stores, and refreshment rooms, machine, fitting, and blacksmith shops. The organisation follows as nearly as possible that of a munition factory, and the manufacture of actual details of munitions is undertaken.

There are three main lines of shafting, each about 100 ft. long, driven by four electric motors.

In July, 1915, the following equipment was installed: 30 lathes, 11 drilling machines, 3 power hack saws, 2 shaping machines, 1 punching machine, 1 shearing machine, 45 vices.

The following machines have since been added: 6 capstan lathes, 12 milling machines (including profiling machines), 3 lathes for 18-pounder cartridge cases, 2 turret lathes for 18-pounder shells, 2 tool grinders, 2 universal cutter grinders, 1 slotting machine.

The following machines are on order: 8 milling machines (including profiling machines), 5 lathes (including 3 capstans), 1 two-spindle drilling machine, 1 power hack saw.

Two definite classes of workers are trained: (a) Ordinary operators at the vice and machine tools; (b) tool-setters on lathes, milling and allied machines. Set schemes are worked to except where special requisition is made by individual firms for workpeople to meet specified needs.

All tool-setters, and nearly all the operatives, have been placed in munition factories. The following table illustrates the nature of the training and the results obtained (at five London centres):—

	General course.	Lead burning, setters.	Tool makers.	Gauge makers.	Total.
Number in attendance during week ended May 20th 1916	51	38	36	26	61
Number certificated up to May 20th 1916	2,887	75	38	28	3,038
Number refused certificates and withdrawn	936	26	1	11	974
Certificated—					
Number known to have entered factories or H.M. Forces	2,561	75	37	27	2,703
Number unplaced	333	—	1	1	335
Uncertificated—					
Number known to have entered factories	76	—	—	—	76

Students have been supplied to 338 individual firms, one of which has taken 344 students; 18 firms have taken over 20 students each. Included in the number of students placed in factories are 46 women who have been trained as tracers.

Some 10,800 applications have been registered, apart from those whose applications have been declined. It will be noticed that about 25 per cent. of the entrants are found wanting, and are refused certificates.

In addition to machining operations, the art of lead-burning is taught at the school on a practical scale, for the autogenous welding of the seams of lead-lined tanks; the limit gauges used in the workshop are made in the school, and the special form tools that are required for some processes also are made, of high-speed steel.

Following the inspection of the school, a munition factory where shell-cases are made was visited; the shell number was 350, women being in the majority, and with the exception of a small proportion of skilled supervisors, the whole of the employes had been trained at the training centres. Every operation from the rough solid bar or forging to the finished shell-case was in progress, and apart from the personnel, the shop presented no feature distinguishing it from a shop operated by skilled mechanics. The impression left on the minds of the visitors was that employers need have no hesitation whatever in availing themselves of the assistance of the Ministry's schools in staffing their works.

CHURCH LIGHTING WITHOUT FITTINGS.

An article by Messrs. A. L. POWELL and R. B. THOMPSON in the *Electrical World* describes the methods adopted for lighting St. George's Episcopal Church, Newburgh, N.Y. The auditorium is rectangular in shape and measures 73 ft. long by 40 ft. wide. At the two sides and at the rear is a balcony with a sloping floor about 9 ft. wide. The front edge of this balcony is 9 ft. above the floor. The ceiling over the balcony is flat, while the central portion is slightly arched, rising to a height of 28 ft.

The posts which extend from the floor to the balcony and from this to the ceiling are cylindrical, with very plain bases and capitals. These and all the rest of the woodwork are painted a pure white. The pews are also white, with mahogany edging. The floor is of red and white tile, and the walls are finished in light cream. The ceiling is painted a flat white.

The system of electric lighting formerly installed employed brackets on the columns and along the front edge of the balcony, with carbon lamps, and shades which gave no diffusion, and did not conceal the lamp filaments.

The lighting was not satisfactory; it was, moreover, costly for the effects secured, the fixtures were inartistic, and glare was extreme.

Last year it was decided to remodel the lighting system and to install something thoroughly up-to-date, which would make the church comfortable and bring out its full beauty.

After inspection of the building and taking the necessary measurements, a set of recommendations was drawn up for lighting the church with standard indirect fixtures; the report was presented to the committee having the matter in charge, but was rejected on the ground of want of harmony with the period of the church, and eventually it was decided that the building should be well lighted without any fixtures being visible.

Cove lighting was suggested, but abandoned; flood-lighting, using focus-type tungsten lamps with parabolic reflectors, directing their beams on the ceiling, was experimented with, but did not produce the desired effect. Since it was seen that projector units concentrated the light too strongly, the

FIG. 1.—ADJUSTABLE BOX USED IN EXPERIMENTS.

next attempt was to use standard deep-bowl industrial reflectors, placed so as to illuminate evenly the central portion of the ceiling.

From this experiment it was evident that satisfactory effects could be produced with a very deep reflector designed to give the proper angle of cut-off. An adjustable box 8 ft. deep, of sheet iron, painted white inside, was made as shown in fig. 1. The sides, being hinged, could be set at any angle and held in place by thumb-screws working in the slots. It was then a very simple matter to find the exact shape of reflector desired. Six units of the design which gave the best results were constructed and installed; sections of the seats in the first row of the balcony were removed and the reflectors boxed in, as indicated in fig. 2. The boxes are so arranged that persons sitting behind or beside them are not annoyed

FIG. 2.—ONE OF THE REFLECTOR UNITS IN PLACE.

by stray light, and are deep enough so that when viewed from the opposite balcony no glare is visible. In the entire auditorium there are only two seats where a person, when standing, can see a lamp. Deep-bowl, porcelain-enamel, intensive distribution steel reflectors are placed about the lamps, which are 500-watt Mazda type C units. Below the balcony opalescent-glass deck lamps are fixed flush with the ceiling, with 60-watt lamps in recesses above them. In order to obtain a warmer tone of illumination than that given by the unmodified gas-filled lamps, gelatine screens of very light amber are available, to place across the mouths of the large reflectors. The sanctuary is illuminated by a row of lamps placed about

the upper part of the arch, which are concealed by the moulding, and two small windows of art glass are illuminated from behind.

The church now presents a most attractive appearance; the illumination is even, very well diffused, and of a pleasing character. The ceiling is very evenly lighted, yet none of the light strikes the side walls. The direction of the light is the same at that of daylight, and the shadow effects produced by sunlight have been duplicated. The total power consumption has been increased somewhat, but the results warrant the slight additional cost.

In the *Electrical News* an account is given by Mr. G. J. Beattie of the lighting of the Timothy Eaton Memorial Church, of Toronto, which was recently completed, and is said to be the finest building of its kind in the Dominion. In this case the lighting is effected by means of large fittings, each of which contains eight 300-watt Mazda "C" lamps; the fittings are of Gothic design, in harmony with the architecture of the church, and are suspended from the ceiling, which is painted a light cream. The total power consumption for the main auditorium is 17.4 kw., the aggregate floor area being 9,270 sq. ft. It is estimated that a uniform intensity of illumination of 4 ft. candles is obtained on a 30-inch working plane. "X-ray" reflectors are used in the fittings, which also have white glass panels, softly illuminated, with excellent effect.

The large stained-glass memorial window is illuminated from without by a powerful searchlight mounted on a steel tower at some distance from the window; a large amount of experimental work was necessary before the proper height, distance, and intensity of light was determined, but the result is believed amply to justify the labour and expense incurred, many observers holding the opinion that the auditorium appears at its best at night.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Industrial Organisation and the Worker.

The columns of the technical Press, and especially those of the *ELECTRICAL REVIEW*, have recently been replete with references to the necessity of reviewing the many problems that are arising out of the war. Nowhere does it seem to be disputed that our present enemies will continue their activities against the Allied nations at the conclusion of a military peace, and everywhere it is recognised that the war, even though it was begun in the trenches, will be carried into the marketplace. "Not prepared for war, let us at least be prepared for peace!" is a slogan that has a healthy ring in it, and one which commands the scientist, the business organiser, and the worker to review candidly the motives and principles, or the lack of them, that have decided their former relations and decided their efficiency.

Criticism has been active, and so far as it has exposed defects, useful, in regard to business organisation and scientific method and training. The elements of economic geography have been vividly brought to our notice when we have passed in review the supply of raw materials and their enemy source of origin. New light has been thrown on the specialisation of processes, and the economic determination of the situation. The Consular service has emphasised once again its own ineptitude when not recruited from home sources. The relations of the State to business enterprise and finance are also among the many points we have had to review. Among these, and not least in its significance, arises the problem of the worker. Will he be in the way? Judging by the opinions of recent speakers and writers there does seem to be some doubt whether the worker will rise to the occasion when new times will demand new methods and new men. It seems to depend primarily on the point whether any proposition will be a real departure from the practice of old mistakes, or the old mistakes in a new form.

The worker has an interest in his industry. It remains very much with external influences whether that interest is merely a *cash nexus* or a professional pride. So long as he is denied the latter he will pursue the former. The specialisation of processes and that inexplicably bad old economic law of demand and supply, when applied to his labour as a marketable commodity, have operated strongly, and have neutralised and dominated whatever inclinations he had in developing for himself his productive capacity. That is an indictment that the best friend of Labour ought to admit; the trade union official may even feel in it a source of satisfaction. But the essential point at the present moment is to take this as a basis for review.

Half a century of trade union activity has shown the organisers of industry, and ought to have shown the workers of industry, that progress can now only lie in the direction of increasing the productive power of effort applied under the direction of organising ability to raw materials. No progressive employer now denies the necessity of a reasonable standard of living. The efficiency of well-paid

labour is now an accepted economic axiom, and with the exit from the purview of debate of this, the real *raison d'être* of trade unionism, the time has now arrived when, both in the interests of employer and employed, attention should be focused on the problem of bringing all forces together in pursuit of a common end.

There seems some support for those who can only see progress in fighting trade unionism. This has in it the same essential error as the worker who is blessed with class consciousness and imagines progress follows further extractions from the profits of industry. Acrimony of this description blurs the real issue. In most industrial centres some sort of technical institute exists where young artisans get sufficient training to enable them to earn their living in the "shops." Does it never occur to anyone how it is that when they fall off from the technical school at the age of, say, 22, they cease to be interested in technical matters, and very often graduate to the public-house or become engrossed in trade union work? Most technical and trade associations fail lamentably in this respect, and even if a young artisan by dint of much exertion got access to some of these societies, he would find them engrossed chiefly in grinding axes of various descriptions. I doubt not that he would hear of more valiant feats of engineering in some local public-house. It is said that there are more guns and ammunition made and more coal drawn from the pits over pots of beer than in all the engineering works and coal mines in the country. And that is just the problem: How to bring into line with the new form of industrial organisation the undoubted interest and technical capacity of the worker, instead of leaving him to wallow in incapacity in idle and profitless company or brood over wrongs in trade union clubs.

Technical education should be more thorough, and the preliminary subjects more insisted on in our scheme of public education. A man's inventive capacity begins where the existing knowledge of laws and rules and formula ends, or where his imagination is such as to transcend all such bounds and start him on a train of thought and action purely original. More sympathetic treatment and greater encouragement financially and materially would do much to raise the worker who has capacity, and prove to him that his interest lies in that of his industry, in its development and scientific organisation.

Francis Shirley.

May 29th, 1916.

The Future in Russia.

I notice a reference in the current issue of the ELECTRICAL REVIEW to the desirability of encouraging the commercial, industrial, and technological development of Russia. One of the difficulties in the way to this end, so far as it depends on intercourse between the peoples of Great Britain and Russia, is the barrier of language. The heroic attempts now being made on the part of English people to master Russian are doomed to end in failure, except in rare cases where students have opportunities for a prolonged stay in Russia. Why should we persist in such a futile course? The language problem is capable of a fairly simple solution by the adoption of Esperanto for intercommunication between the two countries. We have recently seen the adoption of the Summer Time measure in one country followed rapidly by its adoption in others. In the same way, if Russia and Britain adopted Esperanto—a proposition as practicable as the Daylight Saving Bill—the whole of Europe would follow suit in a short time. One unanswerable argument in favour of Esperanto which should appeal to business men is the fact that, while it is quite efficient to express all international ideas, it can be learnt in any country in a few months. The writer has spoken in Esperanto with a number of Russians, some few of whom had learnt the language from a text-book without the assistance of a teacher.

The case for an international language for engineers was presented in a paper read before the Society of Engineers on March 2nd, 1914. The paper was reprinted separately from the transactions of the Society. May I add that anyone desiring information as to Esperanto may obtain it on application to the British Esperanto Association (Incor.), 17, Hart Street, W.C.?

P. G. Cameron.

Hon. Sec., London Esperanto Club.

London, E.C., May 28th, 1916.

Decimal Coinage.

What a pity the "Speso" should be an imaginary coin. It would be good business to buy them at 1,000 for a florin and sell them to Mr. Bridges at 20 a shilling. Is there a catch somewhere, or is it only that, like most decimalists, Mr. Bridges is weak in arithmetic?

W. M. M.

London, E.C., May 26th, 1916.

[Our correspondent of last week has obviously let himself in for it. But by what right, and on what evidence, does "W.M.M." cast a gratuitous slur upon the arithmetical capabilities of "most" decimalists? All civilised nations, except the British and some of their Oversea Dominions, employ decimal coinage.—EDS. ELEC. REV.]

Faults in Bitumen Cables.

In reply to the letter signed "Bitumen" in the current number of your valuable periodical, from the data given in this case my opinion is that the positive cable had sustained some mechanical damage, possibly when drawn into the earthenware ducts.

The effect of changing the polarity—making the faulty positive cable negative with an earthed neutral—would be to bring its life to a sudden termination.

In this connection I have recently experienced an unusual phenomenon on a power distribution system under my control, which may be of some general interest. The system contains some 25 miles of .05 v.b. cable laid solid with bitumen in wooden troughing. The cable is looped up every 10 ft., and connected to some 15,000 magnetically-operated switches with a bitumen seal between the trough and the switch boxes. Normally the cable is positive, and the negative return is through steel rails at earth potential. The system has been in operation 15 years, and has given very little trouble.

One day, for a short time—a few minutes—the polarity was reversed, with the result that alarming leakages developed at several switch boxes, ultimately necessitating the renewal of the bitumen and compound seal at about 200 points.

I must here explain that the normal voltage is 500 direct-current, and the leakage current registered on the morning of the breakdown on the sections affected was as follows:—.026, .03, and .018 ampere.

In order to investigate the cause of the trouble, I carried out a series of experiments, including the following:—

1. A test was made on three different sections with about 30 switches on each.

Leakage current with cable positive: (a) 14 milliamperes, (b) 1 milliamp., (c) 1 milliamp. Leakage current with cable negative: (a) 23 milliamperes, (b) 5 milliamperes, (c) 2 milliamperes.

2. The lengths of bare .05 cable were carefully insulated with bitumen tape and pierced with several pin-holes. Each cable was coiled up and placed in a metal box about 12 in. by

CATAPHORESIS EXPERIMENT.

3 in. The boxes were then filled with damp sand. No. 1 cable was connected to the positive terminal of the 500-volt supply, and the metal box it was in was connected to a negative terminal.

No. 2 cable was connected to the negative and box to positive. An ammeter was placed in circuit. Megger test on each registered over 50,000 ohms. Current was switched on, and after three minutes No. 2 cable registered .025 amp., and No. 1 50,000 ohms.

After six minutes, No. 2 reading 1.1 amps.; No. 1 50,000 ohms, current was now reversed, and in a few seconds the leakage on No. 2 dropped to .2 amp. In three minutes a leakage of 1 amp. was registered on No. 1.

The current was again reversed to pass through as originally, and in ten minutes No. 1 registered .05 amp. and No. 2 was rising quickly from 2 amperes.

On opening up, I found No. 2 cable saturated with moisture, and, of course, steaming from the heat of current leakage, and No. 1 cable I found in a comparatively normal state.

The experiment was repeated with one box, and the result was plotted as shown on the accompanying curve. Other experiments were carried out, tending to show that the presence of coal, gas, or alkali salts was not necessary for the effect; also, that vulcanised bitumen was practically unaffected by coal gas, but ordinary bitumen was liquefied.

From the data collected I have formed the following opinions:—

1. That the dielectric of a well-made cable is not a "membrane" for practical purposes.

2. It is, therefore, misleading to speak of "electric endosmosis" or an "osmotic effect" causing a breakdown on direct-current negative cables under the conditions here recorded.

3. At least an incipient mechanical fault is necessary before a leakage is observed.

1. The flow of moisture down the current, from positive to negative, would be more accurately described by the electro-mechanical term "cataphoresis."

2. In using vulcanised bitumen cables on the negative side of a direct current system very great care should be taken, in order to prevent mechanical damage which causes incipient faults in the cable, which will with the presence of moisture cause faults to develop by "cataphoresis." Similarly, great care should be exercised in hermetically sealing the end connections.

3. All classes of cable would be similarly affected, but vulcanised bitumen is the least adapted to withstand rough mechanical usage.

Cosine.

WAR ITEMS.

Technical Men and the "Commercial War."—The *Liverpool Journal of Commerce* contains a summary of an address delivered in Liverpool on Empire Day by Mr. T. C. Fider (B.E.A.M.A.) on "Engineering for the Empire: The Way to Victory and Prosperity." The Lord Mayor of Liverpool presided, and in the course of the discussion Prof. Marchant was one of the principal speakers. He referred, among other things, to Germany's superior technical equipment for warfare, and expressed the opinion that after the war we should be in the same position as now in regard to the commercial war unless we recognised that highly-trained technical men were the first necessity if progress was to be made. They were necessary not only to occupy technical positions, but as directors and leaders of industry, to know when and how to take advantage of new discoveries. If progress was to be made in manufacture, highly-trained technical men must be available both as leaders of industry and in the research laboratories. We felt the need of such men today in fighting the war, but it was of still greater importance in the industrial war of the future, and he hoped that every effort would be made to bring home to the public the enormous importance of this question, so that action might ensue. We learn from Mr. Elder that the following resolution was moved by the Chairman of the Liverpool Corporation Tramways and Electric Power and Light Committee (Mr. Councillor E. Fussell-Taylor), and seconded by the Chairman of the Manchester Corporation Electricity Committee (Mr. Alderman W. Walker):—

That the indispensable military services rendered to the engineering industry and its fundamental importance in the future as a basis of defensive power and of prosperous economic development, entitle it to special State recognition in many reform of national and imperial commercial policy, and to the patriotic support of all public and private users of plant and machinery throughout the Empire.

The Supply of Light and Power for War Purposes.—The following addition has been made to the Defence of the Realm Acts:

10. Any company, authority, or person supplying or authorised to supply water, light, heat, or power, shall, if so required by the Admiralty or Army Council or the Ministry of Munitions, supply water, light, heat or power to any factory, building, camp, or other premises belonging to or used for the purposes of the Admiralty or Army Council or the Minister of Munitions, and shall carry out such works and render such services as may be directed by the Admiralty or Army Council or the Minister of Munitions for the purpose of enabling such a supply to be given either by themselves or by some other such company, authority, or person:

Provided that a company, authority or person shall not be required under this regulation to supply water, light, heat or power to premises within the area of supply of any other company, authority or person except with the concurrence of the appropriate Government Department, and if any question arises as to which Government Department is the appropriate Government Department the question shall be finally determined by the Treasury.

If any company, authority or person fail to comply with a requisition under this regulation the company, authority or person shall be guilty of an offence against these regulations, and any director or officer of the company or officer of the authority who is knowingly a party to the default shall also be guilty of an offence against these regulations."

Women in German Industry.—The "Daily Telegraph," quoting from the "Vorwärts" regarding the employment of women workers in Germany, mentions the experience of one centre—Cologne, a fairly typical manufacturing city. Here in January, 1914, there were 46,634 working-class women registered as subscribers to the sick funds of the local trade unions. In January, 1915, the number had risen to 60,194, and in January, 1916, it was 75,319. This information was furnished by Herr Haas, secretary of the Cologne United Trade Union Committee, who added: "That means an increase of 2,987, or 6.1 per cent. The additional women and girls employed had fairly reasonable and difficult work to do. There are many women, previously not employed at anything at all, who are now acting as chauffeurs, drivers of trams,

navvies, and porters. Others are in charge of electric cranes, and several of the more intelligent are acting as "foremen" in charge of squads of roadmenders. Nor are the hours of work easy. It is not uncommon for these women to have to work 11 hours a day; and in a few cases I have known them work for 30, and even as much as 36, hours on end. In many instances this extra work is not paid for at all; in others the overtime rate is miserably small. In no case do the women earn as much as a man would earn for doing the same work; and in this respect, unfortunately, the State and municipal authorities are setting the worst example."

Exemption Applications.—At Lambeth, Messrs. Toy and Winslow, electrical engineers, applied for the exemption of Charles A. Winslow, aged 30, a brother of one of the partners. Mr. Winslow said his brother was indispensable to the business, being the only man who was really reliable. The application was refused, but, as it was stated the firm was engaged on Government work, the Tribunal suggested they should appeal to the Ministry of Munitions for a badge.

At Blackpool Tribunal, on May 25th, Mr. C. Furness, electrical engineer, applied for exemptions for 11 men in the electricity department and 12 in the tramways department. Coun. Fielding said there was a great deal of talk about the men kept at the electricity works. Mr. Furness should take the opportunity of replying to it. Mr. Furness said electricity was a young profession, and most men engaged in it were aged from 30 to 40 years. The electricity supply had to be continuous, and men engaged on the switchboards had to have their meals under the roof. Mr. Birkett (Military representative) said men in the electricity department were all engaged in exempted occupations. All the 11 men were conditionally exempted. When the tramway men were considered, Mr. Furness explained that 73 men had joined the Army from this department and 53 from the electricity department. Eleven men were granted conditional exemption, and one until July 1st.

Before the Ripon City Tribunal, a firm of mechanical and electrical engineers applied for the exemption of their costs clerk, aged 29, and married, who had taken the place of an unmarried man. It was stated that it would be impossible for a woman to do the clerk's work. Exemption until July 26th.

At Stretford, exemption till June 30th was granted to an electrical wireman employed by a firm of electrical engineers.

Whitehaven Tribunal granted exemption until August 17th to a pipe fitter engaged by a local firm of electrical engineers, and whose service was claimed to be absolutely necessary.

Six months' exemption each has been granted by the West Kent Appeal Court to Mr. F. J. Quinell, electrician, of Gravesend, and to Mr. H. C. C. Silver, electrical engineer, of Park Grove, Bromley.

Coventry Tribunal, on May 22nd, considered a request by Messrs. F. C. Brown & Co., electrical specialists and contractors, for exemption for Mr. R. A. Davies, their head electrical engineer, engaged on Government contracts. The case was put back for a month for Mr. Davies to be badged.—Messrs. H. W. Burbury & Co., electrical engineers, applied for three months' additional exemption for Mr. F. W. Thompson, electrician. It was stated that the firm, who had Government work in hand, had only four electricians left out of 14. Two months were allowed.—Mr. J. Hutt, electrical engineer and contractor, who appealed for himself, said he was chiefly engaged on war work, and it would mean financial ruin if he went. Exemption was allowed until August 20th.

Newmarket (Suffolk) Tribunal has refused exemption to the clerk and draughtsman of the electrical company.

At Stratford-on-Avon, the Electricity Co. appealed for a joiner and electrician. It was explained that in January, 1915, there were 10 men employed, and now there were only six men and two boys. On six months being allowed, Mr. Talbot, the manager, intimated that he might possibly appeal, and the Mayor replied: "Just so; but we consider the man is essential, as the company have to supply power and light."

Hull Tribunal has given until September 1st to an electrical fitter who has the supervision of the electric motors for a large number of local firms.

Three months' exemption has been granted to a contractor at Philadelphia (Co. Durham) engaged in repairing boiler furnaces at the power station. The manager of the latter said it was a specialist's work, and unless it was carefully done boilers might give serious trouble, and serious risks were possible. In the area current was being supplied to munition factories.

A Weobley electrician, who asked for absolute exemption, has been given until August 1st.

At Malvern, the U.D.C. has secured conditional exemption for the foreman at the electricity works and a shift engineer.

At Maidenhead, Mr. Bond appealed for temporary exemption for Geo. Lovegrove, his electrician, engaged in connection with contracts for the upkeep of private launches for the river. Exemption until October 1st was conceded.

Cheltenham Tribunal has exempted nine employees at the Corporation electricity works—two charge engineers, the works superintendent, the sub-station man and joiner, three stokers, and an engine-driver—while a clerk was given until July 31st. A motor-man with the Light Railway Co. has been

given exemption on the ground that he was indispensable and in a certified occupation.

Bath Tribunal has granted conditional exemption, with the assent of the Military, to 20 members of the staff, including Mr. W. J. Targett, engineer, at the power station. No less than 171 men have left to join the Colours, and the present staff is only half of that before the war.

Before the Local Tribunal, exemption was claimed by the Surbiton Electricity Supply Co. for the head clerk and accountant. It was stated that two assistants and a junior clerk had enlisted, and that appellant was the only man left who could take the place of the engineer and manager in the latter's absence. Three months were conceded.

At Sevenoaks, an appeal was made for R. S. Terry, electrical engineer with Messrs. G. Humphrey & Co., who is engaged in the maintenance of electric plants in the district. Exemption granted for three months.

Hove Tribunal has granted three months' exemption to an electrician with a local firm who claimed that the business could not be carried on without him owing to the depletion of the staff.

Berkhamstead Rural Tribunal has granted two months' exemption to Albert V. Skinner, electrician.

An electrical fitter in business at Buxton has secured exemption until November 13th.

At Hastings, Messrs. Adams & Jarrett appealed for their only electrical wireman left for this branch of the business. Mr. Jarrett said that his two sons were in the Army, and the staff was very much depleted. Two months were allowed.—Mr. Fred Pillings (37), electrical engineer, appealing for himself, said that many of his staff had gone, and he had five contracts to supervise electric lifts. Two months were granted.

At Godalming, Mr. Geo. Jones sought exemption for A. P. Bowdler, the only electrician left in his business. A month only was granted.

At Southport, Messrs. Ashley, Ltd., electrical engineers, appealed for R. C. Jones, aged 23, on the ground that his work in connection with the manufacture of X-ray materials for use in the hospitals was of national importance. The appeal was disallowed.

At Oldham, an appeal for three electrical fitters was made by Mr. John Jackson, electrician. The men were stated to be engaged on electrical work at mills and waterworks, and the firm has also work in hand for Government controlled works. Exemption till August 1st.—Messrs. Caton & Sons, electricians, appealed for the manager and other men. Three brothers, all married, were in the firm, and the appeal for one was disallowed. The other appeals were put back to September 1st.

At Blackpool, exemption till October 31st was granted to an electrician employed at the Winter Gardens, and to a stoker at the Winter Gardens generating station; and exemption till October 15th was granted to a switchboard attendant at the Tower, the electrician at the Grand Theatre, and the electrician at the Palace.

At the Godalming Tribunal, the Urban Electric Supply Co., Ltd., of Godalming, applied on behalf of two men engaged at their works, one a stoker and cable joiner's mate and the other a switchboard attendant. Mr. R. S. Robertson, manager of the works, said it would be impossible to replace either man; 45 per cent. of the permanent staff had joined the Colours, and any further reduction would mean a serious risk of interrupting the supply. In the case of the switchboard attendant the military authorities agreed to three months' postponement, but dissented in regard to the other man on the ground that he appeared only to be an assistant. The Mayor remarked that both men were in certified occupations, and conditional exemption was given in each case.

The Urban Electric Supply Co. appealed at Grantham for a married stoker, aged 31. Mr. J. E. Edmundson stated that the staff was depleted, and the stoker was claimed under the certified list. A woman could not stoke, and the Board of Trade would not agree to it. Conditional exemption was allowed.

At Sandown (Isle of Wight), the Isle of Wight Electricity Co., Ltd., applied for exemption for Mr. S. H. Smith (34), works engineer in sole charge of the generating station supplying the town and Shanklin. Conditional exemption was allowed, with the consent of the Military.

Weymouth Tribunal has granted exemption until October 31st to Mr. T. H. Escott, manager for Messrs. Brooking & Co., electrical engineers, and until August 31st to the firm's wireman.

Grays Tribunal, on the application of the Urban Council, have given conditional exemption to the foreman stoker and a wireman at the electricity works, and until August 1st to two other employés. It was stated that all types of foreigners had been taken on in order to keep the works going.

Eastbourne Tribunal, on Monday, granted exemption until June 30th to an electrical engineer who said that his work was of a highly technical character, and that he supplied mechanical engineers and munition works.

Wallasey Tribunal on Monday granted exemption to 26 tram drivers appealed for by the Town Council.

British Capital in Russia.—The "Bourse Gazette" states that British capital has been used since the beginning of the war to finance 355 Russian companies for the exploitation of gold, platinum, iron, copper, and asbestos mines. During April three new mining companies, with an aggregate capital of £800,000, were formed with British and French money.—*Times*.

German-American Magnetos.—The Customs Department in Melbourne has stopped delivery from the wharves of a shipment of motor cars until the American Bosch magnetos with which they are fitted are removed by representatives of the Department. It is alleged that the firm manufacturing these magnetos is financed with German money, and refused to supply magnetos for American automobiles ordered by the Allies.—*Sydney Mirror*.

Restoring Belgian Works After the War.—A number of Belgian manufacturers recently met at Lyons under the presidency of Mr. Paul Theeuwissen to discuss what measures can be adopted at present to assure the resumption of work in Belgian metal works after the war, and especially the supply of sufficient tools. From information received from the industrial districts of Belgium, it appears that almost all the metallurgical works are stripped of their plant, which has either been destroyed or simply stolen and dragged off to Germany. The expulsion of the Germans will therefore leave Belgium with empty works, and immediate restocking would be difficult. To obviate this it is intended to place immediate orders for the necessary plant at Lyons and Saint-Etienne, and a Technical Committee has been formed at 4 Rue Sala, Lyons, under the presidency of M. Theeuwissen, who is a consulting engineer and was formerly a bolt manufacturer of Liège.—*Doumonger*.

Tunnelling Commissions.—The president of the Institution of Mining Engineers has been advised by the Secretary of the War Office that the Army Council are desirous of obtaining the services of mining engineers for employment with the Tunnelling Companies of the Royal Engineers. Preference will be given to candidates between the ages of 25 and 35 years, and those found suitable will be appointed to temporary commissions and be required to proceed overseas at an early date. Mining engineers not members of the Institution, but possessing the necessary qualifications, are also eligible. Intending candidates for commissions, or those at present serving in the ranks who desire to be transferred to the Royal Engineers, are requested to communicate at once with the Secretary of their own Institute, who will supply a form of application. Only candidates who have already attested are eligible.

To be Wound-up.—The Board of Trade has ordered the following to be wound-up:—

Scorch Electrical Co., 35, Basinghall Street, London, E.C., electrical engineers. Controller: C. E. Barker, 21, Finsbury Pavement, E.C.

A. T. Speedometer Co., Ltd., 140, Long Acre, W.C., manufacturers of speedometers. Controller: F. G. Van de Linde, 4, Fenchurch Avenue, E.C.

Isleworth Rubber Co., Isleworth, manufacturers of and dealers in rubber goods and tires. Controller: S. W. Tubbs, 23, Basinghall Street, E.C.

Richard Klinger & Co., 66, Fenchurch Street, E.C., engineers. Controller: H. W. Dunn, 46, Queen Victoria Street, E.C.

Mining Engineers and Enemy Aliens.—The Institution of Mining Engineers has issued an official Order of the Council, dated June 10th, 1915, reading as follows:—"All Members, Associate Members, Associates, or Students of the Institution of Mining Engineers, of Austrian, Bulgarian, German, Hungarian, or Ottoman nationality, are hereby requested to abstain from attending any meeting, or from visiting the rooms of the Institution during the continuance of the war."

Copenhagen War Lighting.—It has been decided by the Town Council of Copenhagen that fewer lamps are to be lighted in the streets. In future gas and electric power will not be supplied by the municipal works for illuminated advertising signs.—*Times*.

Exports to China and Siam.—The "London Gazette" for May 30th contains additions to and revisions of the previously issued lists of persons and bodies to whom exports to China and Siam may be consigned.

BUSINESS NOTES.

Electrical Catalogues Wanted.—The new Public Works Engineer in Boma, Belgian Congo, who has in hand the construction of a new lighting plant and the laying of the necessary cables, is anxious to know the names and particulars of English firms who are able to supply electrical machinery and cables. Firms who are interested in the matter should forward catalogues direct to him at the following address:—Mons. Armand Van Hool, Ingénieur aux Travaux Publics, Boma, Congo Belge.

Book Notices.—The Eftandem Co., Ltd., of Fallings Park Works, Wolverhampton, whose enterprising activities have already been referred to in our pages, have now started for circulation among the employés a monthly magazine entitled *The Flashlight*, a name fully appropriate to the principal line of manufactures in which the company has made such excellent headway. The whole of the contents of the first number (May, price 3d.), which is now before us, have been contributed by members of the staff and employés at the works, and Mr. C. H. Stephenson, the works manager, is the editor.

Cable Prices and Discounts.—MESSRS. POOLEY AND AUSTIN, of 28, Victoria Street, S.W., write stating that, owing to the somewhat complex nature of standard cable discounts at the present time, they have, for the convenience of contractors and other users of cables, got out a set of single multiplier figures, which will render the calculation of net cable prices quite a simple matter. They will be very pleased to send a copy to any user of cables who is interested. Until the supply is exhausted, they can also send a cardboard slide rule for getting a price per yard or per coil when the price per mile is known.

Their table is certainly short, convenient and simple, and applies to the discounts at present in force.

Copper-Clad Steel.—The Copper-Clad Steel Co. of Pittsburgh, recently incorporated under the laws of Pennsylvania, has erected a plant at Rankin, Pa., for the purpose of manufacturing copper-clad steel products. The mills are of the most modern construction, and are electrically driven throughout.

American Investigation of Foreign Electrical Markets.—The Bureau of Foreign and Domestic Commerce, Washington, held an examination in various cities, on May 19th, for a special agent to investigate the market for electrical goods in China, India, East Indies, Africa and Australasia. The examination was to consist of practical questions on the subject of investigation, thesis on investigation methods, and a statement of the candidate's knowledge and experience. According to the *American Electrical Review*, the salary was not to exceed \$10 per day and transportation and living expenses (the latter not to exceed \$5 per day). Applicants were to be able to address public gatherings, and were to submit in advance an unmounted photograph.

For Sale.—The Farnworth U.D.C. has for disposal two Lancashire boilers and accessories, one Green's economiser, and one feed pump. Full particulars are given in our advertisement pages.

British Bank for Russian Industry.—The Russian financial press, according to the *Algemeen Handelsblad*, of Amsterdam, says that a group of leading English bankers has approached the Russian Government with a view to a concession for the establishment of a new bank exclusively devoted to lending money for the development of Russian trade and industry. The authorised capital of the bank is fixed at five million roubles.—*Financial Times*.

Empire Trade.—The British Imperial Council of Commerce is holding a luncheon at Cannon Street Hotel, next week, at which the delegates to the Empire Business Conference will be present. Mr. Asquith has accepted an invitation.

In the House of Commons, in reply to a question by Col. Norton Griffiths, who asked whether the Government proposed to take any action with a view to a preferential trading policy with the Dominions and our Allies being adopted before the termination of the war, Mr. Bonar Law said:—"The whole subject is now engaging the attention of the Government."

Bankruptcy Proceedings.—R. E. CONNOLD, late electrician, Canterbury, now R.N.A.S.—First meeting, June 3rd; public examination, June 17th; both at Canterbury.

Trade Announcement.—For the convenience of their London customers, MESSRS. WARD & GOLDSTONE, of Manchester, are opening an office at Albion House, 59-61, New Oxford Street, London, W.C., as from June 1st, with Mr. A. W. Richards as their London representative. A collection of samples of their manufactures will be on view there, and, when exceptional war demands on the factory have passed, a stock will be held at the new branch.

Catalogues and Lists.—MESSRS. WARD & GOLDSTONE, Sampson Works, Salford.—Illustrated price circular of "Volex" dry batteries, multiple cells and single units, and adaptations of same.

BRITISH WESTINGHOUSE ELECTRIC & MANUFACTURING CO., LTD., Trafford Park.—Two new publications—Control Catalogue, No. 91/4, containing a full description and list of prices, &c., of type P steel-rod motor-control pillars; descriptive leaflet, No. 71/5, giving an illustrated account of their type LH hand-operated liquid controllers. The company has also sent us a very acceptable wall calendar for the year ending March, 1917.

Liquidations.—EUREKA PATENT GAS ENGINE STARTER CO. LTD.—A meeting is called for June 30th, at 28, Deansgate, Manchester, to hear an account of the winding up from the liquidator, Mr. T. Forster.

BRITISH GRAYZIN LIGHT, LTD.—The Controller, Mr. Thomas Wise, Bassishaw House, Basinghall Street, E.C., requires creditors to send particulars of debts or claims, &c., to him by June 30th.

JAGGER BROS.—Mr. M. Jenks, 6, Old Jewry, E.C., the Controller in this case, requires creditors to send him particulars of debts or claims, &c., by June 30th.

MASCHINENFABRIK ADOLPH-BURG-NURNBERG, A.G., Caxton House, Westminster.—Creditors must send particulars of debts, &c., to the Controller, Mr. B. E. Mayhew, Alderman's House, Bishopsgate, E.C., by June 30th.

RICHARD KLINGER & Co., engineers, 60, Fenchurch Street, E.C.—Creditors must send particulars of debts, &c., to the Controller, Mr. H. W. Dunn, 46, Queen Victoria Street, E.C., by June 30th.

PHENIX ELECTRIC HEATING CO. (1914), LTD., Creditors must send particulars of their debts, &c., to the liquidator, Mr. A. E. Tilley, 8, Staple Inn, Holborn, W.C., by June 17th.

LIGHTING AND POWER NOTES.

Aberdeen.—The T.C. has decided to purchase additional ground in the vicinity of the Ferryhill Electricity Works, for the extension of the electricity department and for storage.

Argentina.—The following news items are extracted from *La Electricidad y la Maquinaria*:—A beginning has been made with the construction of the electricity station at Maldonado, and its completion is expected in July or August. Popular dissatisfaction is being expressed in Concepcion del Uruguay with the electric light service supplied by the Anglo-Argentine Electric Co., and some 300 subscribers have held a public meeting and decided to form a co-operative society to supply their own requirements. In the town of I de Julio also, the lighting service is being complained of, total interruption of the service having occurred for 15 days together, without either the company or the municipality having taken any action. Owing to the sustained and lengthy exertions of the Instituto Sudamericano de Electricistas y Mecanicos, the Municipality of Buenos Aires has now decided to draft a scheme, for presentation to the Intendente, for the creation of an Office of Inspection of Electric Installations. The staff will consist of technical experts, and its duties will embrace the testing of materials and parts, and the general working of all plants. No installation will be allowed to operate without the previous inspection and permission of the Office.

Australia.—HYDRO-ELECTRIC SCHEMES.—With further reference to the proposed hydro-electric schemes mentioned in our issue of May 12th (p. 537), Mr. Cann, the N.S.W. Minister of Works, in moving to refer to the Public Works Committee the report for a Murrumbidgee scheme at Burrinjuck, stated that the estimated cost of £100,000 would provide plant, transmission lines and distributing stations; the power generated would approximate 8,000,000 units per annum, the annual expenditure would amount to £9,095, and the annual revenue to £11,686, leaving a net profit of £2,591. The scheme would serve the towns of Goulburn, Yass, Harden, Cootamundra, Junee, Wagga, Gundagai and Tumut.

The Snowy River scheme which the Minister also submitted for reference to the Committee was far more costly and pretentious and had greater possibilities, but nothing definite had yet taken place, and the power generated would have to be distributed over a much greater area. The proposed dam on the Snowy River, about a mile above Jindabyne, would be 148 ft. high, and have a capacity for 26,000,000 cu. ft. of water.

The power house would develop an average load of 100,000 kW., with a maximum of 125,000, and there would be available at the point of delivery 750,000,000 units of electricity per annum, as compared with 8,000,000 in the Murrumbidgee scheme. A transmission line, 210 miles in length, would bring the power right into Sydney. It was anticipated, however, that a large amount of power would be used on the South Coast for electro-metallurgical and other processes. This would enable New South Wales, better than any other State, to compete with electric process manufactures in the old world, such as the treatment of ores, &c. The estimated capital cost was \$5,000,000. The annual cost, including interest, would be \$361,173, equal to £2 5s. 5d. per H.P. per annum, and if all the units were sold at 1/4th of a penny per unit it would produce £390,625, showing a surplus of £29,452 over expenditure. Schemes of a like nature were also outlined in regard to hydro-electric developments on the Shoalhaven River, Cataract, and Cordeaux Rivers, Gilmore Creek, and the Tumut River, all of which were referred to the Public Works Committee. A motion was also carried for reference to the Committee of a scheme for hydro-electric development on the Nymboida River. The dam is already in existence, and it is proposed to develop the power for supplying electricity to Grafton and South Grafton. The estimated cost is £35,000. The total cost of all the schemes is estimated at £6,885,800.

Willoughby, on the north side of Sydney Harbour, is the first of the group of northern suburbs to have its streets lighted by electricity. The inauguration took place at the commencement of last month, and it was anticipated that electricity would be available in Lane Cove, a neighbouring municipality, on May 1st. The Fremantle Corporation Tramways and Electric Lighting Board has notified consumers that between July 1st, 1916, and January 1st, 1917, the following changes in the supply of electricity will be made:—For power, from two-phase, 220 volts, 50 cycles, to three-phase, 440 volts, 40 cycles; and for lighting, heating, and motors up to 2 H.P., from single-phase, 220 volts, to single-phase, 250 volts.

Belfast.—The Electricity Committee has had under consideration the matter brought before them by a recent deputation of electrical contractors in the city, in reference to the extension of the electricity undertaking, which had been deferred owing to Treasury restrictions on capital expenditure, and a deputation has been appointed to wait upon the L.G.B. on the subject.

Birmingham.—YEAR'S WORKING.—The accounts of the Corporation electricity supply undertaking for the year ended March 31st last show a profit of £47,497, a decrease of £12,888 on the previous year. It was reported that the output amounted to 177 million units, as compared with 83 million units in 1914-15. Ald. Jephcott stated that the increased revenue had been more than absorbed by the extra expenditure, due principally to the rise in the price of fuel. The Electricity Committee has decided to carry £22,000 to a special fund, and allocate the remaining £25,497 to the relief of rates.—*Birmingham Daily Post*.

Bo'ness.—PLANT EXTENSIONS.—The T.C. has accepted the offer of the National Electric Construction Co., Ltd., to carry out the modified scheme of extensions to the existing electricity works, at a cost of £12,000. Mr. J. M. Munro, consulting engineer, of Edinburgh, has been appointed to supervise the work.

Christchurch.—PRICE INCREASE.—The B. of G. has received a communication from the Bournemouth and Poole Electricity Supply Co. with reference to the 10 per cent. increase in the charge for electricity which the company had added to the accounts for the last quarter, and which the Guardians refused to pay. It was stated, at a meeting of the Board, that the company was under a five-year contract with the Guardians to supply electricity for light and power at a fixed rate, and the Board had decided to hold the company to the contract.—*Bournemouth Guardian.*

Darwen.—PRICE INCREASE.—It is proposed that the charges for electricity for power purposes, which were last year raised 20 per cent., shall be advanced a further 5 per cent.

Eccles.—GENERATING STATION SITE.—The Corporation Electricity Supply Committee has secured a site at Monton for a new generating station.

Edmonton.—PRICE INCREASE.—The North Metropolitan Electric Power Supply Co. has asked the B. of G. to pay an increase of 18d. per unit for electricity supplied, and a recommendation that the increase be paid has been referred back for reconsideration by the Finance and General Purposes Committee.

Grimsbury.—YEAR'S WORKING.—The report on the last year's working of the electricity department shows that, despite the difficult conditions of the period, a net profit of £1,851 was made. There was a net decrease in revenue of £2,068, the gross revenue amounting to £22,144, while expenditure amounted to £12,339, and financial charges to £7,954.

Horsham.—The electrical engineer reports that since the introduction of the Daylight Saving scheme there has been a saving in coal consumption at the works of from 17 to 25 per cent. per evening. Public lighting is to be abandoned during the summer months.

Ilford.—LOAN SANCTIONS, &C.—The U.D.C. has received sanction to the borrowing of £6,098, part of £6,565, for mains, and £1,650 for the provision of the Goodmayes sub-station. The sum deducted from the original application for mains is in respect of new mains to provide current to private houses, which the L.G.B. is not willing to sanction at the present time.

The Electricity Committee has decided to pay the contractors half the extra cost of 6d. per ton for West Cancock slack coal, the increase in cost being due to the 5 per cent. advance in miners' wages.

An expenditure of £1,199 charged in the Council's accounts for the year ended March 31st, 1915, to which exception was taken by the district auditor, has been sanctioned by the L.G.B.

Kettering.—YEAR'S WORKING.—The annual accounts of the Council's electrical undertaking show that the total revenue for the year ended March last was £18,260, while the working expenses amounted to £10,616, leaving a gross profit of £7,643. Including the amount brought forward, the balance of the net revenue account amounted to £12,136, and after meeting interest and sinking fund charges and transferring £2,000 to reserve, the balance carried forward to next year was £3,659. Increased cost of coal, rates, taxes, and loan charges accounted for £3,168 more than in the previous year. Increased revenue from sale of energy to private consumers amounted to £2,218. A total of 2½ million units were sold, an increase for the year of 540,655 units. The maximum load was 1,250 kW., showing an increase of 148 kW., and the net surplus on the year's working amounted to £1,272.

Llanfyllin.—PUBLIC LIGHTING.—The meeting of ratepayers held to consider the offer of Mr. R. A. Jones to light the town by electricity has referred the matter back to the T.C. and promised support in any action that would give the town cheaper lighting.

London.—WOOLWICH.—The L.C.C. has sanctioned the borrowing of £27,500, in respect of the Globe Lane electricity works extensions.

Luton.—PLANT EXTENSION, &C.—The electrical engineer has reported generally as to the erection of a sub-station, the laying of the H.T. mains, and the erection of the new machinery and cooling tower at the electricity works. Since April 6th last, 1,230,853 units have been generated for general supply, and 30,335 units for traction purposes; a total of 1,922 consumers with 71,812 lamps, 1,131 motors of 6,652½ H.P., and 1,580½ kw. in heating are now connected. Compared with the corresponding period last year, the units generated for general supply show an increase of 18 per cent.

New Zealand.—The proposal of the Thames B.C. to raise a loan of £5,500 for the extension of the electric lighting plant and mains was submitted to a poll of the ratepayers recently and carried by a large majority.

Nuneaton.—The T.C. has fixed the following scale of charges for current for power as from April 1st last:—First 5,000 units per quarter, 1d. per unit; the next 1,000, ½d.; all after the first 6,000, ½d. On account of restricted lighting, the same rebate as made by the gas company is to be allowed by the Electricity Committee.

St. Austell.—STREET LIGHTING.—The U.D.C. has accepted the offer of the Electric Light Co. for public lighting for three years, at an increased price of £36 per annum.

Stafford.—PRICE INCREASE.—The T.C. has increased the price of electricity for power, as from July 1st, from 2½d. to 3d. per unit, the graduated discounts to remain as at present. It is anticipated that the increase will bring in an additional revenue of about £1,000 per annum.

Stalybridge.—LOAN APPLICATION.—The Joint Tramways Board has adopted a recommendation of the Generating Station Committee to make application to the L.G.B. for sanction to borrow £39,000 for a turbo-alternator, cooling towers and boiler plant, &c.

Stoke-on-Trent.—EXTENSION SCHEME.—In order to meet the growing load and reduce production costs, it is proposed to add a 3,000-kw. turbine, with condenser, cooling tower, switchgear, and the necessary boilers at the central power house, at an estimated cost of £33,000. The following particulars as to energy generated last year at the various generating plants under the T.C. were submitted in a report on the subject:—

	Coal in tons.	Coal cost £	Units generated.	Cost per unit. in lb. in pence.
Burslem	1,746	1,206	489,976	8 0.59
Hanley	4,584	3,383	849,332	12 0.96
Longton	365	235	37,920	21½ 1.49
Stoke	423	296	68,356	13¼ 1.04
Sub-works total ...	7,118	£5,120	1,445,584	11¼ 0.87
Power house	11,231	£8,612	9,096,796	2¼ 0.23
Gross total	18,349	£13,732	10,542,380	3.9 0.31

It was estimated that by doubling the turbine capacity a saving of £2,610 per annum in coal would be effected, which would pay the new capital charges; moreover, there was 2,000 kW. of rotary and motor generator plant installed, and only about 1,000 kW. of turbine plant to supply it. A new 600-kw. rotary is being installed at Longton, and three-phase supply is being given from static sub-stations in Tunstall, Hanley, and Fenton, while there is a growing demand for bulk supply, which would be met if further economical generating plant were available.

The Electricity Committee recommended that application be made for sanction to the borrowing of £33,000, and the Town Clerk has been instructed to obtain the views of the L.G.B. on the matter.

The North Staffordshire Railway has inquired for a bulk supply on certain terms, while various other firms in Milton are also inquiring as to supplies of electricity.

The Wolstanton United U.D.C. has agreed to remove certain street lamps lighted by the Potteries Electric Traction Co. when the lighting restrictions have been withdrawn.

Tasmania.—Hydro-electric power matters continue to attract attention in Tasmania. It is said that a total of 130,000 H.P. is being negotiated for, which will require other developments in addition to the Great Lake scheme, which is expected to give 75,000 H.P. It is reported that the Mount Lyell Co. has come to terms for a supply of up to 50,000 H.P. for use in connection with electro-metallurgical processes in its zinc industry.

Walthamstow.—TURBINE LOAN APPLICATION, &C.—Having considered the report of the electrical engineer as to the advisability of installing additional plant at the works to meet present and future demands, the Electricity Committee has asked the Finance Committee (and that Committee has agreed) to apply to the L.G.B. for sanction to the borrowing of £11,240 for a 1,500-kw. Ljungström turbine and a 500 kW. motor-converter, the necessary switchgear, cables, foundations, &c. The engineer states that in order to install the above plant, it will be necessary to supersede gas engine No. 8. A tender for water-softening plant is recommended for acceptance, at £750. To cover this expenditure, application for sanction to borrow will be made.

Wolverhampton.—PRICE INCREASE.—From the date of the meter readings for the June quarter, the charges for current have been increased by 10 per cent. by the T.C.

TRAMWAY and RAILWAY NOTES.

Australia.—MELBOURNE SUBURBAN RAILWAY ELECTRIFICATION.—Mr. H. McKenzie, the Minister of Railways, stated last month that the consulting engineer and the Agent-General in London were trying to arrange for a transfer of contracts in connection with the suburban railway scheme, from Messrs. Siemens Bros. to some other firm, and preferably to one with an agency in America. The Minister stated that if the switchgear and certain other parts were available, the scheme could be put into operation in less than a year.—*Melbourne Age.*

The Melbourne Tramway Co.'s undertakings will be taken over by the new Government Tramway Board on July 1st next. The Board has been appointed for a period extending from January last to October, 1917; most of its work has been of a preparatory character, and the questions of revision of fares, and the advisability of electrification, will not be considered until the tramway undertakings have been taken over by the Board.

Birmingham.—Last week the tramway service was again shut down for a short time, owing to the inability of the electric supply department to supply all the demands made upon it under existing conditions.

Blackpool.—**ELECTRIC VEHICLE.**—The Cleansing Committee has decided to provide in its estimates for the purchase of another electric street sprinkler, estimated to cost about £1,000.

Bradford.—**TRAMWAY FARES.**—Mr. C. J. Spencer, the Corporation tramway manager, has submitted his report on the question of fares in Bradford, with particular attention to the Great Horton route. He considers that circumstances are not favourable to the cheapening of fares, and states that had the war-time receipts been the same per car-mile as the average for the five years preceding the war, there would have been a loss of nearly a halfpenny per car-mile run (£12,900) owing to the increased working cost. The receipts per car-mile have been exceedingly good during the war period. He has made inquiries in other towns, and found that in 12 centres, including Birmingham, fares had been increased, and in only one case had there been a decrease.

Chile.—The municipality of Valparaiso has refused to accept the proposition made by the Compañía de Tranvías Eléctricos de Valparaíso, which is the company now operating the electric street railways and furnishing the electric lighting of the city for an extension of franchise. The franchise was to be extended by 75 years, making the total life from date 99 years. The company was to give the city 5 per cent. of its gross receipts from the tramways, this percentage of gross receipts to be applied principally on the city debt, and secondarily on the indebtedness of the city to the traction company for municipal lighting (in June, 1915, the balance due for municipal lighting amounted to \$383,045 U.S. currency). The company was also to double-track several lines, to do all necessary paving, and clean, repair, &c., such paving. The company was to cede to the city on certain conditions and in return for certain payments on part of its equipment, all its equipment, plants, lines, &c., on the expiration of its franchise.—*Electric Railway Journal.*

Hull.—**HALFPENNY FARES.**—In reviewing the year's working of the Corporation tramways, the Lord Mayor stated that since the introduction of the halfpenny stages the income had increased from 834 to 943 per car-mile. There was a profit for the year of £12,469, in addition to paying £8,759 in allowances to men on service, £4,000 in war bonuses and £2,000 extra for coal; 4 million free rides had been given to soldiers.—*Manchester Guardian.*

Hilford.—The tramway manager reports that the working of the new system adopted a short time ago, of charging for the conveyance of parcels on the cars, has proved satisfactory.

Luton.—The B. of T. has issued an order prolonging the period from August 11th next to August 11th, 1918, for wholly completing the tramways authorised by the Corporation Order of 1905.

York.—The traffic returns of the Corporation tramways for April show receipts amounting to £3,033, as against £2,623 last year; passengers carried, 719,353 against 606,513; and receipts per car-mile, 10'47d., as compared with 9'49d.

Holt Committee's report. The Committee proposes that the Holt Committee's recommendations shall be adopted, with modifications in certain cases, in regard to the transfer to other duties of persons suffering from telegraphists' cramp, travelling expenses of telephonists, increment of assistant engineers, credit for telegraph work, and other items.—*Daily Telegraph.*

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdeen.—June 8th. Electricity Committee. Small steam coal for one year. Mr. J. A. Ball, City Electrical Engineer.

Australia.—**PERTH.**—August 16th. P.M.G. Telegraph and measuring instruments. Schedule No. 498, W.A.*

MELBOURNE.—July 26th. Victorian Railways Commissioners. 400 signal lighting transformers.*

June 27th. Deputy P.M.G. 18,551 Stalloy telephone receiver diaphragms.*

SYDNEY.—August 24th. P.M.G. Automatic switchboard and apparatus for North Sydney Exchange. Schedule No. 511.

BRISSBANE.—July 31st. P.M.G. Power board and accumulators. Schedule No. 381.

Barking.—June 9th. U.D.C. Six or twelve months' supply of coal, slack or beans. Engineer and Manager, Electricity Works.

Belfast.—June 7th. Corporation. Supply of coal (40,000 tons), for 12 months, for the Electricity Works. Mr. T. W. Bloxam, City Electrical Engineer.

Dublin.—June 8th. Corporation. One, two or three years' supply of coal for the Electricity Works (approximate amount 40,000 tons per annum). Town Clerk, City Hall.

Glasgow.—June 5th. Six or twelve months' supply of electrical stores for the Trustees of the Clyde Navigation Superintendent of Stores, 16, Robertson Street.

London.—**ST. PANCRAS.**—June 13th. B.C. Twelve months' supply of steam coal for the Electricity Department. Borough Electrical Engineer.

Manchester.—June 7th. Electricity Committee. Electric capstan for Stuart Street station. See "Official Notices" May 26th.

New Zealand.—**PANMUTUA.**—July 10th. Borough Council. Overhead wires, poles, street lamps, gas engines, producers, dynamos, auxiliary apparatus and accumulators. Specifications from Borough Offices or Mr. E. J. Fenn, Consulting Engineer, Auckland.*

INVERCARGILL.—September 28th. Borough Council. Steam turbo alternator, condensing plant and switchgear. Specifications from the Tramway Office.

Torquay.—June 19th. Corporation. 5,500 tons of coal for use with mechanical stokers for the Electric Lighting Committee. Mr. F. S. Hex, Town Clerk.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Eccles.—Corporation Electricity Supply Committee. Superheater and accessories: T. Sugden, Ltd., £85 10s.

Glasgow.—Electricity Committee. Recommended tenders, the first for three months, and the remainder for a year:—

Cast iron boxes, section pillars, &c.—Carron Co.; W. Luce & Co.; Fairbank Iron Co.; D. King & Son; J. Allan, Ben. & Sons.

Cotton waste and dusts.—Basson Bros.

Single cables, concentric and triple concentric cables.—Callender's Cable Co., Ltd.

n.r. cables. W. T. Glover & Co., Ltd.

n.r. cables.—Callender's Cable Co., Ltd.

Rubber-covered cables and flexibles.—Craigpark Electric Cable Co., Ltd.

Electricity meters.—Ferranti, Ltd.; Chamberlain & Hookham, Ltd.;

British Westinghouse Co.

London.—Metropolitan Asylums Board. To install an internal telephone system and overhaul the existing electric bell installation at the Children's Infirmary: J. W. Gray & Son.

Walthamstow.—The following tenders have been accepted:—

Paterson Engineering Co., Ltd.—Water softening plant for the electricity works, at £7 0.

Cannock Laird & Co.—18 treamer axles, at £5 16s. each.

P. R. Jackson & Co., Ltd.—24 commutators, at £5 10s. each.

TELEGRAPH and TELEPHONE NOTES.

Argentina.—Senor Al. Schwimer, representing a North American syndicate, has applied to the municipality of Buenos Aires for permission to install and to exploit a system of automatic telephones in the capital. The system is said to be in operation in more than 500 cities in the United States with a million and a half instruments installed.—*Review of the River Plate.*

Havana.—On the completion of the long-distance telephone line to Key West, Fla., by the American Telephone and Telegraph Co., steps will be taken to lay a submarine cable between that point and Havana, Cuba.—*Telegraph and Telephone Age.*

Improvements in Submarine Telegraphy.—According to the *Telegraph and Telephone Age*, recent experiments intended to increase the speed of working on submarine cables have proved successful, and a much higher speed is now attained on some of the Atlantic cables. Patent considerations prevent the publication of details at present.

Post Office Servants.—A further report has been presented by the Committee appointed, under the chairmanship of Sir George Gibb, to examine the issue with regard to the wages and conditions of employment of Post Office servants, raised by the

FORTHCOMING EVENTS.

North of England Institute of Mining and Mechanical Engineers.—Saturday, June 3rd. At 2 p.m. At the Wood Memorial Hall, Newcastle-on-Tyne. General meeting.

Royal Institution of Great Britain.—Tuesday, June 6th. At 3 p.m. At Abchurch Lane, London, W.C. Lecture III on "Optical Research and Chemical Progress," by Mr. T. M. Lowry, F.R.S.
Friday, June 9th. At 6.30 p.m. Lecture on "Eyesight and the War," by Dr. E. Clarke, F.R.C.S.

Röntgen Society.—Tuesday, June 6th. At 8.15 p.m. At the Institution of Electrical Engineers, Victoria Embankment, W.C. Paper on "Homogeneity of Visible Radiation," by Prof. J. W. Nicholson.

NOTES.

Scientific Research.—By Order in Council, the Secretary of State for the Colonies for the time being has been added to the Committee of the Privy Council for the organisation and development of scientific and industrial research.

Interconnection of Electric Supply Undertakings.

—In our last issue we published, and warmly welcomed, a letter addressed by the Board of Trade to Electricity Supply Authorities, drawing attention to the very considerable saving that could be effected by the adoption of arrangements for the interconnection and joint working of electricity supply undertakings, and stating that the Board was prepared to assist in securing the agreement of all parties interested in any such proposed scheme. This letter was well-timed, in view of a movement which had just been started in Lancashire, in the same direction. In the discussion at Manchester on Mr. E. T. Williams's paper recently read before the Institution of Electrical Engineers, Mr. Robertson, the chief electrical engineer of Salford, whilst maintaining that a national bulk supply scheme such as was proposed by Mr. Williams was not feasible at the present time, threw out the suggestion that a scheme for interconnecting the principal supply undertakings in the industrial districts would be of enormous benefit, and referred particularly to the advantages of such a scheme for the Lancashire and Cheshire districts.

The matter was taken up forthwith by the Municipal Electrical Association of Lancashire and Cheshire, and at a meeting held in the School of Technology, under the chairmanship of Mr. S. L. Pearce, on May 9th, and attended by a large majority of the chief engineers of the electricity supply undertakings (municipal, company, and railway) interested in the matter, a committee was formed to prepare a scheme for the interconnecting (where possible from an engineering point of view, and commercially feasible) of the principal supply stations of the two counties. The committee consists of the following gentlemen:—Mr. S. L. Pearce, Manchester, chairman; Mr. B. Welbourn, Prescott Electric Light Co., vice-chairman; Mr. J. A. Robertson, Salford, hon. secretary; Mr. C. C. Atkinson, Rochdale; Mr. S. E. Britton, Chester; Mr. H. Dickinson, Liverpool; Mr. E. H. Edwards, South Lancashire Tramways Co.; Mr. R. Blakmore, Stalybridge; Mr. J. Purrett, Lancashire Electric Power Co.; Mr. S. J. Watson, Bury; Mr. P. P. Wheelwright, Blackburn; Mr. Aspinall, Lancashire and Yorkshire Railway.

The area of supply coming within the scope of the Committee has been divided into the following districts:—Manchester Inner district; Manchester Outer district; Stalybridge and Oldham district; Liverpool district; North Lancashire district; Cheshire district.

Sub Committees have been allocated to the various districts to obtain the necessary technical data, which will be compiled and tabulated at an early date. The central Committee will then be in a position to review the whole question and to present its report, including estimates of cost, to the various municipal committees and supply companies. The sympathetic consideration of the Board of Trade being assured, there should be no difficulty in carrying out the scheme without additional Parliamentary powers, and in view of its importance at the present time, it is hoped that the Local Government Board will also lend its assistance to enable the financial difficulties to be overcome.

We hope to see similar steps taken in other districts in which suitable conditions obtain—there are many such. As we pointed out in our last issue, the matter is of urgent importance, and energetic action should be taken at once.

We congratulate the M.E.A. of Lancashire and Cheshire on its promptitude—it will be noticed that the first meeting was held on the 9th ult., long before the Board of Trade letter was circulated—and hope that its action will be rewarded with equally rapid success.

Fatality.—The *Daily Telegraph* reports that a Sheffield electrician, named John Silvester, while engaged in repairing an electric motor, on Saturday afternoon was killed through his right hand coming in contact with a live wire.

Appointments Vacant.—Station engineers, fitters, wiremen, and engine drivers (steam and oil), for the Western Command, Chester; switchboard attendants (30s.), for the Faversham Corporation sewage pumping station; shorthand typist (male or female), for the chief engineer, Southern Command, Salisbury; steam engine driver (45s.) for the County of Middlesex War Hospital, Napsbury. See our advertising pages to-day.

New Testing Institution.—The Istituto Elettrotecnico Italiano has lately been formed in Turin in connection with the Polytechnic of that city, with the object of carrying on and extending the electrical measuring-instrument testing department of the last-named institution.

Institution Notes.—Institution of Electrical Engineers.

—On Thursday last week a special meeting of Corporate Members was held to consider the resolution, already recorded in this column, for altering the articles of association so as to exclude alien enemies from membership. After a brief discussion, the resolution was put to the vote, and carried by a majority of 41 to 1. A meeting to confirm the resolution will be held on June 15th, at 5.15 p.m.

Volunteer Notes.—BIRMINGHAM ELECTRICAL ENGINEERS.

—The Birmingham Electrical Engineers (V.) has supplied and maintained a batch of skilled engineers for experimental and constructional work in connection with coast defence since the beginning of the year. More than 50 men, representing 17 branches of the engineers' profession, have joined the Navy for this work, and take duty on H.M.S. *Vernon*, for periods of two weeks or more, as and when such periods of duty can conveniently be arranged. Their services have been so useful to the Admiralty that a request is being made to the Birmingham Electrical Engineers to supply and maintain twice the original number of men.

To cope with this new demand an appeal is being made to draughtsmen, fitters, toolmakers, turners, mechanics, wiremen, and others with engineering knowledge, to offer themselves as volunteers for this work. Applicants should possess good health, and be between the ages of 18 and 50. Arrangements have been made for the transfer of specially selected "Darby" men to this scheme.

There are also vacancies for fitters and turners who wish to join the full-time service for the period of the war. Details of pay and allowances may be obtained from the Commandant of the Birmingham Electrical Engineers (V.), 56, Digbeth, each Friday, between 7 p.m. and 7.30 p.m., or from the Adjutant, Mr. S. T. Pemberton, 8, Church Street.

The following letter from the Secretary of the Admiralty shows that the services of the Volunteers are highly appreciated:—

"With reference to the arrangements made by which assistance has been rendered to the staff of H.M.S. *Vernon* by the Birmingham Electrical Engineers (V.), I am commanded by my Lords Commissioners of the Admiralty to inform you that a report has now been received from the Commander-in-Chief, Portsmouth, stating that the scheme has proved very satisfactory during the first three months of its working. The men's services have been of great value, and they have been uniformly well reported upon by the Departments of H.M.S. *Vernon* to which they have been attached.

"I am to add that their Lordships, who have received with pleasure this excellent report, have approved of the scheme being continued during the period of the war."—*Birmingham Despatch.*

1ST LONDON ENGINEERS VOLUNTEERS.—Orders for the week by Lieut.-Col. C. B. Clay, V.D. Commanding.

Saturday, June 3rd.—Uniform Parade, 2.45, for Ceremonial Drill. Every Member is urged to attend.

Monday, June 5th.—Technical for Sections 1 and 2, No. 3 Company, 46 Regency Street, S.W.; Squad and Platoon Drill, Sections 3 and 4, No. 3 Company; Signalling Class and Recruits.

Tuesday, June 6th.—School of Arms, 6 to 7; lecture, "Bridging," Company Commander E. I. Castell; Recruits, 7.15 to 8.15.

Wednesday, June 7th.—Platoon Drill, No. 1 Platoon, No. 1 Company.

Thursday, June 8th.—Platoon Drill, No. 5 Platoon, No. 2 Company; Shooting for Sections 3 and 4, No. 3 Company, Miniature Range; Recruits, 5.45 to 7.45; Instructional Class, 5.45.

Friday, June 9th.—Technical for Sections 3 and 4, No. 3 Company, 46 Regency Street, S.W.; Squad and Platoon Drill, Sections 1 and 2, No. 3 Company.

Sunday, June 11th.—Entrenching duties: Parade, Victoria Station (S.E. & C. Railway Booking Office), 8.35 a.m.

MACLEOD YEARSLEY, Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, June 1st, 1916:—

Week-End Parades.—*Saturday.*—The Battalion will Parade outside Baker Street Station, at 2.30 p.m., and proceed by train to Wembley Park for Drill under the Commandant.

Sunday.—The Battalion will Parade at Richmond Green, at 11.10 a.m., the 4th inst. Dress: Marching Order.

In the afternoon a Parade will be held by the Regimental Commandant, Brig.-Gen. the Hon. F. C. Bridgeman.

It is most important that every man should attend these Parades.

Bridgeman Cup Competition.—This competition will be fired at Runmede Range on Saturday next, June 3rd.

A. G. JOINER, Major and Adjutant, O.B.C.

The Diesel Auction at Ipswich.—Messrs. Wheatley Kirk, Price & Co. have issued a catalogue of the "Diesel" engines, &c., that are to be offered for sale by auction at Ipswich, on Wednesday next, under the liquidation of the Consolidated Diesel Engine Manufacturers, Ltd., and Diesel Engine Co. Ltd.

Engineering Wages.—Arising out of the refusal of the Committee on Production to grant any increase in wages to the Clyde allied engineering trades, a national movement has been set on foot to present an advance of 2s. 6d. per hour to all sections of engineering workmen. It is stated by a prominent Trade Union official that this effort has come into being solely as a result of the great increase in the cost of living, and that a restriction of food prices on the lines of the limitation of prices of coal exported to France will stop any further efforts to secure increased wages from different sections of workmen. —*Morning Post*.

Private J. POWELL, of the North Staffordshire Regiment,

Strand Electric & Engineering Co., Ltd. (143,933).—This company was registered on May 25th, with a capital of £750 in £1 shares, to carry on the business of manufacturers of and dealers in machinery, apparatus, and oil or petrol engines, motor cars and accessories, pumping apparatus, electric motors and lamps, electrical accessories and apparatus, and to carry on the business of electrical engineers and electricians. The company is engaged in the production of electrical stage effects, cinematographs, phonographs, sewing machines, vacuum pumps, electrical or mechanical fans, and air inductors and extractors, electrical and mechanical engineering, and electrical contracting. The directors are: Edward James Vincent Lane, Hither Green, S.E., electrical engineer; J. M. Woolnough, 125, Finsbury Road, Goodmayes, electrical engineer; P. Sheridan, "Monalee," 151, Culverley Road, Catford, S.E., electrical engineer. Private company. The above are the directors. The company is managed or more than five. A. C. Earnshaw signs documents as managing director. Registered office: 66a, St. Martin's Lane, E.C.1.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

New Era Signs, Ltd.—Particulars of £2,000 debts., created May 1st, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £1,300. Property charged: The company's property, present and future, including uncalled capital. No trustees.

Carville Site & Power Co., Ltd.—Issue on May 19th, 1916, of £10,000 debts., part of a series of which particulars have already been filed.

CITY NOTES.

Peel-Conner Telephone Works, Ltd.

The net profit for the year ended March 31st, 1916, was £21,749, out of which £5,000 has been put to reserve for depreciation and £4,000 to general reserve, leaving £12,749, plus £41,201 brought forward. The dividend on the preference shares for the year absorbs £5,000, and a dividend of 2s. per share on the ls. ordinary shares requires £8,000, leaving £3,950 to carry forward. The directors expressed themselves as satisfied with the result, more especially as during the past year the cost of labour and raw materials showed considerable increases. The annual meeting was held on Wednesday.

West London and Provincial Electric Supply Co., Ltd.

Mr. H. KAHN, in addressing the annual meeting recently, referred to the difficulties of the year. Everything seemed to have conspired to make the lot of those conducting an electric light concern an unhappy one. On the one hand, owing to the Defence of the Realm Act, one of the most profitable sources of revenue—namely, shop window and outside lighting—had been practically done away with, and in Aberystwyth, where the Chiswick Corporation supplied the street lamps on the front, that source of revenue was for the time being extinct, and, on the other hand, coal and oil had gone up in price tremendously. Coal, for which the corporation used to pay 18s. per ton, now cost 28s., and for oil fuel, which used to range from 60s. to 70s. per ton, it had now to pay 124s. to 140s. To meet the situation, the Corporation had been compelled to raise its price for current by 10 per cent. and to fix a minimum payment per quarter of 13s. 4d. per consumer, and unless in the near future some reduction occurred in the prices of fuel—which seemed very unlikely—the Corporation might be forced to make a further increase in its charges. The second Diesel engine was working satisfactorily at Aberystwyth, and the Corporation was now installing a new one at Chiswick, as its reserve power there was becoming dangerously small. This engine would be ready for use in about a fortnight's time. Mr. W. B. ESSON (managing director) seconded the adoption of the report.

The Electric Construction Co., Ltd.

The annual meeting was held on Tuesday. Mr. P. E. BEACHCROFT, who presided, said that again he had to submit a report which showed an improvement upon that of the preceding year. The gross profits for the year had amounted to £88,500, with net profits of £43,200, an increase of £16,000 in the gross profits and of £7,700 net. From these figures it would be seen that of the increase of £16,500 in gross profit from manufacturing and contracting, £8,800 had been absorbed in additional expenditure. This was accounted for by (a) additional income-tax, rates and insurances, £3,500; (b) additional maintenance on plant and buildings, £2,800; and (c) additional provision for depreciation, £2,500. The increase in maintenance was chiefly due to an extensive overhaul of the factory roof, which had to be taken in hand, and which was still proceeding. The increase in depreciation they considered necessary, as the plant and machinery had been in more or less constant use during the past financial year, and the provision for depreciation must be correspondingly increased. They must, however, be prepared for some increase in general charges this year, but the amount would not be serious. It was extremely gratifying, in view of the abnormally high prices of materials, the higher rates of wages, the difficulties of transport, and several other factors which had contributed to increased cost of production, that they had been able to increase the net profit by 21 per cent. The improved results were due principally to a larger volume of business having been handled. There was a balance to be carried forward of £16,839, subject to excess profits duty and assessment under the Munitions of War Act, 1915. They were liable for excess profits duty for the year ended March 31st, 1915. They were also, he presumed, liable for this duty from April 1st to August 18th, 1915 (when their works were declared a controlled establishment), and from that date to March 31st, 1916, to an assessment under the Munitions of War Act, 1915. The amount of their indebtedness had not been finally determined, but they had carried forward more than sufficient to meet the demands of the Government. It had afforded the Board very great satisfaction to be able to recommend a substantially increased dividend, which they considered fully justified. An increase of £1,450 was shown in shares in other companies, which was represented by a holding that they had acquired in an allied concern, and which yielded a good return. On previous occasions he had emphasised the strong financial position of the company. Their financial position to-day was stronger than ever. Regarding their assessment for excess profits duty and assessments under the Munitions of War Act, 1915, two years' assessments had to be provided out of the sum of £16,839 carried forward. The Chancellor of the Exchequer required from non-controlled establishments 50 per cent. (now 60 per cent.) of the excess profits earned over the average of two of the three years prior to the war. Under the Munitions of War Act a pre-war standard was fixed of the average of the net profits for the two financial years completed before the outbreak of war. A controlled establishment was allowed to retain 20 per cent. over the pre-war standard, and anything in excess of that was to be paid to the Minister of Munitions. The last Budget, however, provided that unless the assessment paid to the Ministry of Munitions represented 50 per cent. or 60 per cent., as the case might be, of the increased profits, the Chancellor of the Exchequer would claim part of the 20 per cent. appropriated to the employer under the Munitions of War Act. He realised that the Munitions of War Act was in the nature of an arrangement with the workmen, who represented that they should not be expected to modify their rules and work longer hours to put extra profits into the pockets of the employers. He concurred, but as matters now stood controlled establishments were suffering to a larger extent than non-controlled. He did not wish to be misunderstood, as he had no fault to find with the excess profits duties in principle, but while recognising that certain privileges were enjoyed by controlled establishments, he hoped that something would be done to put matters on a more equitable basis. Moreover, an allowance of 20 per cent. on the pre-war standard was inadequate for the electrical manufacturing industry, which had just emerged from a long period of acute depression. He endorsed what was stated in the report regarding unexecuted orders at the beginning of the new financial year. Indeed, they had never begun a year so well provided with work, and as far as judgment could be formed in these days, there was every prospect of their meeting next year under favourable auspices. Many people had said that after the war there would be a period of depression. He did not share that view entirely, and with regard to the electrical industry, in his judgment they had only touched the fringe of the trade in this country. There were so many things which would come under the industry in the future that he did not see why it should be limited in its operations. There were such things as the electrifying of agriculture and other interests, and there was no reason to suppose that in years to come they might not be able to harness all the coal fields. He felt confident that the electrical industry would not suffer from any falling off in demand after the war. Therefore he was an optimist, and he believed that their company would benefit materially in the future.

Mr. JAMES GRAY (managing director) seconded the motion, and the report was adopted without discussion.

West India and Panama Telegraph Co., Ltd.

SIR ALEX. F. KING, presiding at the annual meeting on May 17th, said that at the half-yearly meeting they foreshadowed a great falling-off in traffic receipts concurrently with increased expenses due, to a large extent, to the hurricane which visited the West Indies in August last. Their prognostications had proved to be correct. Several circumstances had combined to militate against obtaining a more satisfactory record, but they could not at the very best of times hope to emulate the prosperity of the larger telegraph companies, owing mainly, if not entirely, to the narrow field of their operations. The population of the whole of the British West Indies was only about 2,000,000—less than one-third the population of London. Further, the productive area of those Colonies was very limited, and as there was little sympathy of trade between the several islands, traffic receipts must be comparatively small. Under arrangements with the Government they reduced their charges from October, 1914. The loss from so doing was estimated at £26,000 a year, but, as a set-off, the Imperial and Canadian Governments granted subsidies amounting to £16,000 a year for 10 years—leaving £10,000 a year to be made up by the increased traffics which they were told would result from the stimulation the lower rates would induce. Certainly the volume of words had increased, but some part of this was certainly due to circumstances not connected with the question of rates. For instance, war conditions, the difficulty and uncertainty of steamer communications, the favourable crops and the higher prices obtained for them, were factors to which much of the increase in their work could be attributed. Under conditions which had ruled

for very many years, the staff had had to be kept down to a minimum strength; and, owing to the Government requirements that the offices should at times be kept open day and night, the working costs had been higher than in previous years. They had, however, formulated a claim for a modest proportion of the extra cost entailed by the special services rendered, and that claim was at present under the consideration of the departments concerned. In the hurricane referred to, the Island of Jamaica suffered most severely. The deficit in the Jamaica Budget for last year was £62,000, and the estimated deficit for this year was £115,000—both largely due to the hurricane and to war conditions. But they were not without some hope for the future. Their Canadian friends seemed to feel that there was something better in store for their West Indian Colonies. Banking interests were being pressed forward by the establishment of branches of a Canadian bank, and the Dominion was apparently alive to the fact that, given transport facilities, it could offer a market for all the sugar their colonies could produce. Reciprocity of trade relations between Canada and the West Indies ought to be the natural order of things to bring about better results for the company. Indeed, the traffic receipts to the end of March showed an appreciable increase over the corresponding period of 1915, but at present the expenses were not likely to decrease. Some of the articles supplied to their repairing ship had increased in cost from 100 to 200 per cent. They hoped that circumstances would produce a more satisfactory account for the current half-year.

Argentine Tramways and Power Co., Ltd.

The report states that the year ended September, 1915, was largely one of construction. About 20 miles of track are now constructed. The supply of electricity for light and power was commenced in May, 1915. Until the eighth month of the financial year the company was only deriving its revenue from a part of the system, while the expenses charged to revenue covered the whole year. Notwithstanding this, the revenue was nearly sufficient to provide the full year's interest on the whole issue of £200,000 debenture stock. The development of the business had not been so rapid as was anticipated, owing principally to the depression in the Argentine accentuated by the war. The revenue was, however, gradually increasing, but no marked improvement must be looked for until more normal conditions prevail.

Indo-European Telegraph Co., Ltd.

Owing to the continued interruption of the company's route during the whole of 1915, the actual receipts were confined to local traffic. It has been impossible to make final arrangements for the re-establishment of the route. Under the existing arrangements with other companies and administrations the company's receipts have not been prejudicially affected, but the directors foresee a diminution in the receipts for 1916. They hope shortly to conclude an agreement for the acquisition of a substantial interest in a prominent manufacturing firm under which that firm will manufacture and develop apparatus for radio-telegraphic transmission and reception covered by the several patents now owned by the company; these will under the proposed agreement be transferred to that firm. The revenue amounted to £204,190, an increase of £14,806 over 1914. The expenses were £82,218, a decrease of £6,177. Including £20,592 brought forward, £122,297 is available. Deducting £35,000 provided for investment fluctuations, £15,000 provided towards excess profits duty for 1915, and the interim dividend of £10,625, there remains £61,672. An interim dividend of £2 12s. 6d. per share, free of income-tax, was recently paid, amounting to £44,625. This will be confirmed in the form of a final dividend and a bonus of £1 17s. 6d. per share, free of income-tax, amounting to £31,875, with a special distribution of 15s. per share, free of income-tax, amounting to £12,750, will be paid. The latter sum is derived from interest on unappropriated investments and advance accounts. It is proposed to provide a further £10,000 for wireless and other technical development work, carrying forward £19,797 to the credit of 1916. The annual meeting was held on Tuesday.

Kalgoorlie Electric Power and Lighting Corp., Ltd.

Mr. E. Pope presided at the annual meeting in London, on May 23rd. He said that the position of the company had been maintained, though costs and taxation were higher. More power was sold, but the total net profit was a fraction less. The amount of liquid assets showed a substantial increase. The question of debenture redemption had to be dealt with next year, but in the meantime they would continue to buy debentures offered at a reasonable market price. They held larger stocks of firewood in anticipation of trouble with the firewood cutters, many of the workers being alien enemies, this meaning a shortage of labour and a demand for higher wages. This demand was made in January, 1916, and whilst it was being adjusted many of the users of their current, who also used firewood for steam plant, closed down and ceased operations for many weeks, so that the profit fell to about one-third of the normal in January and for February it was also decreased. Ultimately extra wages were agreed to, and the price of fuel was increased by 1s. per ton, which meant an extra cost of 0.55d. per k.w. to produce their power. The cost of all engineering supplies had been greatly raised, some as much as 100 per cent., but notwithstanding the higher expenses they still expected to have

a fairly prosperous year. It was not likely that the gross profit would be equal to that of last year, but if they could reduce expenditure the cash balance might be as large. Mr. Pope referred to the change of managers at Kalgoorlie, Mr. Crocker, who had been there for 16 years, desiring a change. His duties had been assumed by Mr. Marmion, who had always acted as manager when Mr. Crocker was absent. Mr. Crocker, as consulting engineer, would be at hand to advise him.

Callender's Cable and Construction Co., Ltd.

Sir J. FORTESCUE FLANNERY, Bt., M.P., presided over the annual meeting, held at Hamilton House, on May 25th. He referred to the comparatively favourable nature of the report in the face of the difficulties of the year. The Government and the circumstances of the war were more responsible for the difficulties that had arisen than any cause inside their own organisation. They had lost a large number of their workmen who had volunteered for the war; they had had most serious difficulties arising from the restriction of British tonnage, which had caused delay in the delivery of their raw materials and had enormously increased the cost of raw materials and coal; and they had also had to contend with the cancellation of orders—perhaps he had better say the postponement of orders, because they hoped to resume them after the war. The inroads on their earnings, first by the Minister of Munitions, because they were a controlled establishment, and, secondly, by the Chancellor of the Exchequer, especially under the new legislation now before Parliament, were amongst the difficulties they had had to encounter. And yet they claimed to have overcome those difficulties without resorting to any means of which the shareholders would disapprove. They had made no undue profit out of the nation's need. He desired to emphasise that fact, because so many allegations were made at the present time that traders were making profits by excessive charges. They had carefully avoided doing anything of the sort, and all the work they had done for the Government had been done in full confidence with them, with open hands, and with the full approval of the Government officials in respect to every department for which they had worked. The interruption to their ordinary trade due to the war had enabled them to make very considerable changes—some of which, perhaps, would be of advantage after the war—both at Erith and Leigh. They had set as good an example as they could to their brethren in the electrical trade, and, broadly speaking, the electrical trade had not been behind any other trade in its patriotic exertions since the war broke out. In these circumstances, there had been difficulty in maintaining their commercial work, both at home and abroad, and in the Colonies and neutral countries, but they had been able to execute such orders as were urgent, and they had been at great pains to keep alive all the world-wide connections which they possessed, because they realised that whilst doing their duty to their country, yet a duty also rested upon them with regard to their shareholders to see that when the war was over they were able to resume their ordinary business with full advantage, and they believed the measures they had taken were such that after the war the company would be able to continue its ordinary business as advantageously as before, both to customers and shareholders. Indeed, they had reason to believe that their friends were stocking up reservoirs of orders for their requirements which would be opened very fully to their advantage after the war was over. The chairman proceeded to deal at some length with the question of transport, and said that whilst the German submarine menace had failed absolutely upon the whole, still the losses which had been incurred, coupled with the demands of the Government in regard to the construction of ships of war, had caused embarrassment. He saw little hope for relief in the near future, but he suggested that the situation might be relieved by the authorities making more careful use of ships requisitioned, and also by a still further restriction on the import of articles not absolutely required by the nation. Continuing, he said the company had added a great deal of new plant and buildings at the factories both at Erith and Leigh. They had done that at the request of the Government, and he desired to put on record their appreciation of the very businesslike manner in which the Government had met them and co-operated with them in these extensions. In addition to adding new plant, they had kept the existing plant up to the fullest state of repair and efficiency. They worked overtime at both factories, and at Leigh they worked practically continuously night and day. The chairman next referred to the erection of canteens and hostels for the workers. The developments of women's labour were quite astonishing, and he could assure them that in the case of their factories the adaptability of women, the quickness with which they learned technical handicrafts, the steadiness with which they applied themselves, and their utility and efficiency generally, were beyond all praise, and he himself thought that after the war this general recognition of the utility and adaptability of women labour would not be thrown away. Dealing next with the balance sheet, the chairman called attention to the very considerable sum carried forward. On January 1st, 1914, the sum carried forward was £124,000. On January 1st, 1915, it was £163,000, while on January 1st, 1916, they commenced the year with £207,000. That was a reserve against the future. They did not know what the war would bring forth, and it was well to have something laid by in case they had some unexpected difficulty. Their profit was substantially in-

creased through causes which were perfectly legitimate. Stocks both of raw materials and manufactured goods had increased, and now they were £267,000, compared with £145,000. The general expenses at the London office were £11,789, as against £11,000. The saving was due to the fact that as they were not doing so large a commercial business they had re-arranged their agencies in the direction of economy. It might be that when they resumed their full commercial operations they would again have to spend more money in this direction. The allowances to the members of the staff on active service came to £2,551, as compared with £867 last year. The item of £2,405 for samples, experiments, and advertising compared with £1,960 last year. It was important that both at Erith and Leigh the scientific research and investigation of all matters relating to the electrical industry as concerned in their manufactures continued without abatement during the war period. They claimed to be in the first rank of manufacturers of electrical apparatus, and they could only maintain their position by thorough research and by keeping up a special branch for laboratory experiments and for investigation, and they were very satisfied with the result and very grateful for the scientific services of the gentlemen who served them in that capacity. They had a long roll of honour, which included Mr. Tom Callender's own son, who, he believed, would be a credit to the company to which his father belonged. The prosperity of the company was dependent on the skill of the management and the loyalty of the staff of workers. In their managing director, Mr. Tom Callender, they had a man who was known to every shareholder and every worker, and who was appreciated for his extraordinary combination of scientific knowledge and business capacity. He was splendidly supported by Mr. Petersen and Mr. James Callender, who shared with him the responsibility of the management, and in Mr. Walter Alhnitt, their secretary, they had a financier who, if opportunity arose, could give points to the Chancellor of the Exchequer.—Mr. TOM CALLENDER, who seconded the motion, referred to the employees who were with the Forces, making special mention of Flight-Lieutenant Reed, who, in the Schleswig-Holstein raid, descended from the comparative security of the air to render assistance to a comrade, and, failing to rise, was taken prisoner. A shareholder had referred to the fact that the accounts contained no information as to income-tax, but they did not wish to say anything at present. Certain particulars were given them under the Munitions Act, but they did not know what they meant, and as to what was before them under the Finance Act, it was too bad for words. Mr. McKenna said it was his intention to tax every person to the extent of 60 per cent., and that those taxed under the Munitions Act would be called on to make dual returns, and he would take whichever was the largest. This, in their opinion, was a most unfair basis, and they were trying all they could to combat it. In addition, it was a distinct breach of the bargain, because when they were made a controlled establishment they, with others, entered into a three-party bargain between the workers, the employers, and the Government, and they held that it was not competent for one party to break the bargain without the consent of the others. Whether they would be successful in obtaining what they considered their rights was not yet settled, but they would do their best to protect the interests of the company. The difficulties during the past year had been very great. The price they had had to pay for most of the commodities they used they would a short time ago have considered ridiculous. In the early days of the war copper was between £50 and £60, and was now over £150, and, with such a fact before them, it did not need many words of his to show how serious the position might become unless it was handled with considerable care, and they had endeavoured to do that. They had done some overseas trade—not as much as they would have liked, but they had been prevented by the action of the Government, and he thought the action they had taken had been quite correct. No one could have any fault to find with most of the regulations which had been issued. Some had hampered them and restricted their business. Still, they had endeavoured as far as possible to consolidate the fields they had already entered, and he was glad to say they had with them that day Mr. Wadhwa, one of the partners of a firm in Sweden with whom they were in very close touch, and who was doing most excellent work in connection with them. Wherever possible, they were extending their business and doing the best they could. As to the future of the trade generally, he was afraid he could not make any particular remarks. The Government had done him the honour of nominating him as one of the members of the trade on the Committee dealing with the electrical business after the war, and in view of the fact that he was getting information from various sources on which the Committee would eventually have to make a report, it would not be right for him to say anything. He hoped next year they would meet under circumstances which would justify him in wishing the shareholders their share of prosperity in the future.

The gross receipts during 1915 were: Tramway undertaking, £9,604; electricity supply undertaking (including £2,500 for current sold to tramways), £20,199. The last-named figure represents an increase of 7 per cent. over the figures for the previous year, while the tramway revenue shows a reduction of

1½ per cent., due to decreased mileage. The net revenue of the combined undertakings was £10,300, as compared with £8,163 in 1914 and £6,252 in 1913, which is considered satisfactory in view of present conditions. After charging general expenditure in London and Delhi, the debenture and loan interest, the profit and loss account, including £73 brought forward, shows an available balance of £6,113. Of this, £2,218 is devoted to writing-off part of the preliminary expenses, £2,000 to depreciation reserve account, £1,000 to renewals reserve account, and £896 is to be carried forward. The cost of upkeep of cars and permanent way is still heavy, largely due to the increased cost of spares of all kinds. A larger battery has been installed in the power house, and the loss on realisation of the old battery (£750) has been charged to renewals reserve account. Owing to the increasing demand, further generating plant must be provided as soon as funds are available, and new tramway rolling stock is required. The cost of these and of new feeder cables will be met out of surplus revenue, as it will probably be impossible to place the contemplated issue of second debentures for some time.

Rangoon Electric Tramway & Supply Co., Ltd.—The report for 1915 states that the cars carried 10,815,613 passengers, a decrease of 323,335, the total receipts being Rs.8,60,664, a decrease of Rs.2,352, or 3.61 per cent. In the private lighting and power department the gross receipts for current amounted to Rs7,32,172, an increase of 13.77 per cent. The gross profits for the year were £63,347, and transfer fees and interest on deposits and investments in London yielded £1,307, making £84,654. From this has to be deducted, among other items, depreciation on sundry assets in Rangoon £1,847, transfer to reserve for renewals account £12,500, to special reserve for cables, &c., £2,500, leaving £20,927, plus £2,766 brought forward, making £23,693. The directors recommend a dividend on the ordinary shares of 3 per cent. for the year, tax free, leaving £2,783 to be carried forward.—*Financial Times*.

Russian Electrical Companies.—The Russian Wireless Telegraph & Telephone Co. (capital 3,000,000 roubles) made a net profit of 1,016,018 roubles in 1915 (against 1,304,983 roubles in 1914), and is paying a 15 per cent. dividend.

The United Cable Factories (capital 6,000,000 roubles) made a gross profit of 3,586,146 roubles in 1915 (against 3,872,151 roubles in 1914), and a 25 per cent. dividend is being paid.

Reduction of Capital.—Brouett, Lindley & Co., Ltd.—A petition for confirmation of the reduction of the capital of the company from £120,000 to £107,500 is to be heard on June 6th.

R. W. Blackwell & Co., Ltd.—The Courts have confirmed the reduction of capital from £250,000 to £50,000 by cancelling 200,000 shares held by Mr. Blackwell, the chairman and managing director.

Victoria Falls & Transvaal Power Co.—Ten months' dividend at the rate of 6 per cent. per annum, less tax, on the preference shares, bringing the dividend payments down to December, 1915.

Lima Light, Power & Tramways Co., Ltd.—The report of the Empresas Eléctricas Asociadas states that the total profits during 1915 were £183,715, less bond service £60,030, interest, discount and exchange £17,508, European expenses £1,858, provision for bad and doubtful debts £3,000, leaving a net profit of £101,318; balance brought forward, £250,077. There is put to reserve and redemption fund £29,000, to reserve for bad and doubtful debts £13,000, to amount written off value of shares owned by Empresas Eléctricas Asociadas in other companies £29,000, leaving £80,396 to carry forward.—*Financier*.

Stock Exchange Notice.—The Committee has been asked to allow the following to be quoted in the Official List:—

Consolidated Gas, Electric Light & Power Co., of Baltimore.—Further issue of \$3,329,300 common stock.

North Metropolitan Electric Power Supply Co.—The accounts of this company for the year ended December, 1915, appear in the *London Gazette* for May 30th.

Held Over.—Pressure upon our space compels us to hold over reports of several company meetings.

STOCKS AND SHARES.

TUESDAY EVENING.

The calling-up of the penultimate Derby Groups on Monday certainly had its effect upon Stock Exchange business; but, as a City factor, Sir Edward Grey's cold douche to the peace optimists has been the principal market consideration of the past week. The strength of the markets gave way appreciably

after the pronouncement of the Foreign Secretary; but, all the same, there is plenty of money about for investment, and the gilt-edged securities are once more beginning to move up.

This movement will be assisted by the Treasury's drastic steps for compelling holders of American dollar securities to sell their stocks, or to deposit them on loan with the Government. The prospect of paying 7s. in the £ income-tax has had the effect of dislodging already an unexpectedly large number of such securities; and as the Government's list of bonds and shares which it is prepared to purchase runs to nearly a thousand stocks and, even so, is not exhaustive, it is obvious that there will be a lot of money before long seeking investment in home securities.

The industrial sections of the Stock Exchange are certain to feel the benefit of this re-arrangement of capital, because, although the bulk of it will no doubt go into Exchequer Bonds and other war loans, some portion, at any rate, will percolate through to more commercial investments, if only from the fact that the latter give a higher yield and make a good mixture with the gilt-edged security offered by the Government at lower rates of interest.

Various electrical stocks and shares are included in the list published by the Treasury which the latter wishes to buy. For instance, the Consolidated Gas & Electric Co., of Baltimore, general mortgage $\frac{4}{5}$ per cent. of 1954 is fairly well known in our markets, though the Edison Electric Illumination bonds are nothing more than a name on this side of the pond. New York Telephone bonds have been in the list, of course, for some time past. Georgia Electric first mortgage fives are wanted, but we are rather surprised that Shawinigan Water & Power is not to be found in the published list. Nor are Calgary bonds included.

Holders of such securities, however, might well consult their brokers as to whether the bonds would be acceptable to the Government, under the scheme, because there is a charming uncertainty at present as to what dollar securities will have income-tax deducted from their dividends at the rate of 7s. in the £.

The London electric lighting companies have received quiet hints as to the advisability of seeing whether something further cannot be done in the way of linking-up the services, with a view to increased economies in labour and material. The idea seems to be that, in spite of the various arrangements between some of the companies, there is still a certain amount of overlapping and that much might be done by a comprehensive scheme for London as a whole.

The only change in the market for electricity supply shares is a rise of 5s. in Charing Cross ordinary, which has lifted the shares to 33. The yields to be obtained from this market are worth noticing in our tables. They compare well with many other industrial sections in the Stock Exchange, and, as we have said before, the likelihood of further reduction of dividends cannot be very great.

In one or two districts, the price for electric current has been raised in consequence of the Daylight Saving Bill; and users of electricity in other parts will feel something more than curious to see whether this innovation will spread.

The Telegraph market is good. Anglo-American preferred put on another point, and the rise in Eastern ordinary is not yet over. The rest of the stocks and shares in this department hold the rises that they have established during the past week or two. Nor are there many shares about, as buyers find when they endeavour to pick up cheap stock.

At the Eastern Telegraph's meeting, last week, the chairman stated that the gross revenue constituted a record. The company set aside £300,000 for income and excess profits taxes, and, even allowing for this, there was £114,000 more to divide than in 1914. An interesting sidelight upon the company's working was afforded by the chairman's reference to the facilities offered by the company for cheap, and occasionally gratuitous, cabling to soldiers and sailors and nurses.

The Indo-European Telegraph profit of £122,000 showed an improvement of £21,000, as compared with 1914. The board, however, hint that there may be some shrinkage in the revenue in respect of the current year, in consequence of the fact that some of the arrangements with other companies will run out or be modified this year. The through route of the company traverses Germany, so naturally the Indo-European has had to rely upon local traffic for its revenue, plus its share in the arrangements already referred to.

The railway market is a little easier, except as regards the prior charge stocks, for which there is an increasing demand. Underground income bonds lost $\frac{1}{2}$, and there are small falls in Metropolitan and in Districts. Keen interest is, of course, aroused by the publication of the electrification of about 50 miles of single track on the mineral line between Shildon and Newport. Three electric locomotives are now ready. The com-

pany has the advantage of operating in a district where cheap electric current is plentiful; and it is calculated that the scheme will be a most important factor in reducing costs. That it will be extended to other parts of the system, and also followed up by other Trunk lines will come about as a matter of course if it is anything like the success which it seems certain to be; and its operation will be watched with lively attention by the community at large.

Brazil Tractions have gone back a little, after their rise of 8 points in the previous week; but Mexican issues are slightly better as regards the first mortgage bonds. The Brisbane Electric Tramways Investment maintained its ordinary dividend of 8 per cent., although its receipts have fallen off pretty considerably. The special allocations this time last year, however, were on a sufficiently liberal scale to render their repetition this year unnecessary; and the carry-forward of £10,400 is £7,000 better than it was in 1915.

One of the features in the manufacturing group is a rise of 2s. in British Aluminium ordinary. The iron and steel group, too, is exceedingly firm. Babcock & Wilcox are better. Castner-Kellners, in the chemical list, are 1/16 harder. The rubber share market is quiet, because of a steady dwindling in the price of the raw material, which once more is sinking towards the half-crown per lb. level. At the latter figure, big profits will still be available to the good concerns; and if rubber were to drop to a florin per lb., dividends good enough to satisfy most people could be counted upon. More activity is noticeable in the armament group; and, as before, the industrial market of the Stock Exchange shows conspicuous activity.

THE SHILDON-NEWPORT RAILWAY ELECTRIFICATION.

(Concluded from page 607.)

The motor equipment of each locomotive consists of four totally-enclosed motors, each driving an axle through single reduction twin gearing. The gears are machine-cut with straight teeth of the involute pattern, the face dimensions of the spur wheels and pinion being nearly 4 in.

A pinion is mounted on each end of the armature shaft and meshes into a corresponding gear-wheel

an average pull of 28,000 lb. at the tread of the wheels when starting under normal conditions of rail. The maximum pull at the tread of the wheels is, of course, considerably greater than this.

The motors and gearing are designed so as to run at a speed of 45 miles per hour without exceeding the limits of safety, but the normal speed on the level when hauling a train of 1,400 British tons is

25 miles per hour. The equipment is so designed that each locomotive is capable of performing four round trips in 12 hours, each consisting of a trip from Shildon to Newport with a train of 1,400 tons, followed by a trip from Newport to Shildon with a train of 800 tons, the distance of each trip being about 18 miles. The locomotives are able to start a train of 800 tons from rest on a grade of 1 in 100, and accelerate to normal running speed.

A novel feature is the ring lubrication on the motor shaft. The gearing is enclosed in a welded sheet-iron case fitted with a siphon wick oil lubricator.

The air supply for ventilating the motors is supplied from fans

driven by the dynamotors; in order to avoid the use of a flexible pipe between the fan air duct in the base of the cab structure and the motors, a special form of spring sliding gland is employed. The normal quantity of air passed through each motor case is 700 cu. ft. per minute.

Two master controllers are fitted in the cab, fig.

FIG. 11.—ELECTRIC FREIGHT LOCOMOTIVE, N.E. RAILWAY.

mounted on the running wheel axle, the gear ratio being 1 to 4.5.

The motors are suspended by means of a cross beam suspension bar with bearings and reaction springs. These, with the motor suspension bearings on the axle, provide the motors with four points of suspension.

The four main motors are fitted two in each bogie,

FIG. 12.—VIEW IN THE LOCOMOTIVE CAB.

FIG. 13.—ROOF OF LOCO. CAB, SHOWING BOW COLLECTORS, &c.

and are each wound for 750 volts, the pair of motors in each bogie being connected permanently in series, and the two pairs or units being controlled on the usual series-parallel system.

Each motor is capable of developing 275 B.H.P. at a speed of 20 miles for one hour with forced ventilation. The motor equipment is capable without injury of exerting a torque sufficient to skid the wheels under any conditions of rail, and will exert

12, one at each end. Notching up can either be carried out by hand or automatically. The automatic arrangement consists of a spring which is wound up by the controller handle, the speed at which the controller drum follows the handle being governed by a step-by-step escapement movement.

The maximum current taken at each step is limited by a switch fitted in the sloping ends of the cab, which, on the current rising beyond a predetermined

point, closes the circuit of a small magnetic interlock, which locks the escapement mentioned, holding the drum of the controller until the current has fallen to the required value.

In addition to the above, by means of a catch inside the controller, which when lifted disconnects the spring and escapement action, the automatic arrangement described can be thrown out of action and notching performed by hand.

An acceleration switch is also provided so that, in special circumstances, the adjustment of the limit switch mentioned can be altered by short-circuiting some of the turns of an opposing coil, thus allowing of a larger current for accelerating under special conditions.

Each master controller is fitted with the usual reversing barrel, the handle of which can only be removed when in the "off" position; when left in this position, the reversing handle locks the main handle. There is also fitted

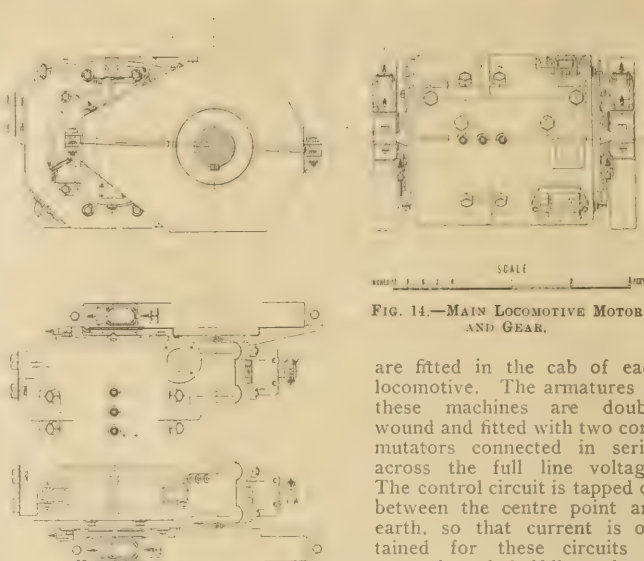

FIG. 14.—MAIN LOCOMOTIVE MOTOR AND GEAR.

are fitted in the cab of each locomotive. The armatures of these machines are double wound and fitted with two commutators connected in series across the full line voltage. The control circuit is tapped off between the centre point and earth, so that current is obtained for these circuits at approximately half-line voltage.

The actual voltage when supplying the control circuits and about 1 kW. for lighting is about 710 volts. The speed is 1,500 R.P.M.

The shaft of each dynamotor is extended and fitted with a fan for supplying ventilating air to the pair of main motors on one bogie. The rated continuous output with a 50 deg. C. temperature rise is 4.5 kW.

Each dynamotor is controlled by an ironclad circuit-breaker and a No-ark fuse. A starting resistance is in circuit with each machine, the resistance being automatically short-circuited by a relay a few seconds after the circuit-breaker is closed.

A motor-driven air compressor is fitted in the cab of each locomotive for supplying air for the Westinghouse brake equipment, air sanding, raising the bow collectors, and for air whistles. The machine is capable of dealing with 50 cu. ft. of free air per minute, and of raising this to 100 lb. per sq. in. pressure.

The machine is run at full line voltage and is

on the master controller a small spring switch by means of which the automatic circuit breaker on the locomotive can be tripped or set. This switch is also locked by the reversing handle in the "off" position.

Current for operating the whole of the control circuits and the lighting and heating in the cab is supplied from either of the dynamotors at a pressure equal to half the line voltage.

The contactors are electrically operated and are also fitted with auxiliary interlocking contacts to ensure their operating in the correct order. The resistances of the usual cast-iron grid type are fitted in the sloping ends.

The main automatic circuit-breaker on the roof of the cab is fitted with horned spark gaps which project through the roof. The circuit-breaker is operated either by means of the set-and-trip switch on the master controllers, as mentioned, or by means of a mechanical hand trip, but can only be closed by the set-and-trip switch; red and green lamps are provided to indicate whether the circuit-breaker is set or tripped, and an illuminated dial ammeter is provided at each end of the cab in front of the driver.

As mentioned above, two independent dynamotors

FIG. 16.—VIEW OF SHIELD ON SUB-STATION ROTARY CONVERTER.

coupled direct in the circuit of the collector bows on the line side of the main circuit-breaker, so that immediately on the bows being raised by the hand-

pump the compressor starts pumping the air in the reservoir up to full working pressure. It is controlled by a circuit-breaker similar to those controlling the dynamotor circuits, a starting resistance being provided and short-circuited by an automatic relay in the same manner, but in this case the relay is fitted with a time-limit arrangement to extend the starting time.

An automatic governor is provided for the com-

pressor, and is so arranged that the motor circuit is opened when the air pressure rises to 100 lb. per sq. in., and closes again when the pressure falls to 80 lb. per sq. in.

Two bow collectors, fig. 13, are provided on each locomotive. Each consists of a hinged pantograph built up of steel tubing supported off the cab structure by strong corrugated insulators. Each collector has two bows, each fitted with an aluminium rubbing strip; there are thus four rubbing strips per locomotive, which with the double contact wire makes eight points of contact. The bows are attached by leaf springs to provide for small irregularities in level independently of the movement of the pantograph.

A hand-pump is provided by means of which the bows are raised if no pressure is available in the reservoir.

The pantographs are held in position by air cylinders, so that in the event of a failure of the air pressure the bows are automatically lowered.

Tests have been carried out recently with one of the electric locomotives. Several journeys were made between Shildon and Newport, a train of 1,400 tons of laden wagons being taken down from Shildon to Newport, and a train of 800 tons, consisting of 92 empty wagons, hauled from Newport up to Shildon with stops on certain of the heaviest grades. The 800-ton train was stopped and started on a gradient of 1 in 103. The maximum drawbar pull during the tests reached 16 tons, the average speed on the run up from Newport to Shildon being 18.3 miles per hour, the maximum speed being 26 miles per hour. Up a grade of 1 in 230, which is $4\frac{1}{2}$ miles long, the 800-ton load of empty wagons was hauled at an average speed of 23 miles per hour. The locomotive also proved capable of hauling the 1,400-ton train on the level at 26 miles

FIG. 17.—INTERIOR OF ATCLIFFE SUB STATION.

per hour. The series arrangement enabled the machines to be designed with a reasonable commutator speed and a conservative voltage between commutator parts.

The machines, which are of the six-phase commutating pole type, operating on 40-cycle three-phase current, were designed to operate normally at 95 per cent. leading power factor, and to withstand overloads of 50 per cent. for two hours and 200 per cent. momentarily. As a precaution against flashover occasioned by short circuits on the system, the operating parts of the brushgear were entirely enclosed, and the commutator was screened from the armature and machine frame.

It will be noticed that, this being a high-tension sub-station, the machines are enclosed by expanded metal screens. The rotary converters were built by the British

Thomson-Houston Co., Ltd., who were the main contractors for the sub-station plant, including the transformers and switchgear; part of the work was sub-contracted, the transformers being of the British Westinghouse Co.'s make. The rotaries are of the self-synchronising type, and are started by oil-immersed drum-type starting switches.

The Erimus sub-station is generally similar, and two rotary sets are also fitted, but in this case one

FIG. 18.—1,500-VOLT DIRECT-CURRENT SWITCHGEAR, ATCLIFFE.

is of 1,200-KW. capacity. Two auxiliary transformers are installed in each sub-station, connected directly across the high-tension terminals of the main transformers.

A feature of interest is that they are fitted with a double secondary winding, one section being used exclusively for metering, and the other for supplying lighting and auxiliary power in the station for portable air compressors, &c. The sub-stations are supplied from the interconnected mains systems of

the North-East Coast Power Companies, through the Cleveland and Durham Electric Power Co.

The Aycliffe sub-station is supplied at a pressure of 20,000 volts between phases through two overhead three-phase 40-cycle lines; the 20,000-volt switchgear is of the Reyrolle ironclad wall-operated type.

The Erimus sub-station is supplied at a pressure of 11,000 volts between phases through underground three-phase 40-cycle cables, the alternating-current switchgear being of the same type as that at Aycliffe. The direct-current switchgear at both sub-stations is of the brick-cell type, being designed somewhat on the lines usually adopted for high-pressure A.C. boards, and of the remote-controlled cubicle type. Special compartments are provided for the bus-bars and isolating switches; circuit breakers; and operating mechanism for those switches, &c.

FIG. 19.—PLAN AND ELEVATION OF THE AYOCLIFF SUB-STATION.

The bus-bar isolating switches are of the H.T. rotary type; the machine circuit breakers are fitted with a differential relay which, in the event of the rotary coming up of the wrong polarity, renders it impossible to close the circuit-breaker on the bus-bars.

In connection with the 800-kw. rotary sets, field splitting switches are provided of the remote-controlled type, operated from the switch gallery. The sub-station lighting is on a 110-volt circuit, the lighting boards being of standard type.

Each sub-station is connected to the overhead contact wires by four paper-insulated bitumen-sheathed single-wire armoured cables (.5 sq. in. section) laid in wood troughing run in with bitumen.

There are two negative cables of similar type and size at each sub-station connecting the track rails to the negative bus-bar. The overhead transmission lines and cables supplying the sub-stations were supplied by the British Insulated & Helsby Cables, Ltd.

A hand-operated travelling crane, by Herbert Morris, Ltd., is fitted in each sub-station.

In conclusion, we are indebted to the courtesy of Messrs. Merz & McLellan, the consulting electrical engineers for the work, for the foregoing particulars and illustrations. The line is the first in this country specifically designed for heavy freight haulage by electrical means, and the North-Eastern Railway Co. is to be congratulated on its enterprise in regard to what is undoubtedly a coming development in connection with railway working in this country.

THE NATURE OF ELECTRICAL INSULATION.

At the annual meeting of the NEWCASTLE-ON-TYNE LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS, on April 10th, Dr. W. M. THORNTON gave an address on "The Nature of Electrical Insulation." He said that electrical engineers were chiefly interested with the direct results of tests on specific insulating materials. When collections of these were made and compared, there were found to be certain general relations which showed clearly the nature of the electric polarisation and of the effects which accompanied its change.

The ease of transmission of electric waves through an insulating medium with which they were most familiar was the passage of light through window glass. According to Maxwell's electromagnetic theory of light, the specific inductive capacity, or dielectric coefficient, K , of an insulating medium should be equal to the square of its refractive index n . This held for many substances, such as the following:—

Substance.	K	n^2
Air	1.000590	1.000588
Petroleum spirit	1.92	1.92
Petroleum oil	2.07	2.07
Carbon disulphide	2.67	2.69
Paraffin wax	2.32	2.28

But for many it did not, of which the following were examples:—

Substance.	K	n^2
Dense flint glass	10.1	2.92
Quartz	4.60	2.39
Alcohol	25.0	1.85
Distilled water	76.0	1.78

That discrepancy had been completely explained on the electron theory of matter. The electrons which were contained in a dielectric molecule could not be torn from it, but could be displaced within it. These loaded the ether and retarded the passage of an electric wave, such as light, through the medium. It could be shown that the differences between K and n^2 were "due to the presence in the medium of electrons having free periods of oscillation coinciding with the frequency of light in the ultra-red part of the spectrum." They were justified in saying that the behaviour of a good electrical insulator, such as quartz, was that of a perfect insulating medium loaded with electrons anchored elastically in each molecule of the substance, whose movement to and fro, as the electric field reversed, gave rise to the value of the dielectric constant observed in low-frequency fields.

In addition to the displacement just considered, there was at frequencies lower than those of light, a secondary effect of great practical importance. The range of movement of the electrons under the influence of light waves was exceedingly small, but when, as in practical working, the frequency was low, the amplitude of movement was relatively so great within the molecule that the electrons in any one molecule were strongly influenced by electrons in neighbouring molecules. Even at the frequency of light there was interattraction, the force of which was nearly one-third of that caused by the applied field. The displacement in low-frequency fields was no longer a simple elastic effect. It had two clear stages, the instantaneous polarisation just considered, which occurred at the velocity of light, and a secondary interattraction, started by the first polarisation, elastic in the sense that when the field was released the electrons returned to their original position. That was familiar in the residual charge of a condenser left standing after being charged and discharged. The first spark at discharge was the release of the first stage, the residual spark arose from the interattraction between opposite electrons lying down. The dependence of the residual charge on the original polarisation was made clearer by the fact discovered by Hopkinson, that the total residual charge was proportional to the original charging voltage. It might be remarked that since a cable was at a constant voltage, the quantity obtained from the insulation by discharging it on short circuit was twice the quantity which it received at charge. One result of this interattraction was loss of energy by hysteresis. In engineering, the movement of the electrons was forced, for even where there was resonance in a cable system the free period was much below that of the electrons.

Referring to polarisation in steady fields, the speaker said that when a steady field was applied to a dielectric, inter-attraction had full scope. In moderate fields it proceeded to a limit independent of the intensity of the field, and might take days to complete. The polarisation was then in most materials many times greater than for rapid reversals, so that the dielectric coefficient corresponding to the slowest possible polarisation was much higher than even for one minute's electrification. On switching-off and insulating a cable which had been under continuous voltage for a few days, the inter-attraction slowly relaxed, and the total quantity released, which corresponded to the above high dielectric coefficient, might be sufficient to raise the insulated conductor to a dangerous potential. Rubber cables might have from four to five times their original charging voltage. Quartz and glass reached over 100 times their starting values. The danger in the case of a cable left standing was that the charge which had soaked out was not bound, but free, so that the shock from it would be much greater than from a charge-discharge spark. It was common knowledge that the best way to release the residual charge was to short-circuit the conductors for several days after use.

The interattraction between the polarised atoms or molecules in a dielectric had great influence on its electric strength. It could be shown, in fact, to take complete charge of the material after a certain voltage had been reached, and to determine the electric strength. The action was found in solids, liquids, and gases. When there was absorption caused by interattraction, the polarisation increased to a value independent of the strength of the applied field, and depending only on the structure of the atoms or molecules. Referring to experiments on the influence of time of application on breakdown voltage, the speaker said that the fact that it had a finite value when v (voltage) and t (thickness) were exceedingly small, showed that the thinnest possible substances required a definite time to break down. This, when worked out, showed that there was a thickness which could not be broken down, for it would take an infinite time to establish the state of failure. The speaker referred in some detail to the breakdown voltage of liquids and solids, and added that it could be stated as a general law for solids, liquids, or gases, that their failure under electric stress had two stages. In the first stage the work done on the material up to the point of failure was independent of the thickness of the specimen or length of spark gap. In the second stage, interattraction was in one sense more important than the applied field. Beyond the point of transition, the work of breakdown was not independent of thickness, but was a linear function of the voltage. Summarising the work on polarisation and on breakdown strength, Dr. Thornton said that most of the phenomena of dielectrics were brought into line by considering the inter-attraction of electrons in adjoining molecules to play the chief part in polarisation.

TRADE STATISTICS OF SWITZERLAND.

IMPORTS.

The following figures of the imports of electrical and similar goods into Switzerland in the year 1914 are taken from the recently-issued trade statistics; the figures for 1913 are added for purposes of comparison, and notes of increases or decreases are given. The poor participation of Great Britain is apparent:—

	1913. Francs.	1914. Francs.	Inc. or dec. Francs.
<i>Electric cable not insulated.</i> —			
From Germany ...	42,000	19,000	— 23,000
„ France ...	17,000	1,000	— 16,000
„ Other countries ...	1,000	200	— 800
Total ...	60,000	20,200	— 39,800
<i>Electric cable insulated with rubber or paper.</i> —			
From Germany ...	139,000	90,000	— 49,000
„ Great Britain ...	3,000	—	— 3,000
„ Other countries ...	16,000*	23,000†	+ 7,000
Total ...	158,000	113,000	— 45,000

*Includes Belgium 5,000 fcs.

†Includes France 20,000 fcs.

<i>Cable ditto covered with lead.</i> —			
From Germany ...	4,000	3,000	— 1,000
<i>Cable insulated with rubber or paper and covered with textiles.</i> —			
From Germany ...	194,000	171,000	— 23,000
„ Other countries ...	15,000*	30,000†	+ 15,000
Total ...	209,000	201,000	— 8,000

*Includes Italy 9,000 fcs.

†Includes Great Britain 16,000 fcs.; Italy 6,000 fcs.

	1913. Francs.	1914. Francs.	Inc. or dec. Francs.
<i>Cable ditto covered with lead.</i> —			
From Germany ...	14,000	12,000	— 2,000
„ Austria ...	188,000	187,000	— 1,000
„ Other countries ...	15,000	1,000	— 14,000
Total ...	217,000	200,000	— 17,000
<i>Cable ditto covered with lead and iron-armoured.</i> —			
From Germany ...	25,000	165,000	+ 140,000
„ Great Britain ...	25,000	1,000	— 24,000
Total ...	50,000	166,000	+ 116,000
<i>Dynamo-electric machines and electric transformers.</i> —			
From Germany ...	1,341,000	1,224,000	— 117,000
„ France ...	81,000	90,000	+ 9,000
„ Italy ...	89,000	34,000	— 55,000
„ Great Britain ...	15,000	8,000	— 7,000
„ Other countries ...	17,000	19,000	+ 2,000
Total ...	1,543,000	1,375,000	— 168,000
<i>Accumulators, batteries, electrodes.</i> —			
From Germany ...	342,000	222,000	— 120,000
„ Austria ...	45,000	70,000	+ 25,000
„ France ...	33,000	31,000	— 2,000
„ Other countries ...	9,000	8,000	— 1,000
Total ...	429,000	331,000	— 98,000
<i>Insulators, mounted.</i> —			
From Germany ...	149,000	78,000	— 71,000
„ France ...	2,000	2,000	—
„ Other countries ...	1,000	2,000	+ 1,000
Total ...	152,000	82,000	— 70,000
<i>Electric meters.</i> —			
From Germany ...	963,000	697,000	— 266,000
„ France ...	78,000	85,000	+ 7,000
„ Italy ...	12,000	10,000	— 2,000
„ Great Britain ...	7,000	3,000	— 4,000
„ United States ...	6,000	—	— 6,000
„ Other countries ...	5,000	7,000	+ 2,000
Total ...	1,071,000	802,000	— 269,000
<i>Telegraph and telephone apparatus.</i> —			
From Germany ...	515,000	474,000	— 41,000
„ Belgium ...	224,000	277,000	+ 53,000
„ Great Britain ...	24,000	318,000	+ 294,000
„ Sweden ...	55,000	90,000	+ 35,000
„ Other countries ...	54,000	53,000	— 1,000
Total ...	872,000	1,212,000	+ 340,000

NOTE.—25 francs = £1.

EXPORTS.

The following figures show the exports of electrical and similar machinery from Switzerland in 1913 compared with 1914. The diversity of Switzerland's growing export trade is noteworthy:—

Dynamo-electric machines and electric transformers of all kinds.—

	1913. Francs.	1914. Francs.	Inc. or dec. Francs.
To Germany ...	3,471,000	2,257,000	— 1,214,000
„ Austria ...	1,125,000	525,000	— 600,000
„ France ...	4,174,000	3,002,000	— 1,172,000
„ Italy ...	934,000	1,158,000	+ 224,000
„ Belgium ...	882,000	401,000	— 481,000
„ Great Britain ...	1,234,000	2,014,000	+ 780,000
„ Russia ...	3,278,000	2,019,000	— 1,259,000
„ Spain ...	2,080,000	738,000	— 1,342,000
„ British India ...	182,000	30,000	— 152,000
„ Mexico ...	79,000	65,000	— 14,000
„ Brazil ...	1,255,000	308,000	— 947,000
„ Argentina ...	231,000	950,000	+ 719,000
„ Other countries ...	1,428,000	2,111,000	+ 683,000
Total ...	20,353,000	15,578,000	— 4,775,000

Steam engines, cranes, pumps, turbines, &c.—

	1913. Francs.	1914. Francs.	Inc. or dec. Francs.
To Germany ...	2,206,000	941,000	— 1,265,000
„ France ...	888,000	673,000	— 215,000
„ Belgium ...	1,152,000	575,000	— 577,000
„ Russia ...	3,244,000	1,104,000	— 2,140,000
„ British India ...	84,000	49,000	— 35,000
„ Japan ...	590,000	97,000	— 493,000
„ Great Britain ...	651,000	577,000	— 74,000
„ Other countries ...	1,679,000	1,884,000	+ 205,000
Total ...	10,494,000	5,900,000	— 4,594,000

<i>Electric meters.</i> —	1913. Francs.	1914. Francs.	Inc. or dec. Francs.
To Germany	629,000	437,000	— 192,000
„ Austria-Hungary	184,000	197,000	+ 13,000
„ France	635,000	371,000	— 264,000
„ Italy	355,000	276,000	— 79,000
„ Great Britain	181,000	332,000	+ 151,000
„ Other countries	323,000	424,000*	+ 101,000
Total	2,307,000	2,037,000	— 270,000

* Includes Russia 137,000 fcs.

<i>Steam, benzine, and electric locomotives.</i> —	1913. Francs.	1914. Francs.	Inc. or dec. Francs.
To France	405,000	1,013,000	+ 608,000
„ Algeria and Tunis	350,000	436,000	+ 86,000
„ Dutch E. Indies	41,000	247,000	+ 206,000
„ Other countries	637,000†	273,000	— 364,000
Total	1,433,000	1,969,000	+ 536,000

* Electric locos in 1914, 146,000 fcs.; in 1913, none specified.

† Includes Turkey in Asia 158,000 fcs.

<i>Electric cable, not insulated.</i> —	1913. Francs.	1914. Francs.	Inc. or dec. Francs.
To Germany	3,000	6,000	+ 3,000
„ France	5,000	5,000	—
„ Other countries	1,000	4,000	+ 3,000

Breakdown of Governors in Hydro-Electric Station.

The importance of testing at frequent intervals the correct working of governor gear on alternators operating in parallel is emphasised by the report (in *E.T.Z.*) of wholesale destruction in a generating station due to neglect of this simple precaution. The plant concerned was comparatively small, and consisted of three 310 K.V.A., 6,700-volt, 60-cycle alternators, driven by Girard turbines through elastic couplings. At the time of the mishap the machine carried three-quarter load, and the speed of water-flow in the 100-yard pipe line was only about 3 ft. per second, so that the plant was in no sense overloaded. The supply system included a 1,000-K.V.A. transformer, a 16-mile 20,000-volt transmission line, and 13 sub-stations, supplied from a distributing centre at 2,600 volts. A very heavy short-circuit on one of the sub-stations was brought out the instantaneous circuit-breaker in the main distributing station, and the governors on the generating sets began to operate at once. Now the governors were operated by oil at 110 lb. per sq. in., supplied by an oil pump common to all three machines, and though the governors acted satisfactorily till the generators were nearly unloaded, they then failed—partly owing to the oil pressure not being sustained, but chiefly owing to the leather cups on the control pistons being hardened and seizing. As a consequence, the generator at the end of the oil pump line fell out of step with the others, double-frequency currents and pressure-surges were developed, and very extensive damage was done to generators and connected circuits before the time-relay breakers operated. It is unnecessary to detail the damage done, which consisted of numerous breakdowns and burn-outs. The important point is that the leathers of oil-governor gear should be inspected and cleaned several times a year: the bronze or cast-iron pistons themselves should be kept free from a hard crust which is apt to form on them; only oil of the same kind and quality should be added to that already in the governing system; and the correct working of the governors over the whole of their travel should be tested frequently, whilst the generators are in service.

1916 EDITION

READY.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

THE announcement made in our last issue, too late for editorial comment, that the engineers of Lancashire and Cheshire were actively developing a scheme for the purpose of interconnecting the principal supply stations of those counties, formed a most appropriate and well-timed supplement to the circular issued by the Board of Trade in the previous week. It showed that those engineers were fully alive to the possibilities and importance of the proposal, which indeed was not entirely new, but was brought within the scope of practical politics by the war, and they had anticipated the action of the Board of Trade by several weeks; already they had divided up the area into districts and appointed sub-Committees to investigate the conditions obtaining in each district, and no doubt we shall shortly be in a position to report further progress. The immediate credit for the local movement is due to Mr. J. A. Robertson, of Salford, who, in opening the discussion on Mr. E. T. Williams's paper, outlined the policy which is now being pursued; but the greater includes the less, and it must be acknowledged that the idea of interconnecting existing stations formed one of the fundamental and essential features of the more elaborate scheme described by Mr. Williams, to whom, therefore, the thanks of the industry are especially due. It is obvious that if each of the districts in which the conditions favour interconnection independently proceeds to carry out the policy, we shall eventually have a small number of organised areas in which the principle of mutual assistance and support is recognised and adopted, and then there should be far less difficulty in advancing further towards the national organisation so powerfully advocated by Mr. Williams—in fact, it amounts to commencing at the bottom and working upwards, instead of the reverse; and that is the best way to erect a substantial and enduring edifice.

A suggestion has been put forward by Mr. Williams that the Council of the Institution of Electrical Engineers, in view of the trend of opinion disclosed by the discussions, should take energetic action towards the development of the scheme, and we cordially endorse this view. Whether the matter be held by some to be of a "political" nature, or by others to involve "grave difficulties," we care not a jot; we are at war. This is no time for mincing words or splitting hairs; there is general agreement amongst the members of the Institution that the co-ordination of our electricity supply undertakings ought to be carried out: the Board of Trade is anxious to see it done; the engineers themselves—at any rate, in one area—are pushing on with it; and the Council, which is armed under the Memorandum of Association with the widest possible powers to take any lawful action in respect of legislative or industrial matters which may conduce to the advancement of the applications of electrical science, in 1914 pledged itself to take such action. Here is an excellent opportunity for the Institution to take the lead, which, at the outbreak of the war, was passing to other hands. There may never be such another opportunity for it to regain the prestige which it has lost, and to demonstrate its ability and determination to act with promptitude and energy.

We do not suggest that the Lancashire and Cheshire movement is in need of assistance; we are thinking rather of the districts in which no action has yet been taken, but which offer similar possibilities, and only await the initiative. The Council might well communicate with the Board of Trade, and undertake to organise conferences in those areas, with a view to carrying out the Board's proposal.

Support Home Industries.

Most of us are agreed that in the future we should give British engineering manufactures a very decided preference when the expenditure of British public money is involved. Whatever the national policy may be, the municipalities will have to be prepared to reckon with the anti-enemy feeling of the community for a time. But what about that vast number of semi-public undertakings owned by companies and by private parties whose transactions need never be divulged to the public gaze? Can these—railways, collieries, mills, factories, &c.—be relied upon to patriotically support home industries if the Teuton, with his wily way, extends the tempting bait? If we were to judge from what occurred in pre-war days we might despair of reformation in connection with the policy of some of these concerns. Consider the case of British collieries—what a tale could be unfolded regarding the installation of German plant! What chances the British electrical manufacturer has been deprived of by the readiness of owner and adviser to buy elsewhere! But *autres temps, autres mœurs*, and we will indulge the hope that directors and shareholders, owners and advisers, will see that, as we have pointed out in another case, German cheapness may be purchased at too high a price. Pending the declaration of anything definite in regard to a national policy in this connection, we must have faith in the loyalty and determination, and the educational influence, that individual engineers and organisations can exercise. But among the signs of the times which are very welcome is the example of the Oxcroft Colliery Co., Ltd., which is giving out its contracts upon the distinct understanding that the company, firm, or individual to whom they are sent is not in any way under the influence or control directly or indirectly of any German, whether naturalised or otherwise, and that none of the payments or profits arising from the execution of the contracts will pass into the hands of Germans as shareholders, partners, or otherwise. In all probability as time passes we shall hear of all kinds of efforts which private concerns are prepared to make in order to secure the benefit of their contracts to British firms and British investors. The Oxcroft decision will be difficult to apply, for it will not permit even a small proportion of the capital to be held by any naturalised or unnaturalised German, nor may the business be even indirectly influenced or controlled by anybody of German taint. The Oxcroft spirit is willing and most commendable, but perhaps it will be found that the flesh is weak. Such a sweeping decision must, however, make the blood of the purely British electrical and engineering firms flow fast in their veins!

Lead. THE chief feature in the market for pig lead in recent weeks has been the fact that the authorities came to the rescue of consumers by placing at their disposal in the open market large quantities of metal that was held under their control out of the supplies that came from Australia and Spain. Consumers who had run rather short of stock thus availed themselves pretty freely of this opportunity of replenishing in a constantly falling market, under well sustained offerings from that quarter. Some thousands of tons were thus taken care of for prompt delivery. Prices fell to about £31 7s. 6d. a ton, but there has been since some recovery with a very irregular tendency, while offers of Government lead have come to a standstill.

The action of the Government came rather as a surprise to consumers and dealers, who undoubtedly under-rated the importance of this factor. Apparently the authorities were not immediately in need of the metal disposed of, but the fact remains that considerable quantities continue to be absorbed for war munitions, so that it is rather doubtful

whether experience will repeat itself in that respect. However, it is generally assumed that developments are for the time being in no small degree subject to the policy pursued by the authorities, who, moreover, seem resolute in keeping down prices. Indications are now towards a further recovery, although no important developments are looked for, this view being based on the assumption that consumers have been recently pretty well filled up, while export trading has remained almost a negligible quantity as licences are difficult to obtain. The withholding of permits for months past is largely accounted for by the fact that allied countries have been enabled in the last few months to fill their requirements direct from producing centres, such as Spain and Australia. The importance of the London market, therefore, as an international centre is nothing like what it used to be.

The receipts from Spain have this year fallen off, and they are likely to continue comparatively light. During the first quarter of this year, France imported no less than 21,500 tons, or about 14,000 tons more than in the previous year, the great bulk of which came from Spain. It is difficult to form any idea of the true merits of the position, while there are no reliable particulars having regard to the progress of production, yet it is probable that in view of the abnormally high prices, operations in most mining districts, except Spain and Mexico, have been well maintained. The price is now in the neighbourhood of £32 for near delivery, with forward metal at a discount of about 12s. 6d. a ton. Whereas the two extreme points recorded in the past year were £18 6s. 3d. and £30 5s., the price this year rose as high as £36 10s., in spite of the new regulation. There is certainly plenty of lead to go round without resort to importations from America, where prices still stand at a very high level.

The Wire-Drawing Industries.

As the war continues the position in the wire-drawing industries, particularly in the copper section, in common with most other controlled trades, appears to be experiencing increasing difficulties as regards supplies of raw materials. While wire manufacturers do not by any means expect their trade to be immune from the difficulties under which other industries are labouring at the present time, there appears to be some just cause for complaint at the somewhat loose manner in which the Government is handling the freight problem in regard to the supplies of raw metals, particularly copper.

Whereas, on the one hand, the demands from the Government upon wire manufacturers for goods are practically unlimited, and tend to increase as time goes on, the supplies of raw material, the delivery of which now depends entirely upon the authorisation and good organisation of the Government, become more lean and precarious every day. The department under the nominal control of the Ministry of Munitions, which was instituted for the purpose, among others, of ensuring manufacturers a necessary supply of copper, &c., when the freight difficulties otherwise threatened a stoppage of supplies from the normal source, has hardly come up to expectations, and, in most cases, where manufacturers have appealed to this department, they have obtained no satisfaction or sympathy.

The Government officials, apparently, do not sufficiently realise the gravity of the situation, which threatens a serious curtailment of output by wire manufacturers in the near future unless a more sympathetic attitude is manifested towards the vital needs of these trades. It is not improbable that the Minister of Munitions, personally, has not been made sufficiently to realise the gravity of the situation; in which event, an explanation from the High-Conductive Copper Association would, perhaps, prove of considerable weight towards instituting an improvement in the situation.

ELECTRIC VEHICLE PROGRESS.

This year's annual meeting of the (American) Electric Vehicle Section of the National Electric Light Association—our old friend the Electric Vehicle Association of America under a new guise—was held in Chicago during the fourth week in May, and judging by the shoal of papers and reports, for which we are indebted to the Association and to Mr. Jackson Marshall, secretary of the Section in question, it appears to have been as prolific as usual in these matters.

As mentioned previously in our pages, the Electric Vehicle Association recently affiliated with the N.E.L.A., and its annual proceedings now constitute a Section of the annual convention of the larger Association, which incidentally has increased its membership by 948 new members through the amalgamation.

Some of the Committee reports of the Section are of considerable interest to engineers on this side; one of them dealing with federal and municipal transportation, which recalls Mr. Ayton's paper before our own Electric Vehicle Committee last year, contains a comprehensive survey of this particular class of transport service, referring particularly to fire, ambulance, street cleaning and postal uses. As regards the last-named branch of vehicle work we cannot claim much progress in this country, but in municipal circles there appears to be evidence of a growing interest in the "electric," which promises well for the future. We notice in the report a view of the G.V. electric street-watering vehicle in use at Blackpool (which, by the way, our American friends refer to as "a suburb of London"!); 60 of these vehicles are stated to be in use in American and European cities. Judging by the somewhat dangerous economies in scavenging and street watering which many of our municipal authorities are stated to be practising at the present time, owing to shortage of horses and men, an opportunity has undoubtedly arisen for introducing modern labour-saving street appliances, amongst which the battery-driven vehicle, in view of the conditions, should take a leading position.

A brief reference occurs to battery-driven road-rollers. Somewhat similar motor-operated rollers are stated to have been used with great success in the Middle West, served with energy from central station lines by means of flexible cable.

On the subject of postal vehicles, it appears that the "electric" has been specified by the Chicago authorities, while both the Boston and New York Postal Departments have fleets of 2-ton and other vehicles in service; the battery exchange system is in use in both cities, and some of the New York trucks are kept in service practically day and night, only returning to the service station for two 15-min. periods each 24 hours to change the batteries and drivers.

Another report dealing with insurance shows that an effort is being made to obtain regular preferential treatment for electric vehicles, and that special reduced rates are being accorded by various companies. The difficulty appears to be that the vehicle user does not make a point of dealing with the companies offering preferential rates.

A joint report of Committees dealing with operating records, garages, and rates presents some graphic illustrations of data already established regarding the cost of operating electric vehicles, energy consumed for charging purposes, and garage space required for various sizes of vehicles, together with a chart showing an analysis of the cost of garaging commercial electric vehicles.

The cost data summarised in Curve No. 1 (page 641) are derived from the *Electrical World* investigation of groups of installations, published in May last.

Curve No. 2 (page 641) is based on the experience of a number of electric vehicle operators, and will, it is hoped, serve as a means of definitely establishing the question of rate-making for normal energy supply.

The detailed analysis of garaging costs will, no doubt, be useful for reference in this country, although the actual figures have only a comparative value. The total costs for garaging electric vehicles per month are given as follows:—Capacity, 700 lb., \$37.8; 1,000 lb., \$42.3; 2,000 lb., \$47.9; 4,000 lb., \$60.1; 7,000 lb., \$70.9; 10,000 lb., \$81.1.

One paper, on central-station promotion of electrical vehicle use, seems to indicate that station engineers have adopted a non-committal attitude on the question up to now, and, further, points out the serious competition of the petrol passenger and freight vehicles, the latter, in particular, having to be faced as soon as the abnormal export business falls away. The author, Mr. W. P. Kennedy, however, believes that the electric vehicle would unquestionably obtain the preference if a flat price per annum were offered for garage service covering upkeep and maintenance in constant working condition.

A paper on greater garage service, by Mr. Salvat, deals, in breezy language, more especially with the grievances of the Chicago garages and the misleads of the electric-vehicle manufacturers, who, according to this writer, are playing into the hands of the gasoline car makers. This paper gives one a glimpse of the "human nature" side of business, and is well worth reading on that account alone.

A paper on battery service, by Mr. Wagoner, refers to the Hartford Electric Light Co.'s battery service system, some particulars of which have already appeared in our pages; it appears that the General Vehicle Co. co-operated in establishing the system—in which an essential feature is the purchase of electric power by "the mile run"—and has since established similar service in Spokane, Boston, Baltimore, Harrisburg, San Francisco, Los Angeles, Worcester, Fall River, and Wichita, while many other cities are prospective users.

A paper on the electric passenger vehicle problem, by Mr. Chalfont, is a plea for a more rational understanding of the present scope of this type of car. The author points that the electric passenger car is capable of performing fully 95 per cent. of the demands made upon the gasoline car, "but that little 5 per cent. stands up in the sky like a steeple on a church," and is responsible for the sale of a million gasoline cars a year. The writer proceeds to show that this small percentage represents problematical advantages, and to demonstrate how users can be educated as to the true state of affairs.

Other papers deal with the industrial truck and its troubles, and the relation of tires to efficiency, and all of them contain something of interest to electric-vehicle men.

TILLING-STEVENS PETROL-ELECTRIC FIRE ESCAPE.

Through the courtesy of Messrs. Tilling-Stevens, Ltd., of Maidstone, we are able to illustrate one of the petrol-electric fire-escape ladders which they have supplied to the London Fire Brigade.

The Tilling-Stevens petrol-electric drive has been referred to on several occasions in our pages, but we may point out that this equipment consists of a 40-h.p. four-cylinder engine, direct-coupled, through a flexible coupling, to a generator which energises a series-wound motor, the latter driving the back axle through a propeller shaft and worm gearing. The generator, by means of simple switchgear, is used to supply the power requirements of the ladder for elevating and training it, when not required for propulsion.

The generator is capable of an output of up to 30 kW., at speeds varying from 350 to 1,400 R.P.M., and pressures varying from 0 to 300 volts; the machine has a falling characteristic, so that any increase in the current taken by the motor is accompanied by a corresponding reduction in voltage. Thus on the level the demand for current is small, and the voltage high and favourable to high vehicle speed, while on an up-grade, opposite conditions prevail—the motor speed decreases, but the torque increases.

The diagram on page 641 shows the whole of the electrical connections and controlling devices.

Reversibility is obtained by change in the direction of the current in the motor field through the controller-switch. The speed of the vehicle is controlled by means of the throttle-pedal in conjunction with the generator and motor field resistance.

The output of the generator can be reduced practically to zero by lowering the engine speed on the throttle and inserting resistance in the field by means of a resistance lever.

TILLING-STEVENS PETROL-ELECTRIC FIRE ESCAPE; LADDER EXTENDED.

Forward movement of the lever causes the contact drum to cut out resistance until the full field is obtained, and further movement puts in circuit a graduated resistance which shunts the motor field. A two-way shunt switch enables the field winding to be connected directly across the dynamo armature when it is required to supply current for the ladder: when current is required for propelling the vehicle, the shunt circuit is completed through the controller and motor field to the other side of the generator, and in this position when the controller is in the neutral position, the shunt circuit is broken. This prevents the motor from being started up suddenly.

When it is desired to operate the ladder, the controller is placed in the neutral position, the shunt changed over to the ladder position and the S.P. main switch closed. This energises an electrical solenoid governor which regulates pressure to the desired voltage independently of the load. The D.P. switch for the ladder motor circuit can then be closed and the ladder raised, elevated and trained by means of the motors and regulators contained in the base of the ladder turn-table.

It may be of interest to record that the Tilling-Stevens petrol-electric vehicles have found extensive use with the naval

and military services for running searchlight projectors, operating travelling workshops and for signalling purposes. They have also been employed privately for operating arc-welding plants; supplying temporary lighting and in connection with cinematograph apparatus. In view of the above list of uses, it is almost unnecessary to add that a self-contained travelling petrol-electric combination of the type mentioned is invaluable for many industrial applications, when its utility as a goods carrier and for haulage is also taken into account.

In conclusion, we may add that Messrs. Tilling-Stevens are also builders of an "all-electric" chassis, of the industrial type, suited for loads of 3 to 4 tons, and to run 30 or 40 miles on one charge, at a speed of 10 to 12 miles an hour.

ARMSTRONG-WHITWORTH ROAD TRAIN FITTED WITH THOMAS TRANSMISSION.

It may be remembered that a few years ago a road train was designed by a French engineer, Colonel Renard, and a number of road trains were constructed in this country under his patents. A mechanical power shaft ran throughout the length of the Renard train, and provision had to be made for overcoming the unevenness of the drive, due to the varying angles at which the vehicles might be placed in relation to one another when moving on uneven surfaces, and turning corners. This necessitated the use of spring drives, universal joints, and numerous bearings, all of which made the system complicated, costly, inefficient and unreliable.

A few years ago a German firm, Messrs. W. A. Th. Müller, placed on the market a train which might be termed an "all electrical train." In the Müller train the leading vehicle carried a powerful internal combustion-engine and

generator, from which current was transmitted to motors driving all the wheels of the train. Such a train, consisting of 11 vehicles in all, capable of carrying as much as 50 tons with axle weight not exceeding 5 tons, was shipped to Australia three years ago.

The views we give relate to a train which is entirely the product of British brains and work. It was recently built by Messrs. Sir W. G. Armstrong, Whit-

PETROL-ELECTRIC FIRE ESCAPE, SHOWING LADDER TURNTABLE.

TILLING-STEVENS PETROL-ELECTRIC FIRE ESCAPE.

worth & Co., Ltd., who, to avoid the disadvantages of the "all mechanical" and "all electrical" systems adopted the

with only a portion of the power for a relatively small portion of the whole running time, it is comparatively light and cheap.

We have before us particulars of a non-stop 210-mile test with a gross load of 30 tons, in which the train illustrated put up a record of 77-ton miles per gallon of petrol, and this in spite of wet roads and 10 hours' night travelling during the test.

The train is now carrying loads of 25 to 30 tons of the kind illustrated, the material carried being used in the construction of a large factory in the North.

It can be operated conveniently by two men, and in an emergency one man is sufficient. All the wheels are steered, and the facility with which the train can be backed out of awkward places or round corners is remarkable, the wheels following in the same track in either direction of travel.

All the wheels of the leading vehicle are braked by direct mechanical means in the ordinary way, whereas the brakes on the

ELECTRICAL CONNECTIONS, TILLING-STEVENS FIRE ESCAPE.

TYPICAL VIEWS OF A ROAD TRAIN FITTED WITH THOMAS ELECTRO-MECHANICAL TRANSMISSION.

electro-mechanical system known as the "Thomas Transmission."

In previous issues of this paper we have from time to time referred to the Thomas system; briefly it is a combination of an electrical with a mechanical system of transmission, whereby the power is transmitted partly electrically, but mainly mechanically. The portion of the power transmitted mechanically in the case of a road train is confined to the leading vehicle, while the electrical portion is easily transmitted to the trailers and controlled from the leading vehicle.

As in other applications of the Thomas system the electrical transmission is cut out on top drive; the electrical apparatus is used only when large tractive effort is required, i.e., when starting from rest, when travelling on bad roads, and when climbing grades, and since it deals

trailers are electrically operated by means of solenoids, the necessary exciting current being controlled by a switch

CURVE NO. 1.—OPERATING COST OF ELECTRICAL TRUCKS.

CURVE NO. 2.—CHARGING CURRENT FOR ELECTRIC TRUCKS.

within reach of the driver. By means of an electric controller, 15 speeds in either direction are provided.

The train illustrated is equipped with an engine developing 75 H.P., at 1,000 R.P.M. It will run continuously at 12 M.P.H. on ordinary macadam roads, and if the surface be extra good, can be speeded up to 15 M.P.H.

On account of the large single-power unit, the efficient drive, and the relatively low tare weight, the fuel and other expenses of such a train will be very much less than that required by a number of single lorries to handle the same load.

In conclusion, we are indebted to the Thomas Transmission, Ltd., for the foregoing particulars and views.

ELECTROMOBILE DELIVERY VANS.

Messrs. Electromobile (Leeds), Ltd., have recently constructed two 15-cwt. delivery vans for Messrs. Boots, the well-known chemists, the general appearance of these vehicles being shown below. These are built with a similar chassis to that described in the ELECTRICAL REVIEW of March 3rd, last; the battery is of the "Ironclad" type, consisting of 40 eleven-plate cells, allowing a travelling radius of 40 miles per charge.

Pedal resistance and drum control, operated by means of a lever underneath the steering wheel, are fitted.

The vehicles have a speed of 14 miles an hour, and in addition to their expeditious delivery work, provide an excellent advertisement for Messrs. Boots. We may add, as tending to show the simplicity of operation of such a

ELECTROMOBILE DELIVERY VAN.

vehicle, that the driver of one of them was able to commence his regular duties on the day after he ceased driving a horse-van.

A BATTERY-DRIVEN RECRUITING VAN.

Messrs. Drake & Gorham's Manchester branch, some time ago, supplied a standard Edison G.M. 2-ton electric vehicle to the Liverpool Corporation Electricity Department, and during the vigorous recruiting rallies in connection with the Derby scheme, Mr. Dickinson, the city electrical engineer, had a special recruiting body fitted, as shown in our view, the vehicle being in regular use for evening recruiting marches. The battery supplies a number of electric lamps fitted inside the body to illuminate the lettering, and the result was a very effective appeal.

The vehicle has now been in constant use on its ordinary duties for over a year, and has effected a very considerable economy in the cartage work of the department. It is employed largely in connection with mains extension work, and, in addition to the actual saving in the cost of carting (which, we understand, amounts on an average to between £7 and £8 per week), a further advantage is afforded by the reduction of time spent by gangs of men in reaching their work, as, apart from carrying the cable

and other materials required, the car transports the mainmen, labourers, and tools to the required locality with a minimum of delay.

Mr. Dickinson states that during the twelve months that the vehicle has been in use, it has covered 10,000 miles at

LIVERPOOL'S ELECTRICAL RECRUITING VAN.

an average current consumption of 0.7 unit actual input to the battery. Repairs and replacements have been practically nil, so that the total operating costs have been extremely moderate.

LEGAL.

COLSTON ELECTRICAL WORKS CO., LTD.

At the Bristol County Court, his Honour Judge Stanger made a compulsory winding-up order in the case of this company.

MR. HASLAM, who appeared on behalf of the petitioning creditors, Messrs. Haslam & Stretton, of Cardiff, said the facts stated in the petition were not disputed, and he thought he was entitled to the winding-up order asked for. A short time ago the company approached the largest creditors, and asked them to agree to the petition being withdrawn, in order that the company might be wound up voluntarily. The company passed a resolution for voluntary winding up, and appointed Mr. A. Collins as liquidator on May 23rd. They stated that, provided that course was agreed to, outside people would provide a sum sufficient to pay 12s. 6d. in the £. His clients felt that if they got 12s. 6d. in the £ it would be as much as they expected. He did not withdraw his petition, though he thought the matter was one for the creditors to consider.

MR. WEATHERLY, who appeared on behalf of the creditors, said that assuming that the meeting alluded to was regularly called, and assuming that 12s. 6d. in the £ was guaranteed, he would support the petition for compulsory winding up, on the simple ground that the assets would realise more than the liabilities.

MR. TAYLER, who represented the company, said the position of the company was this: The Simplex Conduit Co. claimed about £500. They issued process, got judgment, and put in an execution, which enabled them to reduce their claim to about £90. In view of what the Simplex Co. did, his clients sought the protection of the Court, and the Official Receiver was appointed liquidator to protect the assets. When the largest creditors were approached with a guarantee of 12s. 6d. in the £, on condition that the present petition was withdrawn, it was in the interest of the creditors that the application should not be proceeded with. If his Honour would not dismiss the petition, he suggested an adjournment, so that the matter could be further discussed. If the assets were worth more than 20s. in the £, the creditors would be paid in full. The company had got into its present position simply because it could not collect its debts.

MR. WEATHERLY contended that it was just one of those cases which ought to be investigated by the Court. From the figures supplied to him by the Official Receiver, the assets, which had already realised £420, were likely to yield £960 to meet liabilities of £797.

His Honour made the order asked for.

VICTORIA FALLS AND TRANSVAAL POWER CO. v. VAN BREDA.

ON April 10th, in the Transvaal Provincial Division of the Appeal Court, Mr. Justice Bristowe allowed the appeal of the company from a decision of the magistrate, who, while finding that there was serious and wilful misconduct on the part of the defendant,

awarded £500 as compensation for his death. Van Breda was an electrician, admittedly experienced and competent, employed at Rosherville station, and he was killed on April 18th, 1915, by an electrical discharge at one of the transformers. Mr. Justice Bristowe, in reviewing the matter as considered by the magistrate, said that the magistrate was not entitled to infer, in face of evidence to the contrary, from the mere fact that a permit was signed, that the deceased in entering a live cubicle was acting with the knowledge and approval of Powell, the foreman electrician. "Until the permit had been shown to the deceased and he had signed the declaration he could not know that the cubicle was dead. The fact that there were breaches of the regulations by other officials did not prevent the act of the deceased being so regarded. While one had the fullest sympathy with the defendant's wife and young child, one was not entitled to stretch the law in his favour. The appeal must be allowed, and the judgment altered to one of absolution from the instance, and the appellant would be entitled to costs in both Courts. The other judges concurred.

A WALFORD BODIE "OVERDOSE."

A TAILOR'S presser has been awarded £25 damages against "Doctor" Walford Bodie. Defendant was giving one of his entertainments at the Gaiety Theatre, Birmingham, and plaintiff took hold of the handles of the battery, under the defendant's assurance that he would come to no harm. He was thrown to the ground, and became unconscious for a few seconds, the audience laughing all the while. The County Court Judge said that plaintiff had suffered from an overdose of the current. A man who had a battery like that, and represented to the audience that it was safe, should exercise a high standard of care to keep the current under control, and see that no harmful results happened. He had not done that in this case. Stay of execution was granted.

THE EFFECT OF VACUUM FUSION UPON THE MAGNETIC PROPERTIES OF IRON.*

By TRYGVE D. YENSEN.

In a number of articles during the last two years the writer has described the remarkable magnetic properties obtained by melting electrolytically refined iron *in vacuo*. It has been shown that it is possible by this process to obtain magnetic permeabilities as high as 50,000, accompanied by hysteresis losses of $\frac{1}{2}$ to $\frac{1}{4}$ those of the best commercial transformer steels in use at the present time. The question has naturally arisen: "What effect will the vacuum treatment have upon commercial grades of iron?" In order to answer this question, one of the purest grades of commercial iron obtainable was selected for an investigation; this iron was made by the open-hearth process according to the most approved method.

Test pieces were prepared from the iron as it was received from the manufacturer, and others were prepared from the iron after its being re-melted *in vacuo*. These test pieces, before the final testing, were annealed at 1,100° C. *in vacuo*, and cooled at the rate of 30° C. per hour to room temperature.

The results obtained are given in the accompanying table and

FIG. 1.—MAGNETIC TEST CURVES OF PURE OPEN-HEARTH IRON AS RECEIVED AND AS RE-MELTED IN VACUO.

in fig. 1. It is seen that the vacuum treatment has increased the maximum permeability from two to three times, and decreased the hysteresis loss by a corresponding amount.† For the sake of comparison, there have been included in the table results previously obtained with electrolytic iron—with and without additions of silicon—melted *in vacuo*. This comparison shows plainly that nearly as good results are obtainable with pure open-hearth iron as a base as with the pure electrolytic iron.

* From *Metallurgical and Chemical Engineering*. Abstract.

† A similar improvement has been obtained with Swedish charcoal iron.

As far as the chemical analysis is concerned, it is difficult to point out any material difference between the open-hearth iron before and after the vacuum treatment. Only as far as the CO and CO₂ gases are concerned it may be stated that there has been a material reduction by the vacuum treatment. Density tests showed very slight differences between the treated and untreated iron, but the density of the vacuum-treated iron was in every case found to be higher, the average difference being about 0.1 per cent.

Photomicrographs show that in the untreated iron, while it is remarkably free from slag or other impurities such as are generally met with in commercial iron, there appear a large number of minute spots, evidently cavities caused by dispelled gases. The vacuum-treated iron is practically free from such cavities, and the crystals of the treated iron are much larger than those of the untreated iron.

The results seem to indicate that the purer the iron the larger are the crystals. Previous results also point towards a possible connection between high magnetic permeability and large crystals when comparing irons of the same general composition and having received the same mechanical and heat treatment. It may be a question, however, whether magnetic permeability has anything to do with the crystal size, as it may depend solely upon the purity of the iron. In favour of this contention may be cited the fact that when pure iron has been annealed at temperatures above 900° C., followed by slow cooling, the resulting crystals are much smaller than after annealing at or below 900°, and yet the magnetic permeability is generally increased by annealing at the higher temperatures.

From these facts and indications the only safe conclusion that may be drawn is that the open-hearth iron has been purified by the vacuum treatment to a degree not obtainable by any ordinary process of manufacture; and, furthermore, that this purification has resulted in marked improvements in the magnetic properties. Together with the results previously obtained with Swedish charcoal irons, these results show definitely that it is possible to obtain magnetic properties with commercial grades of iron by vacuum fusion that are comparable with those obtainable with electrolytic iron.

Russian Electricity Tax.—A meeting of the Indirect Taxes and Monopolies Committee was held on May 13th, with A. I. Nikolaevna, Assistant Minister of Finance, in the chair. The tax on electrical energy was considered. According to the scheme of the Minister of Finance, it was proposed to put a tax on electricity used for lighting and for industrial purposes, the general tax for private lighting to be at the rate of 4 copecks (1 d.) per kw.-hour, and that for street lighting 1 copeck (1 d.). Energy for industrial purposes is to pay 2 copecks (1 d.), and for certain auxiliary industries 1 copeck (half-farthing). The representatives of industry said that to put a tax on electricity used for industrial purposes might very prejudicially affect the development of the country's productivity; but most of the Committee, including Profs. Barnadsky, Migulin and Tugan-Baranovsky, found such a tax to be quite admissible if moderately applied, the more so as such an indirect tax would be transferred by the producers to the consumers. Prof. Migulin raised the question of the monopolisation of the production of electrical energy. It was decided to submit this important question to a Special Financial-Economic Committee. The Committee approved the project of the new law.

THE ELECTRIC LIGHTING OF SMALL TOWNS.

By H. N. MUNRO.

(Abstract of paper read before the JUNIOR INSTITUTION OF ENGINEERS.)

The idea is prevalent in the lay mind that an electric undertaking will not pay unless developed on a large scale, and that to attempt to put down an electric generating station and provide electric light and power in a place of less than 10,000 inhabitants is to court disaster. This impression is entirely erroneous; villages with populations as low as 500 have found that it is a profitable venture to follow the times and use electricity in place of oil or gas. These concerns are not only self-supporting, but they manage to yield dividends of 2½ to 5 per cent., and sometimes more after a year or two of working, some of the more successful yielding 10 per cent. after a few years. It is, of course, essential that such concerns should be most economically run in order to keep expenses down and, at the same time, to maintain a reliable and efficient service.

It is well to bear in mind when contemplating the promotion of any such schemes that there will always be a certain amount of local opposition which must be overcome.

In opening up negotiations, the best plan is to interest and obtain the support of two or three prominent residents in the place, these preferably being tradesmen or members of the local governing body. The next thing to do is to call a meeting to which all interested are invited. Prior to this, a judicious distribution of literature stating the case for electricity will arouse interest sufficient to ensure a good representative attendance at the meeting, when the objects and scope of the undertaking can be clearly explained.

Assuming that the support of the inhabitants is assured, it will now be necessary to ascertain how far the local authorities and governing bodies may be expected to favour the scheme officially. This is most important. Assuming that consent is given by the governing bodies concerned, the formation of a company can be proceeded with immediately. There are many schemes of this nature working without any Provisional Order. The obtaining of a Provisional Order is a lengthy and often an expensive matter, and it places on the undertaker many responsibilities. The only substantial benefit to be got from it is permission to break up roads and streets for the purpose of laying cables, and also the securing of compulsory wayleaves; the breaking up of roads is unnecessary, as all mains are run overhead, and wayleaves are not very difficult to obtain when the support of the residents in the place is given to the undertaking. Furthermore, the Provisional Order does not convey a monopoly of electric supply to a company as is commonly thought, since the local authorities can give their consent to any other undertaker to provide an electric supply.

If at all possible, neighbouring villages should be induced to fall in with the proposals, and these should be grouped together, as this will be found to reduce costs per unit and management expenses, besides being conducive to more efficient service.

The company should be well supported locally if it is to be successful, and the majority of the shares should be held by the inhabitants of the locality. The articles of association should contain clauses relating to the selling of fixtures, wiring of premises, and extent of supply in order to give the company full scope for extension. The company should start with full capital and entirely free from all obligations and loans. If sufficient money cannot be obtained at the outset to purchase outright all plant, &c., arrangements can sometimes be made by which contractors will agree to accept shares in the company as part payment.

For a small town of, say, 5,000 inhabitants, a sum in the neighbourhood of £4,500 is necessary to provide plant and mains. A good average figure for load per 1,000 of population is about 12 k.w., and the town under consideration will therefore require plant able to generate some 60 k.w., which, at an average figure of £85 per k.w., gives a sum of £2,100 for plant alone. A substantial brick and galvanised iron building may cost in the neighbourhood of £400, giving a total of £2,500 for plant and building.

In such a town as is here discussed, a mains length of four miles is a fair figure to take. This, carried on wood poles with bare copper conductors at 230 volts on the direct-current two-wire system, would cost approximately £400 per mile, making a total of £1,600 for mains. This would include services, protective apparatus, and house meters. A sum of £50 should be sufficient to cover legal expenses.

The odd amount of £950 should cover contingencies, thus bringing the capital, in round figures, to £4,500. Full powers should be obtained when the company is formed to increase the declared capital, if necessary, by a sum of, say, £1,500 to cover the cost of future extensions, &c.

An average number of 20-watt lamps per house or shop being assumed, the estimated possible load can be arrived at. For residential districts 60 per cent. of the estimated possible load may be taken as the maximum load on the feeders, and for shopping areas a percentage of 80. The next step is to divide the area into districts, each served by a feeder. The

feeder termination point should be as near the power station as possible, but at the same time should be centrally situated in the district.

The distributors should be as few as possible, and each one should take in as many consumers as is practicable.

Each feeder, at its termination, should be adequately fused, as should each distributor leading from it. The fuses should be contained in cast-iron weatherproof boxes, and mounted high up on the pole.

Post Office telegraph or telephone lines must be protected from contact with the power lines by guard wires. At the station end of each feeder is a lightning arrester.

While most of the overhead work of this nature is carried out with wood poles, such as are used by the Post Office for telegraph lines, steel poles are occasionally used, presenting a better appearance. They are, however, about three to five times as costly as wood poles, are more difficult to erect, and cost more for maintenance than wood poles. Good wood poles well cressed should last from 25 to 30 years, and under ordinary conditions require very little maintenance. Light poles used for carrying very small conductors along a straight route are from 22 to 30 ft. long, and about 6 in. diameter at top and 9 in. diameter at the bottom. For medium conductors poles are used about 25 to 35 ft. long, 8 in. at top, and about 10 in. at the butt. Stouter poles are used for heavy conductors and for corner or terminal positions where heavy strain is encountered.

For supporting the line, either wood or iron arms are used, or malleable cast-iron brackets. The insulators used are similar to those adopted by the Post Office on telegraph lines. Ironwork should be well galvanised, and all exposed screw portions should be coated with a tallow mixture. Poles and other woodwork should be well cressed or impregnated with some preservative material, and poles or arms, when drilled or cut in any way after impregnation, should be treated with a coating of hot tar or other preservative solution at the parts affected.

The plant for a power supply in a large city has to be supremely efficient; cost is, to a certain extent, a secondary consideration. The small plants with which this paper is concerned are dependent, to a great extent, on low initial cost. Superlative efficiency is not required, but the plant must be reliable, strong, and simple to work, as skilled drivers and attendants are not readily obtainable in small places.

The type of plant largely depends on circumstances. If good coal is cheap, and plenty of water is obtainable, a self-contained steam plant is worthy of consideration. Some types of this plant are exceedingly efficient and possess a comparatively high overload capacity. With careful attention stand-by losses can be kept low. A suitable steam plant may be obtained for about £9 to £10 per h.p. The average space required for a small town station is about 7 or 8 sq. ft. of floor space per h.p. The fuel consumption of such engines ranges around 4 to 5½ lb. of coal per unit generated.

The gas engine and producer is a popular plant, and can be run very economically. Stand-by losses are not very great; cheap fuel can be utilised, and an abundant water supply is not necessary. It pays to use a fairly good anthracite coal in the form of peas. This ensures a clean gas being generated comparatively free from tar, and reduces cleaning costs.

An efficient horizontal gas plant consumes about 2 to 2½ lb. of anthracite per unit generated, and the cost, including producer plant, averages £8 to £9 per h.p.

Oil engines are an extremely satisfactory plant to deal with, provided they are well chosen and attended to carefully. The crude-oil engine is most frequently met with in small power stations for this work. This plant costs in the neighbourhood of £8 per h.p., and consumes about 1½ pints of crude oil or paraffin per unit generated. The space occupied is about the same as that of a steam plant of the same rating.

Shunt-wound generators are used, controlled by a shunt regulator, with properly designed steps. With low-speed engines a belt drive is usual, while direct coupling is resorted to in case of high-speed engines. A booster is used in stations where a battery is installed.

In such installations as are here considered the plant during the day has but little load to provide for. A reliable battery of adequate capacity should be installed. The maintenance of the battery is very important, and is usually undertaken by the suppliers under a maintenance contract.

A deciding factor in these schemes is the cost which must be borne by the householder in order to be able to use electricity. Unless it is absolutely certain that the arrangement is a sound one, free wiring should not be undertaken; it is better to have a small number of consumers entailing very little expense than a large number whose wiring has to be supplied at a heavy cost. A very satisfactory job can be carried out in wood casing at a cost of about 12s. per point. It is a very good plan for the company to have a separate department for the sale and hire of fittings. A meter rental of about 4s. to 5s. per annum is charged. A "penny-in-the-slot" meter is used in some places for the poorer class of consumer.

The disadvantage of the meter system is that a man must be employed to read the meters. The great advantage of the meter is that the station engineer can obtain valuable records which are indispensable to a progressive undertaking, and the consumer can see what units are actually supplied and charged for.

The method of charging by contract presents little or no

difficulties in the way of operation. It requires no meter reader and no meter, and involves less clerical labour. It is open to the objection, however, that no records are available of each consumer's actual consumption. Of the two systems, the author favours the charging by meter. The lamps mostly used are 15, 20, and 25-watt, and an average of 12 lamps per building may be taken.

In a town of 5,000 inhabitants a reasonable installation to expect is in the neighbourhood of an equivalent of 1,000 lamps of 20 c.p. each for the first year's working. In a well-managed place this should easily be about doubled during the second year. In a great number of these small places gas or oil is the only illuminant, the gas being sometimes as high as 6s. or 7s. per 1,000 cu. ft. Electrical energy may be supplied up to 8d. per unit, 6d. being a good average to take, which compares favourably with gas at 3s. 6d. per 1,000 cu. ft.—a very low rate for a small town.

It is usually possible to enter into a contract with the local authorities for the electric lighting of the whole or part of the main streets; a reasonable price for this is about £3 per lamp per annum. While in many cases a dividend is yielded as the result of a first year's running, it would be unfair to base one's estimate of working on this year. In the second year the scheme has had a good chance to develop, and may be reasonably expected to be running normally.

The private lighting may be taken to comprise 1,800 20-watt lamps, the public lighting 100 3/40-watt lamps. The following figures are based on these assumptions:—

Expenditure.	£	s.	d.
68,040 units at 1d.	283	10	0
Management expenses	525	0	0
Total expenditure	£808	10	0
Revenue.	£	s.	d.
Private lighting—28,800 units at 6d. per unit	720	0	0
Street lighting—100 lamps at £3 each per annum	300	0	0
150 meter rents at 5s. each per annum	38	0	0
	£1,058	0	0

The profit is therefore £250. Of this amount £1,500 debenture or preference shares will absorb their dividend of 5 per cent., totalling £75. The balance of £175 remains to satisfy the ordinary shareholders and any reserve or other fund which is contemplated. A dividend of 5 per cent. can be paid on £3,000 ordinary shares, leaving the sum of £25 to be placed to reserve.

The foregoing figures are representative of what may be met with in actual practice. No notice has been taken in this paper of power loads or requirements or of any profit which may accrue from the sale of fittings, lamps, &c., which, after a few years' working, may amount to a substantial sum.

An average dividend of 5 per cent. has been figured from the statistics of ten companies, with populations varying from 2,500 to 10,500, which shows that such undertakings are paying concerns.

CORRESPONDENCE.

Letters received by us after 5 P.M. on TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Metric System.

We have had long enough to wait for that very practical and economical reform—Daylight Saving—an idea originated by a Briton, but only adopted by Great Britain after almost every other European country. Shall we also be the last to benefit by that equally great, or greater, commercial reform, the substitution for our present weights and measures of the international metric system, the idea of which was also originated by a Briton?

For years the Decimal Association has urged the reform of our coinage and weights and measures to those on a decimal basis, and the prospects for the success of our work are now hopeful. I shall be pleased to send further particulars to anyone applying to me at Finsbury Court, Finsbury Pavement, London, E.C.

E. Merry, Acting Secretary,
The Decimal Association.

London, E.C., June 3rd, 1916.

Decimal Coinage.

"W.M.M.'s" reply is far from edifying in its criticism of my note. It is to such men as he that we owe our present backwardness in commerce and, to a certain extent, in science. These iconoclasts whose policy is to destroy where others construct belong to a class which, were it not so prevalent, one could well afford to ignore—always ready to magnify infinitesimal errors, while they themselves sit on the fence

and watch others struggle. The slip of the pen which "W.M.M.'s" eagle eye spotted would have been obvious to any schoolboy, and allowed for as such.

"W.M.M." should remember that the system of which I wrote is, and has been, in practical use for nearly ten years all over the globe, and has "worked" with unflinching success during that period.

The imaginary coin, the spesmo, with its practical unit the spesmo, 2s., has been scientifically designed in order to give the closest approximation possible to the standard coins of different countries.

By the way, has it occurred to "W.M.M." that all foreign coins are imaginary as far as we are concerned? A franc or mark is simply imagined by our contractors, and its relative value in English currency ascertained.

Unless "W.M.M." is mad (this is not an aspersion) he will not deny that the French decimal coinage system works O.K.; yet has he, or any other man, ever seen in modern French currency a centime piece, of which the French "penny" is a multiple or 10? The same remark applies to many other foreign "imaginary" units. What is needed is an international system to link them up, and the Esperanto spesmo system supplies this need. Ours is about the only European country which has not made a move in the matter. Why, oh why, is England so inert?

Alfred Bridges.

London, W., June 3rd, 1916.

Economy in the Use of Coal.

The figures given by Mr. Horace Bowden in the letter which appeared in your issue of May 26th, advocating the universal substitution of electricity in place of gas for lighting and power purposes, are very misleading, owing partly to his somewhat over-estimating the efficiency of electric lamps and motors and under-estimating that of gas burners and engines, and partly to his leaving a very important factor out of consideration—that of residuals.

From every ton of coal carbonised in a gas works there is a residuum of 10 cwt. of coke for sale; so that, even if it takes two tons of coal to produce the same total candle-power by gas as one ton of coal will produce by electricity—and that is an outside estimate—the net consumption of solid fuel is the same in both cases. But then there must be taken into account the tar and ammoniacal liquor resulting from the distillation of the coal, residuals from which (1) our Navy and Army are deriving invaluable ingredients for the manufacture of high explosives, (2) a host of industries obtain chemicals that are vital to their existence; and (3) the farmers of this and allied countries derive one of the most important of all artificial fertilisers.

All these precious materials go up the chimney at an electric generating station, unless gas engines are used to drive the generators!

Mr. Bowden's figures regarding the relative usage of coal to produce H.P.-hrs. by the gas engine and the electric motor need material correction, as I have said; but even taken as they stand, and amended by the factor of residuals, they show an advantage as to fuel economy in favour of the gas engine. Corrected to a true comparison of efficiencies the balance in favour of the gas engine is very marked.

Mr. Bowden is seeking fuel economy in the wrong direction. It lies, rather, in putting coal through the retort as a prelude to obtaining from it the motive power for the generation of electric energy.

The Gas Light and Coke Co.

London, S.W., June 3rd, 1916.

The I.E.E. Rules.

These days of warfare may not be a suitable time for criticism of the new Wiring Rules issued by the Institution of Electrical Engineers. Electrical contractors have already noted difficulties and defects in the matter and arrangement of some of the rules. The revised rules must themselves be revised. So much is clear. The object of this letter is to recommend that the Wiring Committee begin preparations for a revision as soon as the war work permits. I would suggest, also, that there should be added to the Committee the names of some wiring experts well known for their prolonged effort to raise the standard and the status of this branch of electrical work.

The majority of the Committee should be men whose work has been mainly wiring. Many engineers eminent in other branches undervalue the importance and complexity of wiring problems and practice.

Engineer.

June 3rd, 1916.

[Our correspondent appears to be deeply dissatisfied with the new Rules and refers to "difficulties and defects," but does not enter into particulars. It would be interesting and useful if he would specify the nature of his complaints in detail. We may remind him that the Wiring Rules Committee of the I.E.E. is a Standing Committee, and invites suggestions.—EDS. ELCO. REV.]

WAR ITEMS.

After-the-War Trade.—In the House of Commons last week, Sir R. Cooper complained that the Board of Trade was too slow in tackling the question of trade after the war. It was unfortunate that there should be an impression in the country that many of the Committees which had been set up to deal with the matter were puffed juries. Now was the time to get rid of the German octopus.—In reply, Mr. Pretymann said that the Board of Trade was alive to the situation which would arise in regard to labour when the war ended. He said, according to the *Morning Post* report, that the matter had been considered from the outbreak of the war, and he believed the arrangements which had been formulated would go a long way towards solving the problem when it arose. Before the war the tendency of trade was in the direction of international and cosmopolitan combinations. We looked upon this as a purely trade matter—we assumed political and trade honesty in the Germans. But there was behind this action on the part of the Germans a political object and, indeed, a dishonest trade object. One knew how agencies had been captured by Germans, and German goods gradually substituted for British. The Board of Trade had done a good deal to counter that. The Board of Trade were getting rid of, and closing down, the German element in British trade. One element which was most difficult to get rid of was when German agencies had practical control of the output of some product of pivotal character. It was necessary that this country should have the plant and material ready at the end of the war to combat this. The labour to make and erect such plant, far less to operate it, was difficult to procure. But the Board recognised that the country must be ready to be self-supporting at the end of the war, if we were not to lose our opportunity. If the gates had once again to be opened to an uncontrolled supply of vital products he could not see how they were to be closed again.

Exemption Applications.—At Batley, the managing director of a local firm of electrical engineers applied for exemption for himself as being in a certified occupation. He was regularly employed in the work of electrical fitting, and had suffered great depletion of staff. He had been an active member of the local Volunteer Corps from the beginning. Conditional exemption granted.

At Windsor, Mr. Fowler, electrician, who appeared in R.N.A.S. uniform, applied for exemption for his only adult employé. Mr. Fowler stated that he himself had joined, leaving the man appealed for in charge of the business. If this man left there would be no electrician in the town, and the business would close down. Three months' exemption allowed.

Widmermere Tribunal, after considering appeals by Messrs. J. K. & Ernest C. Thornburrow, electrical engineers, granted the former six months' exemption and the latter one month.

Dover Tribunal has granted conditional exemption to G. Hopkins (32), coal and ashes trimmer at the Corporation electricity works, and six months to E. Smith, driver for a Corporation electric refuse vehicle.

Dartford Tribunal has refused exemption to a coal trimmer appealed for by Mr. Pember, electrical engineer to the U.D.C. At Chatham, on May 30th, exemption was claimed by the Tramway Co. for 35 men, it being stated that if any more had to go things would become very serious. Before the war there were 234 men and 17 boys, but all the latter and 145 of the former had left, and the staff now consisted of 124 men, 23 boys, and 72 female conductors. The Tribunal gave conditional exemption to 22 motor-men, one engineer, and one repairer of electrical mains; three months to a clerk and a stoker; two months to a pavior and a night timekeeper; and one month each to a clerk, a night foreman, a chief motor inspector, and two truck-men. The other appeals failed.

Nuneaton Tribunal has granted exemption until August 1st to E. Burgoyne (29), the only man, out of seven, left with Mr. Harold Birch, electrical engineer.

At Torquay, conditional exemption has been granted to Mr. J. M. Keenan, deputy electrical engineer, and Mr. A. E. Williams, chief clerk at the electrical works.

At Macclesfield, a local firm sought exemption for their electrical engineer, and said that it was impossible to obtain a qualified man over military age. The company supplies a number of business concerns with current for manufacturing purposes, and it was stated that if the engineer went the supply might have to be curtailed, as the staff had now reached the absolute minimum. Three months' conditional exemption was allowed.

Tunbridge Wells Tribunal has granted three months' conditional exemption to Messrs. R. J. Spittles and R. F. Rack, electrical wiremen with Messrs. Strange & Sons.

The Chipping Norton Electric Supply Co., Ltd., appealed to the County Tribunal for Mr. G. G. Bates, shift engineer, claimed to be indispensable to the maintenance of the borough supply. The Local Tribunal considered that Mr. Bates was not wholly indispensable, and that he could be replaced by a man over military age. He had been "starred," but this was removed on May 11th. The Court declined to interfere with the Local Tribunal's decision, but gave the company a month in which to find a substitute.

At Bedford, Mr. R. W. L. Phillips applied for exemption

certificates for 20 men at the borough electricity works. It was explained that although the men had been exempted they were being called up by the Recruiting Officer. The Tribunal decided to issue the certificates.

Before the West Kent Appeal Court, Messrs. T. White and Bushell, electrical engineers, of Chislehurst, appealed for Mr. H. S. White (28), as being indispensable to the business, but no exemption was allowed.

The Barnstable Tribunal has granted conditional exemption to Mr. Frank Bickford, electrician, who had been passed for sedentary work only, and who supervises motors, &c., at local works.

At Canterbury, on May 29th, the city electrical engineer, Mr. C. A. Blaschek, appealed for three men engaged at the dust destructor, and said that there were now only six men instead of 12, and they could work with only one shift. Conditional exemption was allowed.

Chelmsford Tribunal has granted three months' exemption to F. J. East (40), who attends to the electric light installation at the residence of Mr. R. A. Ellis, J.P., of Stock.

Eastbourne Tribunal has given two months' exemption, with leave to appeal again, to an apprenticed electrician with a local firm, whose indentures have still two years to run, and who is the only one of the former staff of seven electricians left.—The proprietor of an electrical engineering business in the town has been exempted until the end of June.

At Hoddesdon (Herts), Messrs. Christie & Co., Ltd., appealed for Mr. W. R. Stone, electrician, responsible for supplying light for 100 men and the offices, and also to several houses in the town. He was exempted whilst he remains in his present position.

Woking Tribunal heard an appeal for five indispensable employés of the Accumulators, Ltd., of Maybury. S. F. Bates, foreman of the carpenters' shop and woodworking mill, was refused exemption, it being considered that he could be replaced; three months' each were allowed to E. H. Cooper, foreman of the assembling and formation department; A. A. Blatcher, foreman of the mixing and pasting department; R. H. Simpson, foreman electrical fitter; and P. D. Hollings, manager and analytical chemist. The same Tribunal has given three months to A. M. Dallen, chief clerk, and A. J. Jameson, meter tester, repairer, and reader, with the Woking Electric Supply Co., and one month to Mr. A. Gill, the company's accountant.

The Aylesbury Rural Tribunal has given three months' exemption to the electrician engaged at Hartwell House.

Oldham Tribunal has refused exemption to three married brothers, partners in the firm of Caton & Sons, electricians, ten of whose staff have enlisted. Three electrical fitters with Mr. J. Jackson, electrician, of Oldham, have been exempted until August 1st.

The military appealed against three months' exemption allowed to a charge-hand at the Rugby U.D.C. refuse destructor, who has been on the staff for ten years and is thoroughly conversant with the work. It was claimed by the surveyor that in the interests of health the work should be done efficiently. The exemption was allowed to stand, but it was intimated that it might not be renewed so easily.

The Peterborough Tribunal has granted six months' exemption to Mr. T. C. G. Claburn, manager of the Peterborough Electric Traction Co.

At Rochdale, an electrical engineer, Mr. W. Pickard, aged 29, who was stated to be engaged in developing a patent, was granted temporary exemption till the end of August.

At Blackpool Tribunal, on June 1st, a local hydro company appealed for their engineer and electrician, aged 32. There were 1,100 lights in the hydro, the plant being under the control of this man. Conditional exemption granted.

Conditional exemption was granted by St. Annes Tribunal, on May 31st, to the chief electrician of the tramway company, and to two engine drivers at the electricity works.

The proprietors of the Royal Mills, Esher, applied to the Tribunal for their electrician to be exempted, he being the only one of the original staff left. Exemption granted until November 20th.

The Dartford Tribunal has granted exemption to Mr. S. W. Botterill, electrical engineer to Messrs. Swaislands, of Crayford.

At the Stockton-on-Tees Tribunal, on May 30th, an application was made for the exemption of Coun. H. C. Watson, manager of the electrical department of the firm of Messrs. T. B. Watson & Son, sanitary and electrical engineers; the department was turning out work for controlled firms, and so many men had joined the Colours that it would be impossible to carry on the business without Mr. Watson. Three months' exemption was granted, with leave to appeal again.

At Fleetwood, an electrical engineer who sought exemption for himself and for two of his employés, produced documents showing that he was fitting wireless to the mine sweepers, and regularly repaired electrical machinery on the boats. He was also engaged on electrical work for the Government and for firms outside the town who were on Government work. The applicant was granted conditional exemption. The other men were exempted till September 30th, and the employer was advised to get badges for them.

Ashby-de-la-Zouch Rural Tribunal has refused exemption to the man in charge of the electric light plant at Measham Hall, the seat of Sir W. Abney.

Before the West Kent Appeal Court, on Monday, Mr. H.

Williams, assistant manager of the Erith U.D.C. electricity works, appealed for Leonard Clarke (31), engineer-fitter's mate. Conditional exemption was allowed.

At Castleford, Mr. C. J. Cox, electrical engineer, appealed for his working manager, Mr. Ralph Sheard (28), and said that without him he would be unable to carry on the business. His other men were gone, and Mr. Sheard was the only man in the town who could do certain repairs at the works in the district. Exemption was allowed whilst he remains in his present occupation.

At Batley, the managing director of a local firm of electrical engineers, who said that, owing to the depletion of the staff he was regularly employed in the work of an electrical fitter, was granted conditional exemption.

The Aysgarth Tribunal has granted conditional exemption to an attested employee of the Askung Electric Light Co.

An attested farmer, butcher, and proprietor and manager of a "public electric light supply" at West Burton was granted conditional exemption.

The Economic Conference.—The Marquess of Crewe will attend the Paris Economic Conference in place of Mr. Runciman, President of the Board of Trade, who is suffering from a breakdown consequent upon the great strain of his manifold duties.

Breach of Lighting Order.—At Accrington, on June 1st, R. P. Gerland, electrician, was fined 7s. 6d. for a breach of the Lighting Order. Defendant had been carrying out electrical work in Whalley Road, and had omitted to switch off one of the lights when leaving.

Coal Trade Committee.—The President of the Board of Trade has appointed a Committee, consisting of the Rt. Hon. Lord Rhonda (chairman), Mr. A. E. Bowen, Mr. Newton Dunn, Mr. F. J. Jones, Mr. A. Nimmo, Mr. A. P. Pease, Sir Daniel M. Stevenson, Bart., and Mr. R. Warham, to consider the position of the coal trade after the war, with especial reference to international competition, and to report what measures, if any, are necessary or desirable to safeguard that position. Mr. J. U. Smith, of the Board of Trade, will act as Secretary.

To be Wound up.—The Board of Trade has ordered the following to be wound up:—

Krupka & Jacoby, Ltd., 26-36, Chapter Street, Westminster, S.W. Importers of electric light fittings, &c. Controller: Thomas Wise, Bassishaw House, Basinghall Street, E.C.

Trading with the Enemy.—The "London Gazette" for June 2nd contains further lists of persons and bodies with whom trading is prohibited in Argentina, Bolivia, Chile, Norway, Peru, Spain, Sweden, Portugal, and other countries.

BUSINESS NOTES.

Catalogues and Lists.—BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—A very fully illustrated brochure of between 80 and 90 pages describing Curtis turbo-generators has been issued by the company. The descriptive matter is very detailed, and is accompanied by half-tone pictures of various parts of the plants and many views of complete sets, line diagrams and curves, and photographs of the works at Rugby. Altogether it is a very fine production and will be of service to power station engineers, consulting engineers, &c.

MESSRS. T. W. BROADBENT, LTD., Victoria Electrical Works, East Parade, Huddersfield.—Leaflet No. 1 of a new catalogue which is being issued in sections. The "D" type generator for continuous current is described in this leaflet.

MESSRS. H. TINSLEY & CO., Eldon Park Works, South Norwood, S.E.—Two pamphlets: No. 44 (12 pp.) contains a description with prices, &c., of the Drysdale-Tinsley non-inductive low resistance standards or "shunts"; No. 47 (12 pp.) deals with optical testing instruments, Dr. Drysdale's field glass and telescope testing apparatus, &c.

MESSRS. PALMISTON, HOPE & SCODEN, LTD., Hulme Electrical Works, Manchester.—Advance copy of a new catalogue of 52 pages, in which fully illustrated and exhaustive information is given respecting the Fluvent fuse system, which is being largely used in the new munitions factories put up by the Government. "Fluvent" switch fuses, power centre boards, glands, &c., "Ajax" ironclad switches and fuses, mining switches, fuse-holders, small power distribution boards, lighting fuseboards, and bi-metal fuse wire, are among the manufactures covered. A number of pages are occupied with shipping weights and dimensions. The firm have now an office in London (Queen Anne's Chambers), where samples of the Fluvent system can be seen.

To Develop Export Trade.—M. Crozier, the French commercial attaché in Belgium, Holland, Switzerland, and Scandinavia, advises certain modifications in present methods of securing trade in these countries. The union of producers is a leading point in his advice. Considering that the bigger firms stand in no need of his recommendations, he limits his remarks to the smaller firms engaged in turning out articles of restricted consumption, or "seasonal" articles, or to those afraid or hesitating to make a start in the export trade. To these he tenders the advice to combine or group their resources and efforts. It is, he says, a *modus operandi* found efficacious by our enemies,

Such selling syndicates should combine from one to two dozen merchants or manufacturers of articles suitable for the same class of customers, but each firm different and non-competitive with other members of the same group or combine. The components of the group should be wisely studied; the number of its members happily limited, so as to help the work of agents and representatives, and assure a sufficient remuneration, so that none may think their interests sacrificed, such groups working in the foreign country chosen either by means of an agent sent direct and settled on the spot and holding local stocks, or by a resident representative of the country, recommended by, say, the French Foreign Trade Office. The choice of this agent or representative should be the subject of great care: he should be capable, intelligent, of credit in the country, and furnish every guarantee of integrity, serious business, mental acumen, and pro-French sympathy. On the other hand, it should be made possible to assure him a suitable position and a remunerative volume of business. At a pinch, resort might be had to commission firms, but these have the faults of occupying themselves with too great a variety of articles, buy from any French or foreign firms, and neglect the little known articles which it is the object of the group to export. Lastly, the attaché recommends the trial and employment of French women already trained in commerce, so as to leave the men free for industrial occupations.

U.S. Electrical Exports in February.—The U.S. electrical exports for the month of February established a new record. The previous record of last November was exceeded by nearly \$168,000. An increase of over \$1,259,000 occurred as compared with February, 1915. For the four electrical classes for which numbers of articles exported are given in the official reports, there were shipped in February the following:—Electric fans, 1,872; arc lamps, 112; carbon-filament lamps, 86,471; metal-filament lamps, 580,667.

	Feb., 1916.	Feb., 1915.
Batteries	\$104,712	\$109,214
Dynamos or generators	112,965	127,565
Fans	30,637	10,206
Insulated wire and cable	217,764	95,641
Interior wiring supplies, &c. (including fixtures)	133,600	67,648
Lamps—		
Arc	1,761	8,031
Carbon filament	12,898	9,862
Metal-filament	107,715	51,373
Meters and other measuring instruments	59,170	22,807
Motors	439,769	326,224
Telegraph instruments (including wireless apparatus)	2,542	5,589
Telephones	105,176	101,957
Transformers	86,414	46,646
All other	1,527,588	700,804
Total	\$2,942,611	\$1,688,567

In February there were also shipped 19 electric locomotives valued at \$134,405; these are not included in the above table.

For the eight months ended February 29th, 1916, the total value of electrical exports was \$18,581,180; for the corresponding period ended February 28th, 1915, the total was \$12,205,421; for the corresponding eight months of 1913-14, it was \$17,723,804.—*Electrical Review and Western Electrician*.

Pay Wallets.—An ingenious pay wallet has been devised by MESSRS. MARTIN BILLING, SON & CO., of Livery Street, Birmingham. It consists of a sheet of stout paper, ruled for a statement of gross and net wages, and deductions for insurance, &c., so arranged that on folding it with Treasury notes and loose cash inside, and sealing two flaps, the coins can be inspected through perforations and the value of the notes ascertained, yet nothing can be withdrawn from the wallet without tearing it open. Thus there can be no dispute as to whether the wallet contained the correct sum when handed to the workman, as the latter can check the amount and return the wallet unopened if he is dissatisfied. The workman's name and number and the statement of wages can be read without opening the wallet. The device should prove very useful in safeguarding against loss by error or fraud, and preventing disputes.

Book Notices.—"The Year-Book of Wireless Telegraphy and Telephony for 1916." London: Wireless Press, Ltd. Price 3s. 6d. net.

"Science Abstracts." A and B. Vol. XIX. Part 5. May 25th, 1916. London: E. and F. N. Spon, Ltd. Price 1s. 6d. each section.

"The Economical Use of Coal." By John H. Anderson, Purfleet. From the Author: price 1s. post free.

The *Paradise House Journal* for the Summer Term contains a further list of students serving in the allied forces, biographical and obituary notices, and examination results for 1916, as well as the usual personal items, &c.

Bankruptcy Proceedings.—G. E. BONNER, electrical agent, Palmer's Green.—June 21st is the last day for receipt of proofs for dividend. Mr. E. W. J. Savill, trustee, 14, Bedford Row, W.C.

F. C. POULTON, consulting and inspecting engineer, Eccles.—June 21st is the last day for receipt of proofs for dividend. Mr. J. G. Gibson, trustee, Byrom Street, Manchester.

For Sale.—The County Borough of Barnsley has for disposal two 75-KW., high-speed, D.C., direct-coupled, generating sets. See our advertisement pages to-day.

Dissolutions and Liquidations.—**LAKE & CURRIE**, consulting engineers, Norfolk House, Laurence Pountney Hill, London, E.C., Messrs. H. W. Lake and D. Currie have dissolved partnership.

EASTON LIFT CO., LTD.—This company is winding up voluntarily, with Mr. H. G. Holmes, 33, Paternoster Row, E.C., as liquidator. A meeting of creditors is called for June 15th, at Express Works, Southwark.

BRITISH AND COLONIAL LIGHTING CO., LTD.—A meeting is called for July 7th, to hear an account of the winding up from the liquidator, Mr. C. W. Rooke, 46, Queen Victoria Street, E.C.

AMERICAN ADDING MACHINE CO., LTD.—A meeting is called for July 7th, at 18, St. Swithin's Lane, E.C., to hear an account of the winding up from the liquidator, Mr. D. L. Honeymann.

WESTON ELECTRIC LAMP CO., 1 and 3, Sun Street, Finsbury, E.C., electric lamp factors and agents, Messrs. C. S. Engzelius and J. S. Nunn have dissolved partnership. Mr. Engzelius attends to debts, and continues the business.

Trade Announcement.—**MESSRS. BERRY, SKINNER AND CO.** announce that in future the address of their head offices will be "The Switch House," 86, Newman Street, Oxford Street, W., where extensive premises have been acquired. Telegraphic address, "Ptolemaist Ox., London"; telephone Nos., "Museum 3310 and 3311."

Lamp Discounts.—**MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD.**, of Upper Thames Street, E.C., have issued a notice withdrawing the 7½ per cent. preferential discount on Wotan, half-watt, and tantalum drawn-wire lamps, as from June 1st, owing to the increased cost of raw material and labour, and the difficulties arising from the shortage of both.

LIGHTING AND POWER NOTES.

Aberdeen.—The total number of units generated during May at the Corporation electricity station amounted to 1,213,370, an increase of 285,366 units over the preceding month; an application has been received from a local shipbuilding firm for a power supply, and that the Electricity Committee has approved a recommendation that the firm be supplied with 400 H.P. on a three years' guarantee of energy consumption. A three-phase E.H.T. supply will be given to a sub-station in the yard.

Accrington.—The Tramways and Electricity Committee has decided that the whole of the fire insurance of its depot shall be undertaken by the Corporation's own fire insurance fund.

The borough treasurer reports that of £26,250 borrowed under a sanction of June, 1900, for the electrical undertaking, provision for repayment had been made to the extent of £25,655 up to March, 1916, leaving a balance of £595.

The Electricity Committee has decided that the sum of £1,000 be repaid to rate funds during 1916-17, which will leave the balance owing at £3,588.

Barrow-in-Furness.—**YEAR'S WORKING.**—The report of Mr. Burnett, the borough electrical engineer, on the working of the Corporation electricity undertaking for the year ended March last, discloses an exceptionally prosperous state of affairs. Whereas in the previous year the units sold totalled 3,397,410, the total for 1915-16 reached 13,806,254 units, an increase of 10,208,844 units in the year. Of this total, over 12 million units represent power supply. The maximum load was 3,905 kW., and the load factor 40.36 per cent., these comparing with 2,285 kW. and 17.97 per cent. in 1914-15. Considerable increases were also shown in the lighting and tramway supply, but naturally public lighting units show a large reduction. The effect of this abnormal increase in power units sold at an average price of 4d. per unit, on the finances of the undertaking is of considerable interest. The revenue during the past three years was made up as follows:—

	1913-14.	1914-15.	1915-16.
Private lighting, &c. ...	£11,310	£13,286	£14,350
Power and heat ...	3,432	7,692	38,929
Public lighting ...	1,467	1,426	1,151
Traction ...	3,492	3,709	4,233
Meter rents, &c. ...	448	472	545
Total receipts ...	£20,149	£26,585	£59,208
Total costs ...	£11,460	£13,867	£24,809
Costs to receipts ...	56.87	52.16	58.79
Gross profits ...	£8,689	£12,718	£24,399
Gross profits to capital expenditure ...	6.68	8.55	14.80
Working costs per unit ...	1.32d.	.92d.	.605d.
Average price per unit ...	2.27d.	1.74d.	1.02d.
Net profit ...	£613	£3,163	£12,804

Some 382 motors of 2,760 H.P. are now connected to the mains, 94 being hired, and hired apparatus for heating and cooking has also attained respectable proportions. In regard to the domestic use of apparatus, Mr. Burnett mentions that the average consumption of a large number of domestic consumers in one district is now three times what it was four years ago.

During the year 723 new consumers were connected, and although many represent workmen's dwellings, the number of lamps added amounts to 63,067 30-watt lamps.

As regards working conditions, Mr. Burnett points out that increased price of coal represented no less than £6,000 or '087d. per unit sold. Nearly 95 per cent. of the total output was generated by two turbo-alternators, which have run practically continuously, frequently overloaded, month after month, and demonstrated the reliability of this type of plant. The large increase in output was only rendered possible by the E.H.T. scheme carried out three years ago, when capital charges amounted to '94d. per unit, as against '20d. now.

In concluding, Mr. Burnett points out that capital repaid, revenue expenditure of a capital nature and renewals fund amount to 44 per cent. of the total capital expenditure; the whole of the balance of net profit, after meeting certain expenditure, has been placed to renewals.

The report is of great technical interest and is worth careful study.

Birmingham.—**YEAR'S WORKING.**—With further reference to the report of the Corporation electricity department for the year ended March 31st last, during the year the capital account was increased by £145,662. On buildings, including the ferro-concrete work and railway sidings at Nechells permanent station, and the cooling tower foundations at Summer Lane and small additions at sub-stations, £22,373 has been expended; the greater part of the £72,928 expended on machinery has been incurred at the Nechells temporary station, retention money on turbo-alternator and cooling towers at Summer Lane, and switch-gear and converters at the Parker Street, Bordesley and Saitley sub-stations.

Mains and services cost £50,830. The total number of units sold, as compared with the previous year, was as follows:—

	1915.	1916.
Low tension—		
Lighting ...	8,726,306	9,064,172
Power ...	21,460,141	27,479,308
High tension ...	28,536,161	53,169,118
Tramway supply ...	24,186,574	27,303,723
Total ...	82,909,182	117,016,321

The output for lighting and power, exclusive of tramways, shows an unusual increase, the units sold being 52.8 per cent. higher than in the previous year. This is due to the large amount of power taken by manufacturers on Government work. The increase in the output for the tramway supply was 12.9 per cent. The balance of the revenue account, £191,283, represents the gross profits of the undertaking.—*Birmingham Daily Post.*

Blackpool.—**YEAR'S WORKING.**—According to figures presented to the Finance Committee, on June 1st, the electricity department made a profit last year of £2,478, and expects to make a profit this year of £2,000; and the tramways department made a profit of £16,275, and this year expects to make £10,000 profit.

The Electricity Committee has decided that no further applications for supply under the ratable value tariff be accepted during the war.

Bolton.—The Electricity Committee having received a letter from the B. of T. (railway department) calling attention to the question of possible economy in national resources that could be effected by a system of interconnection of electrical supply undertakings, the engineer has been requested to prepare a report on the matter.

Bradford.—**PROPOSED PLANT EXTENSION.**—The Electricity Committee has recommended the City Council, in view of the ever-growing demands upon the electricity department, to make application for sanction to borrow £100,000 for the purpose of extending the plant.

Canada.—An agreement has been entered into by the City of Edmonton, with the Alliance Trust Co., of Calgary, for a temporary supply of power until the new hydro-electric plant of the Edmonton Power Co. is ready for operation.—*Canadian Electrical News.*

Continental.—**GERMANY.**—The Daylight Saving scheme has brought some trouble in its train in Germany, for we learn that the leading electricity supply company in Berlin declines to recognise the new "summer time," and that it will not switch off the current furnished for hall and corridor illumination until 10 p.m., as hitherto, i.e., what is now 11 p.m., and will charge accordingly. It justifies its action by the cost of re-adjusting its switching-off system, which would have to be re-altered in the autumn.

SPAIN.—Application has lately been made for a concession to establish a plant to utilise the water power of the river Toran, near Canejan (Province of Barcelona), in the generation of electrical energy for lighting and power purposes in the district.

Plans have been prepared for a new electricity generating station at Medina de Pomar (Province of Burgos). The water power of the river Nela will be utilised, an application having been made to the Spanish Government for the necessary concession.

A concession has lately been granted for the establishment of a plant to utilise the water power of the river Segas, near Tejoa (Province of Santander), in the generation of electrical energy for lighting and power purposes in the district.

FRANCE.—The present and future of the hydroelectric industry in the French Alps region is set out in a recent issue of the *Revue Electrique*. The region embraces one-tenth of the total area of France, and includes the departments of Haute-Savoie, Savoie, Isère, Drome, Hautes Alpes, Basses Alpes, Vaucluse, Bouches du Rhone, Var, and the Alpes-Maritimes, and the basins of 37 rivers. The installed water-power in December, 1910, of this region amounted to 473,000 H.P., which had increased by December, 1915, to 738,000 H.P., or by 255,000 H.P. in the five years. The utilisation of this power in the latter year was industrially subdivided in H.P. as follows:—Power and light, 291,000; metallurgy, 255,000; electrochemistry, 147,000; traction, 10,000; saw-mills, paper-making, wood-working, 30,000; sundry (lime, cement, weaving, &c.), 8,000 H.P. The number of electric works in 1910 was 126, and in 1915, 205, or an increase of 79 in the five years. Their capacity varied as follows:—Up to 100 H.P., 9 in 1910 and 26 in 1915; 101 to 500 H.P., 43 and 70 respectively in the two periods; 501 to 1,000 H.P., 14 and 19; 1,001 to 5,000 H.P., 30 and 43; 5,000 to 10,000 H.P., 17 and 19; and 10,000 H.P. and upwards, 13 and 28 in the years 1910 and 1915 respectively. The electric plants of 500 H.P. and under mostly furnish light to small localities, whereas those above that figure are allied to large industries. The constant calls for energy, as well as the demand created by the increasing scarcity of imported coal, have created a situation such that the distribution companies constantly find themselves unable to meet demands. In consequence, many important undertakings for the utilisation of waterfalls are being taken in hand, and the next quincentennial's advance is likely to more than equal that of its predecessor.

ITALY.—A society has been formed at Turin with the title "Comitato Torinese per lo Sviluppo Hidroelettrico," which, as in the case of the Associazione Elettrotecnica Italiana, is intended to further the utilisation of Italy's water resources by hydro-electric plants. Influential personages and bodies in the Province of Piedmont have joined the board.

The Società Anonima Lugugnanese has been formed at Portobuffolè, with a capital of 35,000 lire, to supply electric current in an area which includes the town of Lugugnan. The Society proposes to purchase energy.—*Revista Tecnica d'Elettricità*.

Exeter.—**PRICE INCREASE.**—The T.C. has decided to increase the charge for electricity for lighting from 4d. to 5d. per unit, as from July 1st next. It is estimated that the Daylight Savings Bill will reduce the income by £500, while restricted street lighting means a reduction of £1,250 for the year.

Finchley.—**PRICE INCREASE.**—The D.C. has decided to increase the price of current for private lighting by 20 per cent. in lieu of the increase of 10 per cent. previously decided upon. The increased price will apply after the June quarter. The price of current for power purposes will also be increased as from the above-mentioned date as follows:—(a) Consumers with a load factor of 33rd per cent. or less, by 10 per cent.; (b) exceeding 33rd per cent., the increase to be the percentage amount of the excess fuel cost over 9d. per unit generated, with a limit of 10 per cent. It is also proposed to suspend, on and after August 1st next and during the period of the war, the clause of the general conditions of supply relating to free service connections.

Glasgow.—**YEAR'S WORKING.**—The electricity department has achieved a record output for the year ending May 31st, consequent largely upon the huge demands for power made by the different factories, shipyards and other establishments engaged on national work. The output for 1915-16 amounted to 130,000,000 units against 104,000,000 units in 1914-15, while the revenue was £500,000 against £400,000 respectively, an increase approximately of 30 per cent. So great was the demand that an overload was carried throughout practically the whole winter, a state of affairs which would have been obviated had the new works at Dalmarnock—a portion of which would have been in operation, but for shortage of labour and material—been ready.

Grimsby.—The Public Lighting Committee is recommending the T.C. in view of the fact that in the current year £966 has been taken from the reserve fund of the electricity undertaking to pay for extensions of mains and services, for which no loans are available, to transfer the whole of the balance of net revenue (£610) to the reserve fund.

Ilford.—**REFUSE DESTROYER REPORTS.**—The question of utilising the steam from the destructor works has formed the subject of recent reports from the Council's officials. The surveyor estimates that some 75,000 lb. of steam per day should be available, and Mr. Shaw, the borough electrical engineer, describes three schemes by which this could be utilised in supplying electricity, giving respectively 551,000, 735,000, and 1,200,000 units delivered at the Ley Street works. For reasons given, either the first or second scheme is preferred, both involving the transfer of machinery from Ley Street to the destructor. Mr. Harvey, the tramway manager, says it is evident that neither of the first two schemes would alone provide the requisite energy for the tramways, and that the third scheme could not be carried out under present conditions.

Ilkeston.—**SALE OF E.L. AND TRAMWAYS.**—The Tramways and Electricity Committee has recommended the Corporation to accept the offer of the Nottingham and Derbyshire Power Co. to take over the tramways and electricity undertakings on certain terms. The matter has been considered by the Council as a General Purposes Committee, and it was decided, by a large majority, to sell the undertakings, and the resolution to that effect will be

submitted to the ordinary meeting of the Council for confirmation. The tramways have been in existence for 13 years.—*Sheffield Telegraph*.

India.—The Karachi Cantonment Committee has decided to light the streets by electricity.—*Indian Engineer*.

Keighley.—**HOSPITAL LIGHTING.**—The Keighley and Bingley Joint Hospital Board last week decided upon an installation of electric lighting in the permanent hospital buildings, at a cost of £216.

Lancaster.—**YEAR'S WORKING.**—The report of the Council's electricity department shows an income of £10,170, against £9,111 in 1914-15; the expenditure increased by £1,865, coal accounting for £1,119. While there was a decrease in lighting, there was an increase of 160,346 power units. For the first time since 1896, there was a deficit amounting to £393—less than anticipated, and met from the reserve fund, which now stands at £3,561.

Leek.—The U.D.C. has received the report of Dr. Watkinson, of Liverpool, on the breakdown at the electricity works, and it is being considered in conjunction with the report of the Council's own engineer.

Leyton.—**STREET LIGHTING.**—The Highways Committee of the D.C. has agreed to the electric lighting department's proposal to make a charge of £10 per lamp per annum for lighting are lamps converted for incandescent lighting. The department is making no charge for carrying out the conversion, the cost of which is estimated at £100.

Liverpool.—The Corporation has been recommended by the Finance Committee not to approve the resolution of the Tramways and Electric Power and Lighting Committees to increase the pay of certain of their employees by 4d. per hour, but that a war bonus of 1s. 6d. per week should be given to all men in the Corporation employ on certain conditions.

Llanfyllin.—**STREET LIGHTING.**—The T.C. has decided to accept the offer of Mr. R. A. Jones to light the streets by electricity at £2 per lamp for 21 lamps, for a period of one year, subject to renewal; the town clerk is to prepare the agreement.

London.—**HAMMERSMITH.**—The L.C.C. has sanctioned the borrowing by the B.C. of £3,000 for electrical extensions, under the usual war conditions.

WESTMINSTER.—With reference to the amended terms for the supply of current to the City Council's buildings by the Charing Cross Co., the Council has been recommended to agree that the contract should be for one year ending June 24th, 1917, determinable at the end of that period, or on any quarter-day thereafter, by three months' notice.

Maidstone.—**PRICE INCREASE.**—The T.C. has adopted a new scale of charges for current, which are some 25 per cent. above the original prices.

Reigate.—The T.C. has decided to further overdraw the electric lighting capital account to the extent of £231, in order to enable certain work to be carried out for increasing the capacity of the two sub-stations. It was stated that the heating and power supply had increased 36½ per cent. up to March last.

Rochdale.—**PLANT EXTENSION.**—Although the formal sanction of the L.G.B. has not yet been given to the expenditure of £10,157 on extensions at the electricity works, it is reported that an intimation has been received that the sanction will be given, and, acting on this, contracts for the work have been let.

Salford.—The Electricity Committee recommends the T.C. to agree to a reduction of 2½ per cent. in the normal contract charges for the supply of energy to the works of Messrs. R. Haworth & Co.

The Committee has decided to temporarily delete Clause 31 (relating to penalty for late completion of contracts) of the Model General Conditions of the I.E.E. from contracts entered into on such conditions.

South Africa.—The Cape Provincial Council has passed an ordinance whereby it will hereafter be lawful for any undertaker of a public electrical supply to supply electrical energy outside the area of a local authority, subject to the consent of the Administrator being obtained. The immediate object of the ordinance is to enable the Municipality of Oudtshoorn to supply electric lighting to the Divisional Council of the district, so that the Congo Caves may be illuminated.

Spennorth.—**YEAR'S WORKING.**—There is a loss of £152 on the Council's electricity undertaking for the past year, as compared with £400 for the previous year. This is considered satisfactory in view of the fact that there was an extra expense of £138 over which the Council had no control.

Sunderland.—**YEAR'S WORKING.**—The last year's working of the Corporation electricity department resulted in a revenue of £71,102, including £37,304 from power supply. After meeting working expenditure a balance remained of £30,636, and after providing for interest and sinking fund charges, the balance of £1,032, being net profit, was carried to renewals. The output sold amounted to 15,056,376 units, an increase of 3·84 per cent.; the load factor also improved from 26 to 31 per cent. The manager, Mr. Blackman, refers to narrow margin of plant capacity, and points out that the breakdown of a generator had led to estimated additions to working cost of £3,500.

Wishoch.—**PRICE INCREASE.**—The T.C. has agreed to allow the Electricity Supply Co. to increase the price of energy for lighting to not more than 6½d. per unit, owing to the great increase in the cost of fuel.

TRAMWAY and RAILWAY NOTES.

Blackpool.—**ELECTRIC VEHICLE.**—The Finance Committee has sanctioned the purchase by the Cleansing Committee of a second electric water-sprinkler, at a cost of about £1,000.

Bolton.—**ELECTRIC VEHICLE.**—A deputation from the Electricity Committee having recommended the advantages of electrically propelled vehicles, the Waterworks Committee has decided that it will consider the views put forward by the deputation when the question of motor transport is next before the Committee.

FEMALE LABOUR.—The tramway manager reported a difficulty in obtaining suitable labour for car cleaning in the night time, and has been authorised to employ women for the work. It was reported that 154 employés of the department were serving with the Colours and 18 had still to go. Forty women conductors were now employed.

Glasgow.—**YEAR'S WORKING.**—The official returns of the last year's working of the Corporation tramways show that the traffic receipts amounted to £1,149,264, an increase of £178,570 on the previous 12 months. The passengers numbered 362,371,164, an increase of 26,110,706, and the car-mileage was 24,963,309, an increase of 748,549. The receipts per car-mile were higher, although the receipts per passenger were slightly decreased. It is noteworthy that 232,871,360 passengers were carried at ½d. fares as against 93,768,671 at 1d. fares.

Launcester.—**YEAR'S WORKING.**—The borough accountants report a traffic revenue of £5,696 on the Council's tramways, against £5,633 in the previous year, an increase of £163. The expenditure increased by £435, but £500 has been set aside for depreciation. After paying interest and redemption, the net deficit is £2,012.

Leeds.—**FEMALE LABOUR.**—The tramway manager (Mr. J. B. Hamilton) has expressed his complete satisfaction with the women conductors, of whom he has now over 400. The employment of the women has released between 400 and 500 men for military service. The pay, with overtime, reaches 30s. a week.

Manchester.—**WAGES.**—As from June 1st, a war bonus is to be paid to the paviers, &c., in the tramway department. The Tramway and Vehicle Workers' Union has applied on behalf of the traffic staff for an additional war bonus, and the Workers' Union has applied for an advance of wages for certain classes of workmen. Both applications have been refused.

North London Electrification.—On Saturday morning last, a successful trial run was carried out on the recently electrified line between Broad Street and Richmond.

Nottingham.—**YEAR'S WORKING.**—The total receipts on the working of the Corporation tramway undertaking for the 12 months ended March 31st last amounted to £195,392, an increase of £16,077 compared with the previous year. Working expenses amounted to £121,266, an increase of £8,632, leaving a balance of £74,125, an increase of £7,394, carried to net revenue account. After providing for interest on loans, contribution to sinking fund, &c., the balance is to be divided, £20,350 going in aid of the rates, and £13,150 to reserve and renewals fund. During the 12 months the cars ran 3,885,322 miles, an increase of 95,465 miles over the previous year, and carried 45,741,208 passengers, an increase of 4,530,246. Since the commencement of the war 228 men have joined the Colours, and 62 left the service for munition work or other employment. There are upwards of 100 women conductors in the service, and the majority are carrying out their duties in a quite satisfactory manner. The difficulty of finding drivers has become serious, as men are leaving faster than they can be replaced. Further, the reserve of conductors suitable for training for drivers is exhausted, and very few applications for employment are being received.

Sunderland.—**YEAR'S WORKING.**—The total receipts of the Corporation tramways for the last year amounted to £79,124; traffic expenses amounted to £20,915, and the balance carried to net revenue was £34,669. From this amount, interest and sinking fund charges were paid, £5,000 was placed to rate relief, £9,784 to renewals, and other expenditure was met. The passengers carried numbered 12,208,911 as against 15,619,364 in 1915.—*Northern Press* August.

Swansea.—**TRAMWAY POWER-PLANT PURCHASE.**—At the last meeting of the B.C., it was reported in connection with the negotiations to take over the Tramway Co.'s power station, that the company had now acquired the freehold, which would be transferred to the Corporation instead of the leasehold interest. Under the agreement, the Corporation has undertaken to purchase the plant and machinery for £10,000, payment to be spread over 26 years at 4 per cent annum.

TELEGRAPH and TELEPHONE NOTES.

A Wireless Record.—It is reported that the American steamer *Ventura*, which has just arrived at Sydney from San Francisco, states that she picked up wireless messages from the station at Tuckerton, New Jersey, when she was 9,000 miles distant from that place. This is claimed to be a world's record.

Ashton-under-Lyne.—The substitution of junction for trunk circuits between Manchester and adjoining towns has been extended to Ashton-under-Lyne, with which are associated Mossley, Mottram, and Hyde.

Norway.—The Western Electric Co., Ltd., has received from the telegraph department a contract for nine automatic telephone exchanges for Christiania, having a total capacity of 30,000 lines and 35,000 subscribers' stations. The work will occupy a period of six years.

Russia.—Some time ago the Pan-Russian District Councils' League organised a telephone factory in Moscow on a small scale. As such apparatus, and most of the parts thereof, had previously been imported, the first efforts to make a complete telephone apparatus without importations met with serious mechanical difficulties. However, under pressure of the absolute necessity of having such apparatus, by the application of all available technical skill the difficulties were overcome, and solid progress has been made. The factory now employs over 200 hands, and the total production is over 50 apparatus per day.

Trans-Atlantic Telegraphy.—During the Irish rebellion many of the Atlantic cables landing on the West Coast of Ireland were for some days deprived of their land-line connections with the cables connecting Ireland with England, and were thrown idle, while the cables having direct submarine connection with England had to deal with an enormously increased traffic.—*T. and T. Age.*

The German Post Office has made arrangements to permit Swedish telegrams to be transmitted to the United States by German wireless telegraphy, subject to certain conditions.

United States.—The naval administration of the U.S. Government proposes to erect three large wireless stations, one at San Diego, California, one at Cavite in the Philippine Islands, and the third at Pearl Harbour, Hawaii. The last two will have a range of about 9,000 km., which is the distance from San Francisco to Paris. The contract has been placed with an American company. The new stations will enable the United States to communicate with Japan by wireless telegraphy.—*Journal Telegraphique.*

Wireless Telephony.—From May 6th to 8th wireless telephony was employed to transmit orders between the U.S. Government at Washington and the U.S. battleship *New Hampshire*, in Hampton Roads; the telephone was also used for communication with naval stations at New York, San Diego (Cal.), Pensacola (Fla.), and other places. During the test the *New Hampshire* was ordered to sea, and returned to her station, reporting by wireless telephone at every hour. The demonstration was successful in every respect.—*T. and T. Age.*

CONTRACTS OPEN and CLOSED.

OPEN.

Ashton-under-Lyne.—June 14th. Engine slack, for the Electricity Committee. Particulars from Borough Electrical Engineer, Wellington Road. Tenders to Mr. J. Neal, Borough Comptroller.

Australia.—**PERTH.**—July 19th. P.M.G. Supply of insulators (Schedule 510). See "Official Notices" to-day.

August 16th. P.M.G. Distilling apparatus (Schedule 502), telegraph and measuring instruments (Schedule 498). See "Official Notices" to-day.

MELBOURNE.—July 26th. Victorian Railways Commissioners. 400 signal lighting transformers.

SYDNEY.—August 24th. P.M.G. Automatic switchboard and apparatus for North Sydney Exchange. Schedule No. 511.

BRISBANE.—July 31st. P.M.G. Power board and accumulators. Schedule No. 381.

Halifax.—June 17th. Steelwork over the dam at the electricity works. Mr. James Lord, Borough Engineer, Town Hall, Halifax. Deposit £1 (returnable).

Keighley.—June 10th. Fitting up the Keighley and Bingley War Hospital, Morton Banks, with electricity. Messrs. Moore & Crabtree, Architects, Keighley.

London.—**ST. PANCRAS.**—June 13th. B.C. Twelve months' supply of steam coal for the Electricity Department Borough Electrical Engineer.

L.C.C.—June 19th. Asylums and Mental Deficiency Committee. Electric lamps for three months. Mr. H. F. Keene, Clerk, 2, Savoy Hill, Victoria Embankment, W.C.

New Zealand.—**PAHIATUA.**—July 10th. Borough Council. Overhead wires, poles, street lamps, gas engines, producers, dynamos, auxiliary apparatus and accumulators. Specifications from Borough Offices or Mr. E. J. Fenn, Consulting Engineer, Auckland.*

INVERCARGILL.—September 28th. Borough Council. Steam turbo-alternator, condensing plant and switchgear. Specifications from the Tramway Office.

Spain.—June 22nd. Municipal authorities of Sancti Spiritus (Province of Salamanca). Concession for the electric lighting of the town during an undetermined period.

June 28th. Municipal authorities of Infantes (Province of Ciudad Real). Concession for the electric lighting of the town during a period of five years.

The municipal authorities of Puebla del Maestra (Province of Badajoz) have lately invited tenders for the concession for the electric lighting of the town during a period of 10 years.

Stoke-on-Trent.—Coal and slack for the Corporation electric works for a year. Chief Electrical Engineer, St. Peter's Chambers.

Torquay.—June 19th. Corporation. 5,500 tons of coal for use with mechanical stokers for the Electric Lighting Committee. Mr. F. S. Hex, Town Clerk.

West Ham.—June 22nd. B. of G. Electrical fittings for three months. Mr. T. Smith, Union Offices, Union Road, Leytonstone, N.E.

Wolverhampton.—June 16th. Electricity Department. Coal and ash-handling plant. See "Official Notices" to-day.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Bury.—T.C. Washed slack, for the electricity works : Pemberton Colliery Co., Ltd.

Dewsbury.—Electricity and Tramways Committee. 2,000 tons of coal, for the electricity works : Crawshaw and Warburton, Ltd.

Installation Contracts.—The following contracts were placed with Messrs. H. J. Cash & Co., Ltd., during May :—

Admiralty.—Electric lighting installation, Chatham.

War Office.—Provision of L.T. cables and distributors, and electric light installation, Dover. Special fittings for operating theatres.

Post Office.—Electric power circuits and mains, telegraph factory, Birmingham.

L.C.C.—Electric light installation, Southampton Street School, Camberwell; ditto, Haverstock Hill School, London, N.W. (See list of tenders below.)

Keighley.—The Keighley and Bingley Joint Hospital Board. Accepted tender : Craven and District Private Telephone and Electric Co., at £216, for the electric lighting of the permanent hospital buildings and the sanatorium.

Leyton.—The District Council is entering into a year's contracts with the Electrical Apparatus Co., Ltd., the Reason Manufacturing Co., Ltd., and Messrs. Chamberlain & Hookham for ordinary electricity meters; also with the B.I. & Helsby Cables, Ltd., for slot meters. The British Thomson-Houston Co. wrote stating that under present conditions they were unable to enter into a contract, as their meter factory was otherwise engaged.

Llanfyllin.—T.C. Accepted tender for the lighting of the streets by electricity for one year, subject to renewal : Mr. R. A. Jones.

London.—London Education Committee. Tenders for installing electric light in the undermentioned schools :—

SOUTHAMPTON STREET, CAMBERWELL.

H. J. Cash & Co., Ltd.	(accepted)	£416
Alpha Manufacturing Co.		491
Poole & Milne, Ltd.		554
Lund Bros. & Co.		598
Alex. Hawkins & Sons		523

HAYESTOCK HILL, ST. PANCRAS.

H. J. Cash & Co., Ltd.	(accepted)	£101
W. C. Tackley & Co., Ltd.		305
Tredgare, Ltd.		399
Poole & Milne, Ltd.		378
Pinching & Walton		410

The Committee will open and accept tenders received during the Whitesun recess for installing electric light in the County Secondary School, Forest Hill.

HAMMERSMITH.—Tenders received by the B.C. for panels required for new switchboards at Shepherd's Bush sub-station :—

Park Royal Eng. Co. (accepted) £18	Ferranti, Ltd.	£29
Edison & Swan	Johnson & Phillips	80
Switchgear & Cowans	Electric Const. Union Co.	81
Reynolds & Co.	Siemens Bros. & Co.	33
Bertram Thomas	General Electric Co.	41

Manchester.—Electricity Committee :—

L.P. pipework and valves.—Aiton & Co., Ltd.

Switchgear.—B.T.H. Co., Ltd.

Two water-tube boilers, drain pipes.—Babcock & Wilcox, Ltd. (Sub-contractors : Economisers, E. Green & Sons, Ltd.; lagging, Newall's Insulation Co., Ltd.)

Cable.—Prest-Electric Cable Works, Ltd.

10,000-kw. turbo-generator, also switchgear.—B.W. Electric & Manufacturing Co., Ltd.

Two motors.—Phoenix Dynamo Mfg. Co., Ltd.

Tramways Committee. Accepted tender :—

Block tin.—Williams, Harvey & Co., Ltd.

Salford.—Electricity Committee. Accepted tenders for materials to March next :—

W. T. Glover & Co., Ltd.—Unarmoured cable, schedule of prices.

Key Engineering Co., Ltd.—Fibre pipes, approx. £100.

Doulton & Co.—Stoneware pipes, troughs, etc., £500.

Albion Clay Co.—Stoneware conduits, £300.

Also accepted :—

United Electric Car Co., Ltd.—Permanent-way wagon body, £159.

British Westinghouse Co., Ltd.—Auxiliary steam turbine, £740.

G. & J. Weir, Ltd.—Two rotor-feed pumps, £550.

Tenders have also been accepted for the erection and equipment of a sub-station in Blackfriars Road as follows :—

Wm. Gonnall.—Building, also machine foundations, £3,390.

British Westinghouse Co., Ltd.—Three-phase z.n.p. switchboard, £1,203.

Bertram Thomas.—Continuous-current switchboard, £2,215.

Materials required in connection with the Willans & Robinson 5,000-kw. turbo-alternator :—

Stewarts & Lloyds, Ltd.—Steel pipes and separator, £159.

Stanton Ironworks Co., Ltd.—Cast-iron pipes and valves, £772.

The Electricity Committee has approved the proposal of Messrs. J. Gerrard & Sons, Ltd., to sub-let the steelwork portion of the contract for the foundations for a turbo-generator to Messrs. Thomas Prickett & Sons.

FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Friday, June 9th. At 5.30 p.m. At Albemarle Street, Piccadilly, W. Lecture on "Eyesight and the War," by Dr. E. Clarke, F.R.C.S.

Chief Technical Assistants' Association.—Saturday, June 10th. At 3 p.m. At the Tavistock Hotel, Covent Garden, W.C. Discussion on "The Advantages and Disadvantages of Various Types of Mechanical Stokers."

Institution of Electrical Engineers. Thursday, June 15th. At 5.15 p.m. At the Institution Building, Victoria Embankment. Special meeting of Corporate Members to confirm the resolution to exclude alien enemies from membership.

Chemical Society.—Thursday, June 15th. At 8.30 p.m. At Burlington House, Piccadilly, W. Ordinary scientific meeting.

Physical Society of London. Friday, June 16th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Ordinary meeting.

NOTES.

Power and Heat for Chemical Plants.—In a letter addressed to *Mech. and Chem. Engineering*, attention is drawn to the great economy that can be effected by using exhaust steam for heating purposes. The writer says :—

"If it be assumed that 25 per cent. of the heat units of the coal is required in the development of electric energy in an electrochemical plant employing steam, then that plant should be developed for utilising the remainder of the available heat units of the fuel (chiefly in the form of the latent heat of the steam) in multiple-stage evaporating, &c. By so doing the electric energy required for the electrochemical work would be largely a by-product. There are many purely chemical operations where a large preponderance of heat over power is necessary.

"It is conceivable that great plants where heat (at low temperatures) is king, might well put in electric generators and thus obtain electric energy at very low cost. There are great industries in practically all manufacturing communities, where the two great forms of energy, heat and electricity, might mutually complement each other. As the situation now stands, we have great central lighting and power stations wasting 75 per cent. of the heat units of the coal in condensing the steam; and, on the other hand, we have vast sugar refineries and other industries whose chief need is steam-heat. From a heat standpoint they should operate in combination."

If this course were followed, not only could steam compete with water-power, but it might even be found to possess an advantage over the latter.

Clyde Valley Workers.—Mr. James Macdonald, Edinburgh, arbitrator under the Munitions of War Act, has rejected the claims of the labourers employed by the Clyde Valley Electrical Power Co. for increased wages, time-and-half overtime rates, and double pay for Sunday work.

Cobalt for Thermocouples.—In a paper read before the American Electrochemical Society, Prof. O. L. Kowalske advocated the use of cobalt in thermocouples, stating that it was strong and gave a high E.M.F., did not grow brittle like nickel, and could be obtained in a fairly pure state. The combination of cobalt and constantan gave a particularly satisfactory couple. Unfortunately, at present the metal is costly.

Safety Lamps.—The Home Secretary has approved the following safety lamps for coal mines :—

Best's "Excelsior" Lamp, No. 3.

Best's "Cautelous" Lamps, No. 1 and No. 1A.

"Freswick Patent Protector" Lamp.

Rothwell and Co.'s "A3," "B3," "C3," "D3," and "E3" Lamps.

Teale's Mueseler or Thornbury No. 6 and No. 6A Lamps.

Teale's No. 1 Miners' Electric Safety Lamp.

Foreign Trade.—THE MAY FIGURES.—The following are the electrical and machinery figures given in the official returns for May:—

IMPORTS.	Month		Inc. or dec.	
	of	or	to date compared	with 1915.
Electrical goods and apparatus, excluding machinery and un-insulated wire...	May.	dec.		
£186,489	£298,901	+	£294,569	
Machinery	£86,846	81,957	+	70,969

EXPORTS.	Month		Inc. or dec.	
	of	or	to date compared	with 1915.
Electrical goods and apparatus, excluding machinery and un-insulated wire...	May.	dec.		
£81,164	147,591	+	307,977	
Machinery	1,920,850	90,550	—	310,417

Terrestrial Magnetism.—The report of the Astronomer Royal for the past year states that the magnetic declination is decreasing at the rate of nearly 10 minutes of arc per annum, the declination at Greenwich Observatory being now less than 15°. The magnetic dip, having passed through a minimum, is slowly increasing, and the horizontal force, after remaining at a maximum for some years, has been decreasing since 1912.

Danish Peat Fuel.—Electrical enterprise falls within the scope of the operations which the Danish Teknisk Forening have set themselves, and in 1903 that society instituted a prize of 1,000 kr. for a competitive essay for "the best means of utilising peat as a source of energy for electricity works," the object being to turn to advantage the extensive peat moors existing in Denmark. Various essays have since, at times, been submitted, showing the feasibility of utilising the gas extracted from peat for driving large electricity works. This year the society again invites essays on the best means of recovering and employing the gas for heating and driving purposes, as also the nitric acid and ammonia obtained for other uses.—*Den Tekniske Forenings Tidsskrift.*

Patents, Designs, and Trade Marks.—The report of the Comptroller-General of Patents, Designs, and Trade Marks for 1915 states that during the year 151 applications for the avoidance or suspension of patent rights were made; licences were granted in 117 cases, 1 patent was suspended, 4 licences were avoided, 6 applications were refused, and 7 abandoned. The number of applications filed for patents was 18,191, compared with 24,820 in 1914 and 30,077 in 1913; the number of patents sealed was 11,457, compared with 15,636 and 16,599 in the two preceding years. The receipts from fees were £275,087, a decrease of £36,191, and the surplus of receipts over expenditure was £94,298, as compared with £128,062 in 1914. Renewal fees amounted to £183,929, a decrease of £1,146, and the sealing fees to £12,837, a decrease of £1,841. The number of applications for the restoration of lapsed patents was 26; 18 were granted, and others are pending. Only three patents are in force which have been prolonged beyond the normal period of 14 years.

Electric Smelting in Newfoundland.—The Hydro-Electric Smelting Co., Ltd., has recently installed an electric copper smelter at St. John's, Newfoundland. Tests have been made on ore from the Little Bay copper mines, with satisfactory results.

Volunteer Notes.—1ST LONDON ENGINEER VOLUNTEERS.—Orders for the week by Lieut.-Col. C. B. Clay, V.D., Commanding.

Monday, June 12th.—Technical for Platoon No. 9, 16 Regency Street, S.W.; Squad and Platoon Drill, Platoon No. 10; Signalling Class and Recruits.

Tuesday, June 13th.—School of Arms, 6 to 7; Recruits, 7.15 to 8.15.

Wednesday, June 14th.—Platoon Drill, No. 2 Platoon.

Thursday, June 15th.—Platoon Drill, No. 6 Platoon; Shooting for No. 9 Platoon. Miniature Range; Recruits, 5.15 to 7.15; Instructional Class, 5.45.

Friday, June 16th.—Technical for No. 10 Platoon, 46, Regency Street, S.W.; Squad and Platoon Drill, No. 9 Platoon.

Saturday, June 17th.—Probable date of inspection by Lord French. Special orders will be issued.

Sunday, June 18th.—Entrenching duties: Parade, Victoria Station (S.E. & C. Railway Booking Office), 8.35 a.m.

MACEFORD YEARLEY, Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, June 8th, 1916.

Week-End Orders.—**Saturday.**—The Battalion will Parade outside Baker Street Station at 2.30 p.m., and proceed by train to Wembley Park for Drill under the Commandant.

Sunday.—The Battalion will Parade at Liverpool Street Station (Low-Level entrance, G.E.R.), at 9.30 a.m., and proceed by train for Entrenching duties.

G. H. F. DUNCAN, Adjutant, Adjutant, O.B.C., Platoon Commander.

Technical College for Middlesbrough.—The *Times* states that Mr. Joseph Constantine, a Middlesbrough shipowner, has given £10,000 towards a scheme for the establishment of a technical college in the town, and other local firms have promised £15,000.

Institution Notes.—National Electric Light Association, U.S.A.—At the end of last month the annual convention of the "N.E.L.A." was held at Chicago. The Association

was formed in 1885, and now has a membership of over 11,700, representing, according to the *Electrical World*, nine-tenths of the electricity supply industry of the United States, which possesses an aggregate capitalisation of 600 millions sterling and an annual revenue of 90 millions.

Institution of Electrical Engineers.—On Thursday next, June 15th, at 5.15 p.m., a special meeting of Corporate Members will be held to confirm the resolution which was passed on May 25th to exclude alien enemies from membership. It is to be hoped that members will not regard this as a mere formality, and fail to attend in sufficient numbers to ratify the resolution; it is important that they should not now slacken their efforts, but be present in force to complete the work to which they have set their hands.

Inquiries.—Makers of electrical condensers of large capacity, and machinery for manufacturing small pocket batteries for flash-lights, are asked for.

Appointment Vacant.—Engineer for telephone system in India. See our advertising pages to-day.

The Organisation of British Engineering Industry.—The following resolutions were unanimously carried at a general meeting of the Council for the Organisation of British Engineering Industry (Manufacturing Engineering Concerns Section), held in Manchester on Tuesday last:—

"1. That this meeting approves the steps taken to organise British Engineering Industry by the Council appointed on December 6th, 1915.

"2. That this meeting approves the formation of an Association on the lines advocated in the memorandum circulated, with power to negotiate, and if advisable to amalgamate or combine with existing or projected Associations; and this meeting pledges itself to support such an Organisation.

"3. That those firms who by signing the card have promised their adhesion and support to the Organisation be asked to subscribe to the funds of the new Association, and to make forthwith a minimum payment of £5 on account of their first year's subscription towards preliminary expenses.

"4. That the existing Committee be empowered to give effect to the resolutions passed at this meeting."

Skin Effect in Strip Conductors.—In the *Electrical World*, Mr. H. B. Dwight has given a practical way to calculate the skin effect in strip conductors—that is, the ratio of the alternating-current resistance to the direct-current resistance.

SKIN EFFECT IN CABLE AND STRIP CONDUCTORS.

The curve shown in the figure, which is self-explanatory, applies to strip of copper, aluminium or other non-magnetic conductor. The strip should not be close to the return conductor; that is, there should be an air space between the strip and the return conductor somewhat greater than the width of the strip. The thickness of the strip should not be more than about one-tenth the width, otherwise the value of skin effect will lie intermediate between the curves for strip and wire. The curve applies to a single strip, and not to the case where two or more strips are close together and connected in parallel, as in ventilated bus-bars. The curve is applicable for any temperature, since the value of the resistance R is to be taken for the temperature required.

Resistance Alloys.—Messrs. F. M. Sebast and G. L. Gray read a paper at a recent meeting of the American Electrochemical Society on alloys of nickel and chromium with copper and manganese. They stated that an alloy of 15 Cu, 85 Ni, 20 Cr, had a very high resistivity (112 microhms per cm.), and a negligible temperature coefficient (0.000078). An alloy containing approximately 85 Cu, 45 Ni, 15 Mn had a resistivity of 70 microhms per cm., and a zero temperature coefficient at 20°C. This they considered a better resistance alloy than any at present used for precision apparatus.

Russian Copper Production in 1915.—According to a statement issued by the Military Industrial Committee, the total production of copper in Russia in the year 1915 amounted to 1,587,155 pounds, against 1,919,721 pounds in 1914 and 2,095,289 pounds in 1913. The production per district in the last three years was as follows, in pounds:—

	1913.	1914.	1915.
Urals	1,055,122	1,035,057	1,043,892
Caucasus	610,661	495,887	233,559
Siberia	345,273	342,881	259,123
Chemical and refining works	84,233	86,396	50,281
	2,095,289	1,949,721	1,587,155

Embargo on the "E.T.Z."—It is reported in *l'Industrie Electrique*, on the authority of the Swiss *Elektroindustrie*, that the German Government has forbidden the transmission abroad of the *Elektrotechnische Zeitschrift*, the official organ of the German *Elektrotechnischer Verein* and the *Verband Deutscher Elektrotechniker*. The *E.T.Z.* has never busied itself with war affairs, but our contemporary suggests that the interdiction is due to the desire of the Government to conceal from foreign eyes the scarcity of certain materials such as copper and aluminium, which is revealed by the publication of official regulations for the use of zinc and iron as electrical conductors. If so, it comes too late.

The Metric System.—On April 1st, 1916, the old systems of weights and measures in use in Denmark were abolished and the metric system came into force.

Germans and Austrians Suing in the Courts.

In the City of London Court, on June 6th, A. T. Speedometer, Ltd., assignees of George Zimmermann, of London, E.C., sued Stanley & Co., of Southend, for £10 for goods supplied. Defendants objected to pay because plaintiffs were Germans. Mr. H. Snowman, plaintiffs' solicitor, said that Zimmermann was a German, and he was interned. While he was an alien enemy he did not come within the scope of the Defence of the Realm Act. A man named Max Niechy, who said he was an Austrian who was exempt from internment (although he was not naturalised), having lived in England for 10 years, was called to prove the assignment. The plaintiff company, he said, was now in liquidation, and was under the control of the Board of Trade. The majority of the shareholders were Austrians and Germans. Some of them were in England and some in Germany. Judge Atherley Jones, K.C., said he must find for the plaintiff with some reluctance, having regard to the last decision of the Court of Appeal, as that was the law until the House of Lords gave its long-deferred judgment. In his humble view, the opinion of the Court of Appeal enabling such companies to sue was not the law of the country. Therefore, as the company was registered in England, it was entitled to recover, notwithstanding the fact that the beneficiaries were alien enemy shareholders resident, or carrying on business, in enemy territory. But the money would be kept in Court until after the war was over. That was a security against the money leaving the country.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Mr. P. PRIESTLEY, the engineer and manager of the Mexborough and Swinton Tramways Co., who is about to leave to take up the management of the Oldham Corporation tramways department, was the recipient of a presentation and good wishes at the Tramways Institute, Rawmarsh. The presentation took the form of a silver tea service.

Mr. G. H. BROWNE, A.M.I.E.E., acting engineer and manager of the Borough of Ilkeston tramways and electricity department, has been appointed manager and engineer of the Mexborough and Swinton Tramways Co., at £400 per year, succeeding Mr. P. Priestley.

Mr. W. G. STOCK has been appointed chief engineer at the Hindhead (Surrey) electricity works.

On May 4th one of the employees at the Fulham electricity works (J. Fish) was struck by the crane on the Quay Wall at the Townmead Wharf, and knocked insensible into the river at high tide. Shift engineer T. H. WELCH promptly jumped in and saved him. The Electricity Committee has very fittingly passed a resolution congratulating Mr. Welch upon his courage and skill, and recommending him for the Royal Humane Society's Medal or Certificate.

The original list of 42 candidates for the position of tramways manager at Belfast has been reduced to six. The question of the appointment has been referred to a sub-committee of the Tramways and Electricity Committee for consideration and report.

General.—Mr. J. ARTHUR SYKES, M.I.E.E., assistant to general manager of Messrs. Wm. Beardmore & Co., Ltd., Glasgow, has resigned this appointment in order to take up that of works manager to the Yorkshire Copper Works, Ltd., Leeds.

In the list of aliens to whom certificates of naturalisation were granted during May, the following entries appear:—J. Prosper Dethier (known as John Prosper), Belgium, electrician, residing at Palmers Green, Middlesex.

F. O. C. Nielsen, Denmark, retired manager of a telegraph company, residing at Westminster.

Coun. JAMES HEALD, head of the firm of Messrs. Calvert and Heald, electrical engineers, Lancaster, and chairman of the Lancaster Electricity Committee, has been elected Alderman of the Borough, of which he was Mayor in 1904-5.

Prof. DOBSON, general manager of the Johannesburg municipal gas, electric, and tramway departments, has been appointed Major in command of two Pioneer Corps for service in East Africa. Each Corps is to consist of 120 men, and is intended to be formed of men skilled in the use of explosives.

Mr. J. M. GRAY, assistant engineer and electrician at the Maypole Margarine Works, Southall, has retired after 23 years' service. He was presented with a gold watch by the directors, a canteen of plate by the heads of departments, and a marble clock by the engineering staff. The Maypole Co. produces its own power, the average output being over 1,500,000 units per annum, the installation comprising over 100 motors.

Mr. G. S. HERSCHELL and Mr. T. BIRKETT, who have both been 43 years in the service, has been appointed to succeed Messrs. H. M. Knight and T. Warden (retired), as superintendents in the telegraph department of the Edinburgh Post Office.

London Gazette notice:—Territorial Force, Royal Engineers. *Tyne Electrical Engineers:* Staff Sergeant ADDISON STANLEY BURDIS to be Second-Lieutenant (on probation).

Mr. C. LA MAISTRE, secretary of the International Electro-technical Commission, arrived in New York on May 12th on a mission to the electrical engineering societies of the United States and Canada with regard to the adoption of international standards for electrical machinery, &c.

Birthday Honours.—In the list of King's Birthday Honours are the following, to whom we tender our congratulations:—

Knighthoods are conferred upon: GEORGE T. BILBY, Esq., F.R.S., the well-known chemist; E. C. GEDDES, Esq., Deputy-Director-General of Munitions, and formerly of the North-Eastern Railway.

Appointed C.B.'s:—Capt. M. H. P. RIAL SANKEY, late R.E.; the Hon. ARTHUR STANLEY, M.V.O., M.P.; GEORGE E. PEMBERTON MURRAY, Esq., Secretary to the Post Office; W. H. BEVERIDGE, Esq., Assistant Secretary, Board of Trade; U. F. WINTOUR, Esq., C.M.G., Director of Contracts, War Office.

Roll of Honour.—In the first list of losses of officers in the great battle of the North Sea, May 31st, we find the names of the following:—

Warrant Electrician LAWRENCE GATT, H.M.S. *Queen Mary*.

Warrant Telegraphist ERNEST KEMP and Warrant Electrician ARTHUR C. WORTHINGTON, H.M.S. *Invincible*.

Warrant Electrician ARTHUR BEALES, H.M.S. *Indefatigable*.

Warrant Telegraphist HENRY ABERREY, H.M.S. *Defence*.

Acting Warrant Telegraphist HARRY BURNELL and Warrant Electrician E. G. GOAD, other ships.

Mr. JOHN REGINALD HATCH, an electrician on the *Queen Mary*, which was lost in the big sea fight last week, was employed at the Southport electricity works prior to his enlistment in the naval service, being apprenticed to Mr. A. Bluck, the borough electrician engineer.

Private A. McCULLOCH, of the Loyal North Lancashire Regiment, formerly employed at the Peel-Conner Telephone Works, Salford, has died from wounds received in action.

The death in action of Private CHAS. HOLDWAY, Loyal North Lancashires, who, prior to the war, was engaged at the works of Messrs. Dick, Kerr & Co., Ltd., Preston, is reported.

Mr. C. R. STEELE, of the Somerset Light Infantry, who has fallen in action in France, was, until the war broke out, engaged at Siemens Bros. Dynamo Works, at Stafford.

Mr. HARWOOD MAULKINSON, of the Royal Naval Reserve, formerly an electrician at Fleetwood, has lost his life through the minding of a trawler in the Mediterranean whilst on patrol work.

The Distinguished Service Cross has been awarded to the following officer in recognition of his services whilst employed on transport duties at the Dardanelles:—

HAROLD G. E. WIGHTMAN, Officer Commanding cable ship *Levant*, who rendered good services in connection with the laying of the cable from Imbros to Suvla on the night of the Suvla landing, and in laying and repairing cables off the peninsula frequently under heavy fire.

The following officers are mentioned for good services whilst employed on transport duties at the Dardanelles:—

ALAN HENRY BLACK, Chief Officer, cable ship *Levant*.

ALFRED L. SPALDING, Chief Electrician, cable ship *Levant*.

THOMAS C. BIRBECK, Assistant Electrician, cable ship *Levant*.

ALEXANDER S. HENDERSON, Chief Engineer, cable ship *Levant*.

ARTHUR HILL, Cable Joiner, cable ship *Levant*.

The Distinguished Service Medal is to be awarded to Wireless Telegraph Operator (First Class) A. ANDREWS, R.N.R., O.N. 13 W.T.S.

Obituary.—MR. LESLIE S. ROBERTSON.—Amongst the staff of Lord Kitchener on board H.M.S. *Hampshire* was Mr. L. S. Robertson, whose death will be lamented by the engineering world, and is to ourselves a personal loss. Mr. Robertson was best known as the Secretary of the Engineering Standards Committee, a position which he filled with the greatest ability from the formation of the Committee in 1901 to the time of his death; in July, 1915, he received an appointment at the Ministry of Munitions as Assistant to the Director of Production, in which capacity he was accompanying Lord Kitchener to Russia. He was the youngest son of Sir W. R. Robinson, sometime Governor of the Presidency of Madras (the family name "Robertson," its original form, having been resumed in 1898), and entered engineering life at the works of Messrs. Denny Bros., Dumbarton; he afterwards joined Messrs. John I. Thornycroft & Co., of Chiswick. He was the author of a standard work on steam boilers, and a member of the firm of Robertson & Ontram, consulting engineers; he also took an active part in the management of engineering concerns, being a director of a large number of companies, and chairman of two of them. His loss will be long and widely felt, not only in the engineering world, but also in social circles, for he was a most genial and warm-hearted companion, and of a kindly disposition.

MR. D. T. MILES.—The death occurred on Monday of Mr. D. T. Miles, mains engineer, Bath Corporation electricity works. He was taken unwell with tonsillitis on Saturday morning. He had for 15 years held the position of mains engineer at Bath, and had been solely responsible to Mr. Francis Teague, the electrical engineer, for the whole of the outside work. He assisted to lay the original cables in Bath in 1889, when he was a foreman for Callender's Company, the contractors. Mr. Miles's death is deeply regretted, for he was one of the best known men in Bath. He leaves a widow and four children.

NEW COMPANIES REGISTERED.

Mander & Co., Ltd. (143,989).—This company was registered on May 31st, with a capital of £2,000 in £1 shares, to take over, as from April 1st, 1916, the business of electrical and mechanical engineers now carried on at 25, Hockley Hill, Birmingham, and to adopt an agreement with A. F. Mander. The subscribers (with one share each) are: A. F. Mander, 28, Dave Road, Handsworth, electrical engineer; L. E. Bondall, 20, Greenhill Road, Moseley, baker and confectioner. Private company. The first directors are: A. F. Mander, and J. L. Bondall (both permanent). Solicitor: E. H. Cotterbach, Minorities' Chambers, Birmingham. (Registered office: 125, Hockley Hill, Birmingham.)

Galloway Engineering Co., Ltd. (9,604).—This company was registered, in Edinburgh, on May 26th, with a capital of £40,000 in £1 shares, to carry on the business of engineers, electricians, chemists, &c. The subscribers (with one share each) are: D. L. Forrest, 116, Hope Street, Glasgow; C. Finlayson, 160, West George Street, Glasgow. Private company. The number of directors is not to be less than two or more than seven; the first are: Major H. R. Alexander and R. H. Ballantine, Qualification, £100. Registered office: Shakespeare Street, Dumfries.

Telephone Motor Works, Ltd. (143,934).—This company was registered on May 26th, with a capital of £1,000 in £1 shares, to take over the business of motor engineers, makers and repairers, &c., carried on as the Telephone Motor Works at 11a, Allsop Place, Baker Street, W., and elsewhere. The subscribers are: J. J. Watt, 11a, Allsop Place, Baker Street, W., engineer, 200 shares; C. W. G. Green, 28, Rectory Road, Stoke Newington, N., law clerk, 350 shares. Private company. The number of directors is not to be less than three; the first are: J. J. Watt (managing director) and C. W. G. Green (Solicitor: A. Sargeant, 207, Union Court, Old Broad Street, E.C.). Registered office: 11a, Allsop Place, Baker Street, W.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

C. A. Vandervell & Co., Ltd.—Particulars of £100,000 debentures, created by resolutions of March 24th and May 15th, 1916, filed pursuant to Section 93 of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital and leasehold and leasehold property. No trustees.

Baxendale Bros., Ltd.—Particulars of £2,000 debentures, created May 11th, 1916, filed pursuant to Section 93 of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Pritchett & Gold and Electrical Power Storage Co., Ltd.—In part on May 12th, 1916, of deeds of a mortgage on land and buildings at Highfield, Feltham, Mdx., to secure all moneys due or to become due from company to Barclay & Co., Ltd., 55, Victoria Street, S.W., stamped to cover £3,000 registered. A return of satisfaction in full on May 11th, 1916, of charge dated July 29th, 1915, stating all moneys due or to become due from company to Barclay & Co., Ltd., has also been notified.

Berkeley & Young, Ltd. (formerly Berghill & Young, Ltd.) (95,405)—Return dated September 21st, 1915, filed April 20th, 1916. Capital, £12,000, in £1 shares. 10,010 shares taken up, £7 paid, £10,003 considered as paid. Mortgages and charges: Nil.

British L. M. Ericsson Manufacturing Co., Ltd. (79,061).—Capital, £200,000, in £1 shares (99,990 preference and 100,010 ordinary). Return dated 1st, 29th, 1916. All shares taken up, £1 per share called up on 50,010 ordinary, 8s. per share on 50,000 ordinary, and £1 per share on 99,990 preference. £170,000 paid, £20,000 (12s. per share) considered as paid on 50,000 ordinary. Mortgages and charges: £20,000.

Electro Galvanizers, Ltd.—Particulars of £4,000 debentures, created May 9th, 1916, filed pursuant to Section 93 of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

CITY NOTES.

Lancashire Dynamo and Motor Co., Ltd.

After providing for debenture and bank interest, and charging extra depreciation on machinery and plant on account of war wastage, the profit for the year ended December 31st, 1915, was £31,534, plus £1,118 brought forward. The dividend on the preference shares, 3½ per cent., is paid, and interim and final dividends and bonus on the ordinary shares total 12½ per cent. for the year, free of tax, as against 8 per cent., free of tax, for the previous year. Directors' fees require £1,400, £14,992 is put to reserve (making it £42,000), and £1,450 is to be carried forward. The profit as shown for the past year is considerably greater than the pre-war average years (1912 and 1913), but this is almost entirely caused by additional output, partly at Trafford Park works, but mainly at a specially equipped new works for war service. The total number of persons employed in 1915 was double the average of the two pre-war standard years. The current year's orders on hand are very large, and might be still further increased if they could be executed, but the shortage of men continues. Women in considerable numbers have been engaged and successfully trained for working the smaller machines installed in the new works. The annual meeting was held on Monday last.

German Electrical Companies.

The Hoch Frequenz Maschinen A.G., of Berlin (Goldschmidt machines for wireless telegraphy) has been absolved from submitting accounts for the past year.

The Kabelwerk Duisburg, of Duisburg, recommends the payment of a dividend of 18 per cent. for 1915, as in the previous year, together with a bonus of 12 per cent.

The accounts of the Kabelwerk Wilhelminenhof, of Berlin, which belongs to the Carlswerk group, show net profits amounting to £12,200 for 1915, as compared with £10,500 in the previous year on an ordinary share capital of £50,000.

The Ver. Isolatoren Werke, of Berlin-Pankow, report that the company's activity in peace manufactures (insulators, &c.) further diminished in 1915, although extensions of buildings and machinery were necessary for the execution of Army orders. No dividend was paid for the previous year, and the net profits of £600 earned in 1915 also do not permit of any distribution on the ordinary capital of £50,000.

The accounts of Felten & Guillaume, Carlswerk, of Cologne-Mulheim, for 1915 indicate net profits, after appropriating £149,000 for depreciation, as against £111,000 in 1914, amounting to £353,000, as compared with £300,000 in the previous year. A dividend of 11 per cent. is in contemplation, as compared with 8 per cent. in 1914. It is proposed to increase the share capital to £3,000,000 by the issue of new shares for £250,000.

The report of the C. Lorenz A.G. (Telephone and Telegraph Works), of Berlin-Schöneberg, states that the turnover in 1915 experienced a considerable increase, and most of the business was for war contracts. The orders referred almost exclusively to articles of bulk production, and special plant had to be obtained for their manufacture. Including the balance from 1914, the accounts show net profits amounting to £83,000, as compared with £50,000 in the preceding year, and a dividend of 34 per cent. is proposed, as against 32½ per cent. in 1914. It is now intended to increase the share capital to £225,000 by the issue of new shares for £75,000, at the price of 175 per cent.

The Deutsch-Überrheinische Elektrizitäts Gesellschaft, of Berlin, which owns large supply works at Buenos Aires and other towns in South America, reports gross receipts amounting to £1,520,000 for 1915, against £1,495,000 in the previous year. After defraying general expenses, interest charges, &c., there remain gross profits of £1,118,000, as against £1,105,000, of which depreciation and reserve funds have absorbed £371,000 and £353,000 in the two years respectively. The directors recommend the payment of 6 per cent. on the preference capital, as compared with 5 per cent. in 1914, and 10 per cent. on the ordinary shares, as in the preceding year.

The report of Hartmann & Braun A.G., of Frankfurt-on-Main, states that the production of munitions, which began at the end of 1914, was brought into full operation in 1915, and new electrical measuring instruments were also required for the defence of the country. Thanks to the large stocks of measuring apparatus, the company was able to supply customers in neutral countries in so far as legal regulations did not impose an embargo. After allocating £26,000 to depreciation, as compared with £12,000 in 1914, the accounts exhibit net profits of £98,000, as against £15,000, and the dividend proposed is at the rate of 12 per cent., this contrasting with 8 per cent. for 1914.

The directors of the Akkumulatoren Fabrik A.G., of Berlin-Hagen, report that the works were well employed in 1915, and the turnover of the German and Austrian works rose from £1,011,000 in 1914 to £1,229,000 last year. Increases in sale prices were made to equalise the dearness of raw materials and higher wages, so as to earn the profits usual in peace times. It was impossible to give any information regarding the company's foreign undertakings, as communications, even with neutral countries, were difficult. The net profits total £138,000, as compared with £148,000, but as no special war dividend grant is provided for, as against £26,000 set aside

for this purpose in 1914, the dividend is at the rate of 20 per cent., as compared with 15 per cent. in the preceding year.

The report of the *Deutsch Sudamerikanische Telegraphen Gesellschaft, of Cologne*, states that the cable between Montevideo and Pernambuco was still in operation during the first eight months of 1915. On September 13th, however, the cable was severed, and since that date the company's network has been at a standstill. The *Compania Telefonica-Telegrafica del Plata*, of Buenos Aires, in which the company is interested to the extent of £106,000, again concluded its year's working with a slight loss, and the Cologne company consequently transferred £15,000 from the disposition fund, so as to provide a reserve for this investment. The net profits are returned at £41,000, as compared with £59,000 in 1914, and a dividend of 6 per cent. is proposed, being the same rate as in the previous year.

The report of the *Deutsch-Atlantische Telegraphen Ges., of Cologne*, states that it could not be foreseen when the repair of the company's interrupted cables and the resumption of working could take place. The news from the Vigo station was good, and the information from Horta to the end of March, 1916, was also favourable. The gross profits declined by £62,000 in 1915, as compared with the previous year. After meeting general expenses, the accounts indicate a loss of £43,000, which is reduced to £26,000 through the balance brought forward from 1914. By the appropriation of £100,000 from the special reserve fund, it is possible to extinguish the deficit and pay a dividend of 6 per cent. on the ordinary share capital of £1,200,000, as compared with 6½ per cent. in 1914, and 7½ per cent. in each of the four preceding years.

The report of the *Bergmann Elektrizitäts Werke* for 1915 states that while the departments reserved for peace manufactures had to work at a restricted output owing to the State seizure of various raw materials, those devoted to the production of war materials had to work with continuous day and night shifts. A considerable increase in the turnover took place as compared with the preceding year, and the sale prices were adjusted to the dearer raw materials and higher wages. The greater total profits were not only due to the execution of war contracts, but also to the sale at good prices of stocks which were previously entered at a low valuation. In order to render the undertaking independent as far as possible in the provision of raw materials, the company had embarked upon the working up of metals in substitution for those which were requisitioned by the Government. The dividend, as previously reported, is at the rate of 10 per cent., as against 5 per cent.

Indo-European Telegraph Co., Ltd.

The adjourned general meeting was held on May 30th, Mr. J. H. TRITTON presiding. The position of the company, he said, had remained unchanged during the year. Their communications through Germany had remained severed. The South Russian and Persian lines had done good service, the staff everywhere having remained at their posts. The Odessa-Constantinople cable, in which they had a joint interest, had been closed down since Turkey entered the war. There was no prospect of resumption of the company's main route, and it was the wish of the British Government and the cable companies with whom they had working arrangements that they should await the termination of hostilities before committing themselves to any definite decision for the re-establishment of the through service to India via Russia, so that the most suitable route should be determined upon. Last year they received an assurance from the British Government that facilities would be given to the company for the re-establishment of the Indo route. The Imperial Russian Government had also promised facilities to the same end, together with an extension of the existing concession. Such extension should render possible the very considerable expenditure on capital account which would be involved in the re-establishment of their route. The revenue for the year showed an important increase, and the expenses a decrease—a satisfactory and unlooked for state of affairs, which was entirely due to a prolongation of the working arrangements with the other telegraph administrations, except for which a large decrease of receipts would have been recorded. They could not hope for a continuance of such more or less artificial prosperity, and under new arrangements with their friends they considered they were assured of sufficient receipts to provide a dividend of 7 per cent. upon the capital of the company after payment of all expenses, an arrangement which would continue until one year after the war. The company had been very liberally treated by the Indo-European Telegraph Department of the Indian Government and the Eastern and associated companies. It would remain with the directors to augment the dividend thus provided by withdrawal from the fund established for the equalisation of dividends. They might well congratulate themselves that the reserve funds of the company stood as they did. Their endeavours to assist the Government of the country had ranged from the manufacture of gauges of microscopic accuracy, which had more than once received high commendation, to subscriptions to war loans aggregating upwards of £150,000. The levy of the tax-gatherer in respect of excess profits necessitated the putting aside out of surplus £15,000 for last year's excess. In regard to the constantly recurring items of depreciation of investments, the £23,000 set aside in 1914, which some thought excessive, had not proved sufficient, and they had now set aside £35,000 for the same purpose. It was proposed to appropriate £10,000 towards wireless development

and research, although last year's vote had not been quite exhausted. They would not be able to do this out of income for 1916. They would eventually have no cause to regret the money expended in this direction. The Indo Co. had a predominant interest in the Galletti Co. For more than eighteen months it had been nothing but a source of expenditure to them, and this in spite of negotiations which at one time appeared likely to offer a solution of what was practically, owing to the war, a deadlock, but which came to nothing. The directors had determined to bring to an end this state of affairs; indeed, they had no option but to do so in view of the material diminution of the earning power of the Indo Co. They proposed, therefore, in the interest of all concerned, and particularly of the Galletti shareholders, before whom there was no other alternative than liquidation, to enter into a new combination of interests with Creed Bille & Co., Ltd., manufacturers of telegraph apparatus of every sort, whose business was in a highly prosperous position. This company would be enlarged by the issue of additional capital, of which the Indo Co. would take up to £30,000 for the development of the wireless side of the business. The patents owned by the Indo Co. and those owned by the Galletti Co. would be transferred to the Creed Bille Co., on whose board the Indo Co. would be represented. The value at which these patents were taken was fixed at £105,000, of which the greater part was applicable to the Galletti Co., to be paid in cash by an annual percentage of the divisible profits of the combined undertakings. Facilities were also given for an option to take up 20,000 £1 shares at par, should the issue be advisable, thus enabling Mr. Galletti or others interested to participate in the future development of their patents. The directors felt that the prospects of the radio-telegraphic and telephonic patents would be enhanced by this arrangement. They hoped that in the interest of the War Office and the Admiralty no difficulty might be found when they made the necessary application to the Treasury Committee for new issues to sanction the scheme. They would regret that anything should retard a step which they considered afforded good prospects of ultimate success and provided an immediately dividend-paying investment.

Anglo- Argentine Tramways Co., Ltd.

MR. J. B. CONCANON presided at the annual meeting on May 25th. He said that there was a net decrease in receipts of £141,380, and a saving in expenses of £94,256. The amount carried to net revenue account was £17,123 less than last year. In view of the outlook for the current year they could not recommend an ordinary dividend. Although the financial position in Argentina was sound, enterprise in Buenos Aires had been almost at a standstill, particularly in the building trade, capitalists and financiers being reluctant to embark in new operations. Confidence seemed to be slowly gaining ground, but he feared that no marked improvement could be looked for during the continuance of the war. The very high cost of freight and limited tonnage hampered both exports and imports, and would have a very detrimental effect on expenditure on cost of energy. Up to April 30th, though the receipts were down by only £32 compared with the corresponding period of 1915, the expenditure was £33,495 more, entirely due to dearer energy, and they would have to face a greater ratio of increase for the remainder of the year. The supply company from whom they got their current assured them that they had already secured sufficient fuel to carry on until the end of the year. Great credit was due to the general manager, Mr. Pedriali, for the substantial economies he had effected, but there was a limit beyond which he could not go, having regard to the efficient working of the system. The sinking fund for the redemption of the 5 per cent. debentures came into operation this year, and would entail a charge on revenue of £8,000. The chairman said he thought it well that he should correct a misapprehension which had got about to the effect that the company was "controlled by Germans." There was no foundation for that rumour. The ordinary shares were all held by the *Compagnie Générale de Tramways de Buenos Aires*, of Brussels, and the shares of the Brussels Co. were owned by Belgian, French, and Swiss subjects, none being held by Germans.—MR. G. A. TOUCHE, M.P., who seconded the adoption of the report, said that the position was that the gross takings had gone back to a little below the level of 1912, notwithstanding the opening of the subway. Shipping difficulties would stand in the way for some time to come. While the present condition of things obtained it would be idle to pretend that the outlook for such an enterprise as theirs, depending upon the supply of fuel, was promising. He feared that the position was likely to get worse rather than better.

Great Northern Telegraph Co., Ltd., of Denmark.

At the meeting held at Copenhagen, on May 6th, Consul-General W. WEIMANN said that the company had experienced the same difficulties as had hampered all international intercourse since the beginning of the war, but the strict neutrality observed by the company and the correctness of its service were being rewarded by the continued confidence of its concessionary Governments. Apart from the cables between Denmark and Russia, which, on account of the war, they had been unable to repair since they became interrupted in November, 1914, seven of the company's cables in Europe had suffered 11 interruptions, whilst in the Far East 19 breaks had occurred in nine cables. Considering the dangers to navigation in

the European seas spanned by their cables, it was fortunate that the interruptions during 1915 had been less numerous than in the last few years. In Europe the cable steamer *H. C. Oesled* had been on active service for 140 days, of which 82 were for the account of others, whilst in the Far East the cable steamers *Stora Nordiske* and *Pacific* had been occupied for 171 days, for 103 of which they were engaged for account of other parties. The Vladivostok and Kiachta routes had been in satisfactory working order, but unfortunately the decrease in the traffic transmitted by these lines between Europe and the Far East since the beginning of the war had continued, and had been even more perceptible towards the end of the year. In these circumstances, they had provisionally returned to the Imperial Russian Telegraphs the wire between Petrograd and Irkutsk, which some years ago was placed at the disposal of the company's offices at the two places above-mentioned and was reserved for the transmission of the Far Eastern traffic. The wire was now fully used for the huge internal correspondence of Russia. The automatic instruments lately introduced at their principal offices in Europe had demonstrated their great value during the war; but for these instruments the work would have proved overwhelming for the staff. They had recently commenced to introduce similar instruments in the Far East, where the working conditions differed in several respects from those existing in Europe, and as soon as circumstances permitted these instruments would be employed more generally in the Far East also. They naturally continued to watch the development of wireless telegraphy, but hitherto had had no occasion for occupying themselves actively therewith, apart from the installations on board the cable steamers during later years. A change in this passive attitude might, however, be brought about in the near future, as they were negotiating an arrangement with the Danish Government, by which the company was to undertake the establishment of wireless communication within the Faroe Islands and the working of the stations on behalf of the Government. Circumstances permitting, two stations were to be erected in the course of the current year, one at Thorshavn (Stromoe) and the other at Tveraa (Suderoe); the former would be open also for communication with ships at sea. The scope of the scheme was purely local, and, as the traffic to be transmitted was insignificant, they did not expect to derive pecuniary benefit from the arrangement. Their main purpose in proposing to saddle themselves with this wireless service was to facilitate the fulfilment of a most natural wish of the Danish Government, viz., to give to the inhabitants of Suderoe the benefit of telegraphic communication with the rest of the world. The International Telegraph Conference which was planned to take place in Paris last year—the 50th since the foundation of the Telegraph Union—had been deferred *sine die*. During the year, and particularly during the first six months, the telegraphic traffic over the company's European cables had been extraordinarily heavy, and, as a consequence, the working zeal of the staff at the majority of the European stations had been tested most severely. The employees had, however, everywhere performed the very strenuous task imposed upon them with goodwill and with unflagging ardour, but now that certain classes of traffic were decreasing owing to circumstances in connection with the war, they might hope to obtain a well-earned respite shortly. The outcome of the present situation was still so obscure that every reason existed for repeating the view emphasised at the last general meeting, viz.: "That this appalling war which has hitherto brought prosperity to the company, may at any moment affect its interests adversely." The speaker proceeded to refer to the accounts, and to say that the board felt that the same dividend and bonus as last year (22 per cent.) might safely be paid.

Eastern Telegraph Co., Ltd.

SIR J. WOLFE BARRY, presiding on May 24th at the annual meeting, said that the result of the year's operations was remarkable. The gross revenue was in excess of any hitherto attained by the company, and amounted in round figures to £2,104,000, an increase of £458,691. The total expenses were about £72,000 more than last year. Included was an amount of £36,542 for special payments to the staff and other expenses in connection with the war. The large sum of £307,037 appeared in expenses for income-tax payable in England and excess profits duty. Notwithstanding these heavy additional taxes and the increased expenses, the final amount available for distribution was £113,895 in excess of 1914. Under those circumstances, they were fully justified in recommending a final dividend of 21 per cent., making 6 per cent. for the year, as against 5 per cent. which had been paid for many years past, while maintaining the usual bonus of 2 per cent., making a total distribution of 8 per cent. for the year, free of income-tax. The stockholders were asked to approve the proposal that the directors' fees should be paid free of income-tax, as was the case in respect of the stockholders' dividends and bonuses, and was also the case with respect to all salaries of the staff at home and abroad. He had referred at recent meetings to the renewal of some of the older section of cable in the Red Sea, and to new cables which had been laid between Gibraltar and Alexandria and from Aden to Colombo. These operations had entailed a very large expenditure, aggregating nearly £1,400,000, and this sum had been charged against the general reserve fund during a period covering the last five years, the final instalment of £200,000 being included in the present

accounts. Although it was difficult under the existing circumstances to obtain a reliable valuation of the reserve fund investments, it had been decided, as a result of the approximate valuation made, to increase the provision for investment fluctuations, and a further sum of £125,000 had been taken from the general reserve fund for that purpose, making a total provision to date of £450,000. This fund had been well maintained, and the balance remaining was £1,805,945, or rather more than it was before the heavy withdrawals on account of the new cables, &c. He believed that at no period in its history had this company stood so well in the eyes of the Government and of the public as to-day. The foresight exercised in laying additional cables to provide in advance a margin of carrying capacity beyond immediate requirements had stood them in good stead. It had enabled them to maintain an efficient system for the Government, and, subject to the conditions which had necessarily been imposed upon commercial correspondence, a continuous and trustworthy service had also been available, notwithstanding the unprecedented volume of traffic. The principal factors which had caused the increase in the number of words carried during the year were the interruption of the Indo-European Telegraph Co.'s line to India, and also that the carrying capacity for commercial work of the Great Northern Telegraph Co.'s route to China and Japan had been greatly reduced on account of Governmental requirements. Although the Government had permitted the use of nine codes, which had to a considerable extent restricted the use of plain-language telegrams, still the amount of work transmitted over the cables had shown a large increase, so that when any of the main cables had become interrupted from one or other of the natural causes, some delay to commercial traffic must necessarily result. So far, however, they had been able to maintain a constant service throughout their system. The chairman proceeded to refer in some detail to the manner in which the company had assisted Government departments, the Colonial, and other Forces by facilitating communication by telegraph in every possible way.

The revenue received and accrued during the year ended March, 1916, amounted to £20,280. The profit was £11,300, plus Traction Co., Ltd. £7,081 brought forward, making £18,381.

A dividend of 4 per cent. is recommended, less income-tax, leaving £7,901 to be carried forward. The traffic receipts of the Norwich Electric Tramways Co., Ltd., were fully maintained, and a 3 per cent. dividend was paid for the year ended June, 1915, the same as for 1914. The necessary work of relaying and renewing portions of the track has been continued throughout the year. The Douglas Southern Electric Tramways system has been closed down on account of the war; all expenses have been reduced to the minimum necessary for the safeguarding and upkeep of the undertaking. The income received from the Philadelphia undertaking was £14,238. The balance of the proceeds of the sale of the Coventry undertaking to the municipality has now been distributed, and the company's interest in that concern is, therefore, finally liquidated. Annual meeting: June 14th.

Marconi International Marine Communication Co., Ltd.

The business continued to show substantial expansion during 1915. The net profit amounted to £63,630, after deducting £23,281 for depreciation and debenture interest, compared with a net profit of £55,668 for 1914. Notwithstanding the considerable decrease in passenger traffic, and the necessary restrictions in respect of private messages at sea, the revenue from ships' telegrams, subsidies, &c., amounted to £208,899, a substantial increase over 1914, when it was £175,021. This increase is mainly due to the greater number of ships installed with wireless apparatus. The number of telegraph stations owned and worked by the company as public telegraph stations on the high seas increased from 875 in 1914 to 1,008 in 1915. The organisation of this company, together with that of its associated companies, with a total of some 2,300 mercantile vessels fitted with Marconi telegraph stations, has continued to render inestimable service. The amount of the profit and loss account now stands at £75,062, including £11,971 carried forward. The directors recommend a final dividend of 7½ per cent., which, with the interim dividend, makes 12½ per cent. for the year. The losses sustained in consequence of attacks upon the mercantile fleet during the latter part of 1914 and those incurred during 1915 have now been debited to profit and loss account. Therefore the £10,000 which was placed last year to the credit of a special reserve account to meet any losses arising from this cause remains intact, and it is now proposed to transfer this sum, together with the share premium account, to a general reserve account, which will then stand at £27,639. The continuous growth of the company's business and the large number of additional telegraph stations on board ships, which are being installed year by year without the issue of additional capital, render it prudent to carry forward the substantial balance of £33,841, after providing the sum of £3,500 for the redemption of debentures. During the year under review there has been a net increase of 133 stations, representing a substantial capital outlay for which it would have been impossible to provide without raising additional capital had it not been for the policy of prudently husbanding the cash resources of the company. The balance carried forward will also serve to meet the excess profits duty, which must exceed £8,000, the amount payable under this head for 1914. The

Amalgamated Wireless (Australasia), Ltd., in which this company is interested, has paid a dividend of 6 per cent. for the year ended June, 1915. Annual meeting: June 14th.

United Electric Tramways of Monte Video, Ltd.

During the year ended October 31st, 1915, the gross receipts of the tramway system were \$1,553,821, a decrease of \$154,061, and the operating expenses were \$988,791, a decrease of \$45,151. The net receipts were \$565,033, a decrease of \$99,910, which at exchange of \$4.7 to the £ is £21,257. The passengers carried were 40,357,643, a decrease of 3,525,206, and the car miles decreased by 44,070. The percentage of operating expenses to gross receipts increased by 2.78 to 63.64. The further decline in tariffs which was anticipated is attributable mainly to the war. The summer weather conditions were also unfavourable, but conditions in general showed some tendency towards recovery at the close of the year. Further economies in working have produced the substantial decrease in operating expenses. Certain services which had been reduced on the outbreak of war owing to the uncertainty of obtaining coal supplies, have been resumed by municipal regulation, although in some instances they are unremunerative. The charges for freight and insurance have shown an alarming percentage of increase. Owing to the scarcity of shipping, high rates for freight still exist, and the cost of coal delivered in the power-house in Monte Video is now between 150 and 200 per cent. above the pre-war cost. Capital expenditure was £30,482, mainly for paying and rolling stock, the latter ordered before the war. Only 10 cars and 15 trailers had been ordered and supplied. Further expenditure on rolling stock, &c., had been postponed where possible until after the war. The amount receivable from La Sociedad Comercial de Montevideo in respect of revenue was £111,414. The profit and loss account for the year, after providing for administration expenses and charging £48,937 for debenture interest, showed a credit balance of £51,693, plus £12,973 brought forward. There has been put to redemption of debenture stock £3,562, to redemption of preference and ordinary capital £2,500, to renewals and contingencies £20,000. The dividend of 6 per cent. on the preference shares, less income-tax at 3s. in the £, for the year ended March, 1916, required £25,500, leaving to be carried forward £13,103. Owing to the war no dividend on the ordinary shares is recommended. Annual meeting: June 15th.

Reduction of Capital.—Browett, Lindley & Co., Ltd.—Mr. Justice Sargant, in the Chancery Division on Tuesday, June 6th, confirmed the reduction of the capital of Browett, Lindley & Co., Ltd., electrical engineers, by a sum of £12,500, being capital lost or unrepresented by available assets. Mr. H. E. Wright, for the company, said the company was incorporated in July, 1899, with a capital of £120,000, divided into 60,000 preference and 60,000 ordinary shares of £1 each. They issued 50,000 preference and 50,000 ordinary shares, all fully paid. The Articles of Association gave the preference shareholders priority as to their cumulative dividend and capital, and to nothing more, and the ordinary shareholders got the rest of the assets in the event of a winding-up. The resolution for reduction threw all the loss on the ordinary shareholders, but a scheme had been arranged, which did not require the sanction of the Court, by which the holders of both preference and ordinary shares would be satisfied. It had been approved by both classes of shareholders. As to the cause of the loss, the company had been compelled to take over investments in satisfaction of bad debts, and these were never worth the nominal value at which they were put into the balance sheet. His lordship remarked that the scheme was of the nature of a bargain.

Ferranti, Ltd.—At an extraordinary general meeting, called for June 16th, a resolution will be submitted extending the borrowing powers, which already stand at £200,000, to £200,000 exclusive of amounts owing or secured to the Government.

Worcester Electric Traction Co., Ltd.—Including £293 brought forward, the accounts for 1915 show:—Available, £4,042; dividend 3 per cent., transfer £1,000 to reserve, carry forward £180.—*Financial Times*.

Marshall, Sons & Co., Ltd.—A financial daily states that the dividend for the year is 7½ per cent., with £10,000 carried to reserve, and £19,635 forward.

STOCKS AND SHARES.

TUESDAY EVENING.

The first effect of the news of Lord Kitchener's tragic death was to bring business in the Stock Exchange to a standstill. Nobody could believe it possible; and for half-an-hour business was suspended. Then markets quietly returned into something approaching their usual condition. A slight fall in Consols was the only noticeable change. There was no rush to sell; the investor and the community at large take their

loss with courage and calmness—eloquent testimony to the confidence with which Lord Kitchener has inspired the nation as to the eventual conclusion of the struggle, come what may in the meantime.

Therefore prices remain firm and steady. The readiness of the investor to buy securities is so great as to give rise to some surprise in the City that the Government do not issue a popular long-dated loan. The public are content to buy Home Railway debenture stocks up to a price that reduces the yield to 4½ per cent. on the money; and even at this level there is not enough stock to go round.

Industrial markets continue to hold the field for activity and public interest. And the reason for this is simple. Investors find that they have such difficulty in getting even good second-grade stocks that they turn perforce to the ordinary shares, and to such preferences and debentures as are available, particularly those of the best sort, amongst manufacturing concerns.

There is a strong disposition, moreover, to endeavour to discount what is going to happen after the war is over; and money is being directed to any direction which is likely to experience a rebound of prosperity in those days. Interesting problems crop up here-ant; and we have been asked, quite seriously, what price Armstrongs shares will command when peace is signed.

In the industrial markets are to be found wider ranges of selection than other departments afford. The man who holds War Loan says he would not sell it, even apart from patriotic reasons, simply because he does not know in what other stock of similar class he can employ his money to equal advantage. The holder of Colonials re-echoes this sentiment. Meanwhile, money is being piled up in the provinces. A great part of the present national spending consists of transferring bank balances from one set of pockets into another set; and the restrictions laid upon new issues, together with those which militate against realisations by capitalists outside Great Britain, are all points in favour of existing securities here.

Nevertheless, the electric lighting market is dull, and the only two movements on the week are in the downward direction. St. James' fell ½, Brompton ordinary ¼. The latter stand at 6½, and are worth considering by the investor, because the company was one of those which did not reduce its dividend for 1915, and at the present price the return on the money comes to £7 13s. 10d. per cent. No doubt the various calls to economy, daylight saving, linking up, reduction in lighting, and so on, have the effect of keeping money away from this department. But its turn will come some day, of course; and then it will be just as difficult to buy shares as now it is hard to realise them at reasonable figures.

Home Railway stocks were buoyant until Sir Edward Grey's cold douche to the peace expectations led to modification of the buying orders which had been steadily streaming in. North-Easterns keep good, in consequence of the anticipations in connection with the electrification. The Underground list is steady, with recovery in the price of Underground Electric income bonds. It is worth noticing that the return at the present time is 6½ per cent., which, allowing for income-tax at 6s. in the £, works out to the equivalent of 9½ per cent., less tax, on the money. No changes worth mentioning have occurred in Districts or Metropolitan.

Telegraphs are good all round. Advances have occurred in the American and the Eastern groups. Great Northerns are up 10s. Westerns gained ½. Globe shares of both kinds participated in the improvements, which, of course, come on the top of gains recently established. A feature is the strength of Marconis, which are 7½ higher at 27½, on the expectation of a favourable report. The Marconi Marine Co. has done very well, and the dividend is raised from 10 per cent. to 12½ per cent. The company carries forward the substantial balance of £34,000. It is stated in the report that the Amalgamated Wireless (Australasia), Ltd., paid a dividend of 6 per cent. in respect of the year ended June 30th last. The price of Marconi Marines is better at 29s. Oriental Telephone ordinary shares are ½ up, and the strength of the market is carried on into the industrial list.

Telegraph Constructions are 30s. higher. There are rises of 15s. in India-Rubber shares, of 10s. in Callenders and in Henleys. Another noticeable spurt in this department is one of 3s. 6d. secured by British Aluminium ordinary, the shares standing now at 27s. 6d., against 20s. a few weeks ago. British Westinghouse preference improved to 2½. The electrical manufacturing shares, however, have moved in the other direction. Electric Constructions fell 1s. 6d., Edison and Swan fully-paid 2s. 6d. Engineering, iron and steel descriptions are mostly good, and further rises are recorded in some of the chemical shares. Castner-Kellners are 3 7/16 ex the interim dividend of 1s. 9d.

Brazil Tractions are fluctuating sharply. The price rose to 64½, fell 2 points, and recovered to 64, at which it shows a rise of 1½ on the week. The buying is attributed to New York. Mexicans are not so good, the news from the country being still vague and unsatisfactory. Nothing fresh has occurred in the British Columbia list. The heaviness of the Anglo-Argentine Tramway group is giving way to a better feeling, but there is no quotable change in price.

The rubber share market keeps firm, upon a recovery in the price of the raw material. Business continues quiet, as compared with what it was six weeks ago. A good deal of money is being put into the shares; and any material

advance in the price of rubber would probably find a scarcity of shares if demand became pressing.

Rangoon Electric Tramway & Supply Co., Ltd.—The cars carried 10,315,613 passengers, a decrease of 323,335, during the year, the total receipts being Rs6,60,664, a decrease of Rs2,252, or 3.61 per cent. In the private lighting and power department the gross receipts for current amounted to Rs7,32,172, an increase of 13.77 per cent. The gross profits for the year were £63,347. Out of this there is allowed for depreciation on sundry assets in Rangoon £1,847, transferred to reserve for renewals account £12,500, to special reserve for cables, &c., £2,500. A dividend on the ordinary shares of 3 per cent. for the year, tax free, is to be paid, leaving £2,783 to be carried forward.

Russia.—At the annual meeting of the Volta Co., where 13,078 shares were represented, of which the chairman, A. L. Nobel, and the Discount & Loan Bank, controlled 3,000, the accounts presented showed a profit of 394,811 roubles for 1915, or 20 per cent. more than in 1914. The increase was due to better prices and a larger business.

Richardsons, Westgarth & Co., Ltd.—Profit for 1915, £76,241. After paying debenture stock interest, providing for depreciation, writing off capital expenditure, &c., there is a credit balance of £17,511. Special contracts received early in 1915 were not sufficient to compensate for the large amount of mercantile work hung up.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the four weeks ended April 26th, 1916, amounted to 1,917,213, compared with 1,804,722 units in the corresponding four weeks of 1915.

Canadian General Electric Co., Ltd.—Dividend on the common stock for quarter ended June, 1½ per cent. (7 per cent. per annum).

Mackay Companies.—Quarterly dividend, 1½ per cent. on the common stock.

Brazilian Traction, Light & Power Co., Ltd.—Quarterly dividend of 1½ per cent. on the cumulative preference shares.

Western Telegraph Co., Ltd.—Third quarterly dividend, 3s. per share (6 per cent. per annum), free of tax.

Commercial Cable Co.—Quarterly dividend, 1½ per cent.

METAL MARKET.

Fluctuations in May.

Electricity Works and "Excess Profits."—The

Financial Times, writing editorially on the problems of the Excess Profits Duty, refers to the case of electric supply companies, which are in a peculiar position in regard to the Act, as follows:—"Mr. H. B. Renwick, who is closely associated with the working of such undertakings, and who is an authority on electrical finance, reminds us that these concerns work under such special restrictions, that it would be most inequitable for the present statutory percentage standard to be taken to apply to such undertakings without increasing it by at least 4 per cent. The electric supply companies are under statutory obligations to provide machinery, to lay mains, and to give supply wherever required under their orders, thus necessitating a continuous expenditure of capital in advance of profitable demands, with the result that ordinary shareholders have to go without dividends for many years in the earlier stages. Further, the companies have a very limited tenure, mostly from 33 to 42 years, during which to earn a return on their capital, and at the end are subject to purchase under conditions which are particularly onerous. They have, therefore, necessarily to look to the latter years of their tenure to compensate for the unproductive early years, and to make provision for loss of capital. Certainly these factors should be taken into consideration, and there seems good ground for a modification of the rate by the Board of Referees."

LABOUR AND INDUSTRY.

(Continued from page 612.)

AT one critical stage of the war, when the need for expediting the raising of the new armies and the production of munitions was very real, there was such a strong feeling exhibiting itself in some Labour conferences that it seemed possible that it might be necessary for the Labour representatives to leave the Coalition Government. It is a matter for gratification that that was not the upshot; and while it cannot be said that the Labour representatives in the Government have the unanimous backing of the workers' organisations, the presence of Mr. A. Henderson and his colleagues has been responsible for the smoother running of the industrial wheels. We believe that it will be in that direction, rather than by any direct initiative exercised in the office over which he more particularly presides, that the President of the Board of Education will be found to have served the nation by his counsels in the Cabinet. But though Labour in some of its parts would have liked to hold aloof from the Coalition, we find it, in others, expressing a strong dissatisfaction with the constitution of some of the Committees that have been set up by the President of the Board of Trade to study after-the-war trade problems. It will make its voice heard when we come to the question of adopting new national policies; and it does not see why, in forming Committees which are to make suggestions for the future safety and development of industries which involve the security and prosperity of the workers, it should be ignored. There may be, and probably is, some justification for that attitude, but so much must depend upon what these Committees are expected to do. If their sole thought is to be devoted to suggesting, as the result of their specialised industrial and trade experience, effective ways in which we may ensure ample prosperity of their own class of industries—that is, increased turnover and a satisfactory rate of profit, also the safety of "key" industries—they will almost certainly be all the time studying means which shall safeguard employment for the worker. To secure or increase the volume of industry will be to provide for work and wages in those trades; but we do not see the absolute necessity of Labour men sitting on Committees where for the most part the problems arising will be quite foreign to what they are in the habit of considering. Educationally, no doubt, it would be for their good and for the good of Labour that they should learn at close quarters what have been, and will be, the acute problems of the industrial employer, but—we hope that we can say it without being misunderstood—they could hardly expect to bring to a gathering of employers a counsel of ripe experience in actual trade and industry which could assist such Committees to arrive at better conclusions than they could reach alone. Briefly, it is a case where the employer, in thinking out what is best for the national industries, and, therefore, what is best for himself and his colleagues as units in those industries, is studying the interests of Labour. Perhaps Labour will be able to suitably represent its cause in the form of evidence before the Committee. When recommendations are made, and the Government of the day evolves a policy based thereon, Labour will be well able to protect itself if it finds itself in disagreement with the proposed policy, or policies. At the present juncture, Labour politicians would be better able to serve the ultimate best interests of the nation by stimulating a healthy Labour attitude in the different industrial centres of the country, than by aspiring to scatter themselves over a number of Parliamentary Trade Committees. Labour needs strong and timely leadership to prevent an irreconcilable spirit from becoming dangerous in the critical days that must almost inevitably follow the war, and if it can be led along the lines adopted by Mr. Hodge, M.P., and his colleagues in the League referred to last week, well and good; if the workers can be induced to listen, there are many useful and educative truths that may be spread broadcast, and with urgency and emphasis. For example, if one thing is more certain than another, it is that, considering the demands of the Colonies and of the Allies, who will reduce their trade connections with the Central Empires if it be made possible for them to do so, we shall have to be equipped in every

way with modern and efficient management, with scientific insight and oversight, with increased manufacturing capacity, and with increased efficiency of Labour, and more of it. It will be of little avail for Labour, as representing the workers, to cry out against future trade with Germany, if by its policies, and by reluctance to comply with the necessities of the new situation, it is going to clog the wheels of our industries. There never was a time when harmony and co-operation between Capital and Labour were so urgent a matter as they will be when the economic position assumes its next phase—as the Government ceases to be the employer of millions, when the high wages of a national emergency cannot be paid out of trade as they are now being paid out of national capital, and when the excess profits drawn from war business give way to the much smaller ordinary profits of every-day trade.

There is one aspect of the work of these After-the-War Trade Committees which, to our mind, bids fair to affect Labour very materially—we refer to its suggestions for increasing our share of trade with colonial and foreign markets. By adequate regard being paid to our national representation throughout the world, we could do vastly better than we have done in the past. We have for years witnessed the efforts of the Teuton to wrench from the British grasp by dint of Governmental and financial force, and to filch, by characteristic underhand methods, our trade connections, not entirely for the purposes of legitimate business, but for other ends which are now revealed in the clear light of day. Our national weaknesses in such matters have been fully availed of by the enemy, and we have largely to thank ourselves that we have afforded him the opportunity to work his dark designs and strengthen his movement towards Commercial Domination. Too many people seem to overlook the fact that one aggressive, enterprising representative abroad may, by the timely and appropriate exercise of business ability and adequate knowledge, secure for British factories work which may employ thousands of British workers for a year. This is so elementary a thing that we dare hardly utter it again here; it is, of course, mainly a matter calling for initiative on the part of manufacturers and financiers, commercial men, and, at times, concession-hunters, either individually or collectively; but the worker needs to recognise these common trade truths so that he may see how important it is that in such representation we should have support of the utmost efficiency in the form of Governmental assistance. We refer to such matters as Consular activities, trained and accredited Commercial attachés, and Trade Commissioners. Labour will not be slow to see that the expenditure in such ways of hundreds of thousands of pounds annually may be a profitable national investment in the interests of the worker. It needs to have a vision of the developing world which none can give it in more appropriate manner than some of its own Leaders, who, as they tell us, have seen the Union Jack flying from the lonely shack in Canada, West Australia, and so on, and have observed the spirit of Home and Empire so warmly displayed. Surely, if the workers can be brought to see something of the immensity of the demands of the thousands of millions of population in other lands for manufactures which they cannot yet produce for themselves, if they will ever be able to do so, they will see that there ought to be "work for all," and no complaining in our streets, if only we avail ourselves in an awakened manner of the world's opportunities as they will present themselves when the nations gradually feel their way back to normal life again. We repeat that this is a question for Labour quite as much as for Capital, and we consider that Labour should, and probably will, as it comes to a better understanding of the difficulties of British industry in the past, see that the demand for a more extensive and more efficient organisation of Governmental fostering of trade by official overwatching in all parts of the Globe, is not a selfish cry from a few manufacturers, as the representatives of capitalists, as has sometimes been suggested, but is a reasonable demand made in the interests of national industry, which, if satisfied, should go far to provide that "work for all" who desire it, which employers are anxious to be able to give.

In some trades, and more particularly those connected with engineering and electrical pursuits, there is considered

to be a large reservoir of orders accumulating which will await execution after munitions are done with, and the increased works and plant capacity, when adapted, will certainly require all that business to keep it occupied. No doubt for some years to come also there will be very large requirements from countries where the destructive effects of war have been so great; but a revision of our Consular and trade representation system and service should not be delayed because of the arrears of orders and the work of rehabilitation that await us. In this matter it is in the interests of industry, and therefore of Labour, that we act in time, for the problem of finding ample work for all will be more acute after a year or two than it may be at once. The difficulties of readjustment consequent upon the transfer of labour from different places and from different industries may be enormous, but the need for increased volume of some classes of trade will probably make itself keenly felt a little later. Organised Labour, therefore, needs, in whatever policy it adopts, to be very long-sighted; some of these matters which appear at first sight to be questions for the master, are far from remote in the interest that they possess for the worker. Indeed, here again we need to make it known that the interests of employer and employé are, in the main, alike; they only differ in degree.

(To be continued.)

ELECTRICAL PRECIPITATION OF SMOKE AND DUST.*

By HALBERT P. HILL.

ELECTRICAL precipitation has proved an effective method for obviating smoke and dust and for the recovery of solids suspended in gases.

The writer has conducted a number of experiments under many varying conditions on various materials to determine the most practical ways of making electrical precipitation effective. The first apparatus used consisted of a 7.5-kw. motor-generator set operated from 220-volt direct current, generating alternating current at 154 volts, 60 cycles, single-phase. This unit was connected to a transformer with primaries arranged with six taps so that secondary voltages of 40,000, 50,000, 60,000, 70,000, 80,000 and 100,000 were available. In order to get a finer adjustment a variable resistance was connected between the taps, so that it was

FIG. 1.—CONSTRUCTION OF HOME-MADE DRY GAS TREATER.

possible to secure voltages in 1,000-volt steps from 40,000 volts to 100,000 volts, and ratings from 2.5 kw. to 7.5 kw. The secondary of this transformer was connected to a rotary rectifying switch which rectified the current into a pulsating unidirectional current. From the switch the high-tension wires were carried to the treater. Since the experiments were being conducted on relatively cold gases, at a temperature seldom exceeding 200° F., a wood box 8 ft. long, 6 ft. wide and 4 ft. deep was used, in which wooden frames covered with copper screens of No. 100 mesh were mounted. There were six screens, and all were connected to the ground. An insulated frame was provided at each end, and between each screen three piano wires were so spaced that they were 10 in. from

* From the Electrical World.

each screen and 10 in. apart. All these wires were connected together and formed the positive pole (fig. 1).

This treater was used in conjunction with an atomising house, where fluids containing solids, such as milk, salt solution, and various chemicals were atomised. By applying heat and spraying the solution in the room, a large percentage of the solids would fall to the floor as a powder, but from 15 to 20 per cent. was carried off in the exit gases. Various mechanical means for the recovery of the solids carried away in suspension were tried, but the electric treater was found the most effective and dependable. Serious difficulties were encountered at first with the treater, as long sprays of the product would build up and cause the treater to arc. Mechanical means for shaking the screens were provided which proved quite effective. Another difficulty was encountered in building a transformer that was dependable for the service, as the end coils would gradually disintegrate owing to corona. It was only after numerous experiments that it was possible to correct this difficulty. The first experiment was conducted with a disk switch having four contacts 90° apart, with one strap connecting

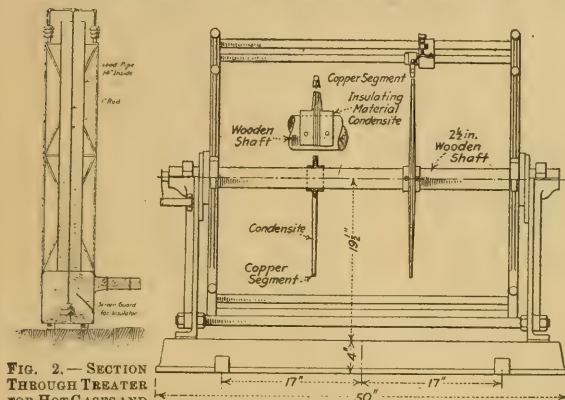

FIG. 2.—SECTION THROUGH TREATER FOR HOT GASES AND SMOKE.

FIG. 4.—POSITIVE-CONTACT SWITCH.

the top and right-hand stud, and a second strap connecting the bottom and left-hand stud (fig. 3). In front of these two studs a second disk was mounted with four contact shoes each about 10° long, and to the top and bottom studs were connected the high-tension secondaries from the transformer. The right-hand and left-hand studs were connected to the treater. The right-hand stud, being positive, was connected to the positive wires, with the negative left-hand stud connected to the screen or ground.

With switches of this character, as well as two-arm and four-arm rectifier switches, in the beginning only 10 per cent. of the wave was rectified. Finally the shoes were increased until 70 per cent. of the wave was rectified. Trouble still developed in the transformers, however, caused by the fact that the treaters had high condenser capacity, and the current commutated arced from the rotor arm to the shoe, so that a high frequency was set up. The experiments seemed to show that the longer the arc or the greater the portion of the wave that was commutated the less current it was necessary to

second, always bearing the fact in mind that when the contact at the switch is broken the treater charges and discharges and the velocity of the materials must necessarily be retarded a certain percentage because of the discharge of the treater. Therefore, with the positive-contact switch, the materials passing through the treater take on a charge, or each particle stores up a certain kinetic energy which will carry it a fixed distance, so that the nearer a true direct current or a uniform positive charge can be applied to the substance in suspension the greater attraction will be imparted to each particle and a more perfect precipitation secured.

A number of experiments have also been conducted on tube-type treaters, laying them flat and passing the gases through them at a fixed velocity; standing them on end and admitting gases through the bottom; and standing them on end and admitting gases at the top (fig. 2). The best results were obtained when the gases were admitted at the top, as the weight of the material as well as the momentum imparted by the velocity tended to deposit it in the bottom of the chamber or the treater. Experiments were conducted operating the apparatus at various frequencies from 25 cycles to 100 cycles, and while at the higher frequency better results were obtained, for commercial efficiency 40 to 60 cycles was deemed best, as this allowed a speed of 1,200 R.P.M. at 40 cycles for the switch and 1,800 at 60 cycles. The size of the transformers and the cost of the apparatus were in favour of the 60-cycle equipment.

The size of the treater and the proportioning of the positive and negative elements are important considerations. Owing to the extremely large condenser effect of the treaters, great care should be exercised in the designing of a transformer to operate in connection with them. The windings should be protected with mica insulation, and as each end of the transformer is alternately grounded at every alternation, extreme care should be taken in insulating the coils from the core. The best design of transformer seems to be a square magnetic circuit with a primary wound in the bottom and a secondary in the top. The secondary should be divided into at least four coils, and should be spaced at least 6 in. apart and well insulated with oil. All the transformers used by the writer were put up in steel cases, with the terminals 17 in. apart. The 5 kw. and 7 1/2 kw. sizes were designed for continuous operation at 40° F. rise in temperature. Owing to the length of the magnetic core and spacing of the coils to get proper insulation, there is considerable leakage in these transformers, which, however, is not an objectionable feature, as there are frequent short-circuits in the treaters, and this leakage is an advantage during periods of short-circuit.

A peculiar condition that the writer has never satisfactorily accounted for is that the insulation on the alternator seems to break down, particularly on the collector rings, and for no apparent reason. After operating a rectifier with a positive-contact switch, this trouble seems to have been eliminated.

The field for electrical precipitation is very large. The apparatus can be successfully used for abating smoke nuisance, provides an ideal means of removing the soot, clinker and ash in blast-furnace

FIG. 3.—SMALL RECTIFYING OUTFIT, SHOWING ROTARY CONVERTER, RECTIFYING SWITCH AND TRANSFORMER.

use to get good results on the treater. As an illustration, when handling 80,000 cu. ft. of vapour containing about 15 per cent. of milk powders and solutions, 50 milliamperes at 70,000 volts was used with a switch having shoes commutating 10 per cent. of the arc. When these shoes were increased to 60° it was possible to operate with 50,000 volts and about 33 milliamperes. Afterwards a switch was substituted consisting of two disks with two copper selectors bolted to the sides, the selectors being 80° each, and four brushes made of hack-saw blades resting on glass plates. The plates were 22 in. in diameter, and 1/4 in. thick, and were mounted on aluminium quills. These were slid over a wooden shaft; the whole was mounted in a cast-iron frame, and the brushes were supported on condensate tubes. This made a positive contact switch commutating 80° of the wave. There was very little sparking, as the break occurred 5° in advance of the zero line, and the voltage was quite low at this point. It was found that more of the product

gas which is so objectionable when used with gas engines, and may be used in cement mills and in conjunction with smelters.

In the *Electrical World* of May 13th, Mr. E. R. Walcott described an electrostatic voltmeter reading up to 75,000 volts for use in connection with the precipitation of smoke and fumes. It is constructed on the principle of the Kelvin guard-ring electrometer, comparing the electrostatic attraction due to the pressure with the gravitation of a small weight under zero conditions. The instrument is said to be accurate to one part in 1,000.

THE DUBLIN TRAMWAYS AND THE IRISH REBELLION.

We are indebted to Mr. Marshall Harris, general manager of the Dublin United Tramways Co. (1896), Ltd., for the following interesting particulars and views of the stirring events which took place recently in the Irish Capital.

We feel sure that our readers will join with us in congratulating

DUBLIN TRAMWAY STANDARD, SHOWING SHELL HOLE.

the company and its officials on having escaped what might have involved much more serious loss.

At the commencement of the trouble on Easter Monday, at 12.30 p.m., immediately after the Sinn Féins occupied the principal public buildings the Tramway Co. commenced to withdraw its cars from the city, and at 2.30 p.m. most of them were safely in the different depôts.

In Sackville Street, however, one of the Howth cars was stopped, and the motorman and conductor covered with revolvers and ordered to leave. An attempt was made to upset this car by hand, to form a barricade for Earl Street, but failed, and subsequently a charge of dynamite was exploded underneath it, but did little or no harm. Eventually this car was burnt, due to the adjoining house having caught fire and fallen upon it. Another car was caught on the South Quays, and was also burnt in the same way, and minor damage was done to four or five of the cars by rifle fire. The trolley-wires suffered most severely, several miles being brought down all over the city by rifle fire. Several tramway standards were also damaged by shell fire, and one of the views shows a standard at the corner of O'Connell Bridge and North Quays through which a shell passed. Subsequently this pole, and others which were damaged, were filled up with concrete, reinforced with steel rods, on site.

The day after the outbreak the Sinn Féins surrounded the power station, and eventually entered and ordered the men out. The rebels carried revolvers, and some of them a revolver in one hand and digger in the other. They gave the engineer on watch an hour to clear out, under penalty of death, and ordered the whole system to be shut down. This was exactly what it had been decided to do by the officials of the company. However, the Sinn Féins were apparently satisfied that their wishes were carried out, as they did not return, and the staff re-

mained in occupation of the station in its shut-down state throughout the whole of the disturbance, notwithstanding the heavy rifle-fire in the district, which was one of the worst situated, and was the last to capitulate. No attempt was made to do any damage to the power station, nor, indeed, was any direct attempt made to damage the cars except from the Sinn Féins' military point of view.

One of the motormen, in getting his car away from the danger zone, was shot and seriously wounded, and another, coming from a city depot, was shot dead by rifle-fire from the General Post Office; several other tramway employees were also shot by stray bullets in the vicinity of their own homes. The loss included the two cars referred to and the damage to the overhead system, but the loss of traffic was the most serious matter that the Tramway Co. has experienced.

On May 2nd, immediately after the burning of the General Post Office, the fires in the power station were restarted, and on May 3rd most of the system was in working order.

Saiping was very prevalent throughout the whole of the system, which made it very uncomfortable for the men repairing the overhead wires; but by May 6th practically every feeder was temporarily repaired and the service restored as far as allowed by the military authorities, who had drawn a cordon around the whole city, and would not allow the cars to pass more than two bridges—one on the south side and one on the north side.

The total damage to the rolling stock, including the two cars destroyed and injuries to six other cars—mainly breakage of glass by rifle fire—did not much exceed £1,500; the total damage to the overhead system amounted to about £500. Considering, however, the amount of property the company had throughout the city—the various depôts and large number of cars—the company may be congratulated on their good fortune. The system was at a standstill from 12.30 p.m. on Easter Monday, April 24th, until May 3rd.

One of the views shows the Howth car referred to, which was burnt; this car, as well as a smaller one destroyed on the South Quays, was eventually towed home on its own wheels. The field coils of the motors were destroyed, but the armatures are apparently not very much the worse. Notwithstanding that the metal melted from all the bearings, the trucks are not beyond repair. No damage appears to have been caused to the truck as the result of the attempt to blow the car up.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

New Shop-window Reflector.

It is gradually becoming recognised that a shop window may be even more effective as an advertisement by artificial light than by daylight, owing to the precision and flexibility with which the illumination can be arranged.

Considering the variety of conditions which have to be dealt with, the demand for an unusually efficient mode of shop-window illumination might seem beyond the range of practical engineering. But a method has been devised for illuminating the typical deep shop-window in such a way that every article placed in it, in any position, is lit to the best advantage. The means by which this

DUBLIN CAR DESTROYED DURING THE IRISH REBELLION.

result is obtained will be clearly understood from the accompanying diagram—fig. 1.

The diagram shows how these limitations are avoided in a new system of reflectors that has just been brought out by the GENERAL ELECTRIC CO., LTD., of London. By arranging plain mirror reflectors of certain dimensions and of certain angles, in a conchoidal curve, with lamps about 18 in. apart at the focus of the curve, a complex system of direct and reflected light is obtained. The multiplication of reflectors at different angles prevents the streaki-

ness which is usually the result of using plain mirrors; and the general effect is that articles set in any position within the window are bathed in light from every side. At the same time, no light, either direct or reflected from the mirrors, falls in front of the window line; nor are the lamps visible to the public. The stage effect so much sought after is thus retained, with a complete

FIG. 1.—DIAGRAM SHOWING REFLECTED LIGHT RAYS IN THE G.E.C. NEW REFLECTORS FOR SHOP WINDOW LIGHTING.

absence of glare or harsh shadows. It will be seen from the diagram that, from the point of view of effective illumination, it is a matter of indifference how the articles in the window are arranged.

This method of lighting has already been put to the practical test in the window-lighting of large drapery establishments, and has proved completely successful. It provides, in the simplest

FIG. 2.—"ZEDLITE" ELECTRIC CANDLE.

FIG. 3.—ELECTRIC WATER-HEATER.

possible manner, an ideal mode of illumination, and, moreover, it is adapted to the present lighting regulations, which prohibit the overflow of light on to the pavement.

Numerous other applications of this ingenious system of reflectors might be suggested. Stage-lighting is one of the most obvious; and in happier times than the present it will find its use for poster and sign illumination.

"Zedlite" Electric Candles.

THE "Z" ELECTRIC LAMP MANUFACTURING CO., LTD., of Southfield, S.W., have issued a leaflet dealing with their electric candles.

The "Zedlite" candle, fig. 2, is claimed to resemble closely its waxen predecessor: it consists of only two parts, the lamp and the opal tube to slide over the latter, which can be removed for cleaning without disturbing the lamp.

The makers claim that it is the only electric candle that remains upright, being unaffected by vibration. It has been extensively used in the Piccadilly Hotel and many large houses. It is sold for

FIG. 4.—DORMAN 8-10 KW. PETROL-ELECTRIC S.T. (see p. 664).

circuits of 20 to 250 volts pressure, and in candle-powers from 8 to 16.

Lee Electric Water-Heater.

THE LEE ELECTRIC RADIATOR CO. of Chicago, has placed on the market the electric water-heater shown in fig. 3. The most popular sizes in use are the single-heat elements of 500 and 750 watts, although the line is completed with 1,500 and 2,000-watt sizes with three-heat control.

FIG. 5.—DORMAN PETROL-ELECTRIC SETS UNDER TEST (see p. 664).

In construction the water-heater is like a pipe or rod 1 1/2 in. in dia., 56 1/2 in. long, and threaded for one inch at the top so that it is only necessary to insert this unit through the standard opening in the top of any ordinary range tank. The pipe is filled with an insulating, non-oxidising fluid, in which is submerged an open resistance-coil or heating element.

Dorman Petrol-Electric Sets.

MESSRS. W. H. DORMAN & CO., LTD., of Stafford, have been supplying for Government lighting and power uses a number of their standard 8-10 KW. self-contained petrol-electric sets, which we illustrate in figs. 4 and 5 (p. 663). Engine, generator, fan-cooled radiator, fuel tank and silencer are all mounted on one bedplate.

The engine is the firm's standard two-cylinder vertical water-cooled monobloc type 120 mm. bore \times 140 mm. stroke, capable of developing 18 B.H.P. at 1,000 R.P.M. on petrol; it can also be adapted to run on paraffin, in which case petrol is used for starting.

A special type of centrifugal governor is provided which controls the voltage within 5 per cent. between full load and no load. The lubrication is automatic, the oil being forced to all the bearings under pressure through a drilled crankshaft from an oil pump in the base chamber; oil level and circulation indicators are provided. The engine is coupled to the dynamo through a flexible coupling.

The fuel tank is mounted above the base plate, the starting handle of the engine being carried in bearings integral with this tank. The fuel is lifted from the tank to the carburettor or vapouriser on the engine by means of the "Auto-Vac" patent feed system.

The radiator is mounted above the fuel tank, the circulation being by thermo-siphon; the radiator is cooled by a large diameter fan driven by a Whittle belt from the engine shaft.

The silencer is carried on the bedplate.

The total net weight of the set as shown in the views is approximately 35 cwt.

These sets have proved exceedingly convenient for both permanent and emergency purposes; the petrol consumption is approximately 1·6 pints per KW.-hour, and the plant will run continuously with the minimum of attention.

Such plants are built in sizes ranging from 4 KW. up to 30 KW.

Full particulars of the engines are contained in the firm's sectional catalogue No. 20.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

TRANSIT OF GOODS THROUGH FRANCE.—An official statement has been published in the *Board of Trade Journal* of May 11th, giving full particulars of the arrangements for transit through France of goods sent from the United Kingdom to Switzerland, Italy, and Spain *via* France. Goods sent by parcel post to Spain may pass in transit through France without special formality. In the case of Switzerland and Italy, however, a special label indicating that exportation has been licensed must be affixed to the parcel. Special facilities exist for the transmission to the Société Suisse de Surveillance Economique of parcels by post weighing less than 11 lb. gross, and containing certain specified goods. Full information is available at the Commercial Intelligence Branch of the Board of Trade.

BRITISH DOMINIONS, COLONIES, &c.—The Board of Trade have received information that Consular Certificates of Origin are not now required for goods shipped from Italy to British overseas ports.

UNITED KINGDOM AND CERTAIN FOREIGN COUNTRIES.—A Supplement to the *Board of Trade Journal* of May 15th contains complete lists of articles which are prohibited to be exported from the United Kingdom, and certain foreign countries, viz.: Denmark, France, Greece, Italy, Japan, Netherlands, Norway, Portugal, Roumania, Russia, Spain, Sweden, and Switzerland. The list of articles prohibited to be exported from Sweden is based upon information received at the Board of Trade up to May 15th, and should be of considerable interest to British exporters to Russia in view of the application of the Swedish prohibitions to goods passing in transit through Sweden to Russia. The present Supplement supersedes that issued on February 17th last. Copies may be obtained, price 3d. (3½d. post free), from the usual sale agents for Government publications.

CAMEROONS.—The former German Customs Tariff remains in operation. According to the Comptroller of Customs, Nigeria, goods for the Cameroons may be entered at Victoria, where a Custom House has been opened, but goods for Rio del Rey are required to be entered at Calabar. The specified schedule of import duties includes "articles of iron of all kinds," which pay an *ad valorem* rate of 20 per cent. All goods not mentioned in the schedule and not exempted from import duty pay 10 per cent. *ad valorem*. Among the articles on the free list are appliances for wireless and cable telegraph stations; machines and implements of all kinds.

An export duty of 40 pennings per kilog. net (about 2d. per lb.) is payable on rubber, except plantation rubber.

ST. VINCENT.—By an Order-in-Council, dated March 17th, previous Orders issued in March, 1915 (under which an additional duty of 20 per cent. was levied, with certain exceptions, on dutiable articles imported into the Colony) are rescinded, and new additional duties are imposed in lieu thereof, including an increased duty of 10 per cent. on all articles other than tobacco, wines, and spirits.

NORWAY.—The exportation of worked, unworked, and scrap platinum has been prohibited.

FRANCE.—The Bill proposing to authorise the Government, while hostilities continue, to prohibit by Decree the importation of foreign goods, or to increase the import duties thereon—*vide* the REVIEW of May 12th—has now become law.

THE movement towards the adoption of rational methods in the generation and distribution of electricity in this country, to which an added impulse has been given by the Board of Trade circular, is gaining impetus, and, we hope, will soon be in full swing. Our "Lighting and Power Notes" to-day contain references to the steps taken in Lancashire, where a scheme is being prepared for linking-up, and in London, where the municipal authorities have held a conference and passed a resolution in favour of the proposal. Much has already been accomplished in the Metropolitan area, but much remains to be done, and it is to be hoped that the difficulties interposed by the Treasury earlier in the war, as in the case of the Hammersmith-Battersea-Fulham scheme, will be removed by co-operation, if not linking-up, between the Government Departments concerned. It is, no doubt, inevitable that the requirements of the different Government Departments should sometimes clash, as in this instance, as well as that of the Ministry of Munitions and the Board of Trade on the fuel-saving question, but there should be no difficulty in arriving at a solution of the trouble, and facilitating progress in the interests of the nation.

Our present aim is to support the arguments of Mr. E. T. Williams and Mr. J. A. Robertson—and, of course, their distinguished leader on this path, Dr. Ferranti—by drawing attention to some noteworthy examples of the beneficial effects of concentration of management, enlargement of area, and development of the power load. For the most striking of these we have to go to the United States. The undertaking which supplies electrical energy to the City of Chicago is the largest in the world; some up-to-date particulars will be found in our "Notes" columns to-day, from which it will be seen that the annual output by now exceeds the almost incredible amount of 1,200,000,000 units, and the annual revenue is over four million pounds sterling! Why have we no such immense concern to our credit? Simply because, for well-known reasons, the business of electricity supply in this country has been split up into innumerable independent fragments, of which but a very few have been able to attain dimensions of real importance. It cannot be suggested that the social and industrial conditions which obtain in this country do not permit of similar developments—in the areas round several of our great cities there are populations, industries, and railways quite comparable with those of Chicago; the fundamental obstacle to progress is the small scale upon which our electricity supply undertakings have been conceived and developed. Granted that more than half of the Chicago output is supplied for traction—the remainder is still gigantic, nearly four times as great as the output of any of our municipal undertakings for all purposes; and have we not railways that can and should be electrically operated? Thanks to the conduct of supply on an enormous scale, the largest and most up-to-date machinery can be employed—a turbo-alternator of no less than 60,000 kw. is on order in the United States—and the capital and running costs can thus be reduced to values which 10 years ago would have been derided as unattainable. The use of electricity for all purposes results in an excellent load factor, and the concentration of management enables the concern to command the services of the most able men available.

In our "Lighting and Power Notes" to-day we give the results of the past year's working of the Manchester Corporation Electricity Department, the largest municipal undertaking in this country. It will be seen that with one-sixth of the capital expenditure of the Chicago undertaking,

H. ALABASTER, GATEHOUSE & CO.,
4, Ludgate Hill, London, E.C.

its sales of energy amount to over 140 million units—less than one-eighth of the Chicago sales—and the average income per unit is 6.06d. higher. The results are undoubtedly admirable, and reflect the greatest credit upon the city and its engineering staff. But why should not the Manchester undertaking rival, and outstrip, that of Chicago in magnitude and output? Since 1904 the former has increased five-fold—the latter seventeen-fold.

The possibilities of the industry are perhaps still more strikingly shown by the case of Barrow-in-Furness, of which some particulars were given in our last issue. Nothing could more admirably demonstrate the importance and the profitable nature of the power load. Due allowance must, of course, be made for the state of war and its effect upon the rate of growth of the demand; but this has the advantage that instead of comparing the results obtained at an interval of five or 10 years, we can compare the records of two successive years, and note the remarkable contrast which they afford. Thus, in the year 1914-15, the total receipts were £26,585; last year they were £59,208. The total costs during these periods were respectively £13,867 and £34,809, the gross profits being, therefore, almost doubled; but the net profits increased from £3,163 to £12,804, more than fourfold. Also the total costs per unit decreased from 0.925d. to 0.605d., and the average price obtained from 1.742d. to 1.020d. What was the cause of this phenomenal advance?

No change was made in the tariff; the cost of coal, wages, and materials was considerably increased. The improvement was solely due to the increase in output from 3,597,410 to 13,806,254 units, in almost the same ratio as the net profit, and the load factor has improved from 17.97 to 40.36 per cent. The bulk of the increase, amounting to over 10 million units, is attributed by Mr. H. R. Burnett, the borough electrical engineer, to the power and heating load, and almost the whole of the increased revenue is derived from the same source, the receipts under this heading rising from £7,692 to £38,929. These results speak for themselves; but we may emphasise the moral: it is not with the lighting load, but with the power and "other uses" load that the future of the supply industry is bound up—in other words, *with the cheap units*.

To supply at low prices, it is necessary to secure a high load factor, a good diversity factor, and a large output, whilst keeping down capital outlay and running costs; all these objects are best attained by extending the area of operations and increasing the magnitude of the undertaking.

The Position of Rubber.

THERE has been so far no improvement in sentiment in the market for crude rubber, and prices have fluctuated considerably with an erratic tendency in values, which is not surprising, for the outlook has been in no small degree obscured by political apprehensions and the trend of the war news. Prices dropped at one period to about 2s. 6d. per lb. for best plantation rubber on the spot, the lowest figure recorded since October last year, and showing a set-back of 1s. 8d. per lb. from the extreme highest seen this year. The market last week showed at one period quite a good rally, but fresh weakness ensued owing to the fitful character of the demand. At the current relatively low prices holders occasionally displayed more resistance, but in the absence of any sustained demand from users, who seem very reticent about providing for their future needs, and so long as the authorities refrain from granting licences more freely for export to neutrals, it is probable that things will remain unsettled. There is, moreover, a considerable tonnage of the product left unsold on this side, which naturally tends to discourage the nursing of speculative holdings, these being apparently of respectable dimensions. Yet there has been some reduction in the home stocks in the course of the past month, as shown by the usual statistics. The deliveries for May, indeed, made a good showing, amounting to 6,206 tons for London and Liverpool combined,

against receipts of 5,834 tons. The stocks have thus fallen to 9,031 tons, this comparing with 8,763 tons last year, and 5,778 tons two years ago. Of these stocks, only about 1,200 tons represent wild rubber, the bulk being plantation descriptions. There is an increasing inclination on the part of big consumers on either side of the Atlantic to await developments in the general political situation before increasing commitments for forward deliveries, although prices have now again reached a level at which the merits of the commodity should be more closely considered. Pending a lead in that direction, however, buyers are cautious. Indications as to the progress of the world's consumption are anything but clear, while there is just a possibility of American requirements falling off temporarily. It is, moreover, difficult to form any idea regarding the extent of invisible supplies, while not a few people suggest that consumers are as a rule fairly well provided. At the same time, the outlook in shipping is not so tight as it was a few months ago, so that regular supplies should be pretty well assured. The total shipped last month from the Federated Malay States to all ports was about the same as for the previous month at a little below 4,000 tons, making an aggregate of nearly 22,000 tons for the five months against 15,787 tons in 1915, and 11,544 tons in 1914. Our imports from Brazil are now comparatively small, and there is, for the time being, not much interest centered on fine Para, the outlet for which is undoubtedly interfered with by the formidable competition of the plantation product. Developments in the general position are purely problematic until peace is restored, after which it is tolerably certain that big quantities will be required by the Central Powers, whose stocks are utterly exhausted.

Next week the annual meetings of the I.M.E.A. will be held at the Institution of Electrical Engineers; the function, as last year, will be on a modest scale, but we sincerely hope that the weather conditions will be much better than those which prevail at present, in order that the meeting may be as successful as is possible under war conditions. The programme, which we published in our issue of April 7th, shows that papers will be read on boiler-house design, on the economic aspect of area of supply, and on the application of electric power to agriculture; all these are subjects of extreme interest and importance, and should lead to good discussions. The effect of area of supply is the key-note of the movement inaugurated by Mr. E. T. Williams towards the reorganisation of electricity supply in this country, and has figured prominently in our columns of late; we anticipate that it will be discussed with keen interest by the members of the Association. The use of electricity on the farm is, we may say, a "pet subject" of ours; for some years past we have missed no opportunity of bringing it before the notice of our readers, for we have satisfied ourselves—and wish to satisfy them—that it is a matter of the first importance to supply engineers, and offers surprising possibilities. We are glad to be able to add that some of those engineers have begun to realise the facts in this connection. Apart from the author of the paper, Mr. W. T. Kerr, whose enterprising and successful work in this direction were described in our issue of June 11th, 1915, we have recently received letters from other engineers, stating that the farm load, which had appeared unpromising, had turned out very desirable, and that "the enthusiasm of the farmers on the subject is really remarkable." We venture to urge upon the members of the I.M.E.A. whose areas include farming districts the value and importance of this load, and to assure them that they will find it well worth cultivating.

MUNICIPAL ELECTRICAL EXTENSIONS AT KILMARNOCK.

The electricity undertaking of the Kilmarnock Corporation commenced operations in 1904 for lighting, power and tramway supply. Up to the year 1912 the largest consumer of energy was the Corporation tramway, but in that year the Council offered very reasonable tariffs to the factories, and now 90 per cent. of the mills and engineering works in Kilmarnock take the whole of their power from the public mains.

In the year 1914 the Town Council obtained powers to extend its area of supply, and this now includes the Burghs of Troon, Irvine, Galston, Newmilns, and Darvel, and a few villages and parishes; the whole area covers approximately 160 square miles, Kilmarnock being situated in the centre. In order to meet the new conditions efficiently, a three-phase H.T. supply was introduced, and the various localities are now linked up to Kilmarnock. The industries of the town are varied; Troon is one of the noted Ayrshire

through a $\cdot 2$ sq. in. 3,300-volt cable and a 500-kw. Bruce Peebles motor converter, which is wound on the D.C. side for 240 volts. This machine is capable of developing 25 per cent. overload for two hours, and 50 per cent. for a short period, and displaced four reciprocating generating sets of 150-kw. each. Off the same feeder an overhead transmission line is run to give a supply to other works.

A direct-current supply is given to Messrs. Dick, Kerr and Co., Ltd., and Messrs. A. Barclay, Sons & Co., Ltd., from the main Langland Street sub-station. One $\cdot 2$ sq. in. and one $\cdot 06$ sq. in. cables feed this sub-station, and in it are installed one 250-kw. and one 300-kw. Bruce Peebles motor converters; foundations are available for a further 300-kw. machine. The D.C. side of the converters is wound for 480-540 volts, and the machines run in parallel with existing low-tension D.C. mains which feed through the town. The L.T. D.C. switchboard in this sub-station con-

KILMARNOCK POWER STATION: GENERATING PLANT.

residential seaside towns, and has but one engineering works of any size, viz., the Ailsa Engineering and Shipbuilding Co. Irvine is also situated on the coast, but is a purely manufacturing town, with shipbuilding, forge works, block works, hosiery works, chemical, and smaller engineering works. The shipbuilding industry was started some two years ago, and is turning out to be of great importance.

The chief industry of the Burghs of Galston, Newmilns, and Darvel, is lace manufacture; there are approximately 36 lace mills in these burghs, each usually driven by a 60 or 80-h.p. steam engine, and in one or two cases requiring 120 h.p. The chief industry in the county is mining, for which Ayrshire is noted.

Although the Burgh of Kilmarnock has a population of only 36,000, there are numerous industries—blanket mills, yarn spinning, and engineering works. Three large engineering works are those of Messrs. Glenfield & Kennedy, Ltd., hydraulic engineers; Dick, Kerr & Co., Ltd., mechanical engineers; and A. Barclay, Sons & Co., Ltd., locomotive engineers.

The supply to Messrs. Glenfield & Kennedy is given

sists of two machine panels, three feeder panels, and one middle-wire panel, and was built and erected by the works staff. Off the $\cdot 2$ sq. in. feeder a $\cdot 12$ sq. in. main is run to another industrial part of the burgh, where transformers are installed and L.T. and A.C. supply is available.

Owing to the distance between Kilmarnock and the outer burghs, an 11,000-volt overhead transmission system was adopted. Immediately outside the main power station a transformer house is erected, wherein are installed one 800-k.v.a. and one 600-k.v.a. transformers. The larger transformer supplies the western section, and the other the eastern section, but arrangements are made whereby both transformers can be run in parallel. No switchgear is installed on the 11,000-volt side of the transformers, these being operated on the 3,300-volt side by switchgear in the main power station.

Inside the transformer house protective apparatus is installed on each outgoing wire, consisting of isolating switches, horn gaps, static dischargers, and resistances. The spark gaps on each phase consist of 12 non-arcing metallic bobbins in series with a horn-type gap, and a

limiting resistance of the non-inflammable and non-heating type.

The overhead transmission lines commence immediately outside the main power station. The conductors are triangularly spaced, and for the greater part of the route are carried on single creosoted wood poles, the height of the pole being sufficient to provide a clearance of 20 ft. between the conductors and the ground in the centre of the span. In addition, the poles carry two telephone wires. At angles in the transmission line the angle pole is adopted. Each pole is provided with the usual number plate and barbed wire climbing guard; a galvanised

from which 3,300-volt mains are laid underground to various distribution centres. The latter consist of high-tension disconnecting pillars and kiosks containing H.T. oil switches, transformers and L.T. fuses. As far as possible, low-tension mains are laid between these points to provide against a fault occurring on any one transformer. Practically the whole of the load at Troon is lighting, but high-tension mains are laid of sufficient capacity to give a supply to the Ailsa Engineering and Shipbuilding Co., who at the present time generate their own supply by means of two 150-kw. Belliss-Westinghouse sets. The householders at Troon have taken advantage of the electricity supply, and the people

living in the residential part of the burgh have installed all the latest cooking and heating apparatus and water-heating appliances. The supply has only been available since last March, but a good revenue is promising.

At a point in the overhead transmission line, viz., Gateside Bridge, a tapping is taken off to supply the Burgh of Irvine; the distance between this section point and Irvine is about three miles. Between these two points a 50-K.V.A. transformer is installed to supply a training centre, some 4,000 30-watt lamps being in use.

Immediately on the Burgh Boundary of Irvine, a sub-station, similar to the one at Troon, is erected, where the pressure is also reduced from 11,000

volts to 3,300 volts. The whole of the switchgear is similar to that installed at Troon. From the sub-station, underground H.T. mains are laid to the various works and distributing centres.

At the Irvine Shipyard, one 420-kw. Bruce Peebles motor-converter is installed to supply direct current at 480/540 volts. The sub-station at the Caledonian Forge contains one 3,300/415-volt, 150-K.V.A. transformer, and at Messrs. Laird's Blockworks one 200-K.V.A. transformer of similar ratio is installed. In the centre of the town

earth-plate is buried at the foot, and put in metallic connection with each insulator pin. On terminal and tee poles, channel-iron cross-arms are substituted for oak in order to give the necessary strength. Near Hillhouse Quarry the transmission line crosses over ground so soft that a stick can be pushed down 20 or 30 ft. without effort. When the moss litter composing the top surface has been removed to a depth of 18 in., the ground is so treacherous that considerable care has to be exercised in continuing the excavation, and in some of the holes the "ground" was practically a semi-fluid. Tests were made, and it was found impossible to erect wood poles in ground of this nature, while concrete, if supplied in order to give additional strength, disappeared in the course of a few days, and made its way to the bottom of the moss. To meet these conditions, Callender's patent steel towers were used on this part of the route. These poles provide a very wide base, with lightness, and practically float on the surface of the moss. During the winter, heavy gales have been experienced, but the steel towers to-day are absolutely vertical, and in a dead straight line. In addition to the bad weather, the undergrowth on the moss took fire last summer, and flames swept across the moss in some places at a considerable height, but the supply was not interrupted, and the line remained unaffected.

When the transmission line crosses private or public roads, the duplicated insulator system with earth brackets is adopted, no cradle-work being used. Neither are lightning arresters placed on the tops of the poles, but where the overhead line is connected to underground cable, as at railway crossings, choking coils are put in circuit.

The whole of the transmission line is designed for 20,000 volts, but is only working at 11,000 volts at present.

Immediately on the boundary of the Burgh of Troon a sub-station is erected, and the overhead 11,000-volt transmission line terminates; at this sub-station the pressure is reduced to 3,300 volts. B.T.H. truck-type switchgear is employed on the 11,000-volt side of the transformer, and the same makers' ironclad switchgear on the 3,300-volt side,

ROAD CROSSING.

a transformer-kiosk is erected, containing one 50-K.V.A. transformer, and L.T. mains are now laid between the other two transformer stations.

The whole of the underground mains, 11,000-volt, 3,300-volt, and L.T. mains, are paper-insulated, lead-covered, and armoured, laid direct in the ground, and covered over with stout wood boarding in accordance with the Board of Trade regulations. All L.T. distributing mains are 4-core (.1, .1, .1, .05) cables.

The neutral point of such transformers is connected to earth by means of a separate earth-plate buried in the

ground. At various places *en route* tapplings are taken off the transmission lines to supply works, the chief of which

are erected at the foot of section poles, wherein are installed the necessary transformers, &c. Electricity is used on a number of farms for lighting, ironing, heating, motor-driving, and, in one case, milking, having been adopted in view of the prevailing labour shortage; experience so far shows that, contrary to expectations, the revenue derived from farm supply is a very good one. The transmission line was designed to carry 1,000 kw., but the line is already working at 800 kw. A new transmission line is now in course of erection, which will run direct to Irvine, thus forming a ring main. Already on the proposed new line applications have been received, one coal master requiring 256 kw. for pumping purposes.

(To be continued.)

SUB-STATION AND OVERHEAD LINE.

MOTOR-CONVERTERS IN LANGLAND STREET SUB-STATION.

is the Hillhouse Quarry Co., where some 450 H.P. of variable-speed A.C. motors are installed. The farmers on whose land the transmission lines are run have taken

pairs or units controlled on the usual series-parallel system.

The sloping ends of the cab contain the resistances, contactors, &c., and all H.T. electrical apparatus.

NORTH-EASTERN RAILWAY ELECTRIFICATION.

THROUGH the courtesy of Messrs. Merz and McLellan, consulting electrical engineers for the work, we are able to publish the outline drawing below, showing the arrangement of the North-Eastern Railway electric freight locomotives used on the Shildon-Newport route of that company, the electrification of which formed the subject of an illustrated article in our issues of May 26th and June 2nd. While we must refer our readers to the description there given for full details of these locomotives, we may here point out that the equipment includes four 275-B.H.P. totally-enclosed motors, each driving an axle through twin-gearing; the motors are fitted two in each truck, wound for 750 volts, the two on each truck being connected permanently in series, and the

NORTH-EASTERN RAILWAY 1,500-VOLT DIRECT-CURRENT ELECTRIC FREIGHT LOCOMOTIVE.

advantage of the electricity supply, both for lighting and power; and to give a L.T. supply, small concrete buildings

Two master-controllers are fitted in the cab, which also contains auxiliary switches for controlling the air com-

pressor and two dynamotors shown, and for the lighting and heating circuits. The locomotive is mounted on two four-wheel trucks, and is 39 ft. 4 in. in length over the buffers, having a total wheel base of 27 ft.; it weighs about 75 tons, and its rated horse-power is 1,100.

It is designed to haul 1,400-ton trains at a speed of not less than 25 miles an hour on the level, and will exert an average pull of 28,000 lb. at the tread of the wheels when starting under normal rail conditions, with, of course, a considerably greater maximum pull.

The locomotives were designed and built at the company's locomotive works, and the electrical equipment was supplied and fitted by Messrs. Siemens Bros. Dynamo Works, Ltd., the work being carried out under the supervision of Mr. Vincent Raven, chief mechanical engineer to the company.

INTERNAL-COMBUSTION-DRIVEN ELECTRICAL SETS.

By W. A. TOOKEY, M.I.Mech.E.

(Abstract of paper read before the ASSOCIATION OF SUPERVISING ELECTRICIANS.)

ONE very frequently hears that a gas engine should be selected to work at a load 15 per cent., more or less, lower than the makers' ratings. This presupposes that gas-engine makers have agreed upon a standard basis of rating amongst themselves, but, as far as the author is aware, this is not the case. Practice in this matter varies very considerably.

There is one important item which a makers' catalogue very rarely gives, and that is the diameter of the engine piston and its length of stroke; it is upon this dimension that the whole output of the engine depends and comparisons are made possible. In his practice, the author pays no regard whatever to the makers' ratings, and considers only cylinder dimensions. Knowing these, the engineer can select his own engine to suit the job, and allow such margin as he thinks is necessary. Then, knowing the speed of rotation of the engine crank shaft, and the limit of pressure behind the piston that it is advisable not to exceed, he has all the elements which enable him to exercise a wise discretion in making a selection from engines of various types and construction. The necessary information is given in the following table:—

PISTON PRESSURES (LB. PER SQ. IN.) OBTAINABLE FROM INTERNAL-COMBUSTION ENGINES FOR USE IN CALCULATION OF B.H.P. AND KW. OUTPUT.

1	Piston pressures and volumes.	Producer gas.		Fuel oil.	Kero- sene.	Petrol.	Back- swept liquid fuel cylinders
		Town gas.	Anthra- cite.				
	Maximum load.						
2	Pm	95	80	75	80	75	90
3	Pa	81	66	61	66	61	76
4	Em	85	825	814	821	814	845
5	Pw	54	44	40.7	44	40.7	50.6
	Normal full load.						
6	Pm	90	75	70	75	70	85
7	Pa	76	61	56	61	56	71
8	Em	845	813	80	813	80	835
9	Pw	50.6	40.7	37.4	40.7	37.4	47.3
10	Vn	3	3.75	4.1	3.75	4.1	3.22
11	Vw	4.5	3.6	6.1	5.6	6.1	4.84
	Long periods full load.						
12	Vw	5	6.2	6.7	6.2	6.7	11.5
13	Pw	45.8	37	34.2	37	34.2	53

Pm = Mean effective pressure = Indicator diagram positive loop. (I.H.P.)

Pa = Useful piston pressure available at engine shaft. (B.H.P.)

Pw = Useful piston pressure available at generator terminals. (KW.)

Em = Mechanical efficiency of engine = Pa ÷ Pm.

Vn = Piston displacement in cb. ft. per minute per B.H.P. developed (impulse strokes).

Vw = Piston displacement in cb. ft. per minute per KW. developed (impulse strokes).

*Values for Pw and Vw based on full-load generator efficiency of 89.

The head-lines of the table differentiate between the different fuels used in internal-combustion engines.

The second line (Pa) refers to the maximum piston pressure that is procurable from fuel mixtures of full strength for short periods of operation, and is, in fact, the mean effective pressure measured from an indicator diagram.

The third line (Pa) gives figures representing the force which is utilised in giving out power, and the difference between the figures in the second and third line represents, empirically, the amount of pressure absorbed by the friction of the mechanism within the engine itself.

In the fourth line (Em) the ratio of line 3, divided by line 2, is given; in other words, the "mechanical efficiency" which the two sets of figures represent. Pa in line 3 can be calculated from any maker's catalogue, if the cylinder dimensions and speed are known, by the use of the well-known formula: PLAN $\frac{33,000}{\text{B.H.P.}}$

Line 5 (Pw) represents the amount of piston pressure in terms of KW., when current is generated by a dynamo having an efficiency of 0.89, this figure being selected as a reasonable and usual efficiency of electrical machines of moderate output.

Lines 6 and 7 show the piston pressures comparable with lines 2 and 3, but with fuel mixtures of lesser value, upon which it is possible to rely whilst the engines continue in operation for, say, eight-hour periods.

Line 8 is the relative mechanical efficiency of the figures in line 7 divided by line 6. Line 9 shows the useful piston pressure utilised in conversion of H.P. into KW. as working loads, and really represents the maximum figures upon which supervising electricians should rely, and upon which they should base all their computations, in the manner afterwards demonstrated.

So far, all figures noted in lines 2 to 9 in the table refer to piston pressures in terms of lb. per sq. in., and it is important to realise that these pressures alone decide the output of any engine whose cylinder dimensions and speed are known. But, as they stand, they are insufficient to those who require to have a basis of comparing engine outputs, inasmuch as no indication is given as to the actual capacity that such pressures imply, according to cylinder dimensions and number of impulses obtained per unit of time.

By dividing 229.16 by either of the values of P, as noted in lines 2, 3, 5, 6, 7, 9, a figure is obtained which represents the number of cb. ft. of piston displacement required per minute to produce one I.H.P., B.H.P., or KW., as the case may be. In lines 10 and 11 will be found figures which, when multiplied by Pa in line 7 and Pw in line 9 respectively, will give 229. Taking the quantity 4.5 in line 11, under the heading of Town Gas, for example, we have the knowledge that for every KW. required as output from a certain dynamo, the engine cylinder dimensions and number of impulses obtained in a minute must be such that for each KW. generated, at least 4.5 cb. ft. of engine piston displacement must be allowed if the output required is to be maintained for several hours on end; and, further, that if the set is to continue in operation throughout the whole of the 24 hours, even a larger allowance of piston displacement per KW. is advisable—say 10 per cent. more (see line 12). With such an additional margin of 10 per cent., one can feel sure that temporary derangements, say of valve setting, which may result in reduced power from the engine; or temporary abnormalities, such as reduced strength of gas mixtures; or increased engine friction, due possibly to slightly-heated bearings; or any similar occurrence due to operation, will not affect the running to such an extent as to produce either a slowing-up of the engine, or an actual stoppage under full load.

To show the practical application of the figures given in the table, one or two examples of their use are added:—

(a) An engine has four cylinders, each 8 in. in diameter and 7 in. stroke, and runs at a speed of 600 R.P.M. It is served with town gas. What is its output capacity in KW. as a normal working full load?

Answer:—Area of 8-in. piston = 50 sq. in.
Piston displacement = $50 \times 7 \div 1,728 = 0.2025$ cb. ft.
Vn (displacement per min. per KW.) = 4.5 cb. ft.

Therefore:— $0.2025 \times 600 \div 4 \div 2 \times 4.5 = 54$ KW.

NOTE.—For longer periods of operation at full load, say, 50 KW.

(b) A four-stroke, two-cylinder engine, 5 in. diameter and 6 in. stroke, specified to run at 800 R.P.M., is worked on kerosene (refined oil), and is offered by the makers as a suitable engine to drive a dynamo for eight hours at full output of 100 amperes and 135 volts, and to be capable of giving a first battery charge for 24 hours. Is this a fair rating?

Answer:—Area of 5-in. piston = 19.6 sq. in.
Output $100 \times 135 = 13.5$ KW.
Piston displacement = $19.6 \times 6 \div 1,728 = 0.068$ cb. ft.

Therefore:— $0.068 \times 800 \times 2 \div 2 \times 13.5 = Vw = 4.0$.

But the table shows that for refined-oil engines Vw (see line 11) should equal 6.1 cb. ft. displacement per min. per KW., and, therefore, a three-cylinder engine of the same cylinder dimensions and speed would be necessary to give adequate margin.

(c) A single-cylinder two-cycle oil engine, 14 in. diameter and 15 in. stroke, runs at 300 R.P.M. What is its output:—(1) maximum B.H.P.; (2) working B.H.P. (normal full load); and (3) KW. rating—the latter assuming a dynamo efficiency of 0.89—at normal working full-load output?

Answer:—Area of 14-in. piston = 154 sq. in.
Piston displacement = $154 \times 15 \div 1,728 = 1.337$ cb. ft.

Therefore:—
 $1.337 \times 300 \div 10.5$ (line 11) = 38.2 KW.
 $\div 7.0$ (line 10) = 57.3 B.H.P. normal full load.
 $\div 5.7$ = 70.4 B.H.P. maximum.

It is to the shirking of what are, after all, but simple arithmetical problems, that troubles with internal-combustion-driven

dynamo sets are often due. The subject is essentially practical, and should certainly be given much more attention than it usually receives.

A piston-pressure basis of rating as suggested in the table accords generally with practical results obtained. The author has found the method of comparison extremely useful, and for this reason now presents it to his engineering colleagues for what it may be worth.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

White's Patent Corrosion-Proof Fitting.

The latest addition to the series of corrosion-proof fittings developed by the ST. HELENS CABLE AND RUBBER CO., LTD., of Warrington, for use in connection with their cab-tire sheathed cable, is a lampholder specially designed for situations in which it

also the whole of the lamp cap, from corrosion. In fig. 1 the method of looping-in is clearly shown, and it will be seen that the compound with which the top of the holder is filled (shown black) completely protects all metal parts in that chamber, while provision is made for excluding water from the lower chamber with rubber washers. Fig. 2 shows the parts as photographed, and fig. 3 the complete fitting in position. These holders have been tested by total submersion under water, with the lamps burning, for periods of 144 hours, and under battery acid for 24 hours. Mr. White's C.P. fittings, we understand, are being largely used by the Ministry of Munitions (Explosives Department), and are approved by the Home Office for use in Explosive Danger buildings. The body of the holder is made of a special insulating material of the ebonite class, the interior being fireproof and the exterior of a special acid-resisting quality.

Hotpoint Cooking Appliances.

We have received a 1916 pamphlet on the subject of electric ranges, from the HOTPOINT ELECTRIC HEATING CO., of 38, Poland Street, W., which, in addition to general information on the subject of electric cooking, particularises Hotpoint apparatus and its use.

Mention may be made of five new ranges, models D to H, which are being introduced by the company, and of which D and E repre-

FIG. 1.—SECTIONS OF WHITE'S CORROSION-PROOF LAMP-HOLDER, "LOOP-IN" TYPE.

is not convenient to install the corrosion-proof ceiling-rose. The construction of this device is illustrated in figs. 1 and 2, and is on the same lines as that of the company's standard C.P. holder,

FIG. 2.—PARTS OF LAMPHOLDER.

FIG. 3.—CORROSION-PROOF FITTING COMPLETE.

FIG. 4.—HOTPOINT ELECTRIC COOKER, MODEL G.

sent apparatus suitable for large family cooking, while the others are on a less ambitious scale. We illustrate in fig. 4 the Model G range, which most nearly resembles the usual type of English apparatus and includes a baking oven 18 in. x 16 in. x 11 in. high, with drop-down door, and upper and lower heating elements controlled by three heat-indicating snap switches. The upper element is for broiling, and a broiling-pan is provided. Three three-heat circular boiling-plates, giving nine different loadings, from 200 to 1,500 watts, are fitted, of the "glowing coil reflector" type; similar rectangular elements are fitted in the oven. The top of the range is hinged, and the boiling-plates are easily removable. A heat indicator is provided on the oven door, which can be used as a guide to cooking temperatures in conjunction with a chart; the indicator registers a number, not degrees.

Amongst other matters referred to in the pamphlet is the Hotpoint water heater, suitable for 15 or 30-gallon tanks; this is in the form of a hollow cylinder, through which the water circulates, and is made for two loadings, 500-watt, 8 in. long, and

FIG. 5.—HOTPOINT SWITCH.

having their U seal in the top and their special collar, with cushion to protect the terminals and lamp cap. The holder, it will be noted, protects not only the terminals and cable ends, but

1,000-watt, 12 in. long, with the heating element guaranteed for two years. The company has recently issued a neat little push-button switch for use with table-cooking appliances, shown in fig. 5

This switch has a simple and effective movement, giving a quick make and break, and bears the Underwriters' inspection stamp. It should be quite suitable for table appliances.

Electric Fans.

Notwithstanding the fact that in the early days of this week office fires had to be switched on, to prevent the editorial soul from freezing hard in this merry month of June, we are assured that there is every indication of a good fan season. On that assumption, in anticipation of the good times in store, firms that are in a position to supply are being advised to circularise during the next few weeks the local hospitals, doctors, nursing homes, authorities, &c. THE EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., Ponder's End, have issued a new fan list illustrating a number of their leading lines, some of which we show herewith.

Figs. 1 and 2 show their steamship and train fan (D.C.), in two different positions; its essential feature is its special combined supporting device and connection. One or more supports can be fitted in each cabin or saloon, so that the passenger can fix the

EDISON & SWAN ELECTRIC FANS.

fan to suit his own requirements, whilst by means of the swivel and trunion movement the fan can be set to blow in any desired direction, from the roof, floor, or table. Fig. 3 shows a ceiling fan (D.C.), which is specially built for large halls, cinema theatres, clubs, institutions, &c., for energetically moving the air over a large radius without noise. An oil-well fitted inside the body prevents oil from getting into the windings. Fig. 4 is a popular model of convertible fan for convalescent homes, private houses, &c.; it can be used either as a bracket fan or on the table or floor. It is a silent fan, and is fitted with a regulator giving three speeds. The porthole fan (D.C.) shown in fig. 5 is specially built for factory ventilation, and can be easily fitted to all standing buildings—the cast-iron ring may be inserted into a suitable aperture in the wall, window or ceiling.

LEGAL.

CHARGES AGAINST A COLLIERY MANAGER.

In the Sheriff Court at Falkirk, on Friday, before Sheriff Moffatt, John Grierson, colliery manager, Falkirk, was charged with a number of breaches of the Coal Mines Act at No. 7 Pit of Callendar Colliery Co., in which the haulage is worked by mechanical power. It was alleged in the indictment—"You did place, or permit to be placed, electric cables across the entrances to No. 18 and No. 22 refuge holes of the inner set of haulage road, so as to impede ingress." The indictment also charged him with failing to have in use at the mine the code of signals prescribed by No. 92 (a) of the General Regulations, and failing to keep exposed and dangerous parts of the machinery securely fenced. Grierson tendered a plea of guilty, and on his behalf an agent stated that in regard to a number of the counts he could have pleaded not guilty, but to have done that would have necessitated the closing of the pit for a whole day. Immediately the inspector drew his attention to the matter, Mr. Grierson had additional fencing put up. The haulage engine was started and stopped by a lever operated from a separate winding engine house, which had two doors, and the engineer only visited the haulage engine when stopped for oiling purposes. It might be, however, that his client had committed a technical breach of the law, and the engine-room in question had now been provided with two doors. Further, the agent explained that the colliery was supplying mine-sweepers and public works engaged in the manufacture of explosives, grenades, electric-power works, and others, and that the manager was unable to cope with the national demands. In the circumstances he elected to go on working his haulage road, under the honest conviction that in doing so he was really assisting in the national need.

The SHERIFF said it was a question whether the Act of Parliament was to be disregarded in times of national emergency.

Addressing the accused—he said he could not hold that the provisions of the statute or of the regulations could be altered in this case. If it was necessary that the work of making the necessary alterations could not be gone on with, as a result of national emergencies, he (the Sheriff) was sure that those who prosecuted would have taken that into consideration. The accused had contravened the regulations laid down by Parliament, and consequently he would impose a penalty of £15.

THE LEISTON STREET LIGHTING CASE.

In the Court of Appeal, on June 9th, the appeal by the defendants in the case of the Leiston Gas Co., Ltd., v. Leiston-cum-Sewell U.D.C. (recently commented upon in our pages) was dismissed.

THE FIXATION OF NITROGEN IN THE U.S.A.

THE fixation of atmospheric nitrogen with the aid of water power has recently been under discussion in the United States Congress. The importance of providing a supply of nitric acid in time of war, as well as of artificial fertiliser in time of peace, from the country's own resources, is gaining appreciation, but the various interests involved are pulling in different directions, and no definite result has been attained.

In *Metallurgical and Chemical Engineering*, a pamphlet issued by Mr. F. S. Washburn, president of the American Cyanamid Co., is quoted on the relative merits of the arc and cyanamide processes of fixation of nitrogen; the former depends upon direct combination of nitrogen and oxygen by the high temperature of the arc, whereas the latter is based upon the conversion of calcium carbide to cyanamide by combination with nitrogen, the cyanamide being afterwards converted to ammonia by treatment with steam, and the ammonia, if desired, to nitric acid by oxidation. Mr. Washburn states that the arc process requires between five and six times as much electrical energy as the cyanamide process, for the same result; for the production of 180,000 tons of concentrated nitric acid per annum 540,000 continuous horse-power is required by the arc process and 100,000 continuous horse-power by the cyanamide process. With the cost of power installation at the moderate American figure of \$100 per continuous horse-power on the switch-board, a plant for 180,000 net tons of concentrated nitric acid per

OSTWALD APPARATUS FOR CONVERTING AMMONIA TO NITRIC ACID.

annum by the arc process would cost \$80,000,000, and under the same conditions a plant of the same capacity by the cyanamide process would cost \$30,000,000. For the production of fertilisers alone, the disproportionate cost of plants of equal capacity is much greater than is indicated by the figures given above for the production of nitric acid.

The world production of nitrogen by the arc process is 32,000 net tons, and by the cyanamide process 200,000 tons per annum. The former has been confined mainly to Norway, whereas the cyanamide process has found application in Norway, Sweden, Germany, Austria, Italy, France, Japan and Canada.

There are a number of processes for the oxidation of ammonia. The particular process in the development of which the American Cyanamid Co. collaborated has application in Germany equivalent

to the production of 120,000 tons of concentrated nitric acid per annum.

The chemical efficiency of the process is over 90 per cent., and an English company is establishing plants in the allied countries of Europe with this efficiency guaranteed. The cost of production is about 70 per cent. of that of nitric acid by way of Chile nitrate. The art was quite new when the war began, and the enormous demand for nitric acid has given it an extraordinary impetus, and led to improvements which might otherwise have taken years to accomplish. All military explosives are made from and with nitric acid. Germany's supplies of Chile nitrate of soda were consumed early in the war, and she is said to have expended 20 million pounds sterling on the air nitrogen industry, increasing the power employed by 300,000 H.P., whilst the Allies, though able to obtain Chile nitrate, are employing 500,000 H.P. continuously in the fixation of atmospheric nitrogen. Again, Germany produces twice as much food from half the area devoted to grain and potatoes in the United States, by employing seven times as much fertiliser to the acre. Mr. Washburn, at the request of the U.S. War Department, submitted a plan for assuring to the Government an ample supply of nitric acid in the event of war, according to which the Government was to develop 100,000 hydro-electric H.P. (with a reserve of 25 per cent.), costing 2½ millions sterling, the plant remaining the property of the Government; private capital would pay the Government 3 per cent. on the cost of the plant and the operating costs, and would construct a fertiliser plant at a cost of 4½ millions, producing fertiliser equivalent to 2,200,000 tons of standard fertiliser; private capital would also install plant costing £200,000 to manufacture 20,000 tons of nitric acid per annum, the Government's peace requirements, while the Government would install, at a cost of £1,000,000, plant to manufacture 90,000 tons of nitric acid per annum, the latter plant to stand idle but ready, and have all preparations made to double this output within three months.

Regarding the production of ammonia from by-product coke ovens, Mr. Washburn considers the output variable, and says that it is absorbed by industries from which it could not be withdrawn without great disadvantage in time of war. He points out that Germany, producing 90 per cent. of her coke in by-products plant, turned to atmospheric nitrogen in war time. No private interest can afford to prepare itself in time of peace to manufacture nitric acid to meet war demands, owing to the amount of idle capital on which there would be no return. Cheap water power is the chief requisite in the fixation of atmospheric nitrogen, but the United States is not a country of cheap water power; the annual cost of a hydro-electric H.P. in the United States is \$12 to \$20, compared with \$3 to \$6 in Norway. The markets of the United States can be best filled from manufacturing situated on the cheap Canadian water-powers. Only by Government ownership, and a lease at low rates to the user, can power be supplied to the user cheaply enough to manufacture nitrogen from the air, and as the industry is new to American investors, to be relieved of the necessity of providing capital for power plant amounting to about one-half the total investment would greatly assist in raising the capital for the purpose. Mr. Washburn also states that the American Cyanamid Co. is representative of one of the four industries which must have an extraordinary amount of extremely cheap water power, the others being the carbide industry, the aluminium industry, and the arc process. The Union Carbide Co. is the sole representative in the United States of the carbide industry, and it has secured water powers in Norway for future developments. The Aluminium Co. of America, the sole representative of the aluminium industry in the United States, is confined to the use of those powers which are within range of the necessary raw materials, and has secured the cream of the large cheap powers in the United States. The arc process has not, as far, found its way outside of Norway except in an experimental way. The Du Pont Co. states that it is its purpose to establish the arc process in Canada. The Cyanamid Co. is in Canada, and has laid its plans for remaining there; it is engaged in extensive developments for the purpose of providing for the use of the farmers of the U.S.A. a great supply of a concentrated chemical compound of nitrogen and phosphoric acid, constituting a fertiliser of superior merit.

In the same issue of *Met. and Chem. Engineering* is an abstract of an article by G. Schiphane, in *Metall und Erz*, on the Ostwald process, which is the one employed for converting ammonia into nitric acid. Broadly speaking, impure ammonia liquor is first purified, and then pure ammonia gas from this liquor is conducted to a catalyser apparatus, where it is mixed with air and passed over a heated catalyser, forming nitric oxide and steam. The catalysing chambers are arranged in groups of three elements, of which two are in use and the third is in reserve; one is shown on p. 672. At the bottom the ammonia gas enters on one side and air on the other. The air and ammonia, before they meet each other and mix, pass through gauge collars as indicated, whose diameters are so selected that a proper mixture of air and ammonia for burning will be obtained. For further adjustment a valve is placed in each line. The air and ammonia are mixed by a rotating aluminium plate, and pass then through a narrower iron wire screen.

The air-ammonia mixture now goes to the platinum gauze, which is heated to about 700° by electricity. At this temperature an almost quantitative conversion of the ammonia to nitric oxide and water takes place. The platinum gauze takes about 120 to 150 amperes, at 24 to 26 volts, for heating. In order to prevent breaking up of the ammonia by radiation and conduction from the glowing platinum gauze before it reaches the hot zone, the lower half of the casing surrounding the gauze is cooled by water. For conducting away the oxide of nitrogen, an iron hood is fastened

to the burning chamber. This hood rapidly diminishes in cross-section, and is lined with sheet aluminium on the inside, in order to prevent iron oxide particles from falling down on the platinum gauze. The elbow leading from the iron hood is also of aluminium.

The three elements provide nitric acid for the manufacture of 10,000 tons of 66° sulphuric acid per annum, on the lead-chamber system. On the other hand, the process can be worked so as to produce ammonia-nitrite or nitrate, the latter being an excellent fertiliser.

THE SELLING SIDE OF ELECTRICITY SUPPLY.—VII.

ADVERTISING, like politics, is a subject that everybody feels himself capable of criticising, and it therefore behoves one to be wary in offering suggestions. There are, however, one or two points worth a little more consideration than they generally receive, both in the matter and in the distribution of publicity literature.

As regards the matter itself, unless great care is taken with its form, a very large percentage finds an immediate resting-place in the waste-paper basket. Especially is this the case when it is in the shape of advertising matter pure and simple. Progressive advertisers discovered many years ago that, in order to avoid its premature destruction, it was necessary to give their literature some practical or artistic value. This they did by embodying it in a calendar, a diary, or some such thing, which would render it of use, or else giving it an artistic embellishment that would save it from an untimely end. The latter, or a combination of the two, is usually prohibitive on account of expense, and one therefore leans to the utilitarian method for achieving the purpose at a minimum cost.

It has most frequently been the object of electricity supply managers to direct their efforts towards the conversion of the householders, yet all who have had much experience in pushing "other users" of electricity have found that the servants are almost as important.

If the cook, for instance, has made up her mind that she will not like electric cooking, an attempt to force it upon her is foredoomed to failure. There have been many cases where it has been installed in defiance of the autocrat of the kitchen, and one complaint has followed another, until it has been removed. A good deal of diplomacy is required to get her majesty's sympathy and co-operation, but it is well worth the effort, for plenty of cooking installations have been brought about by her advocacy. As time goes on good servants are becoming rarer, and to those lucky enough to possess them, priceless, which in itself suggests a variation in our *modus operandi*.

Supply authorities are, of course, in the habit of reading their meters quarterly, and we offer the suggestion for what it is worth, that in addition to sending advertising matter with the bill—not always a happy moment—the meter-reader should be provided with a supply, and should present a copy to the servants.

We have always believed that the finest introduction to other uses is the electric iron; there is nothing to touch it in convenience or cheapness, and no residential installation can be regarded as satisfactory that does not include one or more.

For a meter-reader to waste his time canvassing is neither necessary nor desirable, but no doubt a little of his time goes in a friendly chat here and there with, perhaps, a pretty maid. With a little encouragement this might be made to take the form of a pleasant inquiry as to whether she has an electric iron. A list could be made of the premises without one, and a mark placed on the meter-card. It might then be possible to offer each meter-reader a bonus, or a small increase of sixpence or so on his weekly wage, for every 25 or 50 irons installed in his district from the date the scheme starts. It would not take him a moment, whilst he is being admitted and escorted to the meter cupboard, to present his publicity matter and suggest the advisability and interest of paying a visit to the show-rooms where demonstrations are being given.

We have mentioned that the advertisement might take the

form of something useful. A calendar is a thing often referred to, and it might be made for a portion of the year, say, the period between the meter reading visits, so that, having supplied a reminder about irons for a time, the next of the series would deal with vacuum cleaners and so on. Other ideas suggest themselves for ensuring frequent reference to the advertisement; for example, spaces beside each day could be provided, wherein to record the quantity of milk and bread delivered.

The scheme should be backed up by every possible means; those interested will find a plan for an iron campaign outlined in our issue of March 19th of last year. The co-operation of manufacturers can always be obtained for providing advertising matter, and possibly for a special display stock.

It is important to make sure that apparatus does not get out of order and become shelved. The meter-reader's advance, when earned, might well be made conditional on his seeing that this does not happen, by making an occasional inquiry as to how it is found to be working.

One other point about irons: there is still room for a very light iron of 2 or 2½ lb. weight for lace and fancy work. Many ladies would be inclined to purchase such an iron for their own use, in addition to one for the kitchen.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Support of Home Industries.

I was pleased to note your Leaderette in reference to the example of the Oxcoft Colliery Co., Ltd., who propose giving out contracts only upon the distinct understanding that the company, firm or individual to whom they are sent is not in any way under the influence or control, directly or indirectly, of any German, whether naturalised or otherwise, and that none of the payments or profits arising from the execution of the contracts will pass into the hands of Germans as shareholders, partners, or otherwise.

For your information, I may say that I believe a municipal authority endeavoured, when advertising for their annual contracts in the early part of this year, to follow the same principle, by issuing, at the time of inviting tenders, forms on which they were asked to fill in the following information:—

1. State as to whether you have directors on the board of alien enemy origin, naturalised or not; if so, the number.
2. As to the shares held by such directors or/and by shareholders of alien enemy origin, naturalised or not, and the percentage of such shares to the total capital.
3. As to the number of staff and employees of alien enemy origin, naturalised or not, receiving payment.
4. As to whether any of the goods or material which it is proposed to supply will be manufactured or obtained from abroad, and, if so, the town and country of origin, with the name of the firm supplying same, must be given, and not the country from which they are imported.

I am informed however, indirectly, that instead of getting the support it was hoped the British manufacturers would give, many firms refused to have anything to do with it. It is hoped, however, now that such an important and influential industry as the coal trade (which at the present moment is all-powerful in the country) has taken the matter up, that it will be possible to enforce conditions which other purchasers, even a municipal body, are unable to do.

It is to be regretted that an Association of which the word "British" forms such a large part should not be starting some active propaganda towards the end which should be the aim of all British-born subjects.

Station Engineer.

June 12th, 1916.

[It is satisfactory to learn of one more municipal authority that is prepared to embody in its conditions of contract the views held by the majority of the British people on this matter, when it is possible to do so. Several important corporations expressed themselves very plainly on this question some time ago—will the others follow?—EDS. ELEC. REV.]

THE RÖNTGEN SOCIETY.

At the meeting of the Röntgen Society on June 6th, Prof. J. W. NICHOLSON read a paper on the homogeneity of visible radiation, and gave an account of spectroscopic researches which he had been conducting at King's College, London. Although the paper was almost wholly concerned with physics, the discussion took a more immediately electrical turn, Major

ROBERT WILSON, of the Canadian Medical Service, raising the question as to the possible homogeneity of X-rays, which homogeneity, he said, was the philosopher's stone of the radiographer. The radiographs obtained to-day by means of high-power transformers were of a totally different order from those obtained with the simpler apparatus of years ago. Not merely was the apparatus more powerful, but the action was different. In taking radiographs of the frontal sinus sideways it was found that with a static machine or coil as the means of excitation a clear-cut image of the bone resulted, but with the high-tension transformers now in use a different type of ray was forthcoming, and one which revealed not only the bones clearly and perfectly, but also the nimbus of flesh, and in some instances on the same plate an image of the very skin itself. He never got these with his static machine. He felt that there was a very definite ratio between the character of the ray which was produced and the strength of the current.

Dr. G. W. C. KAYE said that Prof. Barkla originally laid it down that every element had at least one homogeneous X-ray of its own, and in some cases two, one of which was called the K radiation, and the other the L radiation; but then came the workers on crystals (Bragg and others), and it was found that the X-ray was not by any means homogeneous, and at present the X-ray investigator was in the same position with regard to the number of spectra as was the worker in optics. Dr. Kaye said that previously to the war he had been engaged in analysing the beams of rays obtained from a hard tube under ordinary conditions, and although the work was suspended, he did enough to show that the chances of obtaining homogeneous X-rays were extremely small. The proportion of L radiation got out of an ordinary tube under ordinary working conditions was trifling, perhaps about 5 per cent. If the tube were run "soft"—so soft as to be probably of not much use, except for therapeutic work—it was possible to get a fairly large proportion of homogeneous rays. No matter how much the quantity of radiation were cut down, although a ray almost homogeneous could be obtained, it was never quite homogeneous. The results in this direction were certainly not such as to make one optimistic.

Prof. NICHOLSON said that he had no certain results along this line of investigation at present, but he promised that the Society should hear something about it later on.

WAR ITEMS.

To be Wound-up.—The Board of Trade has ordered more businesses to be wound-up, making the total down to date 196. The latest lists include the following:—

Union Electric Co., Ltd., Park Street, Southwark, S.E., electrical engineers. Controller: P. D. Leake, 25, Abchurch Lane, E.C.

Quarzlampen Gesellschaft m.b.h., 62, Red Lion Street, W.C., dealers in quartz lamps and accessories. Controller: R. W. Brown, 42, Old Square, Lincoln's Inn, W.C.

Coke Oven Machine Co., Ltd., London, manufacturers of coke oven machinery. Controller: J. Duncan, 158, Fenchurch Street, E.C.

Chas. H. Blume, Western Road, Mitcham, Surrey, varnish and enamel manufacturer. Controller: J. W. Barrett, 19a, Coleman Street, E.C.

"Made in —."—The Chamber of Commerce of New South Wales at a recent conference resolved:—"That, with a view to preventing the general use of enemy goods after the war, the Commonwealth Government be approached with a request that legislation be introduced, requiring that all imported goods be indelibly marked with the name of the country or origin."

Empire Trade.—At the annual conference of the New South Wales Chamber of Commerce, the following motion was carried unanimously:—"That this conference places on record its desire to co-operate with any practical proposal for the encouragement of trade within the Empire, and believes that the imposition of a surtax on goods manufactured within the territories of the nations now at war with us would be the most effective means of attaining that end, and thereby to some extent ease the enormous financial burden likely to occur through this disastrous war; that the British and Australian Governments be urged to co-operate with the manufacturing industries by establishing laboratories and centres of scientific research, such to be available to manufacturers throughout the Empire; that these opinions be conveyed at the proper time to the Federal Government, the High Commissioner, the Agent-General for New South Wales, and the London Chamber of Commerce."

At the conference of the British Imperial Council of Commerce, in London, a resolution was carried, with three dissentients (one of whom was Sir Albert Spicer), urging that arrangements should be made at the earliest possible moment to provide for preferential reciprocal relations between all parts of the British Empire; for reciprocal trading between all parts of the Empire and the allied countries; for the favourable treatment of neutral countries; for restricting by tariffs and otherwise trade relations with all enemy countries so as to render dumping, or a return to pre-war conditions, impossible.

Exemption Applications.—At the Yorkshire East Central Tribunal, Messrs. J. T. & J. Taylor, Ltd., woollen manufacturers, of Batley, applied for exemption for the engineman and factory electrician at Blakeridge Mills. They said an untrained man could not be trusted with the work without great risk to person and plant at the mills, where 1,050 people were employed. Their present assistant was the only one to share responsibility with the chief engineer for 300 electric lights and 22 dynamos and motors in five different mills and warehouses. As illustrating the man's importance, it was mentioned that last week 400 people were idle for three and a half hours owing to a slight electrical mishap. Members of the Tribunal are to investigate the requirements at the mills, and the case was adjourned.

At St. Albans, on June 3rd, the North Metropolitan Electric Power Distribution Co., Ltd., appealed for Mr. C. Hocker, electrical engineer. It was stated by Mr. Hind, assistant to the general manager and engineer, that Mr. Hocker was indispensable. His principal work was to look after the requirements of consumers with regard to wiring of power installations, and at present, owing to the shortage of labour, he assisted the resident engineer in case of breakdown, and had control of a contract with the military. He added that out of a staff of 29 they had let 12 go. He admitted that there was no installation work for the military going on at present. No exemption was granted.

At Poole, Mr. Edwin Chas. Newman (23), electrical engineer, of Sandy Lane, Broadstone, claimed exemption on the ground that it was expedient in the national interest that he should remain in business. He was the only partner in the concern, and contended that he was in a certified occupation. He was allowed until September 1st.

At Swindon, Bays & Co., electricians, appealed for the exemption of Walter John Moran (34), engaged on the repair of wires, motors, &c., and the only electrician left with the firm. Mr. Bays said that if the man went they would have to close the electrical department, electricians being very difficult to obtain just now. Mr. Crewe Wood: Did not the Minister of Munitions put his hand on him? Mr. Bays: He volunteered for munition work, and we received a notice from the Ministry of Munitions asking if he could be spared. We said we could not spare him, as he was the last electrician we had. Conditional exemption was allowed.

At Dartford, Mr. S. K. Fergusson, manager of the Light Railway Co., appealed for exemption for a motor-man, and, with the assent of the military representative, the request was acceded to.

At Southend-on-Sea, two electricians sought exemption. One said he was carrying out several contracts, and it would be a serious hardship to give up the business; he had serious financial obligations to fulfil. He was passed for home service only. Exemption was granted until September 1st. The other appellant, a contractor for electric lighting, telephones, &c., said he would have to give up business entirely if he went. As he stated that he suffered from a tubercular complaint, he was directed to go before the Army Medical Board.

Hemel Hempstead Tribunal has given total conditional exemption to Mr. T. Hall, fitter and electrical engineer, appealed for by Mr. H. Martineau.

At Altrincham, an electrician and plumber sought exemption for two men, asking that exemption should be conditional on their remaining in their present employment, or similar work, and that the exemption should not be used to demand an increase of wages, or accept any bribe or offer from any other firm without the usual consent. He was engaged with important sanitary and electrical contracts at private houses, shops, munition works, and flour mills. The Tribunal pointed out that they had nothing to do with wages, and could not deal with the applications in the manner apparently desired by the employer. Eventually temporary exemption for three months was granted to one man, and the other was ordered to go forward when called upon.

At Oldham, on June 8th, Mr. S. Stapleton, electrician, of Hollinwood, was granted temporary exemption to September 1st. Mr. Stapleton also appealed for two employees, but these were disallowed.

At Stretford, three employees at the local electricity station, whose services were said to be indispensable to the maintenance of the electrical supply and distribution, were exempted until August 31st.

At Rochdale, last Friday, Messrs. Fryer & Hartley appealed for Mr. T. Hartley, a member of the firm, who was stated to be engaged on electrical contracts, and temporary exemption to the end of August was granted.

Middleton Tribunal granted conditional exemption to a tramway pavior on the application of the tramways manager.

At Southwark, Messrs. Alexander Hawkins & Son, electrical engineers, of London Road, S.E., applied for the exemption of their manager at Richmond. He was the only man left at their Richmond works, and was a fully-qualified wireman, capable of undertaking repairs at Army camps and depôts. He was granted conditional exemption on joining the Volunteer Training Corps.

Hastings Tribunal has granted three months' temporary exemption to Mr. C. G. Winter (40), electrician at the Albany Hotel, appealed for by Sir Henry Lunn.

At Whitehaven, a local electrician appealed to retain his son (18 years and 8 months), apprenticed to electrical work and the only one left to assist in the business. Three months were granted.

Boston Tribunal granted exemption until September 1st to Mr. C. E. Clare, engaged by Mr. R. W. Sandars, of Queen Street, as a cabinet-maker for electric coils, &c. Mr. Sandars said he was one of the largest coil makers in Great Britain.

Folkestone Tribunal has given conditional exemption to Mr. B. Carr (39), electrician with Messrs. Webster & Son.

At Maidenhead, the manager of the electric light undertaking of the T.C. appealed for exemption for a shift engineer, and engine driver and fitter, a switchboard attendant, and a cable joiner, all essential. With military assent, each was exempted until October 1st.

Three months' exemption, with leave to appeal again, has been granted to Mr. S. A. Stock (24), electrical engineer, in charge of the business of Mrs. E. Storey, whose husband died last year. Mrs. Storey stated that three employees had joined the Forces, and she had a lot of contract work in hand.

An electrician with a firm of caterers at East Grinstead, having 2,000 lights to look after, has been exempted until September 30th.

A Runcorn firm of electrical engineers has been granted exemption for a storekeeper on releasing a single "badged" employee.

At Oxford, Messrs. Hill, Upton & Co., electrical engineers, applied for two electric fitters and wiremen, employed in installation work. It was stated that 17 of the staff had been released. Both men were conditionally exempted.

Mr. Gilbert Clark (34), electrical engineer, of Combe Down, Bath, has received three months' exemption.

The Tudor Accumulator Co., Dukinfield, appealed last week for a number of married men who were said to be indispensable. Several of them were engaged on work which, prior to the war, was done in Germany. One appeal was disallowed, another met with a temporary exemption for three months, and the rest of the men concerned were conditionally exempted, being in reserved occupations.

At Denton, the Oldham, Ashton & Hyde Electric Tramways Co., Ltd., appealed for a number of employees, and it was stated that if any more employees were taken away the car services would have to be further curtailed. Prior to the war the company employed 155 men and nine boys, and now they had 100 men, 13 boys, and 29 women, although more passengers were being carried. In all cases except four conditional exemption was granted, and it was recommended that the four should not be called up before July 31st. It was announced that the company would appeal to the higher tribunal in respect of the four men who were not granted conditional exemption.

Before the County Appeal Court, the Midland Electric Light and Power Co., of Warwick, appealed for Mr. A. E. Pritchard, clerk, and collector of electricity accounts, and two months were allowed, leave to appeal to the Central Tribunal being refused.

An electrical engineer at Sutton (Surrey), who appealed, said that if called up he would have to sacrifice the business he had built up, which included work in a "controlled" establishment at Chelsea. A final month to settle his affairs was allowed.

Tonbridge Tribunal, on June 8th, granted conditional exemption to Mr. F. A. C. Taberner, electrician.

The Kent Appeal Court has allowed exemption to Mr. A. W. Groombridge, electrician, of Ramsgate, on condition that within a month he secures and keeps an engagement with the Government as an electrician.

A Northampton electrical engineer, previously given two months in which to arrange for a manager, applied for further exemption. He stated that he had £500 in the business which had a turnover of £1,500 a year, and was still engaged on contracts. The Tribunal allowed him a month in which to "clear up."

Stoke-on-Trent Tribunal has given three months' exemption to an electrical engineer engaged on the erection, supervision, and maintenance of plant for manufacturers and firms engaged on munition work.

Nuneaton Tribunal, on June 6th, granted conditional exemption to the acting borough electrician, Mr. H. Hodges.

Sevenoaks Tribunal has given three months' exemption to Mr. J. Pink, electrician with Messrs. S. Young & Sons.

Two lead burners were appealed for at Woking by the Accumulators, Ltd., on the ground that they were essential to the completion of Government contracts. It was stated by the military representative that the men had been "combed out" of a reserved occupation. The Chairman observed that, according to an official circular, lead burners were very scarce, and were urgently needed in munition works. A month was given in each case.

At Nuneaton, Mr. F. A. Newdegate, M.P., of Arbury Hall, appealed for Wm. Mitchell (35), electrician, in charge of the plant there, and exemption was allowed until November 1st.

Electric Steel Rails.—Dealing with the rail tonnage of the United States, *Met. and Chem. Engineering* says that statistics of electric steel rails began with 462 tons in 1911, the output rising to its maximum, 3,455 tons, the next year, while 2,436 tons was produced in 1913 and 178 tons in 1914, not a ton being reported for 1915. It may be, however, that judgment is suspended until time has elapsed for a complete try-out of the experimental rails.

BUSINESS NOTES.

Patent Restoration.—Letters Patent No. 6,831, of 1911, granted to J. R. Hannan, for 'Improvements in or relating to side flues and downtakes for boilers' have been restored.

Hawaii: Electrical Imports.—The imports of electrical machinery in Hawaii during the fiscal year 1914-15 attained a value of only £66,606, as compared with £116,944 in 1913-14.

Book Notices.—'Engineering as a Career.' By P. and A. W. Marshall. London: Percival Marshall & Co. Price 6d. net.

'Gronnes Electriques en Régime Troublé.' By L. Barbillion. Paris: Gauthier-Villars et Co. Price 11 fr.

Trade Announcements.—Messrs. J. J. Roche & Co. have removed to larger premises at 47, Glyn Lane, E.C. Telephone number and telegraphic address unaltered.

MR. HANSON PERRY, electrical engineer, of North Quay, Douglas (I. of M.) has had his stock, &c., sold by auction.

Catalogues and Lists.—BRITISH THOMSON-HOUSTON CO. LTD., Rugby.—Descriptive list No. 4,124, detailing, with full dimensions and particulars their isolating switches for H.T. systems.

MESSRS. BROOM & WADE LTD., High Wycombe.—Sixteen-page illustrated catalogue, No. 9, giving descriptions and prices of Hyatt's roller bearings as applied to line shafting.

Bankruptcy Proceedings.—HERBERT PAGE (Smeaton and Page), electrical engineer, London, E.C.—Trustee released June 7th.

A. F. HAWDON, electrical engineer, Gosforth.—A second dividend of 1s. 2d. in the £ is payable June 16th, at the Official Receiver's office, 30, Mosley Street, Newcastle-on-Tyne.

Patent Extension.—A petition of F. G. Creed, W. A. Coulson and Creed, Bille & Co., Ltd., for extension of Patent No. 22,653, of 1902, granted to F. G. Creed and W. A. Coulson, is not to be heard before July 18th.

Export Prohibitions.—The Privy Council has approved certain amendment in the schedule of export prohibitions. The entry "electric lamps" is deleted and in place thereof is included: "Electric lamps, except carbon filament lamps and arc lamps for street lighting."

Board of Trade Inquiries.—The Board of Trade Commercial Intelligence Branch has received applications from firms at home for British makers of two and three-cell flash lamp batteries, and electric balling presses.

Liquidations.—*Re CEDES ELECTRIC TRACTION, LTD.*, 112, Great Portland Street, W.—The report of Mr. H. E. Burgess, Official Receiver and Liquidator, upon the affairs and failure of this company has been issued to the creditors and shareholders. The statement of affairs was briefly summarised in our issue of May 26th. The deficiency as regards contributories is returned at £47,834. According to the report of the Official Receiver the company was incorporated as a private company on May 18th, 1910, with a nominal capital of £2,000, to manufacture and sell motor vehicles of every description. The capital was subsequently increased to £50,000. The issued capital at the date of the winding up was £7,000. 6,995 shares were allotted to the Österreichische Daimler Motoren Aktien Gesellschaft, of Vienna, or its nominees. The directors of the company have been Wilhelm Strauss, George Frederick Underwood, Henry Ichenhauser, Ludslaus Janusz Felix Burmann, Kerbey D. Bowen and Francis M. Luther. The two last-named constituted the board at the date of the winding up. Charles Janin was the secretary throughout. Previous to the incorporation of the company they were acting in similar capacities for the Austrian Daimler Motor Co., Ltd., and Trackless Trolley, Ltd. (companies controlled by the Vienna company). On their taking office with the Cedex Electric Traction, Ltd., it was arranged that a portion of their salary should be subscribed by the latter. Bowen was appointed managing director on January 1st, 1913. Under an agreement dated May 18th, 1911, the company, in consideration of certain royalties, acquired from the Vienna company the sole rights for the sale and manufacture for the United Kingdom, its Colonies and dependencies, of electrically-driven vehicles made under their patents. At the commencement of its operations the company obtained its supplies from the Vienna company. Subsequently arrangements were made with a firm of engineers in this country for the manufacture of vehicles. Delay occurred in delivery and the vehicles were otherwise unsatisfactory, and considerable expense was incurred in putting them in proper order. Proceedings were taken against the company by the firm referred to in respect of additional work, and they were compromised by the company agreeing to pay the sum of £1,500. Part only of this amount has been paid.

At an extraordinary general meeting on November 29th, 1912, the directors were authorised to negotiate for the purchase of the business of Trackless Trolley, Ltd. The necessary documents were apparently prepared, but the purchase was not completed. In anticipation of this being done, the company, who had taken works at Stamford Hill, commenced to manufacture trackless buses. Contracts for these vehicles were carried out for various public bodies, but the buses were not satisfactory, and heavy losses were sustained in effecting replacements and rectifying defects. One

of the contracts was executed for a firm of contractors engaged upon works in South Wales. In consequence of the vehicles failing to meet requirements, a considerable portion of the price has not been received by the company. It is understood that the receiver for debenture-holders has come to an arrangement with the contractors for their taking over and completing this contract. According to Bowen, the principal trouble in connection with these vehicles was due to the motors not being sufficiently powerful, and failing to perform the work which the Vienna company assured him they would do. He also states that recommendations and suggestions made by him with a view of avoiding the trouble were disregarded. Towards the end of 1913, the financial position of the company was such that liquidation was contemplated. The Vienna company, however, were advised that there were prospects of successfully carrying on the business, and it was determined to transfer the undertaking, together with that of the Trackless Trolley Co., to a new company. A prospectus was prepared, but the outbreak of war prevented the matter being proceeded with. While these arrangements were pending negotiations took place with the Directors of the Daimler Motoren Gesellschaft and a credit account was opened for an amount not to exceed £32,000, guaranteed by a Vienna bank. The bulk of the drawings against this account were remitted to the Vienna company on account of the company's indebtedness to that company and to the Austrian Daimler Motor Co., Ltd., in respect of advances made, &c. Bowen states that he understood the account was to be used for the purpose of providing working capital until the new company was formed, and that he was not aware until some time later that remittances had been made to Vienna. In August, 1915, the directors created an issue of debentures for £4,000. These were allotted to the Austrian Daimler Co. to secure £2,000 alleged to be then owing, and further advances to be made by them. In November, 1915, a creditor having obtained judgment against the company, the debenture-holders took steps to protect their security, and on January 14th, 1916, the Court appointed Mr. J. W. Barrett, of 19A, Coleman Street, London, E.C., receiver on their behalf. The company's business has been carried on at a loss throughout, the result of the trading, as shown by its accounts, being as follows:—

From May, 1910, to Jan., 1911.	Loss, £821;
" Feb., 1911, to Jan., 1912.	" £1,274;
" Feb., 1912, to Dec., 1912.	" £518;
" Jan., 1913, to Dec., 1913.	" £6,875;
" Jan., 1914, to Dec., 1914.	" £7,395;
" Jan., 1915, to Jan., 1916.	" £14,001.

The failure of the company is attributed to its resources being too limited to produce on a remunerative scale, to heavy losses in connection with the various contracts referred to, and to friction between the management in London and the Vienna company.

KRUPKA & JACOBY, LTD., London.—Creditors should send particulars of debts or claims, &c., to the controller, Mr. T. Wise, Basinghall House, Basinghall Street, E.C., by July 10th.

UNION ELECTRIC CO. LTD., London, S.E.—Creditors should send particulars of debts or claims, &c., to the controller, Mr. P. D. Leake, 25, Abchurch Lane, E.C., by July 22nd.

SCORCH ELECTRICAL CO. LTD., 35, Basinghall Street, E.C.—Creditors should send particulars of their debts or claims to the controller, Mr. C. E. Barker, 21, Finsbury Pavement, E.C., by July 14th.

LIGHTING AND POWER NOTES.

Australia.—The Melbourne City Council has adopted the recommendation of the Electric Supply Committee, to reduce the present tariff for the supply of electricity in bulk to the municipalities of Footscray, Port Melbourne, Brunswick, and Williamstown, and to the Brunswick and Coburg Tramways Trust, as from November 1st, 1916, as follows:—For a demand up to, but not exceeding, 500 kW., a reduction from the present rate of £5 a kW. a year, to £4 10s.; for any excess above 500 kW. a charge of £4 a kW. a year, plus the present rate of 0.65d. a unit for a consumption up to 1,000,000 units a year, 0.61d. for the next 1,000,000 units a year, and 0.55d. a unit for any excess above 2,000,000 a year.

Barnes.—The Council's electrical engineer, Mr. C. S. Davidson, estimates that there will be a loss of about £900 on the electricity undertaking during the summer months owing to the "daylight saving." The Council has decided to increase the charge for power by 10 per cent., and for private lighting and heating (now 3½d. per unit) by 15 per cent.

Bedford.—LOAN APPLICATIONS.—The J.G.B. having informed the T.C. that no ordinary extension of E.L. mains should be undertaken at present, the town clerk has pointed out that persons in the statutory area have a right to the service. In their reply the J.G.B. state that the cases appear to be covered by the expression "ordinary extensions of mains," and add that they will not be prepared to sanction a loan for any extensions, except such as are necessary for war purposes. The R.D.C. and the B. of T. are to be asked to consent to electricity being supplied to the new works to be established by Messrs. W. H. Allen, Son & Co., Ltd.

Birkenhead.—The chairman of the Electricity Committee states that the charges for electricity will have to be increased in consequence of the Summer Time Act. An increase of 5 per cent. to ordinary consumers would bring in £794, which, with other amounts, would total £2,000.

Barnet.—The Guardians last week decided to purchase and install electrical apparatus in connection with the new infirmary.

Blackburn.—**YEAR'S WORKING.**—The annual report of Mr. Wheelwright, the borough electrical engineer, refers to the difficulties encountered during the past year, particularly as regards coal supply. The total units generated during the year for lighting, power, and traction, amounted to 7,829,477, an increase of 336,464 on the previous year, due to power supply. The receipts were £51,110, and the expenditure was £26,650, leaving a

TYPICAL MILL DAY-LOAD CURVE.

gross profit of £24,460; after payment of interest and sinking fund there was a net surplus of £3,132, compared with £2,348 in the previous year. The nature of the mill load on the three-phase extra-high-pressure mains is well shown by the accompanying diagram, reduced from one of Mr. Wheelwright's.

Canterbury.—**PRICE INCREASE.**—The T.C. has not adopted the recommendation to charge an extra $\frac{1}{4}$ d. per unit for energy supplied for power. There is to be an increase of $\frac{1}{4}$ d. per unit for lighting.

Carnarvon.—**PLANT EXTENSION.**—Owing to the increasing demand for electricity, the Corporation has decided to extend the plant at the works by the addition of a Diesel engine set, at an estimated cost of £2,380.

Continental.—**SPAIN.**—The Sociedad Fuerza Motrices y Regios, of Pamplona, has applied for a concession to establish a plant to utilise the water-power of the River Ebro for the generation of electrical energy for lighting and power purposes in the district.

Crewe.—**PRICE INCREASE.**—The T.C. has increased the charges for energy by 10 per cent.

Ealing.—During the first week of the operation of the Summer Time Act the Council electricity station generated 6,820 units of electricity less than in the previous week, equal to a 25 per cent. decrease.

Eton.—**STREET LIGHTING.**—The U.D.C. has decided to ask the Windsor Electric Installation Co., Ltd., to reconsider the charges made for public lighting, which has been reduced by about 40 per cent. The company had intimated that they were unwilling further to reduce the charges, and the Council's Lighting Committee expressed dissatisfaction with this decision.

Grays.—The U.D.C., on June 8th, decided further to increase the charges for energy for lighting and power by 15 per cent., making a total of 25 per cent. since the outbreak of war.

Hereford.—**PRICE INCREASE.**—The T.C. has adopted the following new scale of charges for energy:—All lighting units charged at $\frac{1}{4}$ d. per unit; before the war to be 6 $\frac{1}{2}$ d. ditto charged at 3d. to be 6 $\frac{1}{2}$ d.; all other units 25 per cent. extra, making, with the 10 per cent. advance last year, a total of 35 per cent. on pre-war charges. Discounts remain unaltered.

Ikinston.—**SALE OF UNDERTAKING.**—The Council has approved the proposed sale of the electricity undertaking, on which there has been a total loss of £4,555, to the Notts. and Derbyshire Power Co.

Keswick.—**PRICE INCREASE.**—The Keswick Electric Light Co., Ltd., is increasing the charges for electricity for lighting as from July 1st by 10 per cent.

Leeds.—**YEAR'S WORKING.**—The report of the manager of the electricity department, Mr. C. N. Hafford, on the results of the past year's working, shows that the revenue from private lighting was £75,100, from street lighting £1,183, from power £91,886, from heating £2,672, from traction £16,181, and from residential bulk supplies £1,539. The total receipts were £187,724, an increase of £17,703. The working expenses were £75,143, an increase of £9,522, and the gross profit was £112,581, an increase of £8,481. While private and public lighting showed a decrease, power sales increased by 26 per cent. Allowances to dependents of employees on active service absorbed £2,041, income tax £1,974, interest £33,845, sinking fund £55,631, and contributions to capital expenditure £8,374, leaving a surplus of £8,716. No increase in the price of energy was made last year, but an increase of 10 per cent. has been considered necessary for the current year. The total energy sold increased from 43 to 44.8 million units, the growth of 26 per cent. in the output for power being almost wiped out by the decrease in sales for other purposes; the largest item was a reduction of 3.9 million units for traction. The

motors connected to the mains have an aggregate capacity of 38,054 H.P., and the revenue from the power load, for the first time on record, has exceeded that from any other source. The "residential bulk system" of charging, which was introduced on January 1st, 1915, and is growing in popularity, is that otherwise known as the assessment system, with a charge of $\frac{1}{4}$ d. per unit. The number of consumers of electricity for heating purposes has increased by 19.5 per cent., the capacity of the heating apparatus installed by 35.3 per cent., and the energy consumed by 53 per cent., in addition to that supplied to residential bulk consumers. The average net price per unit for lighting was 2.931d. for power 0.8d. and for all purposes 1d. The extensions of the generating plant are approaching completion, and will bring up the total capacity to 44,600 kW.

Lincoln.—The working of the Corporation electricity department for the year ended March 31st resulted in a revenue of £17,448, including £9,635 for power supply. After meeting working expenses, a gross profit remained of £6,901; interest and sinking-fund charges amounted to £5,214, leaving a net profit of £1,690 to be carried forward. The energy sold totalled 3,162,831 units, an increase of 861,717 units or 38 per cent. over last year.

London.—**FUEL ECONOMY.**—A conference of representatives of Metropolitan Municipalities owning electricity supply undertakings was held on June 8th, to consider the letter of the Board of Trade with regard to the interconnection of systems for the purpose of saving coal. A resolution was passed pledging the authorities that were represented to do all that was in their power to carry out the object of the Board of Trade.

Hammersmith.—The Electricity Committee has reported upon the letter from the Board of Trade, and reminds the Borough Council that in June last a scheme for linking-up the generating stations of Battersea, Fulham, and Hammersmith was approved in principle. H.M. Treasury, however, only sanctioned such capital expenditure on the scheme as was then alleged to be urgently necessary for the effective maintenance of existing supplies, and the County Council therefore decided that loans must at that time be limited to the cost of linking-up the undertakings of Battersea and Fulham. Accordingly, Hammersmith had no alternative but to withdraw from the scheme. Having regard to the terms of the Board's letter mentioned above, the Committee reports that it has now directed the town clerk to re-open negotiations with the Government Departments concerned with reference to the desirability of completing the original scheme of linking-up.

Loughborough.—**LOAN APPLICATION.**—The T.C. has decided to apply to the L.G.B. for sanction to borrow £1,400, or such other sum as may be necessary, for the laying of a special electric cable to works in Great Central Road and Windmill Road.

Maidenhead.—It is reported that since the Summer Time Act came into force, the sale of lighting units from the Corporation electricity works has been seriously reduced.

Manchester.—At a meeting of the City Council last week, a long-standing notice of motion with regard to the inability of the electricity department to meet demands for energy for proposed new works (which subject was referred to in these columns some time ago) was withdrawn by Councillor Ross Clyne, who said he had received assurances that the Electricity Committee had a complete answer to the points raised by the motion. A war bonus of 2s. per week has been granted to certain workmen in the electricity department.

YEAR'S WORKING.—The report of the Electricity Committee to the City Council for the past year shows that the sales of energy brought in a revenue of £606,056, made up of £475,839 for lighting and power, £126,956 for traction, and £3,261 for public lighting, which, together with £13,914 from other sources, made a total of £620,000, as compared with £513,516 in the previous year. The expenditure amounted to £371,514, as compared with £295,441, leaving a balance of £248,486, practically the same as in the previous year. Discounting £67,919 for interest, £118,393 for sinking fund, £7,302 for repayment of a loan, and £25,419 transferred to renewals, there remained a net surplus of £29,453; this was made up to £30,000 from the reserve fund, and handed over in aid of the rates. The expenditure included £11,110 for war service allowances and £11,338 additional income-tax. The renewals suspense account stands at £191,915, and the reserve fund at £11,335. Borrowing powers amounting to £426,420 were secured during the year; the total outlay stands at £3,112,406, and the mortgage debt at £1,738,726. The energy sold exceeded 141 million units, an increase of 14 millions; the items were:—Private consumers, 113.3 millions; traction, 28.1 millions. The energy used on works amounted to 13.1 millions, and that used in distribution, &c., to 26.7 millions, the total quantity generated being 181.3 millions, compared with 162.7 millions in 1914-15. The maximum demand was, for lighting and power, 42,976 kW.; for traction, 10,000 kW.—total, 52,976 kW., compared with 50,460 kW. in 1914-15. The average price obtained per unit was 1.03d. The curves on the following page are reproduced from the report.

At Stuart Street station a 5,000-kw. turbo-alternator has been installed by the British Westinghouse Co., Ltd., and a repeat order has been placed with the makers, which will displace another of the Yates & Thom-A.E.G. 1,500-kw. reciprocating sets. Two B. and W. boilers have been installed, and pending the commencement of the Barton Works, additional B. and W. boilers have been ordered.

as well as a 15,000-kw. turbo-generator from Messrs. Richardsons, Westgarth & Co., Ltd., with the necessary auxiliary apparatus

KEY TO INDEX NUMBERS:—A and B, scale unit 0-125; C, D, E, F, G, H, and I, unit 200,000; E and F, unit 50,000; G, H and I, unit 10,000,000 kw.-hours.

PROGRESS OF MANCHESTER ELECTRICITY SUPPLY.

from other firms. Many new sub-stations have been installed on power consumers' premises, and 11½ miles of new mains have been laid.

Oldham.—**YEAR'S WORKING.**—The report of the joint managers of the Corporation electricity department. Messrs. W. C. Chamberlain and F. L. Ordén, for the past year shows an increase of 2½ million units sold; the increase would have been much greater, but certain cotton mills which had contracted for a power supply were unable to obtain the necessary plant, making a difference of 3 or 4 million units. Receipts from private lighting were £24,519, from power and heating £18,818, from traction £19,441, and from other sources £930, making a total of £63,920, compared with £52,293 last year. The power and heating receipts were almost doubled. The total costs were £37,222, compared with £27,006, and the gross profit was £26,698. The sales of energy amounted to 10,487,235 units, compared with 7,985,839, and the average price obtained was 1.44d. per unit. The net profit was £5,107, compared with £3,550 in 1914-15.

Perth.—**POWER SUPPLY.**—The Caledonian Railway Co. propose to introduce electricity for power and lighting into their workshops, and at a meeting of the Corporation Electricity Committee a communication was received from the company as to terms of supply. The matter has been remitted to the convener and the electrical engineer, to meet the representatives of the company.

Rathmines.—The U.D.C. has adopted the Lighting Committee's report recommending that the public electric lamps remain unlit during the current month.

Redruth.—**LIGHTING CONTRACT.**—The U.D.C. is to inquire from the L.G.B. whether in view of the restricted lighting, the existing contract with the Electric Supply Co. still holds good. It is asserted that whereas the contract price per lamp is £2 4s. per annum, the Council is really paying over £6, owing to the reduced number of lamps.

Rotherham.—**EXTENSIONS.**—The town clerk has been instructed to approach the Minister of Munition with reference to the immediate requirements of the Corporation for extensions of feeders and cables in order to provide supplies of energy to factories. Upon receiving the Department's approval, it is proposed to take the necessary proceedings to secure sanction to borrow not exceeding £10,000, this being the estimated sum required for main extensions during the ensuing six months.

Salford.—**YEAR'S WORKING.**—Speaking at a meeting of the Council last week, Councillor Billington said the year's financial results of the electricity department were the best in the history of the undertaking. Since the end of the previous financial year the units sold had increased from 20,650,000 units to 24,856,000 units, or 20 per cent.; the revenue had increased from £115,847 to £133,764; the gross profit from £50,807 to £63,325, and the net profit from £8,406 to £16,598. This was the largest net profit recorded, the nearest being the profit of 1906 (£14,800), when, however, coal was 7s. 9d. per ton, as against an average of 15s. 1d. per ton during the past year. The excellence of the year's result was mainly attributable to the introduction of modern plant and the consequent economies in operation. In coal alone a comparison with two years ago showed a saving equal to 15,000 tons per annum, and all other heads of working expenditure, including wages, repairs, distribution, oils and stores, had been reduced. The increased output and the modernisation of the works were being carried out without any increase in the amount of their capital indebtedness, the expenditure being met out of the renewals fund. In referring to the scheme for interconnecting electrical undertakings in this part of the country, Councillor Billington said the Committee would shortly be called upon to consider the scheme, which, it was hoped, would prove of mutual advantage.

Sheffield.—**LOAN SANCTION.**—The L.G.B. has sanctioned the borrowing of £75,000 for mains and £30,000 for sub-stations and equipment, transformers, &c. Of the sum sanctioned for main extensions £10,000 will be appropriated from the reserve fund. The Treasury has intimated its decision not to withhold sanction to the proposed loan of £137,104 for the purchase of additional plant for the power station.

St. Helens.—**YEAR'S WORKING.**—At the meeting of the T.C. last week, Sir J. Beecham said the electricity sold during the year ended March last totalled 6,335,906 units. There was a decrease of 18 per cent. in the units for lighting purposes, and a decrease of 10 per cent. in the units sold to the tramway company, but as against these there was an increase of 21 per cent. in the number of units sold for power purposes, and in the total number of units sold there was an increase of 9 per cent. The revenue increased from £30,179 to £33,979, and the expenditure increased from £29,641 to £33,470. A proposal to advance the prices for energy by 20 per cent., instead of the 10 per cent. advance at present in force, was referred back.

Stretford.—**POWER CONTRACT.**—The Electricity Committee has agreed to a compromise with the United Brassfounders and Engineers, Ltd., in regard to the agreement for the supply of energy to their premises at Old Trafford, viz.:—(1) Electricity to be supplied at ordinary rates plus 15 per cent., subject to a minimum of 50 and a maximum demand of 100 kw., the minimum to apply during working hours only; (2) in the event of the total consumption for the period ending December 31st next exceeding 400,000 units, the Council will refund 25 per cent. of the cost of the cable; (3) any further reimbursement of the cost of cable to be entirely at the discretion of the Council, which will favourably consider the same on an application from the company, if, in the opinion of the Council, the extent of the company's demand for energy in the ensuing 12 months is reasonable in the circumstances.

Swinton and Pendlebury.—The Lancs. E.P. Co. has received permission from the D.C. to lay a cable for the supply of energy to Dean's Mill, Swinton. The company is stated to have ordered a 300-kw. rotary converter for the sub-station, in order to meet the increased demand, and also to provide sufficient stand-by plant. At a meeting of the D.C. last week, it was reported that next winter, in some parts of the district, the cables would be fully loaded, and it might not be possible to accept certain applications for supply, particularly for power purposes. In view of this, it was recommended that people contemplating the adoption of the use of electricity should ascertain whether energy would be available before they ordered machinery or installation work. The electrical engineer is to report on the rates charged to consumers, with special reference to power consumers and the cost of electricity purchased by the Council. Lighting on main roads is to be discontinued during the next five or six weeks.

Tasmania.—The Government's Great Lake Hydro-electric scheme was officially opened by the Governor-General of the Commonwealth at the commencement of last month. The present plant will generate 9,000 H.P., and owing to the demand for electricity for power purposes extensions will have to be made almost immediately.

Uruguay.—It is reported that the State Electrical Department contemplates a considerable reduction in the present price of electrical energy in order to generalise its use. The price talked of is about 2 cents (1d.) per unit. It is proposed to import a large quantity of cheap electrical cooking stoves from the United States. The construction of new power houses at various towns in the interior is being hurried on.—*Review of the River Plate.*

Weybridge.—**PRICE INCREASE.**—Representatives of the U.D.C. are meeting the B. of T. with reference to the proposal of the Urban Electric Supply Co., Ltd., to discontinue the use of the maximum demand system. The D.C. protests against the increase of price proposed as being excessive, considering all the circumstances, and suggests that, if any alteration is made, the price to the consumer should be regulated by the cost of coal, and that any increase of price should be in force only up to the termination of the war.

Wakefield.—**LOAN APPLICATION.**—The City Council has decided to make application to the L.G.B. for sanction to borrow the sum of £5,620 for proposed extensions to the electricity undertaking.

Wigan.—**LOAN APPLICATIONS.**—The T.C. has decided to amend its resolution of May 3rd last (authorising application to be made to the L.G.B. for sanction to borrow the sum of £53,920 for extensions at the electricity works) by the addition of £3,517 for stock, boiler, and accessories.

The Council has further decided to amend its resolution of April 5th last (authorising application to be made to the L.G.B. for sanction to borrow £781, the estimated cost of cable, switchgear, and transformer, in connection with the proposed supply of electricity to the Northern Coarse Spinners, Ltd.) by the substitution of £961 for the sum of £781 above mentioned.

Winchester.—The T.C. has decided to apply to the Ministry of Munitions to certify the 500-kw. turbo-generator set ordered last year from Messrs. C. A. Parsons & Co., Ltd., as necessary to maintain the continuity of the supply of electricity over next winter. The plant can be installed by next September if released.

Windermere.—**PRICE INCREASE.**—The Windermere and District Electricity Supply Co. is increasing the charges for electricity for lighting purposes by 10 per cent. from July 1st next.

Worcester.—**YEAR'S WORKING.**—The report of the city electrical engineer, Mr. C. M. Shaw, for the past year, states that the total income was £21,225, an increase of £365; the working costs were £9,968, leaving a gross profit of £11,257, out of which was paid £3,851 interest and £6,801 redemption of capital, the final trading surplus being £604. But as works of a capital nature were paid for out of revenue to the amount of £726, there was a net deficit of £122. Private and public lighting and tramways showed a decreased consumption, but the power demand increased by nearly a quarter of a million units; 42 motors and 32 heating devices were connected.

TRAMWAY and RAILWAY NOTES.

Aldershot.—**NEW TRAMWAY SCHEME.**—A local conference of public bodies interested, is to be arranged to consider the question of a tramway scheme to link up Aldershot with Farnborough and Farnham.

Continental.—**SPAIN.**—The Sociedad Minera y Metalurgica de Penarroya has applied for a concession for the construction and working of a narrow-gauge electric railway between Conquista and Puertollano.

Croydon.—The T.C. is to renew the tramway track between Selhurst New Road and Selhurst railway bridge loops, strengthen the foundation, and construct a double line of track in continuation of the existing double line. The cost is estimated at £2,156.

Ilkeston.—**SALE OF TRAMWAY.**—The Council has approved the proposed sale of the tramway undertaking to the Notts. and Derbyshire Power Co. There has been a loss of £32,498 since 1904, when the tramways were opened.

Liverpool.—**WAR BONUS.**—The Tramways, Electric Power, and Lighting Committee recently decided to recommend an increase of pay for certain employés of £3. per hour, but at a meeting of the City Council, on June 9th, the Finance Committee recommended that this be not approved, but that a war bonus of 1s. 6d. per week be given to all men of 18 years and over in receipt of a weekly wage. This, with the proviso that no one should receive by such bonus more than £3 per week, was carried.

Loughborough.—**ELECTRIC TRUCK.**—The T.C. has decided to apply to the L.G.B. for sanction to borrow £600 for the purchase of a two-ton electric truck for the Electricity Committee for carting purposes.

Ramsbottom.—The D.C. has rescinded resolutions respecting free travelling facilities on the car, and has decided to confine these facilities to tramway employés going to or returning from duty, policemen in uniform, and wounded soldiers.

Stretford.—**EXTENSION OF TIME.**—The Board of Trade has sanctioned a further extension for two years of the period for completing the lines authorised by the Stretford Light Railways Order, 1906, and Railway No. 10 authorised by the West Manchester Light Railways (New Lines, &c.) Order, 1906.

Warrington.—**YEAR'S WORKING.**—Mr. W. H. Woodcock (assistant borough treasurer) reports that during the past year the tramway undertaking had an income of £24,670, and the expenditure amounted to £16,617. The gross profit was £8,053, and the net profit £2,620. The income in respect of the motorbus undertaking was £3,129, and expenditure £2,910. The gross profit was £219, loan charges amounted to £615, and the net loss was £396. Passengers carried on the buses numbered 846,883, as against 771,510 in the previous year.

London and South-Western Railway Electrification.—On Tuesday a trial run was carried out on the recently electrified section to Hampton Court.

L. & Y. Railway Breakdown.—Between eight and nine o'clock on Monday night a breakdown occurred on the L. & Y. Railway Co.'s electric system between Bury and Manchester. Some inconvenience was caused to passengers by the stoppage, which lasted about an hour. Steam trains were put into service as soon as possible.

Manchester.—According to certain authorities close upon 1,000 women are now serving as conductors on tramcars in Manchester, Salford and adjoining districts of South-East Lancashire. So far, we believe, no female drivers have been employed.

Weston-super-Mare.—**EXTENSION OF TIME.**—The Electric Supply Co., Ltd., has applied to the B. of T. for an extension of time until August 6th, 1918, for the completion of the tramways authorised by the order of 1900.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**PERTH.**—July 19th. P.M.G. Supply of insulators (Schedule 510). See "Official Notices" June 9th.

August 16th. P.M.G. Distilling apparatus (Schedule 502), telegraph and measuring instruments (Schedule 498). See "Official Notices" to-day.

MELBOURNE.—July 26th. Victorian Railways Commissioners, 400 signal lighting transformers.*

SYDNEY.—August 17th. Portable internal combustion engine and dynamo (24 kW.) for the Departmental Stores, Sydney, for P.M.G.*

August 24th. P.M.G. Automatic switchboard and apparatus for North Sydney Exchange. Schedule No. 511.*

BRISBANE.—July 31st. P.M.G. Power board and accumulators. Schedule No. 381.

Brighton.—June 20th. Electrical fittings, for the B. of G. Mr. H. Barfield, Clerk, Prince's Street.

Halifax.—June 17th. Steelwork over the dam at the electricity works. Mr. James Lord, Borough Engineer, Town Hall, Halifax. Deposit £1 (returnable).

Hull.—June 19th. Electrical requirements for six months, for the B. of G. Mr. R. H. Winter, Clerk, St. Mary's Chambers.

London.—**L.C.C.** June 19th. Asylums and Mental Deficiency Committee. Electric lamps for three months. Mr. H. F. Keene, Clerk, 2, Savoy Hill, Victoria Embankment, W.C.

New Zealand.—**INVERCARGILL.**—September 28th. Borough Council. Steam turbo-alternator, condensing plant, and switchgear. Specifications from the Tramway Office.

Rotherham.—July 3rd. Corporation. Twelve months' supply of tramway stores and materials, coal, cable, meters, &c. See "Official Notices" to-day.

Salford.—June 26th. Corporation. Coal conveyors and bunkers, for the Electricity Department. See "Official Notices" to-day.

Spain.—June 27th. Municipal authorities of Albox (Province of Almeria). Concession for the electric lighting of the town for 12 years.

Tenders have lately been invited by the municipal authorities of Zaragoza for the concession for the electric lighting of the town, and by the municipal authorities of Publa de Lillet (Province of Barcelona) for a similar concession for ten years.

Torquay.—June 19th. Corporation. 5,500 tons of coal, for use with mechanical stokers, for the Electric Lighting Committee. Mr. F. S. Hex, Town Clerk.

Warrington.—June 27th (noon). (1) Coal elevator; (2) vertical steam boiler feed pump. Specifications, &c. (£1 1s. each, returnable), from Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley.

West Ham.—June 22nd. B. of G. Electrical fittings for three months. Mr. T. Smith, Union Offices, Union Road, Leytonstone, N.E.

Wigan.—June 20th. Extensions to electric works, for the Electricity Committee. Deposit £1 1s. (returnable). Mr. A. T. Gooseman, Borough Engineer.

Wolverhampton.—June 16th. Electricity Department. Coal and ash-handling plant. See "Official Notices" June 9th.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Australia.—Accepted tenders:—

P.M.G.'s Department, Victoria. Four sections of a lamp-signalling track-line switchboard at Melbourne Central Exchange, 41,444, Western Electric Co. Aust., Ltd.
 Victoria Railways Department. Three-core cable for Newport workshops, 42,866 per mile, R.L. & Helsby Cables, Ltd.
 25-batters signal machines for signal shops, Newport, 1925, Aust. General Electric Co.
 Metropolitan Board of Water Supply and Sewerage, Sydney. Electrical sundries for one year, Edison & Swan U.E.L. Co., Ltd.

Bradford.—Electricity Committee. Two 150-K.V.A. three-phase transformers, and one 250-K.V.A. three-phase transformer: Brush Electrical Engineering Co., Ltd.

Cheltenham.—Corporation. Electrical Apparatus Co., Ltd.: Renewal of contract for one year's supply of electricity meters.

Dublin.—Dynamo for Crooksling Sanatorium, Brittas:—

General Electric Co. recommended £34 10
 British Thomson-Houston Co., Ltd. 54 9
 —Irish Builder.

Guildford.—T.C. Boiler coal-furnace with forced-draught blowers and special fire-bricks, for the refuse destructor: Meldrams, £100.

London.—Twelve-month contracts have been booked by the "Z" Electric Lamp Manufacturing Co., Ltd., as follows:—
 Great Northern Railway.—"Z" drawn-wire metal-filament lamps.
 Metropolitan Water Board.—"Z" drawn-wire lamps.

The following installation contracts were secured by the Alpha Manufacturing Co. during May:—

H.M.O.W.—New offices for Ministry of Munitions, Whitehall Gardens.
 L.C.C.—The "Victoria" Elementary School, Hammersmith; Senior Street Elementary School, Paddington; Star Lane Elementary School, Fulham; Wolmore Street Elementary School, Poplar.
 Metropolitan Asylums Board. Ventilating and lighting at South-Western Hospital, Stockwell; electric heating at Head Office, Embankment.

Rotherham.—Electric Light Committee. Rees Roturbo Manufacturing Co., a turbine boiler feed pump, at £322.

Sheffield.—Electricity Supply Committee:—

T. W. Ward, Ltd., M. C. Burnby & Sons, G. Turner, and Longbottom and Co. Total quantity of approx. 42,600 tons of coal over a period of 12 months.
 E. Taylor, Ltd.—Ash-hoist foundations, £257.

Sunderland.—Electricity and Lighting Committee.

Tenders accepted:—
 Farranti, Ltd.—E.H.T. switchgear and meters.
 Stewart & Lloyds.—Pipework.
 P. A. Mund & Co. Pipe and boiler lagging.

Tonbridge.—U.D.C. Electricity meters for a year:—
 Electrical Apparatus Co., Ltd. 200 tons of Dan Forest coal for the electricity works: Medway Coal Co., 29s. 4d. per ton.

FORTHCOMING EVENTS.

Physical Society of London.—Friday, June 16th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Ordinary meeting.

Incorporated Municipal Electrical Association.—Thursday, June 22nd. At 10 a.m. At the Institution of Electrical Engineers, Victoria Embankment, London, W.C. Annual Meeting. Presidential Address by Mr. A. C. Craigmiles. Papers on "Boiler House Design and Operation," by Mr. W. W. Laekie; "The Generation of Electricity on a Small Scale or Bulk Supply," by Mr. H. S. Ellis; and "The Application of Electricity to Agricultural Purposes," by Mr. W. T. Kerr.

Friday, June 23rd. At 10 a.m. Council Meeting; at 10.30 a.m. Annual General Meeting.

NOTES.

The British Association Meeting.—The annual meeting of the British Association for the Advancement of Science will take place at Newcastle-upon-Tyne from Tuesday, September 5th, to the following Saturday. Sir Arthur Evans, F.R.S., is the president. The sectional presidents include the following:—

Mathematical and Physical Science: Dr. A. N. Whitehead, F.R.S.
 Chemistry: Prof. G. G. Henderson.
 Economic Science and Statistics: Prof. A. W. Kirkaldy.
 Engineering: Mr. G. G. Stoney, F.R.S.

There will, of course, be no excursion, garden parties, &c., but the papers and discussions, as last year, will be concerned with problems arising out of the war, in its scientific, its technological, and its social aspects. The reception room will be at the College of Medicine, and the sections will meet in rooms not far afield. The presidential address will be delivered in the Town Hall.

Indian Notes.—Our special correspondent writes:—

Kabul.—H.M. The Amir's electrical engineer, Mr. G. Murray, has recently returned to India on a two months' holiday at the end of two years' service. The large hydro-electric scheme, which was commenced there a few years ago, has not yet been put into operation, mainly due to shortage of labour and material, and the difficulties of the climate. Mr. Jewett, the chief engineer for the contractors, is still in charge, courageously working against heavy odds to ensure the success of the operation.

Calcutta.—Mr. H. D. F. Jacob, lately of the British Westinghouse Co. has been appointed by the Bengal Government as Executive Engineer, Electrical Division P.W.D., to take the place of Mr. A. K. Taylor, who has been appointed Electrical Inspector under the Indian Electricity Act. Mr. Jacob is a sound engineer of ripe Indian experience; his knowledge of electrical work from a contractor's point of view should be an excellent asset to him in his new sphere.

Japanese Supplies.—The sinking of the s.s. *Chontala* not long ago has been a serious loss to many Calcutta electrical firms, and has given a further chance to the astute and enterprising Japanese traveller to push his wares. Being unable to procure supplies from England in reasonable time and in sufficient quantity, electrical dealers are now buying largely from Japan goods such as cables, wires, lamps, motors, and so on. But it is said that Japanese supplies are improving in quality, the Far East manufacturers being now able to turn out a surprisingly good article with prompt dispatch and at a not unreasonable price.

American Fans.—American ceiling fans hold a good grip of the Indian market, but the deliveries this season are woefully late; it is somewhat astonishing that America has not pushed the electrical accessories business more strenuously in India. The big American companies have hitherto done well in a big machinery way; but they appear to have neglected the smaller lines—in which there is money to be made.

Rats and Lead-Covered Cable.—The sample of lead-covered cable illustrated here-with, which Messrs. Electrical Installations, Ltd., have kindly sent us, was recently taken from an installation in a City restaurant. The lead sheathing and the insulation of the wires have been completely gnawed away by rats, the marks of their teeth being distinctly visible, not only on the lead, but also on the copper wires, of the sample. The insulation in this case was of vulcanised rubber. We do not know which

restaurant harboured these ravenous rodents, but seeing the straits to which they were reduced, we should think it hardly the most promising place in which to look for "satisfied consumers."

As regards the technical aspects of the matter, it is clear that lead sheathing is an inadequate protection for wiring in places to which rats have access, such as warehouses, farm buildings, workshops, &c., and in such places conduit seems to be the only sure protection; but rats should never be found in inhabited buildings—not even in a "City restaurant"—and the present instance need not deter contractors from using lead-covered wire there.

Runaway Car.—In Oldfield Lane, Wortley, Leeds, on Tuesday morning, a Corporation tramway goods hopper car, after being unloaded, ran away owing to the brake being prematurely released by a workman, and dashed down the track, which is on a gradient, at a furious pace. The driver, who was engaged in changing the trolley pole, was knocked on one side in trying to board the car. After running for a mile, the hopper car crashed into a passenger car, shattered the whole of the rear portion, and swerved it half-way round across the pavement, driving it through a five-foot wall and partly into a field. The wagon driver and the driver and conductor of the passenger car were severely injured; a lady passenger was able to proceed home after treatment at the Leeds Infirmary, and the remainder of the half-dozen passengers suffered from shock and minor hurts.

Device for Preventing Collision at Sea.—At the meeting of the Marconi International Marine Communication Co. Ltd., on Wednesday, Mr. Godfrey Isaacs stated that Senator Marconi had authorised him to announce that he would shortly introduce a simple apparatus to be worked from the bridge of a ship, which would put an end to the danger of collision in darkness or fog.

Volunteer Notes.—1ST LONDON ENGINEER VOLUNTEERS.—Orders for the week by Lieut.-Col. C. B. Clay, V.D., Commanding.

Monday, June 19th.—Technical for Platoon No. 9, 46 Regency Street, S.W.; Squad and Platoon Drill, Platoon No. 10; Signalling Class and Recruits.

Tuesday, June 20th.—School of Arms, 6 to 7; Recruits, 7.15 to 8.15; lecture, 7.15, "Sketching and Reconnaissance," Mr. R. J. Finch.

Wednesday, June 21st.—Platoon Drill, No. 3 Platoon.

Thursday, June 22nd.—Platoon Drill, No. 7 Platoon; Shooting for No. 10 Platoon, Miniature Range; Recruits, 5.15 to 7.45; Instructional Class, 5.45.

Friday, June 23rd.—Technical for No. 10 Platoon, 46, Regency Street, S.W.; Squad and Platoon Drill, No. 9 Platoon.

Sunday, June 25th.—Entrenching duties: Parade, Victoria Station (S.E. & C. Railway Booking Office), 8.35 a.m.

MACLEOD YEARLEY, Adjutant.

The Largest Supply Undertaking in the World.

In the *Electrical World*, of May 20th, there is a statistical account of the development of the Commonwealth Edison Co. of Chicago from small beginnings in 1881 to the present huge concern, which has a capital of 18 millions sterling and an annual income from the sale of electricity of more than 4 millions. Mr. Samuel Insull, an Englishman, has been President of the company since 1892 (when it was the Chicago Edison Co.), and its capital was £150,000, and has guided it to its present condition of extraordinary prosperity. Some idea of the rate of development may be gained from the following figures:—

	1900.	1905.	1910.	1915.
KW-hours generated, millions	39	131	626	1,198
Revenue from sale of electricity, millions sterling	452	1'07	2'43	4'17

It will be seen that the output increased 30 fold in the 15 years, whilst the revenue increased nine-fold, showing a great reduction in the prices charged. One of the most impressive and significant features of the article is the fact that the energy supplied to electric railways in 1915 exceeded 670 million units—nearly two-thirds of the total output sold: the length of electric railways (largely composed of tramways) supplied was 1,500 miles. Regular customers numbered 286,202. The maximum daily output, last Christmas Eve, was 41 million units, and the maximum connected load on December 31st was 834,056 KW. The peak load occurred on November 29th, 1915 337,900 KW. The total rating of the eight generating plants being 377,150 KW. The load factor was 42½ per cent., and the average income per KW.-hour 0.97d.

CHICAGO ELECTRICITY SUPPLY: TYPICAL DAY-LOAD CURVES AND PROGRESS CURVES.

It was in 1905 that the railway supply began to assume important dimensions: in that year it was about 10 million units, and in 10 years it steadily rose to 670 millions. The consumption of coal per KW.-hour fell from 7 lb. in 1903 to 2.8 lb. in 1909, rose to 3 lb. in 1911, and is now 2.7. The average retail lighting rates fell from 7d. in 1903 to 3.4d. in 1915, and the lighting revenue in 1915 formed more than half the total income, although the annual load factor was 42½ per cent.; the power and railway returns were almost exactly equal at one-fourth the total each. The present returns are per KW.-hour for lighting 2½d., for power 1.45d., and for traction 0.35d. The company owns 133 electric vehicles, and serves a total area of 199 sq. miles, being "the one accepted source of generation and distribution in Chicago for energy." It possesses a 50 year franchise dating from 1897, when the "Commonwealth Electric Co." was formed to acquire various properties operating in the outlying sections of the city; in 1907 the two companies, which had been closely interconnected, were combined under the present title. The accompanying curves show graphically the rapid development of the undertaking.

Russia's 1886 Company: Ministerial Action.—A Special Council has been held in Moscow, presided over by the President of the Council of Ministers, Mr. B. V. Sturmer, to consider the question of the liquidation of the 1886 Electric Lighting Co. General Shebeko, the Moscow Town Governor, and a number of leading citizens were present. The chairman stated that the 1886 Company was the kernel of German enterprises in Moscow. No one could contradict that contention. Those present unanimously approved of this remark; even the representatives of the temporary board of the company, Messrs. Svetochnikov and Kuchelbaker, did not contradict it. Thus, continued the chairman, they did not need to consider the constitution of the company, but must prepare the programme for clearing up other important questions in connection with the matter. He explained the most important points. First of all it was necessary to show what was to be done in the future with the 1886 Company. The second question was of serious importance—namely, to whom the concern should be transferred for exploitation, when once transfer was decided upon. And, finally, there was the question whether there were technical and economic obstacles should the concern be handed over to the Moscow Town Council. The subsequent discussion was conducted along these lines. The chief of the town, Mr.

Chelnokoff, expressed the desire of the town concerning the future of the company. This desire went no further than it had already been considered necessary to go against the company by Senator Ilyashenko's Committee—namely, the liquidation of the company by means of a special liquidating Committee, and the purchase of the concern by the Town Governor, Mr. Chelnokoff explained that it would not take more than a month to fix the value of the concern, whether by striking a balance of the accounts, or by an actual valuation. On the question to whom the undertaking of the company should be transferred, the town's representatives explained that there would be no financial trouble incurred by the transfer of the company to the town of Moscow. If it should be necessary for the town to pay the company out all at once, or in instalments, it was all the same to the Moscow Government, which could arrange for such a settlement. This opinion was also emphatically held by the representatives of the Financial Committee of the Town Council, Messrs. Katuar and Gutchkoff. In order to pay the company in one sum, the town would have to raise a loan, but for buying up such a concern the raising of the loan presented no difficulties. On the question of technical or economical obstacles to the transfer, the representatives of the town, referring to the practice in connection with their other important enterprises, showed that technical obstacles were non-existent. The town managed very well with its own public works. Touching the question of obstacles of an economic character, the representatives of the town showed that the danger to society or to manufacturers in the form of a rise in price for energy, and especially of strikes in the electrical works, which had been

particularly frequent in municipal concerns, was not groundless. Mr. Chelnokoff and other town representatives showed further, however, that the town was not afraid of these undertakings. Strikes easily broke out in works where there was a large number of workmen, and especially where there were various groups of workmen, as, for example, in the town tramways, where 9,000 men were employed. But in concerns where a small number of workmen were engaged, or where they were technically competent, strikes were not so frequent. The representatives of the town referred also to their experience with their waterworks, sewers, and finally their own electrical station. The representatives of the temporary board of the 1886 Company observed that in view of the immense importance of the station for the service of numerous concerns working for the national defence, it would be unwise to transfer it from one control to another. Notwithstanding this, the town representatives held that the defence of the country would be better served if the concern were in Russian hands, and not in German hands. Then, in a short résumé, the President of the Council of Ministers said that the question of the liquidation of the 1886 Company was quite ripe for the consideration of the Council of Ministers. Subsequent points for consideration would be the time and method of liquidation, and the formation of a liquidation committee. The Council of Ministers would decide the question to whom the company concerned should be transferred, either to the town of Moscow alone, or to the town along with the government, or whether it should be given to the highest bidder at a special auction. With this the conference closed. Whilst considering the question of the liquidation of the company, the representatives of the Gruzin and Narozhitzky district councils said that in connection with the decision as to the disposal of the 1886 Company, the question should also be decided of the liquidation of the Electric Transfer Co.; for their interests were identical, and the decision respecting both should follow the same course.

Lighting the Statue of Liberty.—The American *Electrical Review* is inviting dollar (or less) subscriptions to a fund for electrically illuminating the statue of Liberty in New York Harbour by flood lighting. It is considered that this will be the most significant public demonstration of the effectiveness and beauty of electrical illumination in which the industry has ever had the opportunity of assisting.

Australian Metals Developments.—The Australian newspapers have recently contained very full particulars of the scheme under which practically all the companies interested in silver, lead, and zinc in the Commonwealth are brought together. The Australian Zinc Producers' Association has been formed, through which the products of the whole of the companies will be marketed for a term of 50 years. The companies are extending their works, and according to a statement issued by Mr. Mahon, Acting Attorney-General, who, in the absence of Mr. Hughes, is dealing with the metal question in the Commonwealth, everything points to the conclusion that in the near future Australia will be self-contained in regard to the production of metals in a finished state. Mr. Mahon says:—

"In order that the public may have some idea of what has been performed since the Commonwealth Government adopted the wise policy of prohibiting the exportation of all minerals and metals that can be treated in Australia, it may be stated that the following named companies have enlarged their works, installed new plant and appliances, and generally increased the capacity of their various metallurgical establishments:—

Broken Hill Associated Smelters Pty., Ltd.:

Extensions to smelting and refining works, Port Pirie, for the treatment of lead concentrates and refining of lead bullion, costing £250,000

The Electrolytic Smelting and Refining Co. Works, Port Kembla, N.S.W.:

Additions and extensions to plant and installation of five refining furnaces £150,000

Sulphide Corporation, Cockle Creek Works:

Extensions to acid and superphosphate works for the utilisation of sulphurous fumes from metallurgical operations £50,000

There is also the probability that this company will erect a silver, lead, and gold refinery in the near future, the cost of which will exceed £50,000

The Wallaroo and Moonta Mining and Smelting Co., Wallaroo, S.A.:

Extensions to treatment plant and the installation of an additional large copper refining furnace £25,000

The Broken Hill Proprietary Co.:

Important additions and extensions to its new iron and steel works.

The Mount Lyell Mining and Railway Co.

is conducting large experiments for the recovery of sulphur. This company also has an option over a group of mines in Tasmania, and it is very probable that large works will be erected for the treatment of mixed ores from these properties.

"Several new companies have been formed to further develop the metal industries, viz:—

Metal Manufacturers, Ltd., Capital.

The operations of this company will cover the drawing of copper and brass wire and cables; manufacture of tubes, plates, and all descriptions of bronzes and alloys £200,000

A company (not yet registered) for the production of electrolytic zinc £250,000

Australian Electric Steel, Ltd.:

The objects of this company are the working up of scrap iron and scrap steel, and the manufacture of ferro-alloys in electric furnaces £40,000

"Several small plants have been installed for the separation of bismuth minerals from wolfram and molybdenite. Also, there has been restarting of the smelting of auriferous and non-auriferous antimonial ores for the production of fine gold and 'Star' antimony. The question of alkali manufacture has not been neglected, and plans are progressing satisfactorily for the establishment of this industry on a large scale. Carbide of calcium plant is being installed by the Hydro-Electric and Complex Ore Companies. These companies also intend to work the 'Gillies' process for the production of electrolytic zinc."

Fatality.—BELFAST.—On the evening of the 8th inst., Wm. McDonald (31), foreman electrician, was discovered in a state of collapse, at No. 2 switchboard in the engine-room at Belfast electricity works, where he was on duty. The surmise is that his foot having slipped, he threw out a hand to restore his balance, thus inadvertently establishing the contact that cost him his life. Deceased was the eldest son of Mr. David McDonald, who is overseer in the electricity department. At the inquest the jury found that death was the result of accidental shock, and expressed the opinion that the use of gloves should be enforced in such work as shifting shunts.

Institution Notes.—Association of Teachers in Technical Institutions.—An open meeting will be held on Saturday, June 17th, at 2.30 p.m., at the Day Training College, Southampton Row, W.C., at which Dr. William Garnett will deliver an address, and resolutions will be put to the meeting stating that: (1) The Association views with grave concern any diminution in expenditure which would impair the efficiency of technical education, and thereby react injuriously upon industry at a time when the country should be making every effort to improve its industrial position. The Conference, therefore, urges the Government to take all possible steps to make technical education more effective, not only in relation to existing industries, but in the development of new industries.

(2) The Conference urges the desirability of compulsory attendance for further education of employers until the age of 18 years for not less than six hours per week. The instruction should be given preferably in the day time, and to this end the Conference

urges that adequate facilities should be provided in the conditions of employment.

(3) It is of the greatest importance that the conditions of employment of a technical teacher should provide him with the opportunity of keeping himself in close touch with the development of his subjects.

(4) The Conference notes with great regret the inadequacy of the sum (£40,000) which the Government intends to devote to scientific and industrial research during the present financial year. The Conference is of the opinion that the existing conditions require the expenditure of a much larger sum.

The Association of Consulting Engineers (Inc.).—The report of the Committee for the past year, states that the restrictions which, owing to the war, the Treasury has caused to be placed on the borrowing powers of Local Authorities and on the issue of fresh capital by public companies, coupled with the increasing necessity for diverting the whole energies of most engineering works to the production of munitions of war, have had a very great effect on professional work during the past year; while a considerable number of members are either serving directly with the Forces or engaged on work connected with the supply of munitions.

A deputation from the Association interviewed the L.G.B. in July last year, with a view to obtaining some mitigation of the conditions, and in March last, representations were made to the authorities to the effect that they should employ consulting engineers with local experience when possible, rather than use the services of the servants of public bodies. Protests were also addressed to local authorities which allowed their electrical engineers to advise other local authorities. Negotiations are proceeding with the British Electrical and Allied Manufacturers' Association with a view to agreeing to a standard set of conditions of contract. The total membership now stands at 74. The accounts for the year 1915-16 show a credit balance of £178, compared with £78 last year.

At the annual general meeting on May 31st the report and accounts were unanimously adopted. The new members elected to serve on the Committee were Messrs. A. A. C. Swinton, F. Gill, W. V. Graham, E. P. Hill, A. Hindle, and C. D. Lomax.

The Chemical Society.—The adjourned meeting of the Society, to deal with the question of alien enemy membership, is to be held on Wednesday, June 21st, at 8 p.m. The Council has issued a voting paper with the notice of the meeting, inviting the Fellows to indicate their views with regard to three propositions, contemplating respectively the unconditional removal of the names of alien enemies from the roll of members, the retention of the names with suspension of judgment till after the war, or the removal of the names of nine such members (including those of Nerst and Ostwald) during the war, the position to be reconsidered at the end of the war. The voting, as in the case of the I.E.E., will not be binding, but will no doubt influence the voting at the meeting.

Industrial Research.—The Standing Committee on Engineering appointed by the Advisory Council for Scientific and Industrial Research held its first meeting on Wednesday, June 7th. The Committee has been so constituted as to represent both the scientific and the industrial sides of engineering, and includes the following members nominated by the professional associations:—

Institution of Civil Engineers, Sir Maurice Fitzmaurice, C.M.G.
Institution of Electrical Engineers, Mr. J. S. Highfield.
Institution of Mechanical Engineers, Dr. Dugald Clerk, F.R.S.
Institution of Naval Architects, Sir Archibald Denby, Bart.
N.E. Coast Institution of Engineers and Shipbuilders, Mr. Herbert Rowell.

Manchester Association of Engineers, Mr. Alfred Saxon.

Institution of Engineers and Shipbuilders in Scotland, Mr. James Brown.

The following members have been appointed directly by the Advisory Council:—Mr. F. R. Davenport; Mr. Alfred Herbert; Prof. Bertram Hopkinson, F.R.S.; Mr. C. H. Merz; Mr. V. L. Raven; Mr. A. A. Remington; Mr. G. Gerald Stoney, F.R.S.; Mr. Douglas Vickers; Prof. Miles Walker. The Advisory Council has appointed Sir Maurice Fitzmaurice, C.M.G., to be chairman.

The Committee was welcomed by Sir William McCormick, chairman of the Advisory Council, and D. H. F. Heath, administrative secretary of the Council. Sir A. Selby-Bigge, secretary to the Committee of the Privy Council for Scientific and Industrial Research, also attended, and emphasised the importance attached by the Government to the need for greatly increased activity in research in connection with industry. In Sir Maurice Fitzmaurice's opening statement, as chairman of the Standing Committee, several important aspects of the Government scheme, as issued in July, 1915, were referred to, and attention was directed in particular to the necessity for securing that British industries should get as large a share as possible of the full value of the results of any successful research, and should retain at least the initial advantages derived from them. Applications for aid must be dealt with on as broad lines as possible, without red-tape, and with a constant regard to the ultimate object of the Government scheme, which was to help the industrial community of the Empire in the contest with the common trade enemy. Much time and money had been spent upon research in the works of individual firms, whose aggregate expenditure for the purpose far exceeded the sums at the disposal of the Committee of Council, and from the industrial side such work by firms appealed to him as the most hopeful arrangement. Too much must, however, not be expected from research and experimental work in themselves, for these alone would not win back the industries which should never have left us, or even retain those we still possessed; individual and combined efforts were needed to secure that the products of this country should find their way to those who needed them at home and abroad, and to see that what was wanted was supplied by our industries.

Electrical Man's Court-Martial.—John M'Entee, electrical engineer, Belfast, who was employed at the Dundalk electricity works from January, 1914, until near the end of April last, was tried, with several others, by court-martial on Friday and Saturday last, at Richmond Barracks, Dublin, for the murder of a constable, and attempted murder of a lieutenant in the Grenadier Guards, and taking part in the rebellion, in County Louth, on April 24th. Mr. P. A. Spalding, resident engineer and manager, of Dundalk electricity works, gave evidence as to M'Entee's high character as an engineer, and as a young gentleman of education and intelligence. M'Entee made a lengthy statement absolutely denying and disavowing the charge of murder. He also denied other charges, and repudiated the allegation that he was assisting the King's enemies, directly and indirectly. He said that any action he had taken was actuated only by love of Ireland. He was an enthusiastic Volunteer, but his whole aim on Easter Monday was to resist the suppression of an organisation the maintenance of which he regarded as a great safeguard against the repeal of the Home Rule Act. He was not aware of the plans for the insurrection. Mr. Alexander, a member of the Belfast Corporation, gave evidence in M'Entee's favour, as did also Alderman Magowan, Mr. J. Devlin, M.P., and others. The President announced that the proceedings in open Court were concluded, and the accused was removed.

It was announced in Dublin on Wednesday, that M'Entee was sentenced to death, but that his sentence had been commuted to penal servitude for life.

Appointments Vacant.—The following are required for military electric power stations in Yorkshire and Staffordshire:—District electrical engineer; station engineer; shift engineers; station fitters and linesman-jointers. See our advertisement pages for particulars.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the *ELECTRICAL REVIEW* posted as to their movements.

Central Station Officials.—By 11 votes to 8, the Gillingham (Kent) T.C. has agreed to Mr. RITSON, assistant electrical engineer, joining the Colours. The minority, which included the Mayor, considered that they would be placing themselves in a very awkward position by letting Mr. Ritson go. Mr. CHALMERS, the electrical engineer, has undertaken to take charge of the works for the period of the war without a substitute for Mr. Ritson, three applicants for the position being deemed unsuitable.

In view of the large amount of additional work and responsibility which has been cast upon the general manager of the Sheffield undertaking owing to the war, the Electricity Supply Committee has recommended the City Council to grant him a bonus of £100. The Establishment Committee does not approve, and the Electricity Committee is appealing to the Council.

General.—Mr. ERNEST E. KELL, chief electrical assistant engineer P.W.D., Government Factory, Colombo, Ceylon, was sailing for home last month on short leave. His address here is: Clifton Villa, Clifton Terrace, Hayle, Cornwall.

Gazette Notice.—Territorial Force, Royal Engineers. *Tyne Gazette* Electrical Engineers: Sergt-Major FRANK T. HAMILTON to be Second-Lieutenant (on probation).

Mr. T. N. VAIL, president of the American Telephone and Telegraph Co., was awarded the Elliott Cresson medal at a meeting of the Franklin Institute on May 17th, and Mr. J. J. CARRY, chief engineer of the company, was presented with the Franklin medal.

The marriage took place on June 10th, at Penarth, of Mr. R. L. BOOTH, managing director of Booth & Bonford, Ltd., electrical engineers, Cardiff, and Miss Margaret Lewell.

Roll of Honour.—Many of the friends of Mr. WILLIAM ARTHUR PRICE will desire to join us in an expression of sympathy with him and Mrs. Price and the members of the family in the loss of his second son, Sub-Lieutenant WILFRED BARTHOLOMEW PRICE, in the North Sea Battle on May 31st. Mr. Price's eldest son was at the battle of Mons, and has been a prisoner in the hands of the enemy ever since.

Electrical-Wireman JOHN LUTY, of H.M.S. *Conqueror*, who took part in the North Sea battle, and was uninjured, was formerly an electrician at the municipal power station at Batley.

Sergeant G. H. WOOD, one of the senior inspectors of the Blackburn Corporation tramways department, who has been shot in the head, is in a serious condition.

First-Class Stoker HENRY PARKER, who, prior to joining the Navy in August, 1914, held a position in the electrical department of the North-Eastern Railway, was lost in the *Queen Mary*.

PERCY LAWLEY, lost in H.M.S. *Queen Mary* in the North Sea fight, was formerly an electric wireman with Messrs. Callenders, at Birmingham.

It is feared that Mr. W. F. MURRAY, electrical engineer, was lost in the North Sea battle. He was an engine-room artificer on H.M.S. *Indefatigable*. He was formerly electrical engineer at the Workington Iron & Steel Co.'s iron ore mines.

Captain A. F. MARCHMENT, of the 1/1st London Regiment, who was, when the war broke out, in the engineering department of Callender's Cable & Construction Co., Ltd., has been awarded the Military Cross.

CHARLES CLIFFORD MASSEY, of H.M.S. *Black Prince*, killed in the North Sea battle, served his apprenticeship in the electrical department at Crewe Railway Works, and was later engaged at the Marconi Works, at Chelmsford. He entered the Navy three years ago.

Artificer GEORGE ADAMS MORPHEW, E.R.A., one of the victims in the H.M.S. *Hampshire* disaster, was formerly on the staff of Messrs. Siemens Bros., Ltd., of Charlton, S.E. His mother, who lives at Walmer, received a letter (dated June 4th) from him on June 8th, enclosing his will, and stating that in the North Sea battle his vessel rammed a submarine, and sunk another and a light cruiser by gunfire.

DONALD HERBERT JENNINGS, of H.M.S. *Tiger*, who was severely burned on the face and hands in the North Sea action, was a wireman of the armoury, and, prior to the war, was with Messrs. Tamplin & Makovski, electrical engineers, of Reigate.

Electrical Engineer W. G. WATERMAN, reported lost in H.M.S. *Hampshire*, was formerly mains superintendent at the Doncaster Corporation electricity works, where he served as a pupil for three years. He joined the Navy last July.

Private HIRAM HART, Loyal North Lancashire, formerly an electrician with the Bolton Corporation, has been killed in action.

Electrician J. W. VASEGARDEN, aged 33, is believed to have gone down with the *Hampshire*.

Private FREDERICK MONTIER, formerly engaged at the electricity generating station at Clifton, near Manchester, has been killed in action.

Leading Stoker JOSEPH GRAVES, aged 24, formerly in the employ of Messrs. J. P. Hall & Co., electrical engineers, of Oldham, was lost in the *Indefatigable*.

Sergeant JAMES MUSCROFT, formerly employed at the British Westinghouse Works, Trafford Park, who was reported missing some months ago, is now officially reported killed.

Seaman J. E. STONE, formerly employed by the British Westinghouse Co., Trafford Park, is believed to have been lost in the sea fight. He was serving on H.M.S. *Nestor*.

Electrician HENRY LEWIS DAVEY, H.M.S. *Warrior*, "killed in action," May 31st, 1916 (aged 20 years), was formerly in the employ of Messrs. Edwards & Armstrong, of Bristol.

Electric Artificer JOSEPH SAMUEL PARKER, who belonged to Ipswich, was killed in action whilst on board H.M.S. *Tiger* in the battle on May 31st.

Electrician W. WHARMBY, of Stalybridge (formerly employed by Messrs. Ferranti, Ltd., and later by Messrs. Johnson and Phillips) went down on H.M.S. *Defence* in the North Sea fight.

Obituary.—PROF. SILVANUS P. THOMPSON.—We record with very deep feelings of regret the death of Prof. Silvanus P. Thompson, D.Sc., LL.D., F.R.S., which occurred at his residence at "Morland," Chislet Road, Hampstead, N.W., on Monday last, after two days' illness "without suffering." Prof. Thompson, who had nearly reached his 65th year, was a man of great eminence in the world of physical and electrical science as a scientist, teacher, author, and orator. His prolonged occupation of the position of Principal at Finsbury Technical College, his widely-used standard technical works and biographical writings on Faraday and Kelvin, and his manifold activities in connection with various institutions, had brought him into touch with thousands of men, many of whom recognise how greatly they have benefited from being brought under his influence. We hope to refer to the deceased professor's career in greater detail next week. In the meantime, we tender our sincere sympathy to Mrs. Thompson and her four daughters. Friends of the late professor are invited to a meeting at the Friends' Meeting House, 52, St. Martin's Lane, W.C., to-day, Friday, at 3 p.m. (after the cremation).

MR. WILLIAM STANLEY.—The American *Electrical Review* contains an obituary of Mr. Wm. Stanley, "one of the foremost inventors and engineers in the American electrical industry, and former vice-president of the American Institute of Electrical Engineers," who passed away last month at the age of 58 years. His most notable invention was the transformer which made the a.c. system of long-distance transmission of electrical energy a commercial possibility, the Edison Medal being awarded to him therefor in 1912 by the American I.E.E. The deceased gentleman was a member of the English Institution of Electrical Engineers.

LIEUTENANT J. R. WILKINSON, B.Sc.—Mr. George Wilkinson, borough electrical engineer of Harrogate, has received news of the sudden death of his elder son, Lieutenant J. R. Wilkinson, B.Sc., in Germany, where he had been a prisoner of war for 21 months. Lieut. Wilkinson had gone on to the roof of his quarters at Gnadendorf, Schlesien, to make meteorological observations, when from some cause unknown he fell to the ground and was instantaneously killed. We tender our sincere sympathy with Mr. Wilkinson in his loss.

MR. W. C. MANSELL.—The death is announced of Mr. Wm. Charles Mansell, who was in business as an electrical engineer at Northampton.

It is officially announced that while employed on special duty Sir H. F. DONALDSON and Mr. LESLIE ROBERTSON, both of whom were lost in the *Hampshire*, were to have the relative precedence of a brigadier-general and a lieutenant-colonel respectively. At the instance of the Engineering Institutions a service was held at St. Margaret's Church, Westminster, yesterday, in memory of SIR FREDERICK DONALDSON and MR. LESLIE S. ROBERTSON.

NEW COMPANIES REGISTERED.

CITY NOTES.

Coleman & Appleby, Ltd. (144,022).—This company was registered on June 5th, with a capital of £3,500 in £1 shares (3,000 6 per cent. cumulative preferred, free of income-tax), to enter into an agreement of sale and purchase between Langdon-Hammond Woods, Ltd. and Mr. R. Appleby, the controller thereof, of the first part, O. J. Neale, W. R. Baker, C. B. Appleby, and H. S. Coleman of the second part, and T. J. B. Hassell (for the company) of the third part, and to carry on in the United Kingdom and its Colonies or elsewhere, the business of electro-mechanists, electricians, electricians, manufacturers of and dealers in dynamo machines, electric motors, switches, and all kinds of electrical apparatus and instruments, machinery, and materials for grinding and polishing, and all kinds of chemicals, electro-chemical solutions, &c. The subscribers are: O. J. Neale, 91, Grove Lane, Handsworth, Birmingham, builder and shop fitter; H. S. Coleman, 3, Wandham Road, Edgbaston, Birmingham, electro-chemist; C. B. Appleby, 59, Holly Road, Handsworth, Birmingham, general manager. The first directors to be named are: O. J. Neale (chairman), C. B. Appleby, H. S. Coleman, and one other to be appointed by the subscribers (all life directors). After the issue of 100 ordinary shares to each of the life directors, no further ordinary shares shall be issued by the company without the consent of all the directors. Remuneration of O. J. Neale and such other director to be appointed as above, £75 per annum divided between them. The said C. B. Appleby and H. S. Coleman whilst in the employ of the company, other than as directors, shall not be entitled to any remuneration as directors, but in the event of either of them ceasing to be so employed, he is to receive £400s. per annum. The directors may not allot any shares or register any transfer of shares to a foreigner or a foreign corporation, or a corporation under foreign control, without the consent of the Board of Directors. Another clause provides, however, that the directors shall refuse to allot any shares or register any transfer of shares which would cause more than 25 per cent. of the issued capital or of the voting power to be held by foreigners, and in foreign corporations or corporations under foreign control. Every application for the allotment of shares and for transfer of shares must be accompanied by a statutory declaration as to nationality and allegiance, and a British subject by naturalisation must specifically declare whether he remains for any purpose in the allegiance of any foreign Sovereign or State. The subscribers have made the usual declaration that the company is not formed for the purpose or with the intention of acquiring all or part of the undertaking of a person, firm, or company whose books and documents are liable to inspection under the Trading with the Enemy Act. Solicitors: Jeffrey Parr, Hannell & Parr, 20, Tenare Row, Birmingham. Registered office: 23, Great Hampton Street, Birmingham.

South Coast Kearney High-Speed Railway, Ltd. (144,019).—Registered on June 5th, E. W. C. Kearney, 106, Victoria Street, S.W., Capital, £21,000 in 20,000 ordinary shares of £1 each and 20,000 founders' shares of 1s. each. Objects: To adopt agreements (1) with Charles William Neville and (2) with the Kearney High-Speed Railway Co., Ltd., whereby the said company shall grant to this company every franchise and exclusive use of the patents and other rights in connection with the Kearney High-Speed System for the purpose of constructing a line of railway on the said system on the South Coast of England. The consideration payable is to be the allotment of the said company of 10,000 full-paid founders' shares. The shareholders (with one founder's share each) are: Miss D. A. Cockle, 6, Great Ormond Street, W.C., private secretary; E. W. C. Kearney, 106, Victoria Street, S.W., civil engineer; H. J. Darby, 59, Bromfield Road, Clapham, S.W., solicitor; Rev. H. Hughes, 37, Barmouth Road, N.W.; C. B. Kearney, 85, Cornwall Road, Wimbledon, S.W., mechanical engineer; W. F. Paul, Lorne Cottage, Sutton, Surrey, gentleman; Rev. H. S. G. Walker, The Tower, Easington, Hull. Minimum cash subscription, 100 ordinary shares. The first directors (to number not less than two or more than five) are: E. W. C. Kearney (managing director), C. B. Kearney and W. F. Paul. The said E. W. C. Kearney is to receive £200 per annum and to have allotted to him or his nominees 2,500 full-paid ordinary shares in consideration for his services to the company. Qualification of first directors, one share; of subsequent directors, 200 shares. Solicitors: H. J. Darby, 63, Queen Victoria Street, E.C. Secretary (*pro tem.*): Miss D. A. Cockle. Registered office: 100, Victoria Street, S.W.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Pirelli-General Cable Works, Ltd.—Particulars of £50,000 debts, created April 11th, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncollected capital. No trustees.

James Keith & Blackman Co., Ltd.—A memorandum of satisfaction in full on May 15th, 1916, of £48s. dated June 23rd, 1908, May 25th, 1913, and November 2nd, 1914, securing £500, has been filed.

British Electric Transformer Co., Ltd. (76,351).—Capital, £300,000 in £1 shares (100,000 paid). Return dated March 31st, 1916, 61,988 pref. and 85,498 ord. shares taken up; £1 per share called up on 52,764 pref. and 9,529 ord. and 7s. 6d. per share on 14 ord.; £62,298 5s. paid; £85,179 considered as paid on the remainder. Mortgages and charges: Nil.

Brook, Hirst & Co., Ltd. (95,264).—Capital, £20,000 in £1 shares. Return dated January 12th, 1916 (filed April 20th), 12,500 shares taken up; £12,500 considered as paid. Mortgages and charges: £7,000.

Bridgewater and District Electric Supply & Traction Co., Ltd. (75,429).—Capital, £20,000 in 15,000 ord. and 5,000 pref. shares of £1 each. Return dated May 12th, 1916, 12,899 ord. and 680 pref. shares taken up; £1 per share called up on 4,017 ord. and 680 pref.; £1,747 paid, including £10 on 100 forfeited shares; £7,882 considered as paid on 8,882 ord. Mortgages and charges: £12,950. Further 50 pref. shares were allotted, payable in cash, on May 31st, 1916.

Bromley (Kent) Electric Light & Power Co., Ltd. (54,127).—Capital, £75,000 in £1 shares. Registered September 21st, 1897. Return dated April 17th, 1916 (filed May 9th), All shares taken up. £75,000 paid. Mortgages and charges: £65,000.

Both Electric Tramways, Ltd. (74,278).—Capital, £200,000 in 75,000 £1, 125,000 pref. ord., and 30,000 £1 ord. shares of £1 each. Return dated June 1st, 1916, 100,000 £1 ord. and 75,000 pref. ord., and 30,000 £1 ord. shares taken up; £150,000 paid on the pref. and pref. ord.; £30,000 considered as paid on the def. Mortgages and charges: £155,339.

Beck & Moss, Ltd. (69,298).—Capital, £2,500 in £1 shares. Return dated March 15th, 1916, 2,500 shares taken up; £250 paid; £1,975 considered as paid. Mortgages and charges: £250.

Alderley & Wilmslow Electric Supply Co., Ltd. (47,663).—Capital, £30,000 in 20,000 ord. and 10,000 pref. shares of £1 each. Return dated May 9th, 1916, 15,000 ord. shares taken up; £15,000 paid. Mortgages and charges: £15,000.

British Electric Traction Co., Ltd.

The report for the year ended March, 1916, says that, having regard to the state of war, the increased cost of material and wages, and the difficulty of obtaining sufficient labour, the improvement in the revenue derived from the investments is satisfactory. The general conditions have precluded the directors from entering upon new enterprises of any large extent. The gross profit was £241,065, as against £235,508 in the previous year. After deducting the general expenses and the amount written off sundry assets, £34,896, £206,169 remains, plus £71,100 brought forward. Debenture stock interest absorbs £91,260; there is put to reserve £20,338; 6 per cent. on the participating cum. pref. stock for the year absorbs £12,767; 3 per cent. dividend on the ordinary stock requires £39,788, and £86,428 is to be carried forward. The scheme of reduction and re-arrangement of capital has been approved and confirmed by the Court, and given effect to in the accounts. The shares and investments stand at £1,276,857, after deducting £1,001,002, by which amount the capital has been reduced. The revenue from the investments amounted to £232,330, representing an average yield of 5.19 per cent. for the year on the balance-sheet figure. The award of the arbitrator in regard to the sale of the tramway undertaking of the Devonport & District Tramways Co. to the Plymouth Corporation has been made, and it is estimated that this company will receive about £80,000 in respect of its holding in the Devonport Co. The company's main interests in the Metropolitan Traction and Electricity Supply Companies have been merged in the London and Suburban Traction Co., Ltd., in which the Underground Electric Railways Co. of London, Ltd., is also largely interested. The office of the London & Suburban Co., together with its subsidiary companies, have been transferred to Electric Railway House, Westminster. The direction and management of the Bombay Electric Supply & Tramways Co., Ltd., have been transferred to India in view of the heavy burden of double income-tax. The reserve has been reduced by £93,230, the amount applied in paying up in full a like amount of shares for distribution among the holders of the income certificates, in accordance with the scheme of arrangement. The reserve now stands at £410,000. Sir E. C. K. Ollivant has been elected a director. Annual meeting: June 23rd.

United River Plate Telephone Co., Ltd.

SIR G. FRANKLIN presided at the annual meeting on May 30th. He said that during 1915, a whole year of war conditions, they had added 2,714 subscribers; they had now 56,582 stations, and the revenue continued, though slightly, to expand. The gross earnings increased by £10,930 to £641,581. The expenses fell by £7,536, and the net profit increased by £18,466 to £193,771. After referring to the accounts and to the reserves, the chairman alluded to the visit of the consulting engineer, Mr. F. Gill, of Gill & Cook, to the company's properties. His report generally confirmed the values appearing in the balance sheet, and justified in full measure the policy pursued by the directors and the company in the past in making the company strong. In this connection, they were specially indebted to Sir John Gavey, whose wise counsel and technical skill following upon his visits to the Argentine had been of the highest service to the company. Their trunk-line system giving connection to the Federal capital remained as at the beginning of last year, but they had again extended their lines in the Cordoba district by joining up the Belle Ville district to Villa Maria (38 miles), which town was connected to the city of Cordoba; and a short trunk line (25 miles) had also been built in the province of Buenos Aires connecting up the towns of Tapalque and General Alvear. The common battery boards mentioned last year for their exchanges at Flores, in the city of Buenos Aires, and at Lomas and La Plata (a few miles outside the capital) had been completed and, with the exception of the last-named, brought into service. Only two exchanges in Buenos Aires now remained to be converted into the central battery system, and for one (Belgrano) they had recently accepted a tender for the erection of the necessary building. The other (Barracas) would be dealt with in due course. The automatic installations at Rosario and Cordoba were giving excellent services, but the retention of temporary expert assistance so far necessary made true comparative costs of working for the present unobtainable. As to the current year, it was especially hazardous to forecast results in times such as these. The prospects of Argentine trade were such, however, as to lead them to hope for figures quite as favourable for 1916 as those they were now considering. Regarding the conditions prevailing in the great country upon which the prosperity of their enterprise depended, the paralysis of trade with the Argentine caused by the war was almost past. The difficulties of tonnage notwithstanding, there was every indication that Argentina would maintain its position during the current year. The improvement in the gold position at the end of 1915 showed a very strong position for the future of Argentine trade.

Mr. F. GILL, in referring to his visit to the Argentine, directed his remarks to three points—plant, service, and prospects. The plant had been well chosen, well constructed, and well taken care of. The kind of plant in use was very similar

to that which was now being installed in this and other countries. The chairman had said that Buenos Aires itself was well equipped with modern exchange equipment in the shape of central batteries. A great deal of the capital was invested in underground ducts, underground cables, central battery equipment, and specially designed telephone buildings. All that made for stability. With regard to the service, he thought he might fairly and, perhaps, favourably, compare the service in the city of Buenos Aires itself with that of London, which was not by any means a bad one, and the trunk service was, he thought, a little faster than in this country. No telephone man, however, was ever satisfied with his service; but increasing attention was being given to this very important branch of the work here, and he was sure it was also being given in Buenos Aires, and the service would become still better. With regard to the future, their sphere of operations was the Federal capital, the city of Buenos Aires, the province of Buenos Aires, and Rosario and Cordoba. Buenos Aires itself had a population of about 1½ millions—a large field in itself—and the province of Buenos Aires had a population of another two millions. That combined population was, roughly, about half the population of the whole country; the population was rapidly increasing prior to the war, though it had fallen off now. As the chairman had said, the trade of Buenos Aires during 1915 was good. During the 10 years between 1904 and 1913 the trade of the Argentine—imports and exports—doubled. For some time prior to 1914 there was a very heavy demand upon the company for telephone facilities, and, although that demand slackened during 1914 and 1915, he was quite sure that a heavy demand was coming on the company again for public service, and that there would be an ample field for a large increase in the company's sphere of operations.

Rangoon Electric Tramway and Supply Co., Ltd.

SIR F. FRYER presided at the annual meeting on June 7th. He said that the share capital remained unaltered. After providing for debenture interest, preference dividend, depreciation and reserves for renewals, there remained £8,094, which was almost identical with the balance available in the previous year. The recommended ordinary dividend was 3 per cent., free of income-tax, the same rate as last year. Twelve months of war in 1915 had caused a decrease in tramway and motor omnibus receipts of £2,800, as compared with 1914 with its five months of war. Under all the circumstances, there was ground for congratulation that the decrease had not been even larger. There had been great dislocation of trade in Rangoon consequent on the closing of certain markets and restrictions on others, and both imports and exports had been greatly reduced, consequently the Burmans had had less money to spend. During the current year the traffic, while keeping steady, did not so far show any marked tendency to improve over the 1915 figures. The experimental motor omnibus service had been continued. The best type of motor omnibus for the streets of Rangoon was still unsolved, and, owing to the fact that all motor factories in this country were engaged on munition work, fresh types of motor omnibuses could not be obtained. The difficulties caused by the frequent closing of the roadways in Rangoon for repairs had seriously interfered with the traffic. Coming to the brighter side of the picture, the gross receipts for current supplied in the private lighting and power department showed an increase of 13.77 per cent., against 11½ per cent. in the previous year. Notwithstanding the increased cost of coal and other stores, the working expenses were 41.64 per cent. of the receipts, as against 43.14 per cent. The public lighting negotiations had made a certain amount of progress, but they had not been able to bring matters to a conclusion. Their chief engineer and the engineer to the municipality would be in this country very shortly, when they hoped to be able to bring the proposed new arrangement between the municipality and the company much nearer to a settlement. The house wiring and supply department continued to be satisfactory; it fulfilled its purposes as a feeder for the supply of current, and continued to return a fair profit. The high cost of coal and of all the materials in the electrical business still continued, and signs were not wanting that the increase was likely to be even more acutely felt during the present year. They hoped that the 10 per cent. increase already made in the rates for current would prove in some measure sufficient to counteract the influence of the cost of materials. The serious rise in the price of copper and other metals pressed heavily. Notwithstanding the influence of the war, unmistakable signs of expansion of electrical supply requirements in Rangoon were observable. To meet the increasing public and private demand further capital expenditure would in all probability have to be incurred in the by no means distant future.

Singapore Electric Tramways, Ltd.

SIR FRANK A. SWETENHAM presided at the annual meeting on June 6th. He said that the traffic receipts showed an increase of £2,340, and the sale of electrical energy £1,305, as compared with 1914. Power expenses fell by £1,600, due to the larger proportion of power generated by the Diesel plant. Traffic and general expenses were about the same as in 1914, but maintenance and repairs had risen by £500, owing to increased cost of materials. The passengers carried per car mile were 7.92, as against 7.43. The expenses of the whole undertaking represented 62.2 per cent. of the receipts, while

the Singapore expenses were 59.5 per cent. of the Singapore revenue. These figures in 1914 were 56 per cent. and 54.3 per cent. respectively. In many instances stores were costing more than 100 per cent. above pre-war prices, and the tendency was always to go higher. The new fares came into operation in January, and down to the end of May the passenger receipts were up by 13 per cent., as compared with the same period in 1915, 3 per cent. higher than in 1914, and 7 per cent. higher than in 1913. There had been a large drop in the passengers carried, but the majority of the lost passengers would gradually return. In regard to the urgent question of track renewal to cost £103,000, it was now thought that the work might be extended over a period of eight years, commencing from this year. At the present time, however, it was practically impossible to obtain material, such as rails and other steel work, and the price of cement was too prohibitive. Apparently this state of things would continue until the end of the war, and they had no option but to postpone the commencement of the renewal. The estimate of cost had been drawn up at normal rates. The result of any lengthy delay in commencing the work must be increased cost of track and car maintenance. When the track could be renewed there would be an immediate reduction in these costs, such reduction increasing as the work proceeded, and it would be considerable. The three new Diesel engines had been running for some time. Two were supplying energy for lighting the Tanglin district for the Municipal Commissioners. The municipality had not completed their arrangements for taking the supply, but the delay was automatically extending the ten years' contract.

Lancashire Power Construction Co., Ltd.

In their report for the year ended March 31st, 1916, the directors state that the trading profit of the Lancashire Electric Power Co. for 1915 was £92,235, plus £607 interest on hire-purchase plant, &c., making £92,843 (as against £30,471 for 1914), plus £3,422 brought forward. Debenture interest absorbs £4,500, there is put to reserve £15,000, a dividend of 3 per cent. on the share capital requires £14,700, and £2,064 is carried forward. The following figures indicate the development of the company's business during three years:—

	1913.	1914.	1915.
Units generated	28,191,442	32,157,185	35,768,064
Maximum load in kw. ...	9,720	10,210	10,740
H.P. connected	23,900	27,018	29,000
Receipts	£54,515	£65,433	£72,395
Expenditure	£31,730	£35,472	£40,160
Profit on trading	£22,785	£29,961	£32,235

The revenue account of the Lancashire Power Construction Co., Ltd., shows that the total receipts for the year ended March, 1916, were £19,200, and, after deducting the expenditure of £15,258, the available balance is £3,942, which it is proposed to carry to reserve account. Annual meeting: June 22nd.

Montreal Light, Heat & Power Co., Ltd.—A dividend of 2½ per cent. on the paid-up capital stock, being at the rate of 10 per cent. per annum, is announced for the quarter ending July 31st.

Manila Electric Railroad & Lighting Corporation.—Dividend, 1½ per cent. for the quarter ending June 30th on the common capital stock.

National Electric Supply Co., Ltd.—Interim dividend at the rate of 5 per cent. per annum (2s. 6d. per share) on the ordinary shares for the past half-year.

Shawinigan Water & Power Co., Ltd.—Dividend of 1½ per cent., or at the rate of 7 per cent. per annum, for the quarter to June 30th on the common shares.

Automatic Telephone Manufacturing Co., Ltd.—The preference share and transfer books will be closed from 17th to 24th inst. for the purpose of preparing the dividend warrants on the 6 per cent. preference shares for the past half-year.

STOCKS AND SHARES.

TUESDAY EVENING.

Conditions continue good, so far as Stock Exchange markets are concerned. The victorious advance of the Russian Army and the later details regarding the engagement in the North Sea have both tended to increase the confidence of investors that the end of the struggle may be nearer than anybody except the pacifists expected. At the same time, what was called "peace talk" has died down a good deal. Peace is not expected to come to-morrow or the next day, but that affairs on land and sea are tending in a direction which may make peace essential for the enemy before the winter is cautiously acknowledged.

The sales of American securities to the Treasury are releasing unexpectedly large sums of money; and those who failed to respond to the appeal on patriotic grounds are touched by their country's needs now that the Treasury proposes to lay an income-tax of 7s. in the £ upon the dividends drawn from various American investments. The Home Railway market has suddenly sprung into a condition of vigour, but the market for industrials is still the most active in the House.

With Consols up 4 points since last we wrote, other gilt-edged stocks are naturally very strong. The demand for debenture and preferred issues is insistent. The difficulty is to find stock to supply it. One of the few reasonably-priced stocks left is Metropolitan 3½ per cent. debenture, obtainable at 68, with a half-year's dividend due in the middle of July. The company's "A" debenture stock can be bought a little cheaper, the interest dates being the same.

District 6 per cent. debenture stock is changing hands about 109, at which the yield is 5½ per cent. on the money, with interest due this week. Metropolitan 3½ per cent. preference is about 64, and London Electric 4 per cent. preference found a buyer early this month at 65½. Central London 4½ per cent. preference looks fairly tempting at 81, carrying, as it does, six months' dividend in the price, and the return, allowing for this, being 5½ per cent.

The market for ordinary stocks of the Home Railway companies has risen substantially during the past few days. Metropolitan has put on 1½, and Underground Electric income bonds have hardened to 87½, the £10 shares rising to 36s. 3d. Amongst the Steam stocks, North-Eastern Consols spurted again, on the electrification of part of the goods lines; and the stock occupies the premier position, as regards price, of the active issues in this market—a position which, by the way, used to be held by London & North-Western ordinary.

The British Electric Traction Co. has lately issued its report for the year to March 31st last. It has been received with satisfaction in the market. The 5 per cent. perpetual debenture stock is quoted at 80, and the 4½ per cent. second debenture stock at 70, these prices being respectively 12 and 7½ points lower than the quotations for the securities on the eve of war.

In the electricity supply shares there is not a solitary change to quote this week. At the same time, it is worth noticing that instead of being a dull and depressed market, the position is now decidedly firm, and there is some difficulty in getting the offer of good shares. Cities are being dealt in about 12; and a few Counties changed hands the other day on the basis of 104, the preference shares being 104. London Electrics have been done lately at 26s. Metropolitan at 27/16, and Westminster at 5½. South Metropolitan ordinary are a good market at 16s. 3d., this price comparing with 10s. as the pre-war quotation on July 27th, 1914.

Somewhat a feature in the Kaffir market is the noticeable strength of Victoria Falls & Transvaal Power shares. The preference has risen to 18s., the ordinary to 7s. 10d., while the 5½ per cent. second mortgage are up to 102—19 points above the price they commanded less than two years ago, and double the lowest figure which they touched since the outbreak of war. The debentures, of course, receive their dividend free of income-tax, which is a considerable attraction; and the bonds are full of interest at this price. The company is doing well, and the ordinary shares should now be within reasonable reach of a dividend.

Matters in Mexico are going badly, and the various hopeful points which appeared a couple of months ago are being extinguished one by one. Hopes of United States intervention are dimmed by the political situation, the approach of an American presidential election being sufficient to divert attention from more ordinary affairs. The prices of most Mexican securities are, therefore, leaning to the heavy side, though there is no quotable change in the bonds of the utility companies.

Canadian General Electric's spurted to 123 on buying which was said to come from New York, and the 7 per cent. preferred stock has hardened to 117. The principal item of interest in this market, however, is the organisation in Montreal of the Civic Investment Industrial Co., with an authorised capital of 75 million dollars, formed to take over the Montreal Light, Heat & Power and the Cedars Rapids Manufacturing & Power Companies, to operate both under an agreement for 98 years. The Montreal Co. is to be taken over on the basis of three shares of the new company for one of its own shares; while in the case of the Cedars Rapids, shares for share will be given. Arrangements are made for such proprietors as do not care to exchange their stock, and the new company begins operation on August 1st. The price of Montreal capital stock is about 247, while Cedars Rapids stand at 85.

Brazilian Tractions keep good about 64, the rate of exchange remaining in their favour, while, at the same time, Brazilian issues of all kinds have come into sharp popularity by reason of the substantial change for the better which has occurred in Brazil.

The Telegraph list once more shows a number of important rises. Even West India and Panamas have participated in the general strength, improving 1s. to 1. China shares are ½ up at 14½. Eastern ordinary has risen 2 points, and Globe preference hardened to 104. Both the Anglo-American Telegraph stocks have improved, and in those cases where no changes are shown the difficulty is to get hold of stock at anything like the prevailing levels. United River Plate Telegraphs are good at 64.

There has been further activity in Marconi shares, although the price shows no quotable change at 27/16. Expectation looks to a very flattering report, and we understand that the figures are likely to be out early next month. The strength of the parent shares has not had much effect upon those of the subsidiaries, although Marconi Marines keep good at 31s.

Canadians are a little better at 8s., and a bargain is recorded in Spanish and Generals at 6s. 3d.

In the manufacturing group, Callenders are another 10s. up, and Telegraph Constructions at 39 have gained an equal amount, while Henleys and India-Rubber shares are both ½ to the good. A fair volume of business is passing in British Westinghouse preference, the shares receiving a good deal of attention from Liverpool; the disappointment which was felt recently at the dividend of 7½ per cent., showing no increase over that of the previous year, is giving place to pleasurable anticipations in regard to the distribution for the current twelvemonth. Electric Constructions at 14s. 6d. are ex dividend. The iron and steel group remains very firm, and the chemical shares are also well maintained.

In the rubber share market, business is still quiet. The price of the raw material, at 2s. 7d. per lb., is a little better than it has been lately; and all the recent reports and dividends of the good companies have been so satisfactory as to confirm proprietors in keeping their shares. When the price of rubber takes a pronounced turn for the better, it is safe to prophesy that the share market will be quick to respond.

* Dividends paid free of income-tax.

W. T. Henley's Telegraph Works Co., Ltd.—In our table last week we showed the dividend in this case as being paid free of income-tax. This was a mistake, the company having ceased, a year or two ago, to pay dividends tax free.

Copper Prices.—THE WEEK'S CHANGES.

F. Smith & Co. report, Wednesday, June 14th:—Electrolytic bars, advance from £140 to £142; ditto sheets, £158 to £160; ditto rods, £147 to £149; ditto H.C. wire, 1s. 5½d. to 1s. 5½d.

James & Shakespeare report, Thursday, June 15th:—Copper bars, sheet and rod (best selected) unaltered at £164.

SOME "HYDRO" TROUBLES IN CANADA.

By "ROVER."

THE engineer-in-charge of a steam-driven plant is sometimes given to cursing boilers, pumps and engines, and casts envious glances at his hydro-electric brother, who is never worried by bad coal or low vacuum. But the hydro-electric "operator" has his troubles (in Canada, at any rate), and spends much time in abusing the man who designed the plant, and the Canadian winter.

To begin with, Nature rarely plants a serviceable waterfall close to the place where power is needed, and, consequently, the power house is usually situated in the "bush," 20 or 30 miles from civilisation. The power-house men live in a little colony of from 20 to 40, and are mostly agreed that life at the end of a telephone wire is something worse than purgatory.

In some cases rivers have not been under observation long enough to determine the maximum and minimum flow of water, and plants have been installed "on spec," with the result that during the dry season the gates to the water-wheels are wide open on half-load, or less. It occasionally happens, too, that the high water in spring bursts the dam, and in one case, at least, part of the power house was washed away by the flood.

Water wheels are generally controlled by oil-pressure governors, of which there are almost as many types as power houses. Most governors are belt-driven, and this is the weak spot. A water wheel may be running at full load day and night, and only shut down for an hour or two for inspection on Sunday, or in the mining districts it may run for two or three months without a stop. This is pretty severe on the belts and belt fastenings, and occasionally a breakage occurs and the gate flies wide open. The machine must be put on hand control immediately, and, in some cases, it is hard work for two men to bring the gate from wide open to the normal running position. This does not apply, of course, to governors fitted with electric motors controlled from the switchboard.

Some oil-pressure governors are so constituted that the belt is overworked if the generator switch is tripped at full load and works off the pulley, generally after giving warning with an agonising squeak. The usual remedy is to place a heavy bar or other obstacle to prevent the belt coming off. This does not prevent the squeak, of course, and does not improve the condition of the belt.

The breaking of a governor-belt on an exciter wheel is not so serious a matter, as the hand control gear can usually be attended to by one man. I have known of cases where the exciter governing gear was permanently out of action, and hand control was resorted to. Luckily this was close to the switchboard, but the attendant had to step lively whenever there was a short on the line.

At one power house I encountered a motor-driven exciter, driven off the main bus-bars. This arrangement worked admirably, except that a heavy short circuit sometimes shut us down completely, exciter and all, and we had to run up a small water-driven exciter to get a fresh start.

Shortage of water is sometimes accompanied by another trouble—sand. During low water, the water in the river bed or canal is moving much faster than at normal times, and brings a good deal of sand with it. As a rule, this sand passes through the water-wheels without causing any trouble, but occasionally a sandbank will form in the exciter-wheel passages or other places where the current is slowest. Fallen leaves, sticks, and chips from lumber camps, will accumulate on the racks, but these only come at their accustomed times, and are easily discovered and removed.

During the long Canadian winter, the river or canal flows under ice perhaps 2 ft. in thickness, except at the fore bay and tail race, where the quick motion of the water prevents any ice forming. If the level of the water remains fairly constant, the ice slowly forms during the winter and slowly melts when spring comes without affecting the power plant in any way. But if the water level should vary to the extent of 2 or 3 ft., then large pieces of ice are apt to break away and float on to the racks. The motion of the water causes them to "up-end," and sometimes the opening

to one or more machines is completely blocked. I well remember my first experience of ice in mid-winter, with low water, and the plant carrying about half its rated load. Another power plant, situated about three miles down the river, had phoned an urgent call for more water, and we opened our waste gate to oblige them, bringing down our level about 2 ft. In half-an-hour we saw big ice-floes bearing down upon the power house, and these were carefully guided to the waste gate. All available help was pressed into service to break up the floes and pass them through the gate, but one big piece quickly settled matters for us by wedging itself and completely blocking up the gate. The remaining floes then arranged themselves on the racks and shut down the three machines we had running. It took about half-an-hour to clear the racks and waste gate, and supply was resumed.

Five minutes after the fresh start our state was worse than before. The shut-down had raised the water-level about 3 ft. and a veritable field of ice broke off and floated down on us. We had two more shut-downs that day, the worst one lasting about an hour and a half. Thereafter, extra "booms" were built across the canal, and the water level was kept as constant as possible. We found that a large piece of floating ice is no respecter of booms, and will dive 3 ft. below the surface when on mischief bent, but by extreme vigilance it is possible to guide it into the least dangerous channels, and after a little experience one gets the knack of breaking up an ice-floe very quickly.

Another trouble, of rather an exciting nature, occurred at a hydro plant in Ontario. This plant works with about 120 ft. head of water, and is fed through 8-ft. iron penstocks, about 800 ft. long. Parts of the penstock were on a very inadequate foundation, owing to the sandy nature of the soil and the extreme difficulty in getting down to bed-rock. About 2 o'clock on a February morning the operator on duty was surprised to find a small stream of water trickling under the front door into the power house. The temperature outside was nearly 50° below zero, and the operator, wishing to study this unnatural phenomenon further, incautiously opened the door, and was swept off his feet by the flood which burst into the power house. He tried to close the door again, but the force of water was too much for him, even with the assistance of his oiler. By this time there was a foot of water on the power-house floor, and operator and oiler were obliged to escape by the back door. Here the noise convinced them the penstock had burst, and the two rushed to the top of the hill, and succeeded in closing the valve—a task which ordinarily took two men half-an-hour, but was accomplished in record time on this occasion.

Coming back, they found it was impossible to enter the power house, and when daylight came the floor was still covered to the depth of 2 ft., upon which a crust of ice had already formed. It eventually froze solid, and was removed by hammer and clink. The penstock was rebuilt, and placed on safer foundations, and electric motors were installed on the pipe-line valves, all of them being controlled from the power house.

Severe lightning storms are another bugbear of the Canadian operator, and in the forest districts "bush fires" occasionally burn down the transmission line, but these troubles affect steam-driven plants also, and are not peculiar to a hydro-electric system.

Flies, again, are a nuisance, chiefly to the operators, who get bitten all over. Occasionally they get into the bearings in such numbers as to close up an oil-pipe and cause a hot box; in one instance I know of, bearings had to be protected with muslin on this account. There are legends, too, of big butterflies and moths tripping the oil switches, but I have been unable to verify these tales. I have, however, known big bats to blunder stupidly into the switchboard when in pursuit of flies and other insects.

Aluminium in Norway.—A large plant for the production of aluminium is contemplated at Høyanger, Norway, where hydroelectric power is available to the extent of about 60,000 H.P. It is proposed to develop 20,000 H.P. at once to furnish power for the production of 4,000 tons of aluminium per year.

LABOUR AND INDUSTRY.

(Continued from page 660.)

It would not be right to shut our eyes to the effect upon the mind of the general public of the invigorating campaign of the Ministry of Munitions in regard to Trade Union restrictions, slacking, drink, and so forth. Generally speaking, the effect upon the minds and activities of the workers has been very healthy. But this campaign and this effect have been the work of war-time when we have been fighting for our very existence. One consequence of the high wages in the shipyards, noted by a *Times* correspondent a month or two ago, was a "fastening" upon certain workers of the pre-war habit of absenting themselves early in the week. The artificial prosperity of war-time has not in such cases gone into War-Saving Certificates; restricted hours of licensed houses do not prevent home supplies of liquor being laid in, and the Saint Monday habit, which always has affected industry more or less, has been strengthened. Will the "fastened" habit be easily uprooted after the war? We shall be told that these are exceptional cases—that the great bulk of the working men of England are steady, sober, and reliable. We are not in a position to dispute it, but practical experience has shown a thousand times that a small percentage of slackers can hold up thousands of willing workers. Can the workers be induced to see that many things that have been said in regard to winning the military and naval victory will be applicable with almost equal truth and force when we fight industrially and commercially to prevent the enemy from gaining supremacy. The "boys" will not be at the Front then making their own appeal to us to strain every nerve; the public-houses may be open for normal hours again; and there will be a desire for relaxation or taking things easily after a long period of strain. Peace will be the signal for a more or less prolonged cessation—we shall all need a rest; but when that period is over, and demobilisation, with all its re-adjustments and re-transfers, is complete, there will be no room for anybody to idle, for it is becoming pretty generally recognised that we have got to increase the productivity of our industries by every means in our possession, in order to raise our general standard of efficiency, securing more economical production without reducing quality. We shall require all the scientific assistance at our command, shall have to employ machinery for many things that have been extravagantly made without it, and the fullest co-operation of Labour is required to secure the best possible results from these developments. Will Labour be blind to its responsibility, or fail to respond to the call of duty?

Far more frequently than we like to think, it has been necessary to appeal to the workers in certain trades to cease slacking, or to accelerate the rate of production of war requirements. Notwithstanding higher wages and the promises that Trade Unionism would not be adversely affected after the war by the suspension of its conditions during hostilities, the spirit of the old Adam has exhibited itself again and again. At one stage it was complained that Labour was not enlightened as to the real urgency of the munitions question, that the truth had been withheld or concealed, that the real peril of the men at the Front was not understood. It fell to the Minister of Munitions, and others acting with him, to make the matter plain. The deficiencies of Labour must have been a revelation, almost a shock, to those who previously preferred not to recognise the existence of those weaknesses which in times of normal trade had so often embarrassed industrial concerns, but who were now alive to the peril which faced the nation. The lessons of these critical times will not be lost upon the minds of legislators and social reformers, whatever may be the effect upon the workers. Even at this moment the postponement of the Whitsuntide holiday is proving the extreme importance and urgency of everybody continuing to produce to the utmost of his or her capacity the things that are essential to enable the fighting Forces to hasten the defeat of the Enemy. No body of workers can complain to-day that they do not know, for our losses on the sea and on our 80 miles of Front in France and Flanders, and in the other centres of war where we are still engaged, are making a more urgent appeal than any platform orator can pour

forth. Is not the iron entering the very soul of the people to-day? Letters sent Home by "boys" at the Front, wounded and others returning from the field of battle, all make their own appeal, not merely that we shall "keep the Home fires burning," but keep the motors running in the factory producing—producing as hard as we can go. Yet it is thought necessary to supplement all these invigorating agencies by means of literature, and in this connection we have received from a firm of publishers a copy of a special edition of a book, "Between the Lines," by Boyd Cable, which, after a successful run as a 5s. work, has now been produced in a paper-cover form, 75,000 copies being run off for free distribution in order that it may be read by munition workers. Its object is to give such workers, if they will read it, a glimpse of the trenches, and especially of what any shortage of munitions means there. When we talk of an "Advance!" of a coming "Push Forward," these truths require to be kept constantly in mind; and we hope that the generous effort of the publishers (Messrs. Smith, Elder and Co.), and of the author, will have the desired effect of convincingly bringing home to the right minds the fact "that the fighters count on the workers to help them to victory, to watch the fight closely round by round, to stand solid behind them, and back them and support them, and give every possible ounce of assistance to see it through."

Mr. Frederick Maddison, addressing the Labour Co-Partnership Association, in London, in April, said that nothing could have been more unfortunate than the false impression given by the Minister of Munitions of the general response of the workmen of this country to war demands. They had sacrificed advantages and positions which had taken generations to build up, and had the great mass of Trade Unionists adhered to those conditions, no power in this country could have compelled them to give them up. Mr. Maddison advisedly said "in this country," because he knew that if Trade Unionists had played the traitor, the enemy, once admitted here, would have played havoc with Trade Union restrictions, indeed with all the principles of Trade Unionism. It is sometimes said by Labour that the Military Service Act was aimed at Trade Unionism. We do not for a moment believe anything of the kind, but this we know, and Labour knows equally well, that Trade Unionism and Prussian Militarism could not co-exist. Mr. Maddison said that the great mass loyally, heartily, and voluntarily suspended the conditions because of patriotic considerations, and because they felt that it was necessary. The deplorable friction in certain quarters was only due to a very small section. Unfortunately, it is often a small section that causes industrial strife in times of peace; but how do the Union leaders and members deal with the "small section" in normal times? Mr. Maddison said that there must be the recognition of the dignity of craftsmanship. "Men must not come back simply to become pieces of the mechanism of Capitalism. They were entitled to be industrial freemen, and capitalists must be content with more modest profits. Trade Unionists must not be content with merely forcing up wages by might, and must know that the industrial problem would not be settled by the winning of a strike." The other day another public speaker said that when the war broke out we were heading "straight for revolution" at home. The outlook in industry certainly was the blackest that we had known it—there was industrial strife everywhere. Our differences were temporarily set aside. Another public speaker—a social reformer in the East End of London—who paid a tribute to the readiness with which thousands of restive hooligans and others, brought up amid undesirable surroundings, sprang to the help of the country at the outbreak of war, remarked that when these men returned they would want to find a country worth fighting for; he sometimes wondered "what England had done for them"! And this after years of Democratic legislation!

What do such remarks as these portend? Will the men not say that they have saved the Empire and that a larger share in the fruits of Empire belongs to them? They will demand that Capital takes less and Labour has more; but capital in the form of State loans now earns a higher yield, and industry may not possess the same attractions as

formerly, unless its security is assured. It is industry which must be made more profitable so as to yield a better return for all. How is this to be secured but with the full co-operation of all?

Australia is sometimes spoken of as though it were the very Elysium of Labour, but it must not be imagined that in the Dominion there is freedom from Labour troubles. Strikes are not by any means uncommon, not a few have been recorded during the war; indeed, we believe that the present methods employed there for settling differences between Capital and Labour are considered by some students of the position to be utterly futile. They have not removed the root-causes of the troubles; they have merely devised ways for dealing with them after they have arisen—practically giving recognition to the fact that in the best of all worlds, under the prevailing system, human nature will at times come into conflict. We have received from Melbourne a copy of a book, by Mr. F. Gascoyne Williams, on "Industrial Peace; the Way to Secure Industrial Efficiency, Unity, and National Prosperity." The author holds that the industrial warfare and troublous times ahead are too serious and acute to be treated with indifference. In his opinion, as in that of many other people, the first and great essential is to bring Capital and Labour together. Having long studied the principles of co-partnership and profit-sharing, he says that in building up and developing the huge Continent of Australia it must be recognised that this will be found impossible if there is to be incessant industrial strife. We all recognise that the same remark applies to the case of the future development of British industries at Home. Mr. Williams's observation shows him that, under the profit-sharing system, strikes are rarely known, due to the fact that Labour settles down contentedly when, in addition to the standard wage, it participates in profits. He holds that in Australia other means than Wages Boards, Factory Acts, and Arbitration Courts should be tried, for these methods of conciliation have been operating since 1897 with anything but satisfactory results. "They are supposed to do away with strikes, but, so far, have proved ineffective, and act merely as a temporary expedient." The Arbitration Court is "staggering under its burden"; in October, 1914, its work was two years in arrear; and its awards are being continually flouted. The writer feels that employers generally have failed to note the evolution of Labour during the past 50 years, and are apt to forget that education has taught the workman to appreciate his position as an important factor in the Industrial World, and that he wants to enjoy more of the comforts of life. Labour and Capital are interdependent, and, apart from both of them, management is unemployed. "Profit is produced by the three factors—it should, in consequence, be shared by all three." Mr. Williams concludes one of his chapters by proving that the goals of co-partnership and Trade Unionism cannot be regarded as incompatible. In the next he discusses profit-sharing from the employers' point of view; and in another he illustrates, by British examples of, and chronological notes on, co-partnership and profit-sharing between the years 1895 and 1914, how these means of producing contented Labour and prosperous industry have been successfully practised. The conclusion of the whole matter is that in profit-sharing and co-partnership is to be found the only present method whereby master and man can work together in harmony: "a wise and equitable bond of union between the three great forces in industrial activities—Capital, Management, and Labour." This aspect of the industrial problem has often been discussed in our pages; the principle of co-partnership has sometimes failed ignominiously because of the manner of its application and the suspicion that it was a means to defeat Trade Unionism; but it will doubtless be discussed more and more as we get to grips with the after-the-war Labour problem. Therefore, it may not be out of place to give Mr. Williams's opinions of the essentials of profit-sharing and co-partnership:—

1. It must not degenerate into charity or philanthropy.
2. Its object must be the increased success of the undertaking, with increased prosperity for all connected with it.
3. It must not place Management in the position of servant to Labour through liability to criticism and censure.
4. It must ensure to Labour freedom from control of

Management in the enjoyment of the benefits derived from Profit-sharing.

5. Its benefits must be felt by wives and children.

6. It must have a distinctly elevating tendency on Management and Labour, raising them in the social and intellectual scale, and increasing their power for enjoyment and happiness as well as their power of usefulness.

7. Control must remain with those who find the Capital.

(To be continued.)

THE ELECTRICAL TESTING OF STEEL CONDUCTOR RAILS.

By C. H. RIDSDALE, F.I.C., F.C.S.

(Abstract of paper read before the WEST OF SCOTLAND IRON AND STEEL INSTITUTE.)

STEEL is a relatively cheap and plentiful conductor, for when copper costs, say, twelve times as much per ton as steel, a steel rail of such section as would convey an equal current with no more resistance would only cost about one-half as much as the copper.

For many years, when resistance was specified in terms of copper, the "times copper" was always of "equal volume," meaning equal length and cross-sectional area.

Of some 12 railways, one referred the resistance in microhms to that of a stated volume of copper; one gave it in terms of ohms per mile for a stated cross-sectional area; two were for conductivity percentage of copper of equal volume; the rest were for resistance in "times copper" of equal volume; but not one specified resistance in times copper of equal weight.

Within the last few years the term "mass resistivity" began to be met with in reports, and as the ordinary dictionary meaning of the word "mass" does not clearly indicate weight, as contradistinct to volume, and resistance had not been formerly specified in times copper of equal weight, misunderstandings arose. A steel rail of the same weight as a copper one would have about 1.125 times the cross-sectional area of the latter, or of a steel rail of equal volume to the

FIG. 1.

copper one; and as resistance varies inversely as the area, a resistance of, say, seven times copper of equal volume is only about 6.17 times copper of equal weight, and the resistance of steel expressed in terms of weight at first sight gives the impression that it has a lower resistance than if expressed in terms of volume. Thus certain makes of steel, tests of which were given in terms of weight described as "mass resistivity," appeared to be better than they really were, and engineers sometimes specified (meaning of equal weight) what appeared to be extremely low resistances (if taken to mean of equal volume), and when they were told these were impracticable, contended that they really got them.

Matters were still further complicated by several slightly differing copper standards being in use, and questions sometimes arose as to the density of conductor steel, the temperature at which the terms of resistance were stated—some being at 15.6 deg. C. and others at 20 deg. C., this alone making about 1½ per cent. difference—and other points.

In 1913 the author and his son issued a number of tables describing the electrical properties of steel, and the Engineering Standards Committee, which also had recognised the difficulties arising from the want of uniformity in terms, appointed a conference to prepare a report on the subject of a conductor rail standard; the Committee adopted some of the author's suggestions in its "Report on the British Standard method of specifying the Resistance of Steel Conductor Rails," published in 1914 (Report No. 68). In this report it recommended as a standard mode of expression resistance in "microhms per 100-lb. yard of the steel being tested," and also gave various conversion factors for other modes of expression.

Although this introduced yet another standard, differing

from any of those which had previously been in use, it must be admitted that one universal standard if adopted will be a great advantage.

Pure iron has a resistance about 5.81 times that of copper of equal volume.

Steel for conductivity purposes is, or should be, the softest class of steel made; it has a higher density than other ordinary forms of steel, and also very little segregation. Speaking broadly, the more nearly it approaches in chemical composition to pure iron, the better it is in conductivity.

Sometimes a chemical composition is specified for it, but this, whilst it may tie the maker's hands, can serve no useful purpose for the ultimate object in view, namely, getting in the best manner a steel to satisfy electrical requirements. Conductivity steel is simply the "blown" or "bath" metal (purified by oxidation) with the smallest quantity of deoxidiser or "recarburiser" added that will just enable it to roll. Thus it is metal only just removed from "redshortness."

In the endeavour to keep the steel very soft and low in resistance, makers have to work within such a narrow margin that from time to time they overstep the line, and the steel breaks up in the rolls and yields scrap or defectives. When not so pronounced as this, in steel near the limit, parts of the section which grow cold sooner than the rest are liable to show a number of fine hair cracks close together when they drop to low red, although it will roll quite sound at a bright red heat.

Slight cracks due to redshortness, as, for instance, "fine saw edges" along flanges or corners, such as if present in ordinary track rails (which have to carry heavy running weight) would certainly disqualify them, are no disadvantage for the purpose of a conductor rail which has no weight to carry. Indeed, they should be regarded with favour, as they are an indication that the rails have a very low resistance.

In view of its special suitability for very soft qualities, one of the earliest applications of basic-bessemer steel was for conductivity purposes, and so far back as 1883 or 1884 the North-Eastern Steel Co., of Middlesbrough, made it for telegraph wire, and has continued to make it ever since, mainly for conductor rails.

Although the number of rails which, according to specification, are taken for testing may be only a small percentage, whereas with ordinary track and tram-rails once they are down the manufacturer is not likely to have trouble from them, conductivity rails are liable to be tested as a whole.

Steel wire makers state that its conductivity is not affected by the temperature at which it is rolled or drawn, or the number of holes required to bring it to a given gauge. This corresponds with my own experience on steel in the mass, for this, say in the form of billets 4 in. square, tested in 5-ft. lengths, corresponds quite closely with tests of the wire after it has gone through the various necessary processes.

Rails in the early days were specified to be tested on 20-ft. lengths; a 5-ft. length gives just as accurate results, and this length is now generally accepted. This involves, with what is required for connections, a total length of 8 or 9 ft., say 2 to 2½ cwt.

The apparatus designed by Messrs. Elliott Bros., of Lewis-ham, was probably the first for testing conductor rails; both the system of testing and the apparatus have been approved without question by engineers and contractors (see fig. 2).

The testing apparatus on the drop of potential system consists of two or more accumulators, each having 120 ampere-hours capacity, and coupled two in series, and a switchboard for coupling either the charging current to them, or them to the cables leading to the rail being tested, which are connected with an ammeter registering up to 200 amperes.

These cables go first to a reversing switch, from which one branch goes direct to the rail, the other through three or four resistances, enabling, say, 40, 60, 80 or 100 amperes to be taken to the rail, as required.

These cables are each branched for a couple of feet at the end, and terminate in flat copper blocks for clamping against the head and foot of the rail with screw-clamps. Two knife edges, ground sharp and case-hardened, are mounted on large baulks of timber, from which they are insulated by mica sheet. They have under their centre a horizontal bolt so as to allow a slight rocking lengthways. The knife edges should be parallel and exactly 5 ft. apart.

At each end of these knife edges, and in line and level with them, but with an intervening gap of about 1 in. at each end, are carrier rails on which the lengths of rail to be tested can be stacked. The knife edges are each connected to a small cable leading to one terminal of a double-scale millivoltmeter with zero in the centre, and graduated in tenths up to 12 millivolts on each side.

As each length of rail to be tested is pulled forward on to the knife edges, the sliding motion cuts into its under surface and thus makes a good electrical contact. To facilitate this 4 or 5 in. of the under surface of the rail generally are filed bright just previous to testing, and the rail is pulled a few inches backward and forward several times on the knife edges. The rocking-knife arrangement was introduced by the author because rigid knife edges will not adjust themselves to any slight twist which the pieces may have.

The cables are then clamped to each end, and the current can be turned on. The amount passing is read off from the ammeter, as well as, instantly before or afterwards, the millivolts difference in potential due to the resistance of the length of rail between the knife edges.

For 80 to 100-lb. rails, 60 to 80 amperes is the most satisfactory current. If two or three successive tests of the same piece are made, especially with a large current, it becomes heated appreciably and its resistance increases.

Immediately after taking these readings the current is reversed and a second set of readings is taken. These two tests are often repeated as a further check, giving four sets of readings. From the average of these the resistance is obtained.

The temperature of the rail should be taken, both at the beginning of the test and, if this lasts long, also at its end. A correction may be necessary both for the rail and for the millivoltmeter. The corrections generally specified are 0.5 per cent. per deg. C. for steel, and 0.4 per cent. per deg. C. for copper.

Testing can be done very quickly, and provided the pieces have been filed up just before starting, and the men are accustomed to the work, the calculation for each rail can be done whilst the next is being pulled on, rubbed, and coupled up; 50 or 60 tests can be made in from one and a half to two hours.

If, as may happen, particularly with crop-ends, any of the pieces tested are not of quite true area, a correction for this can easily be made.

In order to avoid misleading results, the insulation of the knife edges, especially in wet weather, should be verified. If one end of the bar being tested be moved so that it rests on the carrier rail (thus completely earthing it), when the current is turned on, although the ammeter will, of course, show it,

A, ammeter; V, voltmeter; AA, pressure terminals; BB, battery terminals; CC, current terminals.

FIG. 2.—ELLIOTT BROS.' RAIL-TESTING APPARATUS.

the millivoltmeter will not move; though if the insulation were bad some current would leak through to the knife edges and indicate it.

To enable the instruments to be readily checked at any time, the author introduced standard copper bars of such cross-sectional area that their resistance falls within the usual range of conductor rails. Such bars once tested and certified by authorities of standing are always available as a check on the whole installation. For convenience, the standard copper bars are mounted on wood. All that is necessary is to put them on the knife edges just as is done with a rail, with—in order to give the necessary weight—a rail laid on the wood backing, and test them, and if they come within a reasonable margin, say 1 per cent., the testing apparatus can be regarded as right.

As regards the minimum distance at each end of the rail at which the contact pieces of the cables should be clamped from the knife edges, although diffusion of the current is very rapid and good tests have been obtained with as little as 3 in., it is better for safety to allow at least 6 in. or more, besides room for handling, clear of the clamps, say 18 in. or 2 ft. overhang altogether at each end.

The effect of variations of thermal and mechanical treatment such as are met with in normal works practice upon the resistance of conductor rails seems to be negligible.

As regards the effect of different impurities on conductivity, taking it very broadly, the relative effects in increasing resistance are, per 0.01 per cent. of the substance present in excess of that in ordinary conductivity steel:—

Carbon from	.05 to .07	" times copper."
Manganese	.05 to .07	"
Silicon	.08 to .10	"
Phosphorus	.02 to .03	"
Sulphur	.01 to .02	"

The higher value should be taken when within the ordinary limits of composition for conductivity steel, say, not over carbon 10 per cent. or manganese 40 per cent., and the lower value when above this. Too much importance must not, however, be attached to these figures.

As illustrating the effect of composition, the following are

some actual tests, showing side by side the theoretical resistance calculated on the basis and from the factors given.

KIND OF STEEL.	COMPOSITION.						Resistance at 20° C. of equal area, Times copper.
	Carbon.	Silicon.	Sulphur.	Phosphorus.	Manganese.	Iron, &c.	
	%	%	%	%	%	%

* Taken as basis.

A rail of eight times the resistance of copper and another of six yield the same resistance as two of seven, and specifications therefore allow a proportion of rails with a maximum above the average specified.

At the same meeting a description of the method adopted by the National Physical Laboratory for the determination of the conductivity of steel rails was given by Mr. S. W. Melsom :—

The sample tested should be of sufficient length to admit of the current being led in at some distance from the contact points (knife edges). If, as is convenient, the distance between the knife edges is 1 yd., a suitable length for the sample would be 5 or 6 ft.

The sample is weighed, its total length measured, and the weight in lb. per yard computed. A hole in which the bulb of a thermometer can be placed may also be drilled to enable the temperature to be more accurately determined.

For the electrical measurement the rail is connected in series with a suitable resistance standard, the value of which is unaffected by temperature. The current is usually of the order of 100 amperes, depending somewhat on the section of the rail.

The contact knife edge and the potential terminals of the resistance standard are connected to the double bridge as shown in the diagram (fig. 3). The double bridge is of the type invented by Lord Kelvin, and is now universally used in the accurate determination of low resistances. It consists of four resistances, two of which, p and p , are equal and usually 100 ohms; the other two, q and q , are variable over a suitable range of values. The effect of having $q = q$ and $p = p$ is that the resistance of the connecting piece k is eliminated. q and q can be simultaneously varied by adjustment of a series of dials. This is done until on making the galvanometer circuit there is no deflection. The value of $q = q$ is read off, and this divided by $p = p$ and multiplied by the value of the resistance standard gives the resistance of the sample under test, which is independent of the value of the current used. This completes the electrical measurement.

For the purpose of comparison the result has to be expressed in terms of some standard. This may be (1) the resistance in microhms of a rail of the same material weighing 100 lb. to the yard length measured at 60 deg. F., as defined by the E.S.C. If the weight of the sample is different from 100 lb., the yard and the temperature other than 60 deg. F., the

These correction factors are taken from the E.S.C. Specification, which also gives reduction factors so that the value may be reduced to other standard terms.

In some instances, where it is required to compare only such samples as rails of definite weight and length, it is possible that a simple bridge, which I designed some years ago for use in the laboratory, would be preferable. For instance, where a steel maker or user required to test samples of a large batch of rails, if the standard R , as shown in fig. 4, were adjusted to be the specified resistance for a given length of the rail a double dial operated by a single handle, having two sets of 20 studs and varying only a given proportion of the bridge arms, would give the value directly in steps of 1 per cent. from 10 per cent. high to 10 per cent. low.

For a bridge of this sort a reflecting galvanometer is not essential, a portable needle instrument such as is used in steel works for thermo-couple work being amply sensitive for the purpose.

Instead of a copper standard it would be much better to use a standard resistance such as an ammeter shunt, which does not vary appreciably with temperature.

In this question of the development of the use of conductivity steel, it is most important that all concerned should use the same standard. The greatest difficulty in comparing

FIG. 4.—MELSOM BRIDGE FOR TESTING RAILS.

two metals is to know whether the comparison is being made in terms of equal volume or equal mass, the results owing to the difference in density between copper and steel being about 10 per cent. different.

In this measurement of steel conductor rails, results which have to be used by electrical people should be stated in terms of the recognised electrical unit. The introduction of the copper standard merely introduces additional calculation, and does not in any way help matters. The engineer who is to use the results is concerned mainly with the loss of energy in his rails. To determine this he has to know the resistance of his line in ohms. At the conference called by the Engineering Standards Committee in 1914, the engineers were unanimously in favour of dropping the reference to copper and of stating the value of the resistance in ohms or microhms.

Steel rails are bought and sold by the ton, and are usually classed by their weight, as, say, 80 lb. per yard, and not by their area. From a testing point of view the comparison of equal mass is made much more easily and accurately than a comparison of equal volume.

The use of several standards, as at present, leaves so much ground for mistakes that I would press most strongly that all concerned should use the method defined by the Engineering Standards Committee's specification, which states the resistance in microhms at a temperature of 60 deg. F. of a rail of the same material as the conductor rail in question, having a length of 1 yd. and a weight of 100 lb.

TRADE STATISTICS OF NEW ZEALAND.

THE following figures, showing the imports of electrical and allied goods into New Zealand in 1914, are taken from the official statistics which have just reached this country. The issue of the statistics has been delayed by alterations in the classification. The figures for the previous year are added and increases or decreases noted. In comparing the 1914 figures with those for 1913 it should be understood that the countries to which the goods were credited in the latter year were not in every case the countries of manufacture, but merely those from which the goods were invoiced. In 1914, however, the country named is to be understood as the country of origin.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSPAPER IN TOWN OR COUNTRY.

OFFICE :—4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGREKAY, LONDON." Code, A.B.C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 8s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADELAIDE: Messrs. Atkinson & Co., Gresham Street.

AUCKLAND N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31A, Strand Arcade, Queen Street.

BRISBANE: Gordon & Gotch, Queen St.

1916 EDITION

READY.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

YESTERDAY, in comparatively mild weather, the twenty-first annual meeting of the Incorporated Municipal Electrical Association was opened at the Institution of Electrical Engineers. Mr. A. C. Cramb, the president, in his address touched upon a variety of interesting subjects, reviewing the work of the Council during the past year; it was inevitable that war conditions should have the effect of restricting the activities of the Council and its Sub-Committees, so that the record is rather suggestive of marking time than of steady progress, but the organisation is ready for action as soon as circumstances permit of it. We share Mr. Cramb's regret that it has not been possible, even with the kind offices of the B.E.A.M.A., to arrive at an agreement with the Electrical Contractors' Association; the terms offered to the latter are so favourable that it is difficult to understand why it should continue to form an obstacle to progress, especially at a time when the only consideration that should weigh with any British citizen is the welfare of the nation as a whole. Mr. Cramb's concluding observation on this subject has an ominous appearance.

Referring to the proposal of the Board of Trade Committee on British Trade after the War to impose upon public bodies the obligation to purchase as far as possible only goods produced within the British Empire, the President indicated that the Council viewed the suggestion unfavourably, as constituting an injustice to the ratepayers; judging by the report of the result of the Economic Conference at Paris, there is reason to hope that, at any rate, no more orders will go to Germany.

The three technical papers which followed were all of interest and value, touching as they did upon subjects which closely concern the future prosperity of electricity supply. The development of the turbine to so remarkable a degree of efficiency and compactness has had the effect of transferring the attention of engineers to the problems of the boiler-house, and Mr. W. W. Lackie's paper on this subject comes at a most opportune time; the more efficient utilisation of our stores of coal is one of the most urgent questions of the day. We look forward to far-reaching changes in this department of engineering in the near future, for, while Mr. Lackie discusses the subject in the light of present conditions and methods, the importance of obtaining from the coal a far greater proportion of its precious contents is rapidly gaining public appreciation. It cannot be denied that the combustion of coal in furnaces is an inherently wasteful process, and we hope that drastic reforms will be effected in this connection.

In his paper on the generation of electricity on a small scale *versus* bulk supply, Mr. Harry S. Ellis draws attention again to the question which has recently been brought so prominently before the industry in the I.E.E. discussions, and indirectly by the Board of Trade circular. Mr. Ellis holds the balance fairly between the two aspects of the question, but allows it to appear that he personally favours the independent station; as he points out, his Committee refused an offer of the North-East Coast system to supply South Shields in bulk some years ago, and "the results have been entirely satisfactory." Yet he keeps the door open for the reverse conclusion by suggesting that the linking-up of large undertakings might reduce costs, and

holds that the present chaotic state of electricity supply in this country calls for thorough investigation by a committee of members of the I.M.E.A., "with power to co-opt members of other scientific societies, such as the Institution of Electrical Engineers, the Institute of Chemistry," &c.—a remark full of significance.

Mr. W. T. Kerr's paper on the application of electricity to agricultural purposes deals with a subject which should command the attention of supply engineers in rural districts; the author points out that it has been extensively developed abroad, and proves from his own experience that it can be made a profitable enterprise. Not only the adoption of electric light and power on the farm, but also the use of electricity for intensifying agriculture, is of great promise; the latter would probably not constitute a heavy load, but it would greatly assist the demand for the former. We hope to deal with these subjects more fully in later issues.

THE FUTURE OF THE ALUMINIUM INDUSTRY.

THE question of the future of the aluminium industry has just been raised in France, almost simultaneously with the annual meeting of the principal company in Switzerland that is engaged in this particular branch, although no direct connection exists between the two events. Nevertheless, it will not be without interest to hear what the Paris newspaper *L'Information* has to say on the problem as it affects the Allied nations. In the first place, it is submitted that, as in the military situation, so in the economic field should France show capability of initiative and energy, and that the country must fulfil the duty of closing to Germany the market for raw materials when France has almost a monopoly of these, as in the case of bauxite. The chief producing countries of bauxite are few. Germany only possesses the deposits in Hessen-Nassau, the quality of the mineral being declared to be more than problematical. It is true that Austria is able to furnish the former with supplies of the raw material from the deposits at Neustadt, in Styria and Carniola, and for that matter Germany has received supplies through the Dalmatian port of Almissa from the products extracted at Prechora. But the Austro-German deposits on the whole only represent a mediocre quantity for a great industry whose future is of such an encouraging character.

The allied countries, on the other hand, are particularly well favoured with deposits of raw materials. Great Britain works the advantageous bauxites at Strain, in the County of Antrim, and those at Glenravel, which afford large supplies to the works of the British Aluminium Co. The French minerals are of a clearly superior quality, and, at the same time, are abundant in comparison with the resources of their rivals in the East and their friends in the North. Thus, the minerals furnished by the Bouches du Rhone and the Var are of specially high quality, and the output is claimed to form two-thirds of the production in Europe. In addition, the Italians have discovered deposits in the Abruzzi which are not to be despised. If we now take into consideration the state of the industry in 1913, the French production of aluminium is returned at 18,000 tons, that of Great Britain (including works erected in Norway) 10,000 tons, and Italy 2,000 tons to 3,000 tons, whilst Germany turned out 7,500 tons, Austria 7,000 tons, and Switzerland 7,500 tons. The figures for the last three countries make a total of 22,000 tons, but the statistics issued by the Frankfort metal companies at the end of July, 1914, only recorded a total of 12,000 tons for these three countries combined.

Leaving, however, this discrepancy on one side, and accepting the considerably higher French figures as being correct, we find the French newspaper—which states that the Neuhausen Aluminium Industry Co. is essentially a German firm whose Austrian works have been purchased by Germany—placing the Teutons in possession of 22,000 tons of aluminium per annum on the outbreak of hostilities, as compared with a combined quantity of 28,000 tons for Great Britain and France, together with 3,000 tons in the case of Italy. Such a large output on the part of Germany and Austria was only possible through its having been possible to import bauxite from France to assist in meeting their own totally inadequate resources, and in this respect the French newspaper clearly implies that the output of the Neuhausen company is controlled by Germany.

We now come to a little interesting history. The Germans, it appears, sought to monopolise the French bauxite deposits, in the same way as they endeavoured to secure possession of the iron ore resources. With this object in view, they first formed the Société de l'Aluminium Français, which started works at Saint Louis du Rhone for the refining of alumina, and which is asserted to be merely a branch of the Neuhausen company. But the former arrived on the scene too late, as the principal deposits were already in the hands of the metallurgical companies making aluminium (Alais and Camargue, Froges, and the Métallurgique des Pyrénées), or in those of the French extracting companies (Union des Bauxites, Bauxites de France, Lecesne and Cie, &c.). Under these circumstances, the voracious appetite of the Teutons had to be content with poor nourishment. They acquired, for instance, mineral deposits at Thoronet (Var), which were so unsatisfactory that 10,000 tons had to be left at the Luc railway station, whilst the Cabasse minerals appeared to be so silicious that the motor lorries purchased for transporting them had to be put into the garages. The deposits at Vins caused the same disappointment, and although more fortunate results were obtained at Mazanges, the minerals were also greatly silicious. But these failures did not deter the Germans, who then resolved to purchase deposits which were already known and appreciated. Nine-tenths of the share capital of the Bauxites de France were secured, and the success of the scheme was celebrated in July, 1914, by the substitution of three Germans for three French directors on the Board. But the company was subsequently placed under sequestration, and although it has since been sought to replace the Teutons by Swiss representatives, the attempted deception was discovered. Now a new scheme appears to have been adopted to overcome the difficulties. This has taken the form of the announcement made by a new Norwegian company that the bauxites from the South of France would no longer be sent to Germany, but would be treated by the company in Scandinavia. Without suspecting the intentions of the company, the French newspaper pertinently asks whether the Neuhausen company is not at the back of it, apprehending a shortage of minerals for its furnaces in the event of the French Government ultimately prohibiting the export of bauxites to enemy countries after the war. The newspaper concludes by stating that it is quite obvious that the French would henceforth no longer permit the Germans to compete with them with their own (the French) products, and that the European manufacture of aluminium must be reserved for the allied countries.

It is evident from the foregoing that our French contemporary considers, as, indeed, it states, that the Neuhausen company is essentially a German firm, especially as the French Government deemed it necessary to sequester the company's works at Marseilles some time ago. As to the assertion that the company's Austrian works have been purchased

by the Germans, no confirmation of this statement was contained in the annual report for 1914, nor is any reference made in the report for 1915 to any transfer having taken place. It, however, naturally follows that the production of the Austrian works would be used by the Central European Powers, together with that of the Neuhausen Co.'s works in Germany, at Goldschmied-Trotha, and the new Martinswerk, near Cologne. Indeed, Col. Naville, addressing the shareholders at the meeting held at Zurich on May 6th, stated that the company had succeeded in securing extensive bauxite mines in Hungary, and the raw materials were being transported to Goldschmied and the new Martinswerk. Under these circumstances, the chairman's fresh denial of the assertion that the company is covertly German—the statement that the majority of the capital is held in Swiss hands, and the majority of the directors and managers have been Swiss since the formation of the company—will not dispel the fact that a large portion of the company's total production from its German and Austrian works is passing into the hands of the Central Powers for use against Great Britain and her Allies. It would be of interest in this connection to learn the exact amount represented by the shares which have been returned to Switzerland since the outbreak of the war, as the Zurich correspondent of the German *Voss. Zeitung* reported at the end of April that "large amounts" had flown back. The expression of our French contemporary that the French supplies of raw material should be wholly reserved for France and her Allies in the future, as well as at present, will consequently be reciprocated by the allied nations.

The Copper Position. THE position of the red metal continues the subject of considerable interest, despite the fact that speculation on this side has remained entirely at a standstill, in view of the prohibition in force under the Defence of the Realm Act. The sensitive state of the market may be gauged from the fact that, although dealings in warrant metal have for weeks past been virtually absent, prices have again fallen heavily, and to a much greater extent than in refined copper. The price for near delivery has now dropped to about £103, this comparing with £145, the highest touched this year, while American fine copper, which reached as high as £155 some time back, stands in the neighbourhood of £140.

That the latter shows more resistance is, of course, due to the control exercised by American producers, whose output is sold far ahead, thus encouraging them in keeping their terms at a high level as long as possible, or until they feel the necessity of competing more freely for new orders. Signs of weakness in the general outlook have, however, not been wanting, since the demand has come to a halt in all directions, even in connection with munition work. As to whether the demand in the latter respect will reassert itself again to any important extent in the near future seems very doubtful, for it is understood that war needs have been already well covered up to the end of this year. There is, therefore, a strong suspicion that no great revival of buying will be witnessed this year, while American industrial requirements, though still very heavy, have of late shown distinct evidences of falling off. Moreover, there is not much doubt that American consumers have purchased far ahead of their needs, and are now getting copper which is not actually wanted, judging from the reported resales effected lately on the part of some manufacturers. These resales, coupled with the second-hand parcels held speculatively now coming on the market, have naturally enough made themselves felt.

This factor appears to be under-rated by producers who, as a matter of fact, still profess indifference in the hope of being able to hold the market, or, at least, to protect it against any further serious fall. In the legitimate trade there is no confidence in the stability of the market, consumers generally being of opinion that it is only a matter of time when producers will be compelled to stimulate new business at considerable concessions. This view is based on the contention that the United States refinery capacity has now been very fully raised to the height of the huge mine and smelters' output. The refinery production is already estimated at about 90,000 tons a month, which should leave a very fair surplus over current requirements after making allowance for exports at the rate of 25,000 tons, which is well above the average recorded so far this year.

It may be remarked that the American exports during the first four months of this year varied between about 20,600 and 26,300 tons, and fell last month to 14,700 tons, in spite of rather easier freight conditions. Metal for early delivery is getting a little more plentiful, and producers outside the United States have, too, rather more to spare than seemed likely only a few weeks ago, and they are somewhat anxious to push business since the aspect of the market has been entirely changed. On the other hand, consumers resolutely refrain from buying beyond their early needs. Warehouse stocks on this side are still very small, but they have lately increased somewhat and the probability is that they will go on increasing.

What is an "Engine-driver"?

A REMARKABLE decision was recently given in the Federal High Court of Australia, which may have very far-reaching effects. The importance of the case is due to the system which prevails in the Commonwealth, according to which the rates of wages for the different classes of labour are fixed by the Courts. In the present instance, an appeal was lodged against a decision of the Melbourne Court of Petty Sessions, which refused to allow a claim preferred by the Federated Engine-drivers' and Firemen's Association that the driver of an electric crane should be regarded and paid as an engine-driver. The Chief Justice said that the power of the electric motor was regulated "by pressing a button," whilst that of a steam crane was controlled by operating a valve; the difference in the simplicity, or difficulty, of the operation performed by the person in charge of the crane made no difference in its character, and therefore the decision of the lower court was reversed.

This decision appears to us to show an extraordinary lack of appreciation of the fundamental difference which exists between the vocation of an engine-driver and that of the user of an electric motor; the former is a trained man, whereas anybody can operate an electric motor without previous experience, that being one of its most valuable characteristics. What the decision means to employers in Australia may be gathered from the fact that every man who drives an electric crane, hoist, tramcar, pump, or any other appliance will in future have to be designated as an engine-driver and paid according to the wages award in force—and engine-drivers are now demanding an award of no less than 12s. 8d. per day from the Federal Arbitration Court, which, from previous decisions, appears to be disposed to grant anything that Labour asks for. If technical evidence had been produced, the Court could not possibly have arrived at so absurd a decision, and we do not know why the employers concerned failed to call such evidence; perhaps they thought the truth was obvious, even to a judge. Unfortunately, the decision cannot be revised except by appeal to the Privy Council in London.

SILVANUS PHILLIPS THOMPSON : AN APPRECIATION.

THE sudden death of Prof. Silvanus Thompson deprives the scientific and literary world of a charming personality and a man of great and diversified talents.

To many thousands of his students, and to the electrical profession, his loss will come as a shock and surprise of which they had no warning; but to his intimate friends it had become increasingly apparent during the last few months, that his health and strength were suffering severely from the long-continued strain of his work at Finsbury, and the many anxieties which the war had brought to him in an especial manner.

Silvanus Phillips Thompson was of Quaker descent and upbringing, and one of the best-known members of the Society of Friends, whose principles and influence have had such an enormous effect on the social and religious life of this country, although in mere numbers they have always been insignificant.

His public life commenced when he became Professor of Experimental Physics at University College, Bristol, in 1878, very soon after the conclusion of his student days which had given great promise of a distinguished scientific and literary career.

Indeed, it was this special combination of scientific ability and literary charm which gave him so prominent a place among his contemporaries, and he was almost as well known in the sphere of literature as in that of science.

In the early days of electrical engineering, Thompson, then quite a young man, achieved a foremost place as a scientific expert, and his early removal to London to become Principal and Professor of Applied Physics and Electrical Engineering at the City and Guilds College, Finsbury, gave him a large field of influence, of which he made full use. Electrical science had then scarcely emerged as a distinct branch of engineering, and Thompson was one of a very few brilliant young men who grasped a unique opportunity to establish its principles on a thoroughly scientific foundation, a work shared in by Profs. Ayrton and Perry, both of whom were connected with the foundation of the Finsbury Technical College. Thompson laboured unceasingly in this work in lectures to London audiences, and by means of books and papers which had a world-wide circulation. In those days Finsbury was almost the only place in London where instruction in electrical engineering could be obtained by evening students, and the college was crowded with young men attracted by lectures of rare lucidity and fascina-

tion, while the publication of his "Elementary Lessons in Electricity and Magnetism," and subsequently a treatise on "Dynamo-Electric Machinery," established his fame both at home and abroad as a brilliant teacher, writer, and man of science, resembling in very many ways Prof. John Tyndall, whose student he was. Prof. Thompson's numerous books, papers, and published lectures are, in fact, so well known to electrical engineers, that it is hardly necessary to deal with them in detail here, and their great value has long been recognised by the electrical engineering world. It is, therefore, rather to his work in other fields that this brief memoir is concerned, since this is, perhaps, not so widely known, although it probably forms the greater portion of his life-work.

To his artistic instinct experimental work on light appealed with especial force, and it always remained a dominant

attraction. His knowledge of this branch of science, in fact, was quite as encyclopædic as in the electrical field, and one could go to him, as I often did, with some perplexing question, perhaps on polarisation phenomena, or an allied topic, and find in him a mine of information. Form and colour especially appealed to him, and he revelled in the gorgeous displays which this kind of work afforded, and to which he contributed many new and original experiments and ideas. His many contributions in this field include a brilliant course of Christmas lectures, at the Royal Institution, on "Light, Visible and Invisible," afterwards published in book form; and, more recently, a translation of Huygens's famous Treatise on Light, and the theory of double refraction, a special

Elliot & Fry.

PROF. S. P. THOMPSON, F.R.S.

London.

contribution to the Optical Society on the occasion of its highly successful Congress in London a few years ago, when Thompson was President and moving spirit.

As a member of the Spectacle Makers' Co. he gave much time and thought to the diffusion of scientific knowledge among opticians, and was one of the recognised experts of this ancient City company.

In another field, that of magnetism, he was distinguished by his literary researches in connection with Gilbert's great work, "De Magnete," the writings of Petrus Peregrinus, and the history of compass cards, which latter formed the subject matter of a course of lectures delivered at University College last year. He also wrote an instructive technical work on the electromagnet, based on a special course of lectures delivered at Finsbury.

Biography had a great fascination for him, as his admirable Life of Faraday shows, but the chief work in this field is undoubtedly his Life of Lord Kelvin. His distinguished subject took a keen interest in this work, and indeed for some time they met each week for an hour, or so to talk over Lord Kelvin's earlier days. Unfortunately, Kelvin died before much progress had been made, and although this was a severe blow to his biographer, he redoubled his efforts, and in a year or so completed his great task and his most considerable literary achievement. Thompson's linguistic powers also were of a high order, and electrical engineers will remember well his Italian oration in memory of Volta, while physicists will recall his services as foreign secretary of the Physical Society of London, of which body he was also president, and his lecture, delivered in German, in Berlin on the life of Faraday.

In addition to his natural gifts, Thompson was a most strenuous worker, and a holiday for him was merely freedom from routine work, and a change of scene to begin some long-cherished project, or to complete another already outlined in his pocket-book. No one was more industrious on holidays than he, and during each summer he invariably added considerably to his collection of water-colour sketches of Alpine scenery or of some favourite haunt nearer home, which later found their way to the Alpine Club, and occasionally to the Royal Academy.

His temperament, in fact, was such that he needed few relaxations, but one of these during the winter was the monthly meeting of a small coterie of distinguished literary and scientific men, the Sette of Odd Volumes, a dining club of which he was a prominent member and past president, and to the interesting proceedings of which he was a frequent contributor. Many honours and distinctions fell to him both at home and abroad, and he filled the presidential chairs of many scientific and professional societies with distinction, tact, and skill.

He was a Fellow of the Royal Society, of long standing, and took an active part in its work, especially in connection with the catalogue of scientific papers. In recent years he was elected a member of the Athenæum, in recognition of his distinguished career.

His death removes from our midst a great teacher and man of science, with rare gifts of thought and expression, which have been freely given to his day and generation.

E. G. COKER.

Following upon the cremation, which took place at Golder's Green, a special meeting was held at the Society of Friends' Meeting House in St. Martin's Lane, W.C., on Friday afternoon. The proceedings were of a most impressive character, and will be remembered for their remarkable simplicity and true sincerity. In addition to the widow and family mourners, and many members of the Society with whom the late Professor had been a fellow worshipper, as well as a profoundly respected teacher in spiritual things, there were present men of eminence in all those departments of activity—scientific, educational, literary—upon which the deceased had left the impress of his intellect and influence. These included the following:—

Sir J. J. Thomson, Sir A. B. Kempe, Sir W. Crookes, and Prof. W. B. Hardy, representing the Royal Society.
 Col. E. H. Hills (Royal Institution).
 Sir Alexander Pedler (British Science Guild).
 Mr. C. Hawkesley (Institution of Civil Engineers).
 Sir H. Trueman Wood (Royal Society of Arts).
 Sir Ernest Clarke (Sette of Odd Volumes).
 Prof. A. Schuster (British Association).
 Mr. C. P. Sparks and Mr. P. F. Rowell (Institution of Electrical Engineers).
 Mr. W. J. Tennant (Junior Institution of Engineers).
 Dr. R. Mullineux Walsley (Northampton Polytechnic Institute).
 Dr. Gregory Foster, Prof. Carey Foster, and Prof. E. G. Coker (University College).

 Mr. F. S. Spiers (Faraday Society).
 Mr. A. G. Temple (Director of the Art Gallery, Corporation of London).
 Prof. G. T. Morgan and Prof. Margetson, both of Finsbury Technical College.
 Mr. Howgrave Graham and Mr. C. R. Darling (the late professor's assistants), also Mr. Abell, his lecture assistant.
 Prof. Dalby, Dean of the C.T.C., and formerly of Finsbury.

Sir John Gavey, Sir J. A. Ewing, Sir J. Mackenzie Davidson, Sir G. Beilby, Sir W. F. Barrett, Sir John Snell, Prof. John Perry, Col. R. E. Crompton, Dr. C. V. Drysdale, Mr. Chas. Bright, Mr. C. H. Worthingham, Mr. J. E. Kingsbury, Prof. Bailly, Dr. Russell, Mr. Gerald Stoney, Mr. W. R. Cooper, Mr. W. P. Thompson (of Liverpool), and many others.

At the beginning of the meeting it was intimated that the Society of Friends had no set order of service for such occasions, and it remained for those present to lead the meeting, either in devotion or by speech, as they were moved so to do. Several Friends spoke in fitting terms and tones of reverence and solemnity of the earnestness and tenacity with which Prof. Thompson had to the last clung to the same simple religious faith with which he had commenced his career of brilliance, referring also to his spirit of humility, which made no task too mean or small which might bring honour to religion or assist those who worshipped with him or who sat under his religious teaching. The temptation of intellectual pursuits had not lured him into beliefs that religion and science were irreconcilable.

CONTROL GEAR FOR DIRECT-CURRENT MOTORS.

By E. F. BUTLER.

THE subject of control gear does not always receive the amount of attention it deserves, and very little information on the subject, as the result of actual operating experience, has been published. The control gear is often the weak point in installations otherwise well laid out. This may be due to a number of reasons. In some instances quotations are given for the motor only, and when the prospective purchaser finds out that he must pay for a starter in addition, he buys the cheapest form obtainable. In other cases the seller, either for fear of losing an order, or, possibly, ignorant of the various types of control gear which are available for every conceivable purpose, cuts down the price to its lowest, and supplies one of the old-fashioned forms of starter. In many instances this has failed to give satisfaction, and created a prejudice against electric driving.

In a paper given by the writer before the Junior Institution of Engineers, on February 27th, 1914, an analysis of 100 breakdowns connected with electric motors was given. It was found that 38 per cent. were on motors, and 62 per cent. on the control gear, starters alone accounting for 28 per cent. of the whole. This is confirmed by Mr. A. P. Drake (*Proceedings of the Association of Mining Electrical Engineers*, Vol. III, page 458): "The unsatisfactory design of starting switches and controllers, together with the careless way in which they are frequently handled, accounts for about 25 per cent. of the troubles that occur in motor driving."

The neglect of suitable control gear is not confined to the commercial side, which we may charitably suppose to be ignorant of these matters. This is evident from a specification, less than three months old, before the writer at this moment. It emanates from the chief engineer of an important power station. After describing the motor in great detail—bearings to be fitted with ring lubrication, armature to be slotted-core type, brushes to be of high quality carbon, &c.—it concludes: "Protected type starter with no-volt and overload release, ventilated grids and coils, also shunt regulator in series with fields for speed regulation." And this for the most important motor in the power house! Fortunately, the importance of control gear is beginning to be recognised, and some public bodies now devote a separate specification to this item.

The following remarks are not intended to be a treatise on the subject, but are written with the idea of bringing to notice some of the types which may often be used with advantage in place of the ordinary plain type, together with some notes on both good and bad features.

The familiar type of starter will be dealt with first. As is well known, the arm moves over the contacts and cuts out the resistance in so doing. The no-volt coil is energised by being placed in series with the shunt field, and holds the

arm in the full-on position against the pull of a spring. A few turns of thick wire in series with the armature form an overload coil which is intended to pull in a pivoted arm at a predetermined current, short-circuit the no-volt coil and return the arm to the off position.

This type of starter is useful for getting small and medium size motors up to speed, and when well made and carefully handled will give good service for such purposes as it is suited for. The greatest objection to it is that it depends too much upon the human element. If the arm is moved too quickly, there is a danger of passing an excessive current through the armature, and possibly melting a fuse or opening a breaker which may shut down a group of motors. On the other hand, keeping the resistance in circuit too long results in overheating or burnt-out coils,

FIG. 1.

besides being wasteful of both time and energy. The writer recalls a steel works having some large rail and girder straightening presses. For some reason these were fitted with plain shunt motors, which took a large current to get under way. The starter was made up of bare iron spirals, above the starting arm. The motor was protected by a circuit-breaker nearly a quarter of a mile away, and the job was to manipulate the starter-arm at the exact moment. If it was moved too quickly the breaker opened, necessitating a walk to the switchboard, while if it was not moved quickly enough, the last spirals got red hot, and could only be kept from burning out by vigorously blowing upon them.

The trouble most commonly met with in this type of starter is the burning of the contacts, caused by moving the arm on and off the first studs. This is particularly common in the printing trade, as it is necessary to "inch" the machine, or move it round a fraction of a revolution when "making ready."

It is also very usual with machine tools when setting work, particularly with lathes having four-jaw independent chucks. When the starter arm is moved on and off the first stud, the breaking of the starting current, together with the self-induction of the shunt fields, sets up a destructive arc, which rapidly burns up the contacts, and renders the starter useless. When the motor is connected across the outers of a three-wire system, and the starter cover is earthed, as it should be, the arc often spreads to the cover, and causes a dead short-circuit, sometimes destroying the starter and burning the operator. In larger sizes trouble arises when starting up, due to the fact that as soon as the contact on the arm touches the first stud on the slate, the whole of the current passes through what is practically a line or point contact, and sticking or welding takes place. This cannot happen with a carbon contact on the arm, but a good deal of pitting and burning away is noticeable. Of course, this trouble can be got over if the attendant can be induced to get the arm full on the first step and close the double-pole switch afterwards; but this is usually asking too much. When starters of this description are met with, and it is not possible to replace them by a more suitable type, the fault can be got over by connecting the end of the resistance coil which is first cut out, to the starter arm, thus doing away with the off position altogether, and passing current through the armature as soon as the double-pole switch is closed. While this certainly gets over the trouble, it may introduce another, for if the current be interrupted and the arm flies back, the motor may run with all the resistance in when the supply is resumed. However, the author has not hitherto come across any trouble from this cause.

Whilst dealing with the ordinary type of starter, some constructional details, both good and bad, may be mentioned.

The usual internal connections are well known, and it will be noticed that as the resistance is cut out of the armature

it is re-inserted in the shunt field. There is no particular objection to this, but it can be obviated in several ways, if necessary. A common method is to fit a small button contact under the last main contact, so as to short-circuit the starting resistance on the last step. Sometimes the inner end of the no-volt coil is connected to its iron core, which has the same effect. This method has the advantage that there is only one end of the coil to break off—namely, the outer end, which can be connected up again without re-winding the coil.

In good-class work it is usual to fit a brass quadrant with a small contact on the arm, so that the shunt circuit is independent of the starting resistance. It may be mentioned, in passing, that a good many no-volt coils are too weak, and the starter arm has a weak spring. If the contacts get very smooth, there is not sufficient friction to hold the arm up; if, on the other hand, the contacts get rough, the spring is not strong enough to return the arm to the off position. In fact, some makes of starters can almost be divided into two classes—those that won't stop on, and those that won't come off.

It would be an advantage if the tension of the spring were adjustable, and if a small brass set-screw and back-nut were fitted to the keeper of the no-volt coil to prevent sticking. Coming now to the overload coil, the usual source of weakness is the contacts. A very common form is shown at A, fig. 1. The trouble generally met with is the wedging of the contacts after they have pulled in. When the motor is next started, the no-volt coil is short-circuited, and the arm will not hold up. It is tied up with a piece of string, which is usually forgotten when the motor is stopped.

Next time the switch is closed, the arm still being tied up, the fuses are blown and the double-pole switch probably

FIG. 2.

damaged. The owner remarks: "Electric driving is a great convenience; it is a pity it is so unreliable." Improved forms of contacts are shown at B and C, fig. 1, the first being a circular disk pivoted underneath, which makes contact with the lower portion of the two studs; the second consists of a short piece of round brass with a broadly-tapered end, which does not become wedged.

In order to comply with the Home Office regulations, it is sometimes necessary to arrange to shut down a motor from a distance. When a starter of the ordinary type is fitted, it is usual to run a pair of wires from the terminals of the no-volt coil to the point of control, and fix a push or switch, the closing of which short-circuits this coil, or, more correctly, more or less shunts it. The best that can be said for this arrangement is that it works—sometimes. By a simple re-arrangement of connections a much more reliable and satisfactory method is possible. Fig. 2 shows a two-way switch without an off position. When the top contact only is made, the no-volt coil is in circuit as usual. In the next position this coil is short-circuited, while in the final position, one lead to the coil is disconnected.*

Another method of connecting the no-volt coil is sometimes used when a separate regulator is used for the shunt field. In this case the coil is made independent of the

shunt field by being placed in series with a resistance directly across the mains. This obviates a common source of trouble—namely, the dropping back of the starter arm, due to the weakening of the holding-up coil.

When so connected, the overload acts by breaking the circuit of the no-volt coil, and to stop the motor from a distance the required number of switches are placed in series and normally make contact.

BAKING OVENS.

THE REFECTORY.

Arising out of these two examples, it may be noted that in dealing with problems involving the opening or interrupting of a circuit by means of magnetic switches or automatic control, it will usually be found much more satisfactory to positively open the control circuit than to shunt it more or less. With any length of wiring, and a number of dirty or oxidised contacts, it is easy to have a resistance equal to that of the coil it is intended to short-circuit.

Emergency stops may not be used for a long time, but when they are needed they are usually needed very badly, and should be reliable and positive in action.

The contacts on the slate should be renewable from the front in all excepting the smallest sizes. One make in particular should be avoided; it has segments held on by countersunk screws passing through the slate and holding the connections on the back. Countersunk screws make it easier to clean the segments, but round-headed ones enable the segments to be reversed, and both sides used. The contacts on the starter arm should also be easily renewable. For small currents a plain brass or copper strip is quite suitable, backed up by a strip of spring steel.

(To be continued.)

Patent Restored.—An order has been made restoring Letters Patent No. 17,926, of 1907, granted to Wm. Reavell and Reavell & Co., Ltd., for "Improvement in mechanism for converting rotary into reciprocating motion, applicable to pumps, compressors, and other machinery."

* Switch positions are indicated on right of diagram.

AN ELECTRIC RESTAURANT AT GOLDER'S GREEN, N.W.

By the courtesy of Mr. B. G. Drummond, engineer and manager of the Hendon Electric Supply Co., Ltd., we were enabled to inspect a new restaurant which has been opened at Golder's Green, and has been equipped with electric cooking apparatus. The restaurant is known as "The Refectory," and is tastefully fitted and furnished in a style in keeping with its name; and judging by the savoury odour and appearance of the dishes in course of preparation at the time of our visit, the traditions of the monastic order with regard to "living well" as an aid to leading a good life, are no less faithfully reflected in the cuisine. The enterprise is conducted by The Company of Electric Caterers, Ltd., which was formed early this year for the purpose by local residents, and the electrical equipment was installed at first on experimental lines: the establishment has now been running for about three months, and the results obtained have been so successful that the installation has been made permanent. The confidence of the promoters in their venture is indicated by the title which they have adopted, and we trust that, as a result of the experience gained in this well-known suburb, their operations will be extended to other districts.

The cooking apparatus was supplied by the Falkirk Iron Co., Ltd., its main

ROASTING OVENS, GRILL, AND TOASTER.

features including two large roasting ovens, two grilling and toasting apparatus, a hot cupboard and carving table, two pastry-baking ovens, a girle plate, and sundry coffee and hot-water urns, milk boiler, &c., each provided with three-heat regulation. The roasting ovens, the meat grill, and the hot cupboard are loaded to 5 kW. each, the pastry ovens to 4 kW. each, and the other apparatus to 2 and 3 kW. each; they are controlled by "Diamond H" switches with indicators and pilot lights. The toaster (3 kW.) and grill (5 kW.) are fitted with convenient devices for regulating the distance of the food from the heating elements. The carving table is fitted with two vegetable trays, two carving trays, and two gravy wells, and, with the hot cupboard beneath it, has given great satisfaction to the kitchen staff.

All the apparatus is controlled with ironclad Henley switches and double-pole fuses, and the wiring is carried out in screwed tubing, with flexible metallic tubing as a protection to the leads entering the cooking apparatus. All the appliances are operated on single-phase circuits, but the general supply is three-phase; maximum-demand indicators are installed, for observational purposes only, and Ferranti meters, on each phase.

In the pastry kitchen, besides the pastry ovens, there is a girdle plate loaded to 3 kw., which is in great demand for the baking of Scotch scones. The pastry ovens, which are loaded with 4 kw. each, are of a new and special design to meet the requirements of the purchasers, having each four heaters, disposed horizontally at the top and bottom of the oven and under the two intermediate shelves, so that in each compartment both top and bottom heat is provided; this arrangement has been found very satisfactory. There are two hot-water urns in the lounge, loaded to 3 kw. The coffee urn above mentioned is rated at 2 kw.

We gathered from the chefs, in both the kitchen and the pastry department, that the electric cooking apparatus gave them great satisfaction, with the one exception that the upward radiation from a coke fire for grilling was preferred to the downward radiation of the electric grill; but that may be a question of taste rather than an actual defect in the system.

The complete cooking installation is more than sufficient to cater for the accommodation provided, namely, 130 to 150 persons, in addition to a large output of pastry and confectionery for sale across the counters.

It is interesting to note that none of the staff had any previous experience with electrical apparatus, but they had no difficulty in familiarising themselves with it in the space of a few days; in fact, the chefs expressed surprise that they so quickly adapted themselves to the most modern system of cooking.

The general heating of the premises is provided for by means of "Falco" and luminous radiators, and ample arrangements are made both for ventilation and cooling the air by electric fans placed in suitable positions.

The lighting is effected with half-watt lamps throughout, and in the public rooms G.E.C. alabaster semi-indirect bowl fittings are used with excellent effect.

In thanking Mr. Drummond and his assistants for affording us facilities to prepare this notice, we add our congratulations to them and to the Electric Caterers on their progressive policy, to which we wish every success. We understand that the Supply Co. will be pleased to receive visitors who wish to inspect the installation.

THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION, 1916.—I.

THE annual meeting of the Association was opened yesterday at the Institution of Electrical Engineers, with the presidential address delivered by Mr. A. C. Cramb, borough electrical engineer of Croydon. The morning session was afterwards devoted to the reading and discussion of a paper on "Boiler-House Design and Operation," by Mr. W. W. Lackie, engineer and manager of the Glasgow Corporation Electricity Department. In the afternoon two papers were down for reading and discussion: "The Generation of Electricity on a Small Scale or Bulk Supply," by Mr. H. S. Ellis, borough electrical engineer, South Shields, and "The Application of Electricity to Agricultural Purposes," by Mr. W. T. Kerr, city electrical engineer, Hereford.

To-day the business meeting will take place, at which the report of the Council and that of the Electric Vehicle Committee will be presented. The following is an abstract of Mr. Cramb's presidential address:—

In attempting to look into the future of electric supply, Mr. Cramb said, one felt that in this, as in most other matters,

things would never be quite the same again. When the country settled down to peaceful times people would aim at and expect greater efficiency and progress in business, and co-operative action quicker and better results would be attained. The electrical industry needed in a greater degree the spirit of co-operation in furthering the expansion of its work for the benefit of the Empire and of its own members. When one considered the need for progress in standardisation, in publicity, in the field of domestic heating and cooking, and in the development of new lines of business, there could be little doubt that the future offered full scope for the energy of the Association.

There could be little doubt in the mind of any member of the Association of the necessity for standard conditions of contract; it was necessary, therefore, that individuals should not press their own personal prejudices to the extent of preventing the establishment of conditions acceptable by the majority. If progress was to be made, the mature opinion of the majority must be loyally accepted. Municipal engineers had in the past enjoyed the privilege of making contracts in which the contractor had little voice, and no doubt the settling of contracts in which both sides met on more equal terms might be somewhat disconcerting at first. The Council had not yet received any report from the Association of Municipal Corporations regarding the contentious clauses of the model conditions referred to them for consideration by the Association nearly two years ago. In the meantime, individual undertakings represented on the Association were accepting these conditions, and they had, he understood, been adopted by other representative bodies concerned.

The Association was indebted to the British Electrical and Allied Manufacturers' Association for their kindly offices in endeavouring to bring about a settlement of the outstanding differences between the Electrical Contractors' Association and themselves in connection with the I.M.E.A. Bill. A joint meeting took place, and it was hoped that an agreement had been reached, but the terms, as on previous occasions, were not accepted by the Electrical Contractors' Association. He wondered how long this policy of obstruction by a small section of the industry would be allowed to continue to seriously curtail the development of the business, not only of electric supply undertakings, but also of manufacturers and contractors. Even when contractors were guaranteed in the Bill that all wiring work, which would be greatly increased by the passing of the Bill, was to be placed in their hands, that supply undertakings were to be limited to prices which contractors could safely underquote, and that increased business would be brought about through hire and hire-purchase systems in which there would be no bad debts, they still hesitated to join in a course which held the promise of a considerable expansion of profitable business. Parliament had already in a number of cases granted much greater powers than those asked for in the Bill, and the present state of affairs, in which one undertaking held powers to develop its business which were denied to a neighbouring undertaking, was extremely illogical. The Association would at an opportune time again press for the Bill.

It had been the aim of the Association to effect an agreement equitable to the various interests, but it might become necessary to adopt a more active policy, to create a greater desire for settlement.

With regard to the Development Committee, the activity of which had been restricted by the war, the work of the Sub-Committee dealing with questions of electrical apparatus for cooking, heating, and other domestic requirements was urgent and important. There had been too much disjointed work in the production of cooking apparatus, and a co-operative effort by manufacturers and supply authorities was urgent. There were many matters of detail, but of great importance to success, which actual experience had demonstrated to require consideration. The production of a suitable and reliable radiant heating unit in place of the usual hot-plate was a case in which the work of the committee should yield good results. It was highly probable that valuable assistance could be rendered by the National Physical Laboratory in solving certain problems connected with electric heating and cooking.

The Publicity Sub-Committee had been instructed to prepare a complete scheme for the development of a publicity organisation in this country. Several attempts had previously been made in this direction, but in all cases had ceased after a certain period. Undoubtedly the want of funds had been the main obstacle. A first essential of success was the appointment of a thoroughly competent whole-time specialist in publicity, who should give his entire attention to the running of such an undertaking. A more liberal spirit of co-operation of the various interested parties was of equal importance. The hanging up of the I.M.E.A. Bill—which contained provision for enabling local authorities to subscribe to such an organisation—also continued to prevent progress.

The passing of the Summer-Time Act served to emphasise the courage and foresight of those undertakings which had adopted the Norwich or some other system of standing and running charges for domestic purposes before the use of metal-filament lamps became general. The advantage to the undertaking by the adoption of such a system, in maintaining financial stability against the large drop in revenue resulting from the introduction of more economical lamps and other causes, far outweighed any objections. His own experience in bringing before the householders the merits of electricity

for domestic purposes had convinced him that there was a very large potential demand if only the electrical industry were ready with a supply of suitable apparatus which could be obtained by consumers on terms comparable with those to which they had become accustomed.

Electricity committees should realise that those members of the staff who had to deal with the development of electricity for domestic purposes should take every possible opportunity of gaining actual experience with various types of apparatus in their own homes, and that all reasonable facilities should be given to this end.

The question of sufficient supplies of coal for the maintenance of electricity undertakings had been a source of anxiety during the past year to the individual members of the Association, and promised next winter to become critical. The Council had done what was possible by appointing a sub-committee to watch the question, and by supporting representations to Parliament and the Board of Trade.

The proposal of the Board of Trade to urge consumers to make a percentage reduction in lighting with a view to economy in coal was not likely to have the desired effect. The view of many supply authorities that an increase in price was the more effective way of bringing about economy was undoubtedly correct. The saving in coal owing to reduction of lighting seemed also to have been greatly over-estimated.

The work of the British Engineering Standards Committee had been approved by the Government, from whom it received financial assistance. The Association was also subscribing to the expenses, and was well represented on the various committees of the Electrical Section. He hoped that local authorities would be prepared to help forward the work by subscribing.

Experience had proved that the control of accounts by an official independent of the engineer-manager inevitably led to unsatisfactory results. Nowadays the chief official of an electric supply department must, to an increasing extent, devote his energies to the financial and commercial side of the business, whilst guiding the work of the technical staff. It would be much more satisfactory if the municipal accountant were to act as an internal auditor.

In the report of the Board of Trade Committee on British Trade after the War, it was proposed that local authorities and other public bodies should be under legal obligation to purchase as far as possible only goods produced in the British Empire. It was felt by the Council that discrimination between local authorities and private companies in this matter was unjust to the ratepayers, and that whatever restrictions were made with a view to assisting British manufacturers, they should be equally applicable to all interests.

ELECTRICITY IN SMALL HOUSEHOLDS.

By W. B. SMITH, A.M.I.E.E.

(Abstract of paper read before the GREENOCK ELECTRICAL SOCIETY.)

ELECTRICITY is not a luxury, and it is economical to make full use of electric energy in any dwelling-house where a supply is available at reasonable rates of charge. Much of the information here put forward is the result of three years' personal experience of electric lighting, heating, and cooking in a house in which no gas was used, and where coal was burned

general practice of adopting more expensive fittings where the wiring is carried out of sight behind plaster and below floors.

To take a typical house of the semi-detached type of, say, five rooms and kitchen, the description of lamps and fittings to adopt might be as shown below. The candle-power of the lamps should be determined experimentally, taking into account the colour of walls and furnishings in the rooms. The cost of an installation of this size might be about £17 in wood casing, and about £23 in screwed tubing, while the annual bill for lighting would vary from £2 to £3.

DWELLING-HOUSE OF FIVE ROOMS AND KITCHEN.

Position.	No.	C.P.	Switches.	Fittings.
Hall	1	50	1	1 pendant (fancy shade).
Dining-room	3	30	2	Rise and fall pendant (silk flounce).
Drawing-room	4	30	2	Brackets or ceiling fixtures (fancy shades).
Kitchen	1	50	1	Rise and fall pendant (fancy shade).
Scullery	1	16	1	Pendant (opal shade).
Stairway	1	16	22-way	Pendant (fancy shade).
Bathroom	1	30	1	Pendant (opal shade).
3 Bedrooms	3	30	3	Pendants (fancy shades).

The actual cost of electricity for lighting in small houses naturally depends on the habits of the occupants, but from information obtained from the accounts of the Greenock electricity department it is evident that the lighting bills of domestic consumers bear some relation to the size of the dwelling. The particulars in fig. 2 have been compiled from the average lighting bills of domestic consumers in Greenock who are charged at present on a flat rate of 3d. per unit. The cost of each lamp per annum averages about 4s. In fig. 3 the variation from month to month is shown, the amounts being calculated from actual meter readings. The cost of electric lighting per month varied from 5s. 7d. in January to 7d. for the month of July.

Having demonstrated the economy of electricity for lighting dwelling-houses, station engineers are now endeavouring to introduce electric energy for other domestic uses. Many "small-current" appliances are now in daily domestic use, the most popular in small houses being the electric iron, consuming one-third to one-half of a unit per hour, the electric kettle, with quick-boiling heating element to boil two pints in less than eight minutes, and the electric vacuum cleaner. On the lighting rate of, say, 3d. per unit, the intermittent use of these "small-current" devices does not very materially increase the electricity bill. But if more frequent use is made of them the consumer should be advised to adopt the "fixed-sum" system of charging, whereby an annual charge is made for the use of the supply and a small rate of, say, 3d. per unit, for energy consumed.

The thick line in fig. 4 gives the average standing charges for small dwellings in Greenock, while the average total electricity bill at 3d. per unit is shown by the dotted line above.

The recent boom in electric heating is undoubtedly due to the advent of a reliable electric "fire" giving radiant as well as convected heat. In a room of dimensions 14 ft. by 12 ft. by 10 ft., the capacity of the heater required would be 2½ kw., which could be reduced to about 1 kw. after the first few hours. In Greenock there are over 400 electric radiators in use, and more than 300 of these have been sent out during the last eighteen months.

In England, where a large amount of roasting and baking is done in the household, the electric cooker is now extensively used; but in Scotland, where boiling, stewing, frying, and grilling form the greater proportion of cooking opera-

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

at intervals for the heating of the rooms, but mainly for the heating of water for washing purposes.

The only hindrance to its universal adoption in dwellings is the initial outlay required to fit up lighting installations. The curves in fig. 1 show the approximate initial cost of installations for houses of from two to eight apartments, wired in steel tubing and wood casing respectively. The figures given are for everything necessary to complete the installation with the best of materials, and allow for inexpensive fittings in the principal rooms. They do not include the provision of wall sockets.

It will be noted from the curves that the cost of wiring in screwed tubing rises in greater proportion than that of wood-casing installations as the size of house increases, due to the

tions, the adoption of the new method has been extremely slow. The reason for this is that although the electric oven has almost reached a state of perfection, the same cannot be said of the hotplates on most electric cookers.

In the selection of an oven, top heat should be insisted on as well as bottom heat, as it enables the food to be well browned on top, and a better variation of the heat distribution in the oven is possible. Side elements are not so serviceable in this respect. The full temperature of 300 deg. or 400 deg. F. should be attained in about 20 minutes after switching on, and the oven should be lagged so that about one-half of full loading maintains this temperature. The energy used for cooking varies from 1 to 1½ units per day for each person, and the annual cost for a family of three or four

persons should not be more than £4 10s. In a small house hold of three persons, where the cooking is done by electricity, and where electric heaters are used for occasional heating of rooms, the lighting costs 1½d. and the heating and cooking about 3½d., a total cost of 5½d. per day in winter. For a day in summer the cost would obviously be much less. The average price paid for the whole supply works out at a little more than 1d. per unit.

The annual cost of cooking, heating, and lighting by electricity and coal from actual results in such a house was as follows:—

	£	s.	d.
Electric lighting at 3d. per unit, 7½d. per week	1	13	9
Electric heating and cooking at 3½d. per unit, 1s. 5½d. per week	3	15	4½
Coal at 1s. 3½d. per cwt., 1s. 11½d. per week	5	0	10
Total cost	4s.	9½d.	per week
	10	9	11½

In Dumbreck, Glasgow, eight small villas of four, five, and six apartments, have been fitted with electrical appliances for lighting, heating, cooking, &c., and the cost of electricity per annum for the year ending May, 1915, was found to vary from £20 to £30 for each house.

For a small dwelling, where no maidservant is kept, a total cost for electricity of £20, or even £30, per annum cannot be said to be excessive, considering the dirt and labour saved, and the usefulness of the whole arrangement. It might be argued that a large cooking and heating load would very materially raise the peak load of a power station without much advantage in increasing the general load factor of the station. Such, however, is not the case. In a town where in large tenement houses the tenants use electricity for lighting, heating, and cooking, although the total of the rated loads of 21 consumers in one block was 110 kw., the maximum load on the service cables supplying the block was only 13.5 kw. In the case of the Glasgow villas mentioned above, the maximum demand on the distributor supplying the houses was 17 kw., although the connected load totalled 80 kw., giving a diversity factor of about 5.

It has been shown in several towns that the domestic cooking and heating load comes on mainly at "off-peak" hours of the day, thereby tending to improve the load factor on the station, and assisting towards the cheaper cost of generation.

Experience has already shown that the middle-class domestic consumer has been the first to adopt electric irons, kettles, &c., and it would seem that it is in the small household where no servant, or at most one servant, is kept, that we may expect the pioneer work will be done in connection with domestic electric heating and cooking on a more comprehensive scale.

WAR ITEMS.

Exports to China.—The "London Gazette" of June 20th contains a further list of persons in China and Siam to whom exports may be consigned.

Export Prohibitions.—The "London Gazette" for June 16th contains a further list of persons or bodies in Greece, Portugal, Spain, Netherlands, &c., with whom or which trading is prohibited.

To be Wound-up.—Under the Trading with the Enemy Act the Board of Trade has ordered the following to be wound up:—

Standard Cable Manufacturing Co., Ltd., 18 and 19, Queenhithe, London, E.C. Agents for cable manufacturers. Controller: Mr. J. S. Feather, 35, Great Tower Street, London, E.C.

The Effect of the British "Black List."—The correspondent of "La Prensa" at Valparaiso says: "The trade war between the belligerent nations of Europe is assuming alarming characteristics here. In virtue of a decision of the British Government, a 'Black List' has been formulated consisting of Austrian and German business houses, with which no industrialist, trader, or private member of the 'Entente' Powers may have commercial dealings of any kind whatsoever. In this list there figure 14 firms domiciled in Chile, amongst the most important and best known in this market and whose business is connected with all Chilean products, but principally nitrate, as also with the Chilean import and export trade. The 'Black List' comprises the following firms: Dante & Co., with offices at Santiago, Valparaiso and Antofagasta; Folsch & Co.; Gildemeister & Co.; Kurtritz; Walter; Winkelhagen & Co.; Ernesto Hans; Leopoldo Reitze; Schultz, R., & Co.; Slomann & Co.; Stubernauch & Co.; Werk & Co.; Weber & Co. The effects of the British Government disposition above referred to are already being felt. The German nitrate company have closed down because British traders refuse to sell them sacks. Furthermore, the firm of Graham Rowe notified the Board of the Gatico Mining Co. (which is Chilean) that they would not supply them with coal or coke so long as Sr. Hutmamm, manager of the German Bank, was a director. Sr. Hutmamm resigned, but the prohibition of sale of coal still persists."—*Review of the River Plate.*

Exemption Applications.—At a sitting of the Bispham Tribunal last week, application was made by the Blackpool and Fleetwood Tramroad Co. for the exemption of 19 employees, including inspectors, cash clerks, a wireman, an engineer and engine tester, a feeder repairer, and motormen. Mr. J. Cameron (manager) said he was short of 50 men, and had put some conductors on as drivers, replacing them with 22 women. In the power house, where 23 men were formerly employed, there were now only 10 men, five being of military age and appealed for, and the rest being over age. In 1914, 73 men were employed, and 31 enlisted direct, and there were only 23 left. The exemptions asked for were the minimum. Exemptions were granted in every case—12 men 35 years old and over receiving conditional exemption, the remaining seven, who were under 35, being exempted until September 1st.

At Rochdale, an appeal by Mr. G. L. Adamson for an electric wireman, aged 22, was disallowed. It was stated that the man was on work directly affecting Government contracts. The firm had lost 50 per cent. of their men.

At Warrington, last Friday, an electrical contractor, aged 32, who was stated to be engaged on electrical work for firms on Government contracts, appealed on his own behalf. His appeal, together with others for certain of his employees, had been adjourned with a view to seeing whether badges which had been applied for were forthcoming. It now transpired that badges had not been received, and it was understood that badges would only be granted to people actually engaged in Government work on direct contracts. The applicant's manager had previously been granted exemption by the military authorities. Applicant now said he would not be disposed to leave anyone to look after his business in his absence, and the Tribunal deferred their decision.

The Portishead District Tribunal granted exemption to the manager and two other employees of an electrical undertaking, it being stated these were the only men left of an original staff of 26.

At the Oxford Local Tribunal, A. H. Pearson, ironmonger, Oxford, asked for absolute exemption for an electrician and fitter, the only mechanic left. Applicant was himself serving. Exemption granted so long as he remains in his present occupation.

At the St. Andrew's Tribunal, the Electric Supply Corporation applied for the exemption of one of their stokers, on the ground that the man was indispensable, as he had the repairs of machinery, &c., to do. Bailie Hall said: "He left my employment at the gas works 14 months ago. He is only a fireman, and knows nothing about the repair of engines." Exempted till July 15th.

At the East Sussex Appeal Tribunal, an electrical kinema engineer applied for the renewal of an exemption given for one week by the Appeal Tribunal. Every effort had been made to dispose of the business, but without success, and if the engineer were compelled to serve the whole of the capital would be lost. "He had a 21 years' lease. The appeal was dismissed. Leave to appeal was refused.

At Cookham (Berks), on June 14th, exemption until September 1st was granted to T. G. Hardy (32), electrician, of Pinkney's Green; and until August 14th to Harry Hill (36), in charge of the electrical plant for Sir R. M. Beachcroft at Cookham Dean.

At Rochdale, exemption until August 31st has been granted to Mr. T. Hartley, of Messrs. Fryer & Hartley, who is engaged on electrical contracts. Conditional exemption has been conceded to Mr. E. Rothwell (32), electrical engineer at the workhouse.

Two months' exemption has been granted, on the application of Mr. Woodman, borough electrical engineer at Dover, to a coal and ash trimmer. Leave to renew the appeal was given. A tramway body maker on the Corporation staff has been granted eight months' exemption, with leave to appeal.

At Calne, exemption until September 1st has been allowed to Mr. A. McKenzie (31), who is in sole charge of the electric power and lighting plant at the works of Messrs. Harris and Co.

Before the Devon Appeal Court, the Bradninch Electric Supply Co. appealed for Mr. L. Jeffery, engineer in charge of the generating station. It was stated that Mr. Jeffery came from Canada at the company's request to fill a gap, and if he was taken the work would have to be practically discontinued. Two months' conditional exemption was allowed.

At Aldershot, a final one month's exemption was allowed to two fitters appealed for by the Aldershot & District Traction Co. It was stated that there were now only 11 fitters on the staff, 50 per cent. having been lost during the past year.

The Tribunal at Wellington (Somerset) has granted exemption until September 1st to Thomas Antobras, electrician, engaged at Nynehead Court, by Major Stobart.

At Salisbury, five men were appealed for by the electric light company. Mr. A. B. Randall (manager) said that all were essential to the satisfactory working of the undertaking. Nine employees had joined the Forces. Conditional exemption was given to a meter, battery, and testing assistant, two engine drivers and electricians, and an assistant engineer. The accountant and chief clerk were exempted until December.

At Walton-on-Thames, Mr. Robert James Rodd (35), electrical engineer, secured conditional exemption on the ground that he was the working manager of a firm engaged solely on Government work.

Before the Tribunal at Woking, Mr. W. H. Exley (38), electrical engineer, designer and draughtsman, Maybury Hill, said that he was engaged on national work, and the War Office wrote to the effect that he was doing work of the utmost importance. Conditional exemption was assented to.

At Aberystwyth, the electric light company applied for exemption for Mr. E. R. Chamberlain (22), shift engineer, in charge of a Diesel engine, a steam engine, and other plant. Mr. C. P. Perkins, the manager, stated that Mr. Chamberlain also assisted in the repair and maintenance of the machinery, and it was difficult to get men capable of looking after Diesel engines. He had only two men capable of taking charge of the engine rooms, and he could not keep the works running with less men than he had now. Conditional exemption was allowed. The same Tribunal allowed exemption until September 9th to Mr. B. W. Chestham, electrician at the local cinema theatre.

At Reigate, on June 13th, Messrs. Tamplin & Makovski, electrical engineers, appealed for exemption for seven employees. Sir Ralph Ashton (Military representative) said that in an electrical works in which he was interested five men had been replaced by women. The appeals were adjourned at the request of Mr. Makovski.

The Reigate Rural Tribunal has refused exemption to J. Penfold (40), in charge of the electric light plant at the residence of Mr. C. F. Rowsell, of Nutfield, and E. E. Cheasley (40), electrical engineer with Mr. C. L. Bower, of Nutfield.

The East Kent Appeal Court has withdrawn exemption allowed to E. J. Farewell (36), electrician at the Hippodrome, Sheerness, and granted a final month's postponement.—Mr. V. Pomfret, of Horton Manor, Chatham, appealed to the same Court for exemption for his electrician, W. J. Pay (38). A final exemption to August 25th was granted.

At Whitstable, three months' exemption has been allowed to Mr. E. C. Spray (40), electrician; and conditional exemption to Mr. A. S. Tyler (32), engineer at the electricity works.

Absolute exemption was claimed, at Witney, by Mr. F. G. Currel, engineer and manager of the U.D.C. electricity works, for Victor Brice (18), on the ground that it was imperative for his daily duties to be executed for the proper maintenance of the public supply of current. Two assistants had already enlisted, and Mr. Currel said that it was impossible to obtain a competent man in Brice's place. Brice had another year's apprenticeship to serve, and, including himself, the staff was now only six. There was great difficulty in finding competent electricians at the present time. One month was allowed "to look round and make other arrangements."

Before the Warwickshire Appeal Court, the Military opposed exemption until November 24th granted to Mr. A. L. Smith, electrician, of Stratford-on-Avon. The Court limited the period of exemption to two months.

At Chatham, the tramway company appealed for Mr. F. W. Bone (34), station superintendent, who has sole charge of the power station, and is indispensable. It was stated that the Board of Trade insisted upon a competent and experienced man being in charge. Three months were allowed.

Conditional exemption has been allowed to Mr. W. Robbins, wireman with Mr. W. H. Smith, of Bexley (Kent), whose former staff of 28 has been reduced to four.

The Dover Tribunal has conceded conditional exemption to Mr. E. W. Wright (39), electrical engineer.

At Stoke-on-Trent, when appeals were considered from the Potteries Electric Traction Co., it was stated that the company were prepared to liberate a considerable number of conductors now, and others later. The general manager, Mr. W. Thom, said that there were 266 eligibles left; about 43 could be gradually released as women were trained at substitutes. He offered to send the men to the military in six weeks' time. This was agreed to by the Tribunal.

The Maidenhead Tribunal, on June 13th, granted exemption until October 1st to Mr. W. E. Wise (38), electrical engineer to Messrs. Wilder & Son, and until August 1st to Mr. Walter Sibley (30), electrician with Messrs. Arundell & Co.

The City of Oxford Tramways Co. appealed for absolute exemption for 29 employees. Two drivers were given one month only; the others were each exempted for three months.

Application was made to the York Tribunal in respect of three engine-room labourers, one boiler-house labourer, and one clincher wheeler, employed in the tramways department. It was stated that it had been mutually agreed that two of the claims should be refused, that two men should be exempted to August 6th, and one until September 6th.

To the Brentford Tribunal application was made for the exemption of a man engaged in the manufacture of magneto fittings for use on aeroplanes supplied to the British and French Governments. The firm had been requested to double its output, and with that object in view new machinery had been acquired. Case adjourned to enable applicant to apply for a badge.

LABOUR AND INDUSTRY.

(Continued from page 689.)

MANY authorities are anxiously engaged with the question of how we are to employ after the war the hundreds of thousands of women-workers who have turned their hands in war-time to entirely unaccustomed pursuits. The *Engineer*, in a recent editorial, says:—"We have trained hundreds of thousands of people who had no previous knowledge of handicraft, to use these tools. What is to be done with that labour when it is no longer required for the making of munitions?" The writer replies to these questions as follows:—"A very large proportion of the labour will be glad enough to escape from the workshop and return to other duties. It is receiving now, under the impulse of necessity, wages that it is inconceivable that it should receive under peace conditions, and it is supported by zeal for its country's success in arms. Under these two influences it gives itself up to the hardship of the workshop, but when they are removed it will welcome a return to less exacting walks in life. The industrial class has broken down its boundaries, but when peace comes once again it will flow again in its old channels, widened perhaps a little, but not very greatly. The total result is that we shall have far more machines than we have workers to use."

It is, of course, impossible to forecast what the future may bring forth, but we agree with our contemporary that much of the woman labour will flow back into ordinary channels after the war—from the factory, the tramcar, the motor-omnibus, and so on. It is the stress of the times, and the desire to "do their bit" while their "boys" are away at the war, that keeps many of them working in unaccustomed ways, the strain of which they may not feel it either necessary or desirable to stand when the boys come home. In some cases they will take the place of the permanently disabled fighter and become the breadwinner, supplementing the pension; but when we read and hear prognostications of serious Labour strife after the war because the women will want to stick to their present kind of life, doing the returned men out of their positions, we are disposed to discount them as exaggerated imaginings. It is altogether too early for us to judge of the position of woman as a substitute for man in industry, however well many of them have acquitted themselves under certain abnormal conditions. Quite legitimately, the women-workers have a committee looking after their interests up and down the country, and a programme is stated to have been drawn up by which the committee hopes to ensure that a woman displaced after the war shall receive, through a Trade Union, adequate out-of-work benefit, either until she gets work or for an agreed period, and that the Government shall subsidise the Trade Unions to enable them to meet the increased cost of unemployment benefit.

At the present moment there is an urgent call being made for hundreds of thousands more women to enter the workers' ranks. As matters stand, only in this way, accompanied by the most complete 'dilution' measures, can industrial output, which might otherwise be seriously affected by the drawing off of men for the active Forces, be maintained. Both in order to supply home needs and to assist in the upkeep of the export trade more woman labour is required. Information is being collected by a special Bureau concerning the women who are available. According to the *Daily Telegraph* there were before the war 2,180,000 women employed in industry, and by a couple of months ago 391,000 more had "enlisted."

These extra women were distributed very unevenly among the various trades. Of 49,000 who secured work between February and April, 41,000 went to the metal and chemical trades, leaving only 8,000 for all other industries, a total very much smaller than the number of men who during the same period had joined the Forces. The need for a further employment of women in these trades is therefore urgent. Some manufacturers have shown considerable enterprise, and are employing women on various new processes, the experiment often turning out quite successfully. With regard to the supply of women before the war, there were about 1½ million who were unmarried and "unoccupied." Of these 1,000,000 were under 25, and for the most part untrained. It is pointed out that these could profitably be employed for munition work, but the needs of the other industries must not be forgotten. The textile trades, for example, employ a large number of

South African Tariffs.—The Customs authorities of South Africa have recently given a decision to the effect that incandescent bulbs for pocket electric torches are to be classified under No. 1146 of the Tariff, the general duty being at the rate of 3 per cent, *ad valorem*, with a rebate of the full duty in the case of bulbs of British manufacture.

women, and are most important from the national standpoint on account of the export trade. These industries are now suffering severely from a shortage of trained women.

The *Engineer* article already referred to proceeds:—"The Public has been shown in a most convincing way that the restriction which Labour put upon output was a very real thing, and that employers under-stated rather than exaggerated it. Very many people who will eventually leave the workshops now know by experience what output can be attained. Hence there will be a large body of public opinion against shirking and 'ca-canny,' and it is probable that under its influence the output per machine will be increased considerably over pre-war times." Taking all the different factors into account, it is concluded that we are "in possession of enormous potential energy. We have a vast number of machine tools, and we have an increased number of workpeople—not sufficient for the tools, but still increased—who are able to turn out more per individual than heretofore. How can we make use of this potential energy? That is the question to which an answer is desired, and we must confess for our own part that we see none at present, and see no probability that prevision will be of much avail." Our contemporary apparently does not consider that there will be a great demand upon British factories for the requirements of Allied countries that before the war we were not supplying. We must make within our own borders more of our own manufactured requirements, must meet the demands of the Empire, and must strain every nerve to increase the volume of our trade.

In regard to the subject of dilution, with which we have already dealt on several occasions, detailing some of the steps which have been taken to train suitable labour and the success which has attended these efforts, the extreme importance of this question is shown by a letter written by the First Lord of the Admiralty on June 8th, in which he stated that "during the period of the war nothing short of an ample scheme of dilution would meet naval requirements and secure national safety." He expressed his appreciation of the loyal way in which the skilled men on the Clyde had assisted dilution in the engineering shops, and did not doubt that those engaged on national work in the shipyards would follow their patriotic example. An important agreement on the matter has been reached between the Commission on the Dilution of Labour and the Clyde and West of Scotland District Committee of the Boilermakers' and Iron and Steel Shipbuilders' Society. We quote from the *Times* the terms of this agreement:—

1. Co-operative efforts to increase production by the adoption of all expedients which tend to increase and maintain output.
2. Interchangeability inside the boilermakers' and iron and steel shipbuilders' trade of the various classes of persons who are members of that trade, and with that purpose in view the suspension for the period of the war of all internal lines of demarcation.
3. The utilisation to the best advantage of existing skilled men, or skilled men interchanged, and the use, as far as practicable, of pneumatic, hydraulic, and electric tools.
4. The upgrading in the boilermakers' and iron and steel shipbuilders' trade of workmen to do more skilled work wherever the nature of the work and the qualifications of the men make such procedure practicable.
5. The introduction into the boilermakers' and iron and steel shipbuilders' trade of (a) skilled men from allied trades; (b) skilled men from other trades; (c) unskilled men and women in all cases where the work is of such a character, or the conditions such, as to enable the labour introduced to perform the work with reasonable efficiency.
6. The relaxation of the existing demarcation restrictions, or the admission of semi-skilled or female labour not to affect adversely the rates customarily paid for the job. In cases where men who ordinarily do the work are adversely affected thereby, the necessary readjustments shall be made, so that they can maintain their previous earnings.
7. A record of the nature of the departure from the conditions prevailing when the establishment became a controlled establishment to be kept.
8. Due notice to be given to the workmen concerned, wherever practicable, of any changes in the working conditions which it is desired to introduce as the result of the establishment becoming a controlled establishment, and opportunity for local consultation with workmen or their representatives to be given, if desired.

(To be continued.)

Accident.—Mr. J. McClenaghan, electrical engineer, Portstewart, was rather badly injured while motor-cycling. He collided with a horse and lorry, and the animal fell on his machine.

LEGAL.

MUNITION CASE.

THE Oldham Munitions Tribunal last week refused an application for a leaving certificate made by an employé of an electrical instrument manufacturing firm, who pleaded ill-health and declared that the fumes from a soldering-pot in the works affected him. The case had been adjourned for medical examination, and the doctor reported that the applicant was suffering from slight bronchitis and slight nasal catarrh, and that there was nothing in the place where he worked that was injurious to his health. On hearing the decision of the Tribunal, applicant said his parents insisted on his leaving the place and he took it he could do so if he "played" for six weeks. Mr. J. Hodgson (President) said that it was not for the Court to advise applicant what to do. The manager of the firm asked that the case should come under Sec. 22 of the Act in regard to the doctor's costs in examining the works, and he contended that the applicant ought to pay the doctor's costs because the proceedings, he alleged, were vexatious and frivolous. The allegations as to the working conditions had been proved unfounded. Mr. Hodgson said he did not think the proceedings were vexatious or frivolous; there was no application by the complainant for the doctor to examine the works, and he (Mr. Hodgson) did not think Sec. 22 applied here.

INJUNCTION AGAINST AN IRISH ELECTRICAL CO.

IN the Irish Chancery Division, before the Master of the Rolls, a consent was received and made a rule of Court in an action by Mary E. Ewing against the Irish Towns Electric Light and Power Co., Ltd., defendants agreeing to an injunction restraining them and their servants and agents and workmen from using or working on their premises at Newcastle, Co. Down, any gas engine or machinery in such a manner as, by reason of vibration or otherwise, to injure plaintiff's dwelling-house and premises at Slieve Dhu, Newcastle, or from interfering with or annoying her.

BUSINESS NOTES.

Board of Trade Inquiry.—The Board of Trade Commercial Intelligence Branch in London has the name and address of a Calcutta firm which desires to communicate with British manufacturers of electrical fittings, such as cut-glass chandeliers, &c.

Monometer Furnaces.—We have received a lengthy list of orders recently received by the MONOMETER MANUFACTURING CO., LTD., of Aston, Birmingham, for their specialities. These include contracts for a number of well-known electrical manufacturing firms and many industrial works of other classes in this country. Monometer aluminium melting furnaces are being exported to Italy and other types by the same firm to Australia and the United States. The Monometer tilting furnace is now constructed for coke firing as well as for oil and gas.

Electricity in Collieries.—Mr. A. F. Pease, presiding at the annual meeting of Messrs. Pease & Partners, Ltd., at Darlington last week, said that the firm had been extremely fortunate in getting nearly all their electrical schemes completed before the war, and it had meant a large saving in labour in their collieries and mines in these difficult times, and left them with a larger amount of coal at the collieries to dispose of.

Patent Applications.—As announced in our advertisement pages, Mr. C. B. Kersting has applied for permission to amend Patent No. 22,549, of 1914, for "Improvements in inter-communication telephone systems."

Messrs. A. G. Hopper, J. E. Hopper Greenwood, and K. Anderson have applied for restoration of Letters Patent No. 25,363, of 1907, granted to A. Greenwood and K. Anderson.

British Trade with Italy.—The British Chamber of Commerce for Italy (Inc.), whose registered London office is at Oxford Court, Cannon Street, E.C., has issued particulars of membership in the Chamber. An official notice from Italy states that the new headquarters of the Chamber at 7, Via Carlo Felice, Genoa, with exhibition show-cases, are now ready. They are centrally situated near the principal business buildings, and in the showrooms will be displayed a sample exhibition of British goods suitable for import into Italy. Communications respecting terms for space, &c., should be addressed to Mr. E. B. Weatherhead, the secretary-general, at the above address at Genoa. The Chamber has branches in Milan, Tuscany, Rome and Naples.

Catalogues and Lists.—ALLIES ELECTRIC LAMP REPAIRING CO., LTD., Montgomery Street, Hammersmith, London. —Folder giving particulars and prices of 'old lamps made into new' by their regenerating process.

THE GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, London, E.C.—A showcard measuring 17 in. by 22 in., attractively designed and executed in 11 colours, has been issued for the purpose of assisting the popularisation of "Magnet" electric fires. Afternoon tea is the subject of the picture.

Book Notices.—"Discovery ; or, the Spirit and Service of Science." By R. A. Gregory. London : Macmillan & Co. Price 5s. net.

"Proceedings of the Physical Society of London." Vol. XXVIII. Part IV. June 15th, 1916. London : The Electrician P. and P. Co., Ltd. Price 4s. net.

Manchester Steam Users' Association.—The annual report of the Committee of Management shows that in 1915 there were 2,089 members, and 10,793 boilers under inspection, and the revenue was £22,642—record figures. The year was the busiest the Association had ever experienced, 22,297 examinations being made.

Meter Approved.—The Board of Trade has approved of the Westinghouse single-phase watt-hour meter, type K, deposited in March, 1915, by the British Westinghouse Electric and Manufacturing Co., Ltd.

Disolutions and Liquidations.—MARINE SMOKE-LESS MECHANICAL STOKER CO., LTD.—This company is winding up voluntarily with Mr. T. W. Gilbert, Blomfield House, London Wall, E.C., as liquidator.

EBURY ELECTRICAL ENGINEERING CO. AND EBURY GARAGE, automobile and electrical engineers and lighting equipment experts, 80, Ebury Mews, Victoria, S.W.—Messrs. R. Ormes, H. K. Gossip and H. Jones, have dissolved partnership, Mr. Gossip retiring. Debts, &c., will be attended to by the other gentlemen named, who will continue the business.

STELLAR SIGNS, LTD.—A meeting is called for July 18th, at 11, Pancras Lane, E.C., to hear an account of the winding up from the liquidators, Messrs. A. C. Hutchins and V. G. Morris.

COLSTON ELECTRICAL WORKS, LTD., Bristol.—First meetings of creditors and contributories, June 28th, at 26, Baldwin Street, Bristol.

Bankruptcy Proceedings.—J. BOULT and J. H. BOLT, electricians, Liverpool ; also JOHN BOULT, separate estate.—July 5th is the last day for the receipt of proofs for dividend. Trustee : Mr. P. S. Booth, 2, Bixteth Street, Liverpool.

JAMES BROCKIE, mechanical engineer, Forest Hill.—July 3rd is the last day for receipt of proofs for dividend, by the Hon. W. J. H. Boyle, 132, York Road, Westminster Bridge Road, S.E., the trustee.

Trade Announcements.—MESSRS. DONNISON, SILLEM AND CO. have decided to close the business of general and electrical engineers and contractors which they have been carrying on at 116, Great Portland Street, W., for the past 20 years. Mr. Donnison has entered into a working arrangement with Messrs. Girdlestone & Co., electrical engineers, of 23, Davies Street, Berkeley Square, W., and he will continue to give his personal attention to orders. Mr. Sillem is retiring from the business.

The style of the firm of E. Keston, Heap & Co., Ltd., Manchester, has been altered to *Erskine, Heap & Co., Ltd.*

LIGHTING AND POWER NOTES.

Aberdeen.—PLANT EXTENSION.—The Corporation Electricity Committee has considered the matter of the extension of the generating plant, together with a supplementary report from Mr. Bell, the engineer, and has instructed Mr. Bell to obtain tenders.

Aylesbury.—PRICE INCREASE.—The U.D.C. has arranged to supply electricity to the Dominion Dairy Co. at 1½d. per unit up to 20,000 per quarter, and 1½d. per unit beyond. The existing rates of charging for lighting and power have been increased by 10 per cent.

Ballymoney.—PUBLIC LIGHTING.—The Council has considered the question of lighting the town by electricity, and has instructed the clerk to inquire of the L.G.B. with regard to the powers possessed by the Council for raising money by loan.

Boothstown.—Electric power, generated on the spot, is now being utilised to drive the machinery at Lord Ellesmere's Mosley Common Collieries, Boothstown, near Manchester. These collieries are amongst the largest and deepest in England, and employ 1,800 men and youths.

Bournemouth.—The Electricity Supply Co., in view of the fact that the Council has not been able, owing to lighting restrictions, to take the minimum quantity of energy specified in the contract, offered to make an allowance of ½d. per unit upon the balance of the minimum consumption ; the Council has accepted the proposal.

Burton-on-Trent.—YEAR'S WORKING.—The report of the year's working of the electricity department shows a total ordinary income of £20,310, and works expenditure £9,542. The profit-sharing bonus amounted to £228, leaving a gross profit of £10,540. After meeting loan and other charges, the surplus remaining was £1,938, as compared with £2,566 last year. The surplus has been allocated as follows :—£1,306 to meet capital expenditure on transformers, mains, and services ; in lieu of borrowing : £520 for depreciation of Console, and the balance of £110 was carried to the renewals fund. The total capital

expended, including £2,616 during the year, was £127,389, of which £14,943 had been provided out of revenue. The total number of units sold was 3,499,388, as compared with 2,914,828 in 1915, an increase of 581,510. The principal increase was in sales for power and heating. The H.P. of motors connected increased by 357 during the year, the total being 3,360 H.P. The total costs decreased from 0'686d. per unit to 0'658d. ; the installation of the new turbo-generator was mainly responsible for the reduction. The maximum load of 1,751 kW. was recorded on December 9th, 1915, representing an increase of 131 kW. on last year.—*Burton Daily Mail*.

Chester.—YEAR'S WORKING.—The report of the City electrical engineer, Mr. S. E. Britton, for the past year shows that the electricity department made a gross profit of £12,370 and a net profit of £2,956 as compared with £12,483 and £3,194 respectively in 1915. These figures embody the results of the steam and the hydro works.

During the 12 months 1,567,300 units were generated by water-power, of which 16,062 were used for pumping sewage, 1,600 were used for lighting the works, 42,310 for excitation and feeder booster, 128,122 in the distribution cables, and 1,379,206 were sold to consumers. The cost of operating these works and producing the above quantity of electrical energy was as follows :—

Oil and stores	£28
Wages	242
Repairs and maintenance	64
Rent	100
Rates and taxes and insurance	138

Total works charges £572 i.e., 0'995d. per unit sold.

The capital charges were :—

Interest on loans	£490
Sinking fund charges	524

Total capital charges £1,014 i.e., 1'765d. per unit sold.

The total cost was 2'76d. per unit sold—a remarkable result, which should give great satisfaction to Mr. Britton and his Committee.

The total output was 3,467,328 units, of which private consumers took 1,076,523 and bulk supply took 917,117 ; the tramways purchased 391,329, and public lighting (946 inc. lamps) consumed 283,089, making a total of 2,668,058 units sold, compared with 2,535,600 in the previous year. Including the whole of the plant, the average works' costs came to 0'583d. per unit sold, and the total costs to 0'877d. Coal alone cost 0'285d. per unit sold, and as only half the output was generated by steam, it would seem that the cost of coal for the steam units was about twice as much as the total cost, including capital charges, of the water units.

Dover.—YEAR'S WORKING.—The report of the Corporation electricity department for the year ended March 31st last shows that 1,572,604 units were sold, an increase of 53,947 on the previous year. The total expenditure on capital account to date was £192,184, including £3,814 on mains extensions for Government use and £277 on new works. The total receipts for the year were £23,586, £21,560 being for electricity supplied. Working costs amounted to £13,572, leaving a gross profit of £10,013. Interest on capital amounted to £7,593, and contributions to sinking fund to £4,174, making a total of £11,767. There was a net loss on the year's working of £1,751, which has been taken from the surplus of £3,080 brought forward from last year.—*Dover Express*.

Farnworth.—Electrical plant is to be put down in place of gas power in the Piggett Street spinning mill, Farnworth, belonging to Messrs. Hollas & Farnworth.

Gillingham (Kent).—TAR OIL.—Owing to the high price of fuel oil (£8 16s. 3d. per ton), the T.C. has referred to a Committee the question of using tar oil at the electricity works, the cost being 80s. per ton, and the efficiency 10 per cent. less than with ordinary fuel oil. About 500 tons per year are used, and with the use of tar oil there would be a yearly saving of £2,200, while the cost of the necessary apparatus for the two engines would be £515.

Great Harwood.—The B. of T. has granted the U.D.C. an extension of the Electric Lighting Order to August 7th, 1917.

Greenock.—LOAN SANCTION.—The Secretary for Scotland has agreed to grant borrowing powers in connection with the Corporation's electricity extension scheme for the full sum of £45,000, instead of £35,000 sanctioned previously. Repayment is to be spread over 25 years. Sanction is given subject to the condition that the whole surplus revenue of the undertaking, after meeting working expenses, depreciation, and debt charges, is transferred annually to the reserve fund, until that fund has reached its maximum. Immediate steps will be taken to proceed with the work involved in the scheme.

Heywood.—YEAR'S WORKING.—The working of the electricity department for the year ended March 31st, 1916, has resulted in a loss of £1,052, including £112 for obsolete plant, disallowed by the L.G.B.

The Roeacre Dyeing and Felting Co., Ltd., has asked for a supply of electricity, and the electrical engineer is to report to the Committee on the matter.

Kilmarnock.—In view of questions that have been raised from time to time regarding the administration of the electricity department, the T.C. has decided to ask Sir Alex. Kennedy to make a general survey and report on the position of the electricity works, and to retain him as consulting electrical engineer for the burgh.

Kingswinford.—PUBLIC LIGHTING.—The R.D.C. has arranged with the Midland Electric Corporation for the public lighting account from January 1st to June 10th, amounting to £550, to be reduced by £150, on account of restricted lighting, on condition that the contract is renewed for three years at the old rate, only lamps actually lighted during the war period to be paid for.

London.—PRICE INCREASE.—The Charing Cross, West End and City Electricity Supply Co., Ltd., announces that, owing to the refusal of the B. of T. to allow the company to increase the charges for electricity by 10 per cent., it has decided to fall back on the powers conferred upon it by the Act of Parliament and the City of London Electric Lighting Order, 1899. The new charges for lighting, which are to come into force at the end of June, are:—Each quarter 6d. per unit for the first three units consumed per 30 watts of connected demand; each quarter 4d. per unit for the next 8 units consumed per 30 watts of connected demand. All units in excess will be charged for at 2d. per unit.—*City Press.*

Middlesbro'.—YEAR'S WORKING.—The report of the electrical engineer, Mr. R. H. Sootson, for the past year shows revenue £25,087, as compared with £25,365 the previous year, and expenditure £14,419 (727d. per unit) as against £14,372 (985d. per unit). The gross profit for the year was £10,668, as compared with £10,994, and the net profit £3,325, as against £3,978. The number of consumers was 2,147, as compared with 2,001, and the average price per unit sold was 1'47d., as against 1'74d. the previous year. Certain alterations he suggested a year ago had been carried out with results more satisfactory than was expected. They had sold over 550,000 more units than in the previous year, yet the combined cost was only £14 more, whereas if this extra current had been generated under the old arrangement it would have cost at least £1,150. They had saved on generation alone £1,136, in addition to the wages of six men, whom it had been possible to dispense with.

The revenue had been adversely affected amongst other things by reduction in private lighting of £2,442, public lighting of £135, and market lighting of £13. The total reduction of £3,423 was entirely due to the war, but had been met by increased revenue from power of £2,241, and a saving on wages of £529, leaving a reduction in the net profit of £653.

Newcastle-under-Lyme.—The T.C. has decided that in future a minimum charge of 5s. per quarter shall be made for electricity services.

Newfoundland.—The Imperial Trade Correspondent at St. Johns (Mr. H. W. Le Mesurier) reports the passing of an Act to incorporate the Union Electric Light and Power Co., and for other purposes. The capital of this company will be about £20,550, and it is authorised to install an electric light and power system and operate electric tramways in the towns of Trinity, Catalina, Bonavista, &c. The company is also granted the exclusive right to use the waters of several lakes and streams.—*Board of Trade Journal.*

Oxford.—PRICE INCREASE.—The Oxford Electric Co., Ltd., announces that after the reading of the meters for the June quarter there will be an increase of 20 per cent. on the present charges for electricity.

Paisley.—SWITCHBOARD FIRE.—Owing to a breakdown at the electricity station, Blackhall, recently, the supply was for a time seriously impaired. It was found that the high-pressure switchboard had caught fire, and six hours elapsed before repairs could be executed.

Shropshire.—The *London Gazette* for June 16th contains a notice of the application of the Shropshire, Worcestershire and Staffordshire Electric Power Co. for Parliamentary sanction to amending their borrowing and other powers.

Swansea.—Mains are to be extended to Prince of Wales Road, at a cost of £250. The B. of T.'s letter re the interconnection of supply undertakings, in order to effect saving in coal, has been referred to the chairman and vice-chairman of the Electricity Committee, together with the engineer, with a view to the proposals being extended, in a similar manner to the Corporation's arrangement with the tramway company, to other large independent consumers of electricity.

Slaithwaite.—The B. of T. has extended the U.D.C.'s electric lighting order for one year.

Sweden.—A new company has lately been formed at Alfdalen, with a capital of £50,000, and the title Alfdalens Elektricitetsverk Aktiebolag, to acquire the rights to certain waterfalls in the district, and to establish electricity generating plants to utilise the same.

Tasmania.—NEW UNDERTAKING.—The inauguration of the Wynyard (Tas.) municipal electric light undertaking took place recently; the generating plant at present installed consists of an 84-h.p. Hornsby suction gas engine driving a 45-kw. D.C. 460-volt three-wire dynamo with static balancer. The storage battery of the Chloride type consists of 256 cells of 460 ampere-hours capacity. There are 50 street lights, 12 of 100 c.p. and 8 of 500 c.p. The scheme has started under very satisfactory conditions as to load;

150 houses were wired and connected, with 40 waiting to be completed, making 190 connected to the plant in the first six weeks of operation. The motor load is also large, and is steadily increasing. The Council's engineer is Mr. A. L. Kerr, to whom is largely due the successful loading of the plant.—*Commonwealth Engineer.*

Tottington (Lanes.).—The D.C. has granted an application made by the Lanes, E.P. Co., to cross Harwood and Bradshaw Roads with their overhead mains.

Walkden.—Amongst the latest cotton mills (weaving and doubling) in Walkden to adopt additional electrical installations are Mr. W. A. Rothwell's Primrose Mill and Messrs. Faulkner's Granville Mill. Further developments in this direction are expected at Messrs. Burgess, Ledward & Co.'s Wardley Mills.

Walsall.—YEAR'S WORKING.—The total expenditure on revenue account of the electricity undertaking during the twelve months ended March 31st last was £4,496 more than in the preceding year, the respective figures being £18,789 and £14,293. The increased cost of generation contributed largely to this increase, the total for the year under review being £11,699 as against £7,920, or an increase of £3,778. £22,026 was received from the sale of energy for lighting, power and bulk supply, £6,726 from sale of energy for tramways, and £553 from public lighting, making, with minor items, total receipts £29,573, or 1'84d. per unit sold, compared with £25,879 in 1915. The balance of £10,781 is carried to net revenue account. From this has to be deducted interest on loans and stock (£1,936) and contributions to sinking funds (£6,747), leaving a deficit on the year's working of £899. The Town Council is recommended to defray this loss out of the reserve fund.

The rotary converter on order for the Darwall Street sub-station is being taken over by the Minister of Munitions, on condition that it will be replaced without any cost to the Corporation. The Electricity Committee proposes to extend the mains to the works of Messrs. Craddock & Sons, at Wisemore.

Walton.—It was reported at last week's meeting of the U.D.C. that the B. of T. had considered the application of the Urban Electric Supply Co. to be allowed to discontinue the maximum demand, with the result that the Board's representative intimated that he would recommend the Board not to accede to the application for a minimum charge asked for by the company—viz., 11s. 7d. per quarter—and that he would recommend that the maximum charge should be increased to 7d. per unit.

Wolverhampton.—PLANT EXTENSIONS.—The Electricity Committee of the Corporation has decided to make application to the L.G.B. for permission to borrow £31,240, being £53,900 for the extensions contained in the electrical engineer's report of February 21st, 1916, less £19,660 for which borrowing powers had been already asked. The Finance Committee has been authorised to borrow the money, and, if necessary, to raise Wolverhampton Corporation stock for the purpose.

TRAMWAY and RAILWAY NOTES.

Ashton-under-Lyne.—TRAMWAY PURCHASE.—The T.C. has adopted a recommendation of the Tramways Committee that a Bill be promoted in Parliament to obtain powers to enable the Corporation to acquire the tramways of the Oldham, Ashton, and Hyde Electric Tramways, Ltd., within the areas of Waterlow and Bardeley.

Australia.—The report of the Deputy Chief Commissioner on the working of the N.S.W. Government tramways for the quarter ended March 31st, 1916, shows revenue £514,661, an increase of £10,178; expenditure, £378,560, an increase of £5,773; and number of passengers carried, 75,537,540, an increase of 2,141,640.

During April two electrical tramway services were opened in Melbourne and its suburbs. The first is that from Princes Bridge, Melbourne, to Hawthorn and Burwood, the total cost of which, when completed, will be approximately £320,000; electricity is purchased in bulk from the Melbourne Electric Supply Co. The second opened was the Coburg section, about two miles of the Melbourne, Brunswick and Coburg tramways.—*Commonwealth Engineer.*

Colchester.—YEAR'S WORKING.—The annual report of the Corporation tramways for the year ended March 31st last shows total revenue £15,741, an increase of £1,919 over the previous year. The gross profit on the year's working is £5,043; after payment of interest on capital £1,853, allowances to men with the Forces £187, and sinking fund charges £2,590, there is a net profit of £440, compared with a loss last year of £402. The total amount appropriated from revenue for repayment of loans since the commencement of working is now £24,619. The total revenue per car-mile was 11'4d. as compared with 9'9d. in 1915; and total working expenses per car-mile were 7'73d. as against 6'90d.

Croydon.—TRAMWAY STRIKE.—The South Metropolitan Tramways Co., which has had a dispute with its employees, has concluded an agreement which is to be retrospective to the beginning of May, and to continue till 1919, the terms and conditions being similar to those obtaining under the L.C.C. The strike of the Croydon tramway employees still continues.

Glasgow.—**WAGES DEMAND.**—The motormen and conductors (male and female) in the employment of the T.C., to the number of 3,100, have applied for an increase of 6s. per week on their present scale of wages, on the ground of increased cost of living. Since the war started, all motormen and conductors have received an increase of 2s. weekly, and in addition a bonus of 2s. was paid to men whose wages were under 30s. weekly. The general manager is to report on the application, and it has been pointed out that the increase, if granted, would represent a weekly payment of £930, or an annual additional expenditure of £48,500, which would not only wipe out the surplus of £43,548 handed to the Common Good as a result of last year's working, but would leave a deficit of nearly £5,000.

Replying to a request by the Springburn Ward Committee, the Tramways Committee of the T.C. has informed the applicants that, in view of the difficulties under which the day service of cars is at present maintained, it is impossible for the department in the meantime to accede to a suggestion for establishing a half-hourly all-night service on the principal car routes in the city.

YEARS WORKING.—The report of the tramway department shows traffic and sundry receipts for the financial year to the end of May at £1,137,336, as compared with £1,076,877. The expenditure is £773,442, including a sum of £80,437 for expenses on account of the European War. For renewal and depreciation the amount set apart is £174,407, and the surplus paid to Common Good is £43,548, as compared with £12,951 last year.

Leigh.—Owing to the rapid opening-out of new coal-fields in the Astley district, local authorities are to approach the South Lancashire Tramways Co. to press for the construction of tramways from Leigh through Astley to Boothstown.

London and South-Western Electrification.—On Sunday last, trains started running on the Waterloo to Hampton Court section of the L. & S.W. Railway. This is the fifth section of the line to be electrified; only two sections, both running to Guildford, now remain to be completed. On the East Putney-Wimbledon route electric trains commenced running on October 25th last year, on the Kingston roundabout route and the Shepperton branch on June 30th, and on the Hounslow loop on March 12th. There will be trains every 20 minutes on the Waterloo-Hampton Court section.

Manchester.—The tramway department on Monday commenced an experimental half-hourly motor-bus service from West Point, Slade Lane, car terminus to the Palatine Road car terminus.

Southend-on-Sea.—**WAR ECONOMIES.**—The Committee appointed by the Corporation to consider the question of effecting economies in public expenditure has considered the possibility of saving money by reducing the tramway service in any particular way, but is of opinion that this step would be inadvisable, both from the point of view of public service and that of economy, as the capital charges in respect of the service would continue whether the cars were in use or not. Regarding the staff at present engaged for the maintenance of the service, the Committee recommends the Corporation to dispense with the services of the traffic superintendent.

Walsall.—The Corporation Tramways Committee proposes to purchase three additional single-deck motor omnibuses, at a total cost of £3,187.

TELEGRAPH and TELEPHONE NOTES.

Australia.—According to the *Melbourne Age*, the Federal Arbitration Court commenced the hearing of the claim filed by the Australian Post and Telegraph Officers' Association against the Commonwealth Public Service Commissioner and Postmaster-General on April 27th. Claims were made for increased salaries for telegraph engineers and telegraphists, reduction of hours of duty, &c.

Holland.—It is reported that several private wireless installations have been seized at The Hague and confiscated by the authorities. The owners will be prosecuted.

Italy.—The automatic telephone exchange for 2,000 subscribers, installed at Rome some two years ago, has given such satisfaction to the Technical Commission supervising its installation and working that a proposal has been introduced into the Italian Parliament to replace all the existing manual exchanges by automatic exchanges. The example of the capital will, it is believed, induce the choice of that system for all future telephone installations throughout Italy.

New Cable.—A triple convention between Russia, China, and Autonomous Outer Mongolia, regarding a telegraphic cable to Outer Mongolia, has been published in Petrograd.

Post Office.—The Postmaster-General was to open the new head office of the London District Post Office Engineering Department, near London Bridge, yesterday.

Permanent male part-time London night telephonists, who have been employed for two years or more, have been granted 3s. a week increase, retrospective to February, 1914. These men now receive 18s., with 7s. a week war bonus, for 18 hours a week.

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—U.D.C. Cable. See "Official Notices" to-day.

Aberdeen.—July 7th. Corporation. One 5,000-kw. turbo-alternator with surface condenser and auxiliaries, for the Electricity Department. See "Official Notices" to-day.

Australia.—PERTH.—July 19th. P.M.G. Supply of insulators (Schedule 510). See "Official Notices" June 9th. August 16th. P.M.G. Distilling apparatus (Schedule 502), telegraph and measuring instruments (Schedule 498). See "Official Notices" June 16th.

MELBOURNE.—July 26th. Victorian Railway Commissioners. 400 signal lighting transformers.*

SYDNEY.—August 17th. Portable internal-combustion engine and dynamo (2½ kw.) for the Departmental Stores, Sydney, for P.M.G.*

August 24th. P.M.G. Automatic switchboard and apparatus for North Sydney Exchange. Schedule No. 511.*

BRISBANE.—July 31st. P.M.G. Power board and accumulators. Schedule No. 381.

Exminster.—June 29th. Electrical appliances for a year, for Devon County Lunatic Asylum. Mr. C. Masters, Clerk.

Liverpool.—June 26th. Electrical supplies to Toxteth Park B. of G. for three months. Mr. R. A. James, Clerk, 15, High Park Street.

Malvern.—Urban Council. Compressor for the electricity works. The Manager.

New Zealand.—[INVERCARGILL.—September 28th. Borough Council. Steam turbo-alternator, condensing plant, and switchgear. Specifications from the Tramway Office.

Rotherham.—July 3rd. Corporation. Twelve months' supply of tramway stores and materials, coal, cable, meters, &c. See "Official Notices" June 16th.

Salford.—June 26th. Corporation. Coal conveyors and bunkers, for the Electricity Department. See "Official Notices" June 16th.

Corporation Tramways. Manganese-steel crossings and steel tramway poles. General Manager, 32, Blackfriars Street.

Spain.—July 4th. Spanish Post and Telegraph authorities in Barcelona. Erection of an interurban telephone line between Igualada, Santa Coloma and Vallfogona, in the Province of Barcelona.

Warrington.—June 27th. (1) Coal elevator; (2) vertical steam boiler feed pump. Specifications, &c. (£1 ls. each, returnable), from Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Accrington.—Electric lighting of Christ Church: Contract let to Messrs. Simpson, of Hapton.

Aylesbury.—U.D.C. Extension of battery at the electricity works: Chloride Co.

Bristol.—Electricity Committee. Contracts with the East Bristol Collieries, Ltd. (value £12,561), for coal to 30th September.

Glasgow.—The Tramways Committee recommends the following for acceptance:—

Scrap trolley wire, copper and mica turnings, scrap lead, scrap lead-covered cables.—MacKinlay, Ltd.
Scrap armature coils, scrap brass, bare stranded cables, D.C.C. copper wire, turnings and borings, scrap rubber and cables, d.m. cells.—R. M. Easdale & Co.
Wall plug-sockets, &c.—W. C. Yule & Co.

The Electricity Committee has accepted the offer (£250) of Messrs. Waygood, Otis & Co. for a hoist for the showrooms in Sauchiehall Street.

Electricity Committee. Recommended tender:—

Babcock & Wilcox, Ltd. Four sets of water-tube boilers for St. Andrew's Cross, £10,832.

Government Contracts.—List of new contracts for May, 1916:—

WAR OFFICE.

Electric cables and wire. B.L. & Helsby Cables, Ltd.; Connolly Bros., Ltd.; W. T. Glover & Co., Ltd.; Hooper's Telegraph & India-Rubber Works, Ltd.; St. Helens Cable & Rubber Co., Ltd.
Conduits and fittings. Simplex Conduits, Ltd.
Electric rod. L.L. G.P. & Telegraph Works Co., Ltd.; Peckham Telephone Works, Ltd.
Generating sets. Brownell, Landley & Co., Ltd.; Coventry Simplex Engines, Ltd.; W. H. Dorman & Co., Norris, Healy & Gardner, Ltd.
Cuttie-percha sheets. Cragg & Electric Cable Co., Ltd.
Electric lamps. British Thomson-Houston Co., Ltd.; Craydon, Ltd.
Works services. Electric light installation at Crumlington. Robson and Coleman. Electric light installation at Lilbourne. G. Weston & Sons.
Electric light installation at London Colney. Tredgers, Ltd.
Machinery and plant for power house, Milton. R. Garrett & Sons, Ltd.; British Westinghouse Electric & Mfg. Co., Ltd.; D.P. Battery Co., Ltd.

INDIA OFFICE STORE DEPARTMENT.

Cable. Callender's Cable & Construction Co., Ltd.; W. T. Glover and Co., Ltd.
Plates. Chloride Electrical Storage Co., Ltd.

POST OFFICE.

Telegraph apparatus. Siemens Bros. & Co., Ltd.
Telephone cables. New Gutta-Percha Co., Ltd.; Siemens Bros. & Co., Ltd.; Western Electric Co., Ltd.
Porous cells. I.R. G.P. & Telegraph Works Co., Ltd.
Installations. J. Bourne & Sons, Buller's, Ltd.; Boulton & Co., Ltd.; J. Macintyre & Co., Ltd.; Taylor, Tinsell & Co., Ltd.
Telegraph ironwork. Bayless, Jones & Bayless, Ltd.; Bullers, Ltd.; T. W. Lench, Ltd.; Portland Bolt & Nut Co., Ltd.
Brace-ware. B.L. & Helsby Cables, Ltd.; F. South & Co., incorporated in the London Electric Wire Co. & Smiths, Ltd.
Armoured copper wire. B.L. & Helsby Cables, Ltd.
Tinned copper wire. B.L. & Helsby Cables, Ltd.
Galvanised-iron wire. Rylands Bros., Ltd.; Shropshire Iron Co.; F. South and Co., Wire Manufacturers, Ltd.

Wolverhampton.—Electricity Committee. Accepted tenders:—

H. Gough & Son.—Building extensions at the electricity works, Commercial Road, £3,620.
Stirling Boiler Co.—Two Stirling boilers and two superheaters, £6,406.
Underfoot Stokers.—Two sets of mechanical stokers, £1,907.
Crompton Co.—Electric motor, £137.
Holly Bank Coal Co., Ltd., and W. Harrison, Ltd.—Fuel for use at the electricity works in stated quantities and at stated prices according to specification.

The Committee has confirmed the action of the chairman and the electrical engineer in placing an order with Messrs. Willans and Robinson for one turbo-alternator with condensing and auxiliary plant for £19,000.

FORTHCOMING EVENTS.

Incorporated Municipal Electrical Association.—Friday, June 23rd. At the Institution of Electrical Engineers, Victoria Embankment, London, W.C. At 10 a.m., Council meeting; at 10.30 a.m., annual general meeting.
Association of Supervising Electricians.—Tuesday, June 27th. At 7.30 p.m. At St. Bride's Institute, Bride Lane, E.C. Annual general meeting.

NOTES.

Organisation of British Engineering Industry.—Mr. F. Dudley Docker, C.B., chairman of the Metropolitan Carriage, Wagon, & Finance Co., Ltd., has joined the Committee of the Council for the Organisation of British Engineering Industry.

Educational Books for British Prisoners of War.—Arrangements have been made, with the approval of the Foreign Office, for extending to British prisoners of war interned abroad the benefits of the scheme, which has been in operation for the last year in connection with Ruhleben, for supplying selected books of an educational character to those of the interned who may be desirous of continuing their studies in any subject. Under this scheme several thousands of carefully selected volumes, mostly standard works, have been supplied to the Ruhleben Camp, which is now provided with excellent libraries (class, reference, and lending). These books, which have been sent out through the agency of officers of the Board of Education, have proved a great boon to the interned, and have enabled sustained educational work of a definite character to be carried on by the Camp Education Department formed among the prisoners. In view of the value of the work, the Board of Trade (Marine Department) have decided to take it into account, in connection with their examinations for the certificates of competency granted by them to officers of the mercantile marine and the fishing service. Accordingly, arrangements have now been completed for recording the time spent by any prisoner interned at Ruhleben or Groningen in the study of nautical or other subjects.

An appeal is, therefore, now made for a plentiful supply of new or second-hand books of an educational character (light literature and fiction is available from other sources) to meet the needs of the many thousands of British prisoners interned in enemy or neutral countries. It is to be hoped that to this appeal there may be a liberal response. A circular explanatory of the educational book scheme can be obtained by sending a postcard addressed to Mr. A. T. Davies, at the Board of Education, Whitehall, S.W., who is in charge of the arrangements.

Electricity and Rainfall.—In a recent issue (May 27th) of the *Scientific American* there is an illustrated article on the anti-hailstorm guns in general use to-day in the south of France, principally in the wine-growing districts of Bordeaux, Bourgogne, and the Champagne. The gun was originally invented by an Austrian of the name of Sieger, in 1896. It is discharged vertically through a funnel against the storm cloud, the discharge producing a whirling vortex of air which, according to M. Vermoret, a French expert, brings about certain changes in the atmosphere. The condensation produced by the discharge—we are told—modifies the unstable electrical state of the clouds which form the seat of the hailstones so much feared by agriculturists, especially winegrowers. The American paper is evidently not satisfied with the explanation of the action of the anti-hailstorm "cannon," but states that "this odd artillery is serving its purpose very well." Another American paper, the *Amerikai Magyar Veszacska*, published, a short time ago, a letter, dated April 5th, from its Budapest correspondent, containing the news that M. Vozary, a Hungarian engineer, had been experimenting among the vineyards in the mountains round Buda with an electric apparatus, with the object of dissipating storm clouds. On two or three occasions the apparatus had failed, and rain fell copiously, but the inventor's explanation was that his apparatus was not powerful enough, and that the current was only placed at his disposal in the day time. In scientific circles the invention is treated very much in the same way as was the anti-hailstorm gun at the outset, but the correspondent understands that the Ministry of Agriculture is inclined to have M. Vozary's electric apparatus examined and reported on by experts.

It is somewhat singular that while Mr. Balsillie, with the assistance of the Australian Government, is making experiments with a view to inducing the fall of rain by electrical means, the Hungarian scientist is trying to prevent it by the same agency. From what is known regarding the phenomena, it would appear far more probable—or less improbable—that electrical discharges would precipitate moisture than the contrary, and therefore Mr. Balsillie's chances of success seem the more favourable.

Germany's Lack of Saltpetre.—The *Munchener Neueste Nachrichten*, in discussing a project of a Munich engineer, Herr Hallinger, for the utilisation of water powers with little fall for the production of electricity, makes some valuable admissions as regards the lack of saltpetre, for the manufacture of which the new scheme is especially intended. It says that the imports of saltpetre to Germany amounted to 774,000 tons in 1913, of which no less than 700,000 were used in agriculture. During the war large Government works had been started to ensure the supply of saltpetre for military purposes, but the supply for agriculture was cut off altogether as regarded Chile, and from Norway only 60,000 tons could be imported. According to agricultural statistics, soil fertilised with saltpetre produces four times the yield that it does without it. If this is correct, the coming harvest must fall by 2 to 3 million tons below the previous annual average. The scheme of Herr Hallinger is, therefore, to be taken in hand immediately, and will be discussed shortly in the Bavarian Landtag. The Bavarian Government itself is meanwhile making preliminary investigations as to the water power that may be available in Bavaria. According to Herr Hallinger, it would take one-and-a-half to two years to carry out his plans.—*Financial Times*.

Steel Shortage in Australia.—According to a Sydney newspaper, representatives of unions whose members are engaged in the iron and steel industry waited on the Assistant Minister for Defence (Senator Gardiner) at the end of April, and pointed out that the shortage of materials in the industry was causing much unemployment. They urged that action should be taken by the Federal Ministry to provide supplies. Mr. Thompson Green (South Australia), said that the shortage of material was causing grave concern to both employers and employés. Unless something were done in the near future, there would be a general stoppage of the works. Prices had risen from 80 to 100 per cent. since the outbreak of war, and were still rising. Shipping was controlled by the Federal Ministry, and arrangements should be made so that ships coming to Australia to take wheat cargoes should bring out materials needed for manufactures. Mr. R. O'Halloran, representing the Victorian Boilermakers' Union, said that if something were not done to relieve the situation something like 2,000 men would be thrown out of employment.

A short time ago the Prime Minister of Australia (Mr. Hughes) introduced a deputation of zinc producers in Australia to the Secretary of State for the Colonies, Mr. Bonar Law, to lay definite proposals before the Government. The deputation owned and controlled all the zinc ores produced in Australia. The scheme was Imperial in its scope and objects, and at the same time rested on sound business lines. It covered a proposal for the erection of smelting works in Britain, and involved the exclusion of German spelter after the war. The scheme, as ready for adoption, provided for preferential treatment of the Empire's products, but also allotted a fair share of raw materials to France and Belgium.

Swedish Export Prohibitions.—The Swedish Chamber of Commerce for the United Kingdom, London, has received a cable from the Swedish Board of Trade, Stockholm, to the effect that the following articles have been added to the list of goods which are now prohibited for exportation from and for transit through Sweden:—Electrical safety appliances, box current regulators, with coverings or inner parts of other metal than iron; mountings for incandescent lamps, with coverings or inner parts of other metal than iron.—*Morning Post*.

Contact Resistance of Metal Electrodes.—In a paper on this subject, read before the American Electrochemical Society, Mr. N. K. Chaney refers to the high "contact resistance" which, under certain conditions, exists between the surface of an electrode of sheet zinc and the electrolyte. This "contact resistance" between zinc and an electrolyte of zinc chloride and ammonium chloride is a secondary development occurring with measurable rapidity after the immersion of the zinc in the electrolyte. At the instant of immersion it is very small. It may rise to values of from 200 to 400 ohms per square inch of electrode surface. It forms the principal part of the internal resistance of dry cells at low current values, and as determined by measurements upon the latter it has a high temperature coefficient, decreasing to one-tenth of its value with a temperature rise of from 0° to 45° C. It is lessened or destroyed temporarily by current densities above certain low limiting values, but is practically unaffected by currents of less than 1 milliampere per 50 sq. in. of electrode surface, even if continued for a considerable time. With higher current densities it begins to decrease rapidly, and becomes negligible at current densities of about 1 ampere per 50 sq. in. On open circuit the resistance again slowly rises towards its initial value. It is destroyed or very greatly reduced by chemical treatment of the zinc surface, e.g., by corrosion with dilute sulphuric acid. An explanation of the high contact resistance observed is based upon the supposed existence of a hydrogen film upon the electrode surface, discharged there by local action between the zinc and the electrolyte. This is supported by a considerable amount of experimental evidence, in which it is shown that the predicted behaviour of such a hydrogen film under selected conditions is in agreement with the observed behaviour of the contact resistance.—*Met. and Chem. Engineering.*

Testing Rubber Insulation.—In testing rubber insulation according to the Underwriters' specifications, Mr. A. A. Ladon found that samples taken from the same coil showed marked variations in strength and elongation. Samples 5 in. long were rolled between two blocks of wood to loosen the insulation; the rubber could then be slipped off the wire. The insulating material was then tested for elongation, stretch, and tensile strength. The results varied as much as 100 per cent., and in only six coils out of 52 did the samples check.

The trouble did not lie in non-uniformity or deterioration of the rubber compound, as was at first supposed. The method of separating the wire from the insulation was at fault. No matter how carefully the samples were rolled between the two blocks, the insulation could not be removed intact. In places it would stick to the wire.

A new method was therefore devised for removing the insulation. The wire was of tinned copper. Tin amalgamates with mercury very easily and forms a very slippery surface on the copper. The mercury has no effect on the rubber compound. About $\frac{1}{4}$ in. of insulation was cut off each end of the samples, and the stripped wire was scraped to remove dirt and grease. The ends of the samples were then immersed in mercury. After a period of time, varying from four to 24 hours, the insulation could be slipped off the wire with almost no effort.

This method is being used by one of the largest electrical manufacturers in the country. Besides the accuracy and uniformity of results accompanying the application of this property of mercury, the cost of the testing has been reduced by over one-third.—*Met. and Chem. Engineering.*

Russian Electricity Tax.—On May 20th, with the Assistant Minister of Finance, A. I. Nikolaenko, in the chair, a sitting of the Committee of Indirect Taxes was held. The consideration of the project for taxing electricity was taken in detail. The most important decision of the Committee was the acceptance of the proposition of the representatives of the electrical industry, that the concern delivering electricity should be free of the obligation to submit to the inspection of the Excise a list of its subscribers using current. The payment of the Excise or tax will be made according to the quantity of energy delivered, and not according to the amounts paid by the clients. The Committee agreed to certain exemptions in various branches of the industry. It ruled out the projected right of the officials of the Excise to enter the premises of the subscribers at any hour of the day or night, and agreed to permit inspection by the Excise officers in private premises only during certain fixed hours of the day.

Niagara Electrochemical Works.—Unable to obtain a sufficient quantity of cheap electric power from the Niagara Falls generating companies, when millions of cubic feet of water are being wasted over the great cataract every 24 hours, the Union Carbide Co. of Niagara Falls, N.Y., has been forced to erect a \$2,000,000 branch plant at Sande, Norway. Construction work has already been started. The Norwegian factory will be known as the Electric Furnace Products Co.; it will be operated as a subsidiary of the Niagara Falls plant, and the products of the foreign company will be sold exclusively in the United States. The plant is expected to be in operation in less than two years.

Practically all the large Niagara Falls electrochemical industries are constructing extensive additions to their plants, and are continually increasing their demand for power. Probably the largest construction work now in progress is the plant of the Niagara Smelting Co. This new industry will be one of the largest users of electric energy along the Niagara frontier. Upwards of \$1,500,000 is being invested in the new plant.

The new plant of the Hooker Electrochemical Co., costing upwards of \$1,000,000, is rapidly nearing completion, and the Aluminium Co. of America has just awarded contracts for a large addition to its Falls plant. Other electrochemical industries are also making large extensions.—*Electrical World.*

Conductors and Flexible Cord in Russia.—Since October last year a scarcity of conductors and flexible cord for electrical installations has been felt in Russia, as the stocks that were in hand have become exhausted, and it has been found impossible to renew them under the existing conditions. Inability to obtain the necessary conductors and flexible cord for factories working for the national defence often brought about a difficult situation, particularly in the provinces, and this circumstance prompted the Electrotechnical Section of the Central Military Industrial Committee to call a special council of representatives of all the cable factories, in order to take measures for the purpose of remedying the trouble. The meeting took place on Friday, 8th/21st January, on the premises of the section, under the chairmanship of Prof. A. A. Veronoff, and considered the necessity of urging the Government to grant facilities for the delivery into Russia from abroad of a certain quantity of copper, rubber, and other necessary materials for the organisation in cable factories of the production of conductors and flexible cord for stock, provided that conductors and flexible cord should be delivered from store only to such concerns as were working for defence, and under a sufficient guarantee. For the coming half-year, according to the estimates of the Electrical Section, about 750 tons of copper will be required for Government purposes, the distribution of which and corresponding quantities of other materials necessary for the production of conductors and flexible cord, and also the control of the regular delivery of all these materials, it is proposed shall be entrusted to the Electrotechnical Section of the Central Military Industrial Committee. Representatives of the cable factories explained at the same time that with an immediate delivery of the necessary materials for the preparation of conductors and flexible cord, installations might be organised only on condition that during the period of the war certain variations in the present system of making the cables and flexible cord should be permitted. The fact is that at certain cable factories at present all the braiding machines are occupied in preparing field telegraph cable, but at the same time the winding machines are empty. It was urged, therefore, as desirable that the winding instead of braiding of wire should be allowed. Another variation from existing construction consists in the application for flexible cord of thicker wires, which indeed reduces its flexibility; but it is possible, and in time of war should be permitted. Prof. A. A. Veronoff was given a copy of the minutes of the corresponding committee of cable factories which met in Moscow from December 29th to January 11th. The examination of these proposals to vary the existing types of conductors and flexible cord was entrusted to the electrotechnical section of the committee, composed of specialists in conductors, &c.—*Elektrichestvo.*

A 15,000-H.P. Motor for a Reversing Rolling Mill.

The Westinghouse Electric and Manufacturing Co., of East Pittsburgh, Pa., has sold to the National Tube Co. the electrical equipment to drive a new 40-in. reversing rolling mill, which it is about to install in its plant at Lorain, O. This rolling mill, when completed, will be one of the largest in the country. The motor will develop 15,000 H.P., and will run at a maximum speed of about 120 R.P.M. Power will be supplied by a fly-wheel motor-generator set, which will be so controlled that the load on the power plant will be limited approximately to 3,000 kW. A similar equipment has been supplied to the Indiana Steel Co., which has purchased Westinghouse electrical equipment to drive and control a new 40-in. reversing blooming mill that is to be installed in its plant at Gary, Ind. In addition to these two units, the Westinghouse Co. is at present building the electrical equipment for four other reversing mills, two of which are of approximately the same size as those mentioned above.—*Elec. Rev. and W. Electrician.*

Terrestrial Magnetism.

—The report of the Astronomer Royal for the past year states that the mean values of the magnetic elements at Greenwich for the past two years were:—

	Declination, W.	Horizontal force in C.G.S. units.	Dip (Inductor).
1914 ...	15° 6' 3"	0.18518	66° 51' 13"
1915 ...	14 56 5	0.18494	66 51 58

Electricity on the Panama Canal.

—According to the *Electrical Review* and *Western Electrician*, extensive changes have been authorised for increasing the capacity of the hydro-electric plant at Gatun, Panama Canal Zone. New turbine wheels have been ordered for the three turbo-generator sets, each of 4,400 H.P., instead of 3,100 H.P. as at present. "No change will be made in the generators, as the very liberal design of these units makes it possible to operate them with an output of 3,650 k.v.a., at 80 per cent. power-factor and 55° C. temperature rise." In other words, it would seem that a miscalculation was made in the design of the generators, which were guaranteed to give only 2,500 k.v.a. continuously with 40° rise, or 3,125 k.v.a. for only two hours with 55° rise.

In order to take care of the increased output of these generators, four new 400,000-circular-mil cables have been ordered for installation between the hydro-electric station and the Gatun sub-station. The present cables between these two points are 10 in number, and of No. 0000 size.

In addition, two 4,000-k.v.a. power transformers have been ordered for the Gatun sub-station. These are the largest transformers that can be installed in the existing compartments.

One of the present 2,667-k.v.a. units will be moved to the Cristobal sub-station, where it will be needed to take care of the increased load, due to the operation of the new cooling plant, the terminal piers, and the projected submarine base.

Late Legal.—THE MAGNETA TIME CO., LTD.—An application in a debenture-holder's action—the Magneta Fabrique d'Horloges Electriques v. the Magneta Time Co., Ltd.—to confirm a provisional contract for the sale of the undertaking of the defendant company to a Mr. Molden, one of the co-plaintiffs in the action, came before Mr. Justice Astbury, in the Chancery Division, on Wednesday. Mr. Vaneck said the application had been before Mr. Justice Neville, when the contract was strenuously opposed, and his Lordship then adjourned the application, with the intimation that the provisional contract would be sanctioned at the adjourned hearing unless in the meantime a better offer was brought forward. The opposition of the company was that the price the applicants were to get for certain of the assets was not sufficient, and that the company would be able to realise to better advantage and save something for themselves, whereas under the provisional contract they would get nothing. The defendants did not now appear on the application, and the applicants had had no notice of any other offer being made, and counsel understood they did not intend to oppose the contract any further. Mr. Justice Astbury thereupon sanctioned the contract.

The British Engineers' Association.—The following communication has been issued to British engineering firms, under date June 19th, from the offices of the Association, 32, Victoria Street, Westminster, S.W.:

"As president and chairman of the Executive Committee of this Association, we appeal to you at a critical moment for your support and co-operation.

"The war is often described as an 'Engineers' War,' and there can be no question as to the vital part played by the British engineering industry.

"One result of the honourable, but heavy, responsibility which was thrust upon our engineers on the outbreak of war has been the inevitable dislocation of our pre-war trade and manufacture. As a consequence, the future contains serious problems which can only be solved by the ablest brains in the engineering trade.

"The first practical step—as in all struggles on a large scale—is mobilisation. It is notorious that neither in peace nor during the war has the British engineering industry exerted the influence to which it is legitimately entitled.

"The cause of this serious handicap has been the failure to combine. The disinclination to combine was due to British individualism and independence. But we would ask you to consider whether the dictates alike of patriotism and business do not call for combination on a large and effective scale in so far as it is vital to secure a national policy which will conserve and foster British engineering.

"If we lean on Government departments or outside helpers and advisers instead of looking after our own interests for ourselves we shall—as the past has proved—be running grave risk.

"We fully realise the strain and pre-occupation imposed upon you by the war, but the issues at stake are too urgent to be any longer side-tracked till 'after the war.'

"It is common knowledge that Germany, and, perhaps, other rivals, are preparing for a vigorous commercial campaign at our expense on the cessation of hostilities. If Germany can do this, so can we. The question is merely one of inclination. The British are the best organisers in the world, as witness the Royal Navy and our Army of 5 million men. They are also the easiest people to organise, once their consent has been won, because they are a free people.

"The time has come for the engineering industry to show the country that it believes in organised self-reliance, and that it is prepared to maintain the supremacy of British engineering against all comers.

"The first practical step towards this end is mobilisation. We, therefore, appeal earnestly to you to join forthwith the 300 firms which already belong to the British Engineers' Association, so that we may henceforward present a united front to our common enemies whoever and whatever they may be.

"The new members whom we hope to welcome will naturally have a say in the coming campaign; and, in order to reduce the call upon the time of busy men to a minimum, we have engaged the services of special organisers to carry out the decisions of our Council and Executive Committee.

"We believe that we are justified in promising you in the near future a practical return for your support, and we shall heartily welcome your criticisms and suggestions.

"WILFRED STOKES, *President*.

"J. E. THORNTON, *President*.

"Chairman of the Executive Committee."

Institution and Lecture Notes.—**Institution of Electrical Engineers.**—On Thursday last week the special meeting of Corporate Members was held to confirm the resolution to alter the Articles of Association, so as to exclude alien enemies from membership. The resolution was passed with one dissentient. In proposing a vote of thanks to the President, Mr. L. B. Atkinson pointed out that the Council had been unable to move in the matter until it was called upon to do so by the members; but directly that step had been taken, the President and Council had acted vigorously and effectively.

Association of Teachers in Technical Institutions.—On Saturday last Dr. Wm. Garnett delivered an address on "Technical Instruction after the War" at the annual conference of the Association. He said that when the full record of the work done for Government departments by Universities and technical colleges could be made public, it would command the attention of the industrial world, and there would no longer be any need for the work of Committees on the neglect of science. He advocated the

formation of associations of manufacturers in allied trades to ascertain the subjects on which research should be undertaken. We had been so keen on dealing in the cheapest markets that we forgot all national considerations; no sacrifice was too great in the way of market price to render this country industrially independent of all other nations in respect of the essentials of life and of national efficiency.

Reform of the teaching of the schools could never be effected except through the examinations, on the results of which schools gained their position in public esteem.

Amongst the special points that Dr. Garnett emphasised were the following:—

(1) That leaders of industry must place a higher value on individual scientific research, which is the greatest need of British industry. (2) That teachers in technical institutions must be more closely associated with industrial leaders. (3) That time and other necessary facilities must be given to teachers in technical institutions to enable them to carry out industrial research. (4) That consumers must be willing to make a sacrifice in order to contribute to the nursing of infant industries, so as to avoid entire dependence on foreign sources for the necessities of life or civilisation.

The Chemical Society.—At the adjourned special general meeting of the Society, on Wednesday, a resolution was carried to remove from the list of honorary and foreign members the names of nine alien enemies, including those of Ernst and Ostwald.

The Electrical Trades Benevolent Institution.—

Mr. F. B. O. Hawes, secretary of the above institution, informs us that the confirmatory general meeting was held on the 19th inst., at the Institution of Electrical Engineers, for the purpose of confirming the alterations in rules which were made at the annual general meeting. The principal alteration was to make the rule regarding the position of members who had not paid their subscriptions slightly less drastic than it formerly was. The rule formerly stated that members whose subscriptions were in arrear were entitled to no privileges whatever. The altered rule is, that a member who is thus in arrears shall not be entitled to votes. Mr. Hawes adds:—"There is no doubt that votes will in the near future be of considerable value, as the election of pensioners is by vote, and the list of members is steadily embracing more names of persons who might possibly be in need of such pensions. It is sincerely to be hoped that the list will contain many more such names in the near future."

Volunteer Notes.—1ST LONDON ENGINEER VOLUNTEERS.—Orders for the week by Lieut.-Col. C. B. Clay, V.D., Commanding.

Monday, June 26th.—Technical for Platoon No. 9, 46, Regency Street, S.W.; Squad and Platoon Drill, Platoon No. 10; Signalling Class and Recruits.

Tuesday, June 27th.—The School of Arms will be discontinued during the summer months; Recruits, 7.15 to 8.15; lecture, 7.15, "Organisation and Discipline," Company Commander W. Hynam.

Wednesday, June 28th.—Platoon Drill, No. 1 Platoon.

Thursday, June 29th.—Platoon Drill, No. 5 Platoon; Shooting for No. 9 Platoon; Miniature Range; Recruits, 5.45 to 7.45; Instructional Class, 5.45.

Friday, June 30th.—Technical for No. 10 Platoon, 46, Regency Street, S.W.; Squad and Platoon Drill, No. 9 Platoon.

Saturday, July 1st.—Parade, 2.45. Uniform.

Sunday, July 2nd.—Entrenching duties: Parade, Victoria (S.E. and C. Railway Booking Office), 8.35 a.m.

MACLEOD YEARSLEY, *Adjutant*.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, June 22nd, 1916:

Week-End Parades.—*Saturday.*—The Battalion will Parade at Wembley Park at 3 p.m. for Drill under the Commandant.

Sunday.—The Battalion will Parade at Liverpool Street Station (Low-Level entrance, G.E.R.) at 9.30 a.m., and proceed by train for Entrenching duties.

Battalion Sergeant-Major's O.I.C. Class will be examined by the Commandant on Saturday, 24th inst., at 3 p.m., at Wembley Park. A new class will commence on Monday, the 26th, at Lord's Cricket Ground, at 5.30 p.m., and will continue for two months. Names should be sent in to the Adjutant as soon as possible.

Map Reading.—Mr. W. Page will commence a new class at Headquarters on Wednesday, 28th inst., at 5.30 p.m. Those who wish to attend should send in their names to the Adjutant as soon as possible.

Musketry.—Competitors for the "Holland Cup" and other members who have sent in their names to shoot at Bisleigh on Sunday, 25th inst., will report in uniform to Sergeant J. W. S. Barmister, at 9.45 a.m., at No. 8 Platform, Waterloo Station.

G. H. F. DUNCAN, *Acting Adjutant*, O.B.C.

Fatalities.—A young machineman was examining a machine with the aid of an electric lamp in the Speedwell Iron Works, Coatbridge, when he sustained a shock which proved fatal.

A verdict of "Accidental death" was returned at a Kilburn inquest, on Saturday, on Walter Percy Harris, 33, an electric fitter, of Kensington, who was killed on June 15th. According to the *Daily Telegraph*, it was stated in evidence that Harris was employed by the British Westinghouse Co., Ltd., at the electric sub-station of the London and North-Western Railway Co., at Kilburn. He was engaged in connecting some cables, and as there was an obstruction, he went to a cubicle containing live wires with the object of finding out what the obstruction was. He had been warned of the danger. It appears that he struck a spanner against

a live wire at the top of the cubicle, and he received a shock of 11,000 volts. The jury added a rider to their verdict to the effect that greater care should be taken in guarding live wires.

Appointments Vacant.—Mains engineer, fitter drivers, engine drivers, and wiremen for the Military Electric Power Stations, Southern Command, Salisbury; junior assistant (30s.) for the Leek U.D.C. electricity works; station engineer, assistant engineer, charge engineer, station fitter, and lineaman joiner, for the Ripon military camp. See our advertisement pages for particulars.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Official.—Mr. R. M. WILSON, late assistant superintendent at the Thornhill power station of the Yorkshire Electric Power Co., Ltd., who is leaving to take up a position with the Ebbw Vale Steel Works Co., has been presented by his colleagues with a gold Albert.

General.—At a largely attended social gathering, the South Shields Corporation tramways department presented a silver cigarette case and a silver watch to Motor-man WILLIAM MIDDLETON, who was serving on one of the warships which took part in the naval battle off Jutland. Mr. W. Bunting presided, and Alderman Wythe, chairman of the Tramways Committee, made the presentation.

Mr. JOHN BROTHERTON, manager of the British Insulated and Helsby Cable Works, Helsby, has been placed on the Commission of the Peace for Cheshire.

Mr. E. A. NASH, secretary of the Faraday House Testing and Training Institution, has joined the Artists' O.T.C.

Roll of Honour.—Captain HENRY NEWTON, of the 5th Notts and Derbyshire Regiment (attached to the Royal Engineers), who is a director of Messrs. Newton Bros. (Derby), Ltd., electrical engineers and contractors, of Derby, has been awarded the D.S.O. According to the *Derby Daily Telegraph*, Captain Newton accompanied the Ilkeston Company of the 5th Battalion (T.F.) to the Front, and while there he was responsible for a number of inventions which were used to advantage by his own Battalion, and the Brigadier-General, realising their excellence and utility, gave instructions for them to be provided for the Brigade. A workshop, which now employs over 1,000 men, was established in France for his operations to be conducted on the spot, and Captain Newton was placed in command. It is stated that the King, the Prince of Wales, and the late Lord Kitchener all evinced great interest in his inventions.

Lieutenant F. DIXON, Dorset Regiment, an electrician under the Cleckheaton Urban Council, has been wounded.

Sapper EDGAR LOCKWOOD, of the 13th Divisional Company of the Royal Engineers, a member of the Institution of Electrical Engineers, aged 28 years, and formerly engaged at the Ashton-under-Lyne electricity works, has died of disease contracted on active service.

Private ERNEST BARKER, of the Lancashire Fusiliers, for nine years in the employ of the British Westinghouse Electric and Manufacturing Co., Ltd., Trafford Park, has been killed in action.

Private J. H. LEONARD, of the King's Liverpool Regiment, who has been missing since June, 1915, is now officially presumed killed. Prior to enlistment he was employed at Messrs. Dick, Kerr & Co.'s works at Preston.

Electrical Artificer J. W. HORNER, formerly on the electrical staff of the North-Eastern Railway Co. at York, was on *H.M.S. Warrior* in the North Sea battle, and was injured. He is in a Scottish hospital, and is making a good recovery.

Private THOMAS BURNS, Loyal North Lancashires, has died from wounds in the head received whilst fighting in France. He had worked previously as an electrician.

Lieutenant H. DUNCAN, of the Royal Flying Corps, formerly in the testing department at the Rugby works of the British Thomson-Houston Co., Ltd., has been decorated by the King with the Military Cross for services rendered at the Front.

Air Mechanic ERNEST WHITFIELD, of the Royal Flying Corps, who has died of smallpox whilst on active service at Cairo, was formerly on the Doncaster municipal electricity works staff.

E. R. L. SNOW, who was a wireman on board *H.M.S. Invincible*, lost his life in the North Sea battle.

Electrical Artificer HARRY WOODMAN was lost in the North Sea fight on board *H.M.S. Queen Mary*.

Our readers will, we are sure, join us in tendering sincere sympathy to Mr. R. A. Chattock, city electrical engineer of Birmingham, on the death of his only son, Private A. A. CHATTOCK, who was killed in action on June 4th. Private Chattock, who was 23 years of age, was educated at Hillbrow School, Rugby, and subsequently at Charterhouse School (Robinets). He studied at the Birmingham Municipal School of Art and in Paris. He was engaged on designing work when war broke out, and he joined the 2nd City of Birmingham Battalion in October, 1914, as a private. This was after-

wards named the 15th Service Battalion Royal Warwickshire Regiment. The Battalion went to France in November, 1915, and he was on active service there until his death occurred.

Lance-Corporal EDWARD MEE, of the Loyal North Lancashires, on the Bolton tramways clerical staff, has been missing since May 21st.

Obituary.—Mr. E. MARCH WEBB.—We regret to record the death, which occurred somewhat suddenly on June 15th, at the Arundell Arms Hotel, Lifton, Devon, of Mr. E. March Webb, of the India-Rubber, Gutta-Percha & Telegraph Works Co., Ltd. Mr. March Webb commenced his career at Silvertown in 1869, on the staff of the late Sir Charles Bright, during the manufacture of 4,000 odd miles of submarine cable for the West India & Panama Telegraph Co., which was laid in 1870. Subsequently Mr. Webb joined the Silvertown company, and took part in many cable-laying expeditions as chief electrician between 1872 and 1895. He was at one time manager of the West Coast of America Telegraph Co., Ltd., and lately he had filled the office of secretary of the Spanish National Submarine Telegraph Co., Ltd. The cable-laying expeditions in which he took part were as follows:—The Direct Spanish cable (1872); Havana-Key West (1873); New-haven-Dieppe Shore End (1874); Chile-Peru cables (1875); Marseilles-Algiers laying and Direct Spanish repairs (1879); Lizard-Bilbao (1880); Marseilles-Algiers (1880); Mexican cables and Havana-Key West repairs (1880); C. & S.A. cables (Pacific side) (1881); Spanish National cables (1883 and 1884); Havana-Key West repairs (1886); Congo cable repairs (1887); Western and Brazilian (1891); South American Co. (1892); ditto (repairs) (1893); Spanish Government and S.A. (1895). His death is regretted by his remaining Silvertown friends as the loss of one who was kind-hearted and genial to all.

Mr. WILLIAM TODHUNTER.—We regret to record the death of Mr. William Todhunter, of the Telegraph Construction and Maintenance Co., Ltd., which occurred at Blackheath on June 19th, at the age of 59 years.

Mr. J. TRANTER.—The death is announced of Mr. Joshua Tranter, of Kendal, who, under the National Telephone Co., inaugurated the service at that town 20 years ago. Later he had charge of the underground installation work at Blackpool, Lytham, and St. Annes, and he retired when the undertaking came under Government control. He was 71 years of age.

NEW COMPANIES REGISTERED.

L. Weekes, Ltd. (144,093). This company was registered on June 14th, with a capital of £10,000 in £1 shares (1,000 founders'), to take over the businesses (1) of an electric fuse manufacturer carried on by A. L. Weekes at Langley Street, Luton, Beds., as the British Electric Calibrated Fuse Co., and (2) of electric switch manufacturers carried on as the "Safetec" Controlling Appliances Co., Ltd., at Lingley Street, Luton. The subscribers (with one share each) are: A. L. Weekes, Brooklands, Harefield, Herts., gentleman; W. J. Coom, 30, Conway Road, Luton, Beds., engineer. Private company. The number of directors is not to be more than five; the first are: A. L. Weekes (permanent chairman and sole governing director) and W. J. Coom. Qualification, £100. Registered office: Langley Street, Luton.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Bourton-on-the-Water Electric Light & Power Co., Ltd. Particulars of £600 second debentures created August 27th, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £280. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Rural Electricity Supply Co., Ltd.—Issue on June 6th, 1916, of £100 debentures, part of a series of which particulars have already been filed.

South Metropolitan Electric Light & Power Co., Ltd.—Issue on May 24th, 1916, of a £20,000 debenture, part of a series (this debenture, with others, particulars of which have already been filed, is issued to trustees as security for an issue of debenture stock).

T. W. Broadbent, Ltd. (95,420).—Capital, £5,000 in 440 pref. and 560 ord. shares of £5 each. Return dated August 27th, 1915 (first April 22nd, 1916). All shares taken up; £5,000 paid. Mortgages and charges: £1,000.

British Mica Co., Ltd. (72,187).—Capital, £5,000 in 2,000 pref. and 3,000 ord. shares of £1 each. Return dated March 16th, 1916. 629 pref. and 2,000 ord. shares taken up; £629 paid on the pref.; £2,000 considered as paid on the ord. Mortgages and charges: Nil.

Camborne Electricity Supply Co., Ltd. (57,950).—Capital, £10,000 in £1 shares. Return dated April 26th, 1916. 607 shares taken up; £605 paid, leaving £2 in arrears. Mortgages and charges: Nil.

CITY NOTES.

Paris Metropolitan Railway.

The report for 1915 of the Compagnie du Chemin de Fer Métropolitain, of Paris, refers at length to the tunnel and incidental works carried out by the City of Paris in connection with the extensions of the railway, and states that no routes were handed over to the company for the construction of the permanent way and

equipment for working. Although delays had taken place in consequence of the difficulty of obtaining labour and materials, progress had been made everywhere. Similar obstacles confronted the company in the execution of its works, and the route length in operation had not varied since September 30th, 1913, the mileage slightly exceeding 48. The completion of the orders placed in 1913 for additional motor cars and trailers had been interrupted, and the rolling stock consequently remained at 700 motor cars, 270 first-class trailers, and 335 second-class trailers. The train service, which had to be reorganised and reduced in the second half of 1914, was gradually brought last year up to a time-table which substantially approached that which prevailed prior to the war, whilst the number of employees had risen from 3,658 at the end of 1914 to 4,133 at the close of last December. Concerning the bonuses granted to the staff in order to give the men a greater interest in the efficient working of the railway, the report mentions that over £36,000 was paid in this manner in 1915, and both the regular men and the temporary substitutes for those called to the Colours participated in the distribution. The total receipts amounted to £1,846,000, of which £596,000 represented the share payable to the City of Paris according to the terms of the concession, and the working expenses absorbed £806,000. After making various appropriations, the net profits are returned at £252,000, which sum has permitted of the declaration of a dividend at the rate of 5.6 per cent. on the ordinary capital of £3,000,000.

Imperial Tramways Co., Ltd.

The directors, in their report for the year ended December, 1915, state that the gross receipts of the Middlesbrough, Stockton and Thornaby electric tramways amounted to £60,529, an increase of £2,967. The passengers carried were 12,291,280, an increase of 37,656. The net profit was £15,432, as compared with £17,604. The traffic receipts continued to develop in spite of the difficult conditions in the districts served by the tramways and omnibuses. Since the beginning of the war 84 per cent. of the employees have joined the Forces or attested. The special allowances granted to dependents of employees amounted during 1915 to £1,531. This company holds £22,230 5 per cent. cumulative preference shares of £1 each and 112,451 ordinary shares of £1 each in the London & Suburban Traction Co., Ltd., and has received the full dividend for the past year on the preference shares, but the revenue of that company for the year 1915 was not sufficient to permit the payment of any dividend on the ordinary capital. The company's net revenue account for the year shows an available balance of £25,760, and after payment of interest on the debenture stock for the whole year an interim dividend on the preference shares in respect of the half-year to June 30th last, amounting together to £17,075, 6 per cent. per annum on the preference capital (less income-tax) absorbs £5,025, and a dividend for the year at 2 per cent. on the ordinary capital (less income-tax) requires £3,467, £194 remaining to be carried forward. Annual meeting: June 20th, Bristol.

United Electric Tramways of Monte Video, Ltd.

MR. G. A. TOUCHE, M.P., presiding at the annual meeting on June 15th, said that the war was still a dominating factor in the River Plate. The company suffered from the abnormal conditions in the shipping world, and would do so more in the current year. Practically all materials required by them had to be shipped to Monte Video. The coal situation continued to cause anxiety. There was no coal supply in Uruguay, but there were fairly extensive peat deposits, and experiments as to their use for fuel purposes were being made. Failing British coal, it became necessary to rely on America, although it was not of the same steaming qualities as Welsh. The large railway companies and other consumers of coal in the Argentine and Uruguay had formed a committee to regulate, as far as possible, the exportation of coal to the River Plate. The Admiralty had agreed to liberate a certain amount of requisitioned shipping to carry coal from American ports to the River Plate. The cost of this coal, delivered in Monte Video, would be approximately 105s. per ton, of which 85s. represented freight. This compared with an average pre-war price of 40s. 6d. British coal might cost even more, but at the moment there was little or no chance of obtaining any. It was by no means certain that the company's requirements, even in American coal, would be fully supplied, as it was very difficult to find the ships necessary to carry it south. The fuel difficulty had not reached its acutest stage during the period covered by the accounts, but during the year now current it must represent a serious charge on the company's receipts. Weather conditions in Monte Video had also been unfavourable again. By carrying out rigid economies in every department of the hotel, the reduction in the expenses almost compensated for the decrease in the receipts. All these adverse circumstances made a rather depressing narrative, but none of them represented conditions which should be permanent. Having referred to the political and economic situation in Monte Video and given details of the results of the past year's working, the chairman expressed regret that the directors were unable to recommend the payment of any dividend on the ordinary shares. In the circumstances, there was no prudent alternative. With regard to the current year, weather conditions during the past summer season showed some improvement, with the result that the traffic had shown increases when compared with the corresponding months in the previous year. It was, however, to be regretted

that practically all the increase in gross receipts had been absorbed by heavier operating expenses. Those expenses were bound to go on increasing while fuel and freight costs continued on the up-grade. He feared they could not expect any improvement in the net revenue position in the current year unless conditions made some rapid change. For some time past it had been the policy of the Government of Uruguay to municipalise businesses of public utility. With this object in view they acquired recently a controlling interest in the Norte Tramway Co., which still operated a system of trams in Monte Video by animal traction. He believed it to be the intention of the State to electrify this system and extend it in various directions—probably in competition with existing electric tramways. Experience showed that co-operation was better than competition, whether the result aimed at the public utility or financial stability. If the municipality was to enter upon the tramway business it would clearly be better that it should control the largest system in the city instead of being in competition with it. This might explain why some months ago informal inquiries were made as to whether this company would be prepared to sell to the State, and, if so, on what terms. The directors recognised that the position created by the war and the desire of the Government that British investments in North and South America should, when opportunity offered, be realised, were factors which ought to be taken into account. They therefore caused the authorities to be informed that if the Government were prepared to make a definite offer on a fair and reasonable basis of valuation, they would give it their serious consideration. Since the report was issued the Government had made a proposal, which the directors would give their full and careful consideration.

German Netherlands Telegraph Co.

The report for 1915 of the Deutsch-Niederländische Telegraphen Gesellschaft, of Cologne, states that no changes took place in the conditions of the company's stations and cables as compared with the preceding year, the cables being still in good condition. No news had so far come to hand from the officials who remained at Yap in regard to this station, and the directors assumed that the Japanese censor had not permitted any report being made. The company had again received a dividend of 6 per cent. for 1914-15 on its investment in the German South Seas Wireless Telegraph Co. in so far as it was paid up. As a result of the alteration in the agreement with the Great Northern Telegraph Co., of Copenhagen, according to which the annual payment for repairs was reduced by £3,000 from June 1st, 1915, the German Netherlands Co. had to pay a sum lower in this year by £1,750, but a reduction in the expenses as against 1913-14 was not shown, owing to the unfavourable rate of exchange. The net profits are returned at £41,000, as contrasted with £41,600 in 1914, and the directors recommend a dividend of 6 per cent., as compared with 6½ per cent. in 1914.

German Electrical Companies.

The Elektrizitäts Gesellschaft (late W. Lahmeyer & Co.), of Frankfurt-on-Main, reports net profits amounting to £103,000 for 1915, as compared with £103,500 in the previous year. It is intended to pay a dividend of 7 per cent., being the same rate as in 1914.

The accounts of the Land und Seekabel Werke, of Cologn-Nippes, show gross profits amounting to £61,000 for 1915, as compared with £67,000 in the preceding twelve months. After setting aside £4,000 for depreciation, as against £12,000 in 1914, and making other appropriations, the net profits are recorded at £38,000, as compared with £35,000. It is proposed to distribute 11 per cent. on the paid-up capital of £262,500, this comparing with 10 per cent. in 1914.

The shareholders in the Bergmann Elektrizitäts Werke, of Berlin, were informed by the general manager at the recent annual meeting that over one-half of the total turnover in 1915 represented peace manufactures, the balance comprising war contracts. As a result of the Government requisitions of copper and certain other metals, the company had been compelled to equip itself for the production of metal substitutes, and this had rendered it possible to continue the output of articles for peace purposes. This fact was also of importance for the period after the war in regard to the price movements in copper. If the price of copper exceeded permissible limits the continued use of substitutes would make the works independent of other countries. On the conclusion of peace it would be possible quickly to change over to the manufacture of peace products, and competition would be keen, especially with American firms.

Marconi International Marine Communication Co., Ltd.

MR. GODFREY ISAACS presided, on June 14th, at the annual meeting, in the absence of Mr. Marconi in Italy. After dealing with the balance sheet and the increase in the receipts, which has already been mentioned in the report, he said that they were entitled to congratulate themselves upon the result, especially considering that the business was necessarily being conducted in very difficult and abnormal circumstances; and that the whole of the losses incurred through the submarine warfare had been debited to profit and loss account. The gross receipts, which in 1911 were £44,166, had grown in successive years to £100,325 (1912), £146,325 (1913), £175,105 (1914), £208,927 (1915). Their

telegraphic receipts were very much below what they would have been in ordinary circumstances. Except in such abnormal times as these their business was not subject to any material variation in its figures in consequence of fortuitous circumstances, activity or slackness of trade. They provided what was an absolute need, the great importance of which was more marked each year. Not only was it essential that every merchant ship should be fitted with a wireless installation, but overwhelming evidence had been afforded of the importance of a world-wide organisation such as the company had built up. The number of telegraph stations owned and worked by the company as public telegraph stations on the high seas had increased since December from 1,008 to between 1,100 and 1,200, and the number was increasing daily as fast as it was possible to turn out and fit the installations. They had to-day a sound industrial business which could only progress, and which, after the war, would develop more quickly than hitherto. Their position had not been obtained without a very great struggle. Since their inception, 16 years ago, they had encountered innumerable difficulties, the country was slow to appreciate the value of their work, and the business was dangerously near to falling into foreign hands. It gave one hope that the lessons of the war would lead to national assistance—should it again fall to the lot of a British company, situated as this company was—to develop a new science and a new industry destined to become of such paramount importance to the nation. Mr. Marconi's recent developments would dispose of one more peril of the seas. He authorised him to state that in the near future he would introduce a new, independent, and very simple apparatus to be worked from the bridge of a ship, and by one of the ship's officers, which should put an end to all danger of collision in darkness or fog. Mr. Marconi had described that new work to him, and he had little doubt that every sea-going vessel would be equipped with the invention. This should prove of no small value to their company. Mr. Isaacs went on to refer to the bravery in these perilous times of their operators, of whom they had 2,000 almost continuously on the seas. Eighty-two of their operators were employed on mercantile ships which had been sunk by the enemy. Three were drowned, two had been seriously injured, and seven slightly injured. The chairman spoke very highly of the services of the manager, Mr. Bradfield, and the heads of the ship department, Messrs. Cross and Lewis, and their staff.

J. G. White & Co., Ltd.—A dividend of 6 per cent., less tax, is proposed, carrying forward £34,939. The war continues to adversely affect the business. Methods for broadening the scope of the company's work are being developed with encouraging prospects. Investments having been conservatively valued in the past, no readjustment of values is now necessary.

Marconi's Wireless Telegraph Co., Ltd.—Gross profit for 1915, £531,125; net profit, £377,818, an increase of £145,101. In view of the state of war, and having regard to the large sums of money abroad, and to the uncertainty when the moneys due from the Government will be received, the resources are to be husbanded. A final dividend of 5 per cent. will make 10 per cent. for the year. Annual meeting: June 30th.

Trowbridge Electric Supply Co., Ltd.—Mr. J. H. Blake presided at the annual meeting, on June 13th, at which a dividend of 5 per cent. on the ordinary shares was declared. The profits were only £348, as against £438 last year. That was not due to a reduction in sales, but to their not putting up the price to consumers as early as they ought to have done. It was stated that the Bradley Road residents could not have a supply, as the Council would not grant permission there for overhead wires. The cost of underground cables was prohibitive, and would be for some years to come.

Waygood-Otis, Ltd.—For the year ended March, 1916, the profit was £12,798. Depreciation absorbs £3,900, directors' remuneration and salaries of directors managing departments £6,542, grants to employés' dependents £2,396, and there is carried forward £671.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—Interim dividend of 3 per cent. on account of the accrued dividend on the 6 per cent. cum. pref. shares.

Veritys, Ltd.—Dividend for the year, 6 per cent. on the ordinary shares, carrying forward £1,064.

Coventry Chain Co., Ltd.—Interim dividend of 6 per cent. per annum, less tax, on the ordinary shares.

STOCKS AND SHARES.

TUESDAY EVENING.

The capital news of the Russian advance contributed in no small measure to further improvements in the Stock Exchange markets, prices going ahead rapidly under the leadership of Consols. The Funds, indeed, moved much too quickly, as was apparent immediately the buying pressure

became relaxed, with the result that the 4-point rise secured in less than a week was cut in half as sellers came in, tempted by the rapidity of the rush-up. Consols have once more taken the premier position as regards markets, upon them depending movements in other gilt-edged securities. The latter hardened with Consols, but in their case they managed to retain the rises considerably better than Consols did.

Home Railway stocks have dwindled a little, following upon their big rises of last week. The attention called to the market by the advances, spread to the Central London issues; though when would-be purchasers sent in their orders, they found scarcely any stock on supply, and the quotations nominal except to sellers. The 4 per cent. preferred stock is changing hands about 57½; but the 4 per cent. assented preferred stock is quoted about 72, with none on offer. The last business marked in the company's ordinary stock (non-assented) was at 35½, which is about half the present quotation for assented ordinary. Underground Electric ordinary are better at 1 15/16, though the income bonds have given way a little.

Electricity ordinary shares have a rise of 7s. 6d. to the credit of Westminster, which has raised these to 6, at which price the return on the money comes to £5 18s. 8d. per cent. This gives Westminster ordinary the pride of place, as yielding less than any of the shares of its class in the list. Chelseas at 3 are 1 down; up to the present they have held the position now taken by Westminster. The highest returns are those afforded by the ordinary shares of the South London, the Brompton, and the London Electric Companies, in the order named; while from the preference shares the average yield works out to about 6½ per cent., taking the list through. There is rather more business doing in the market than usual, and jobbers report inquiry for the shares of the leading companies. In the manufacturing group, too, Edison & Swans have picked up to half-a-guinea. British Westinghouse preference have further improved.

British Aluminium ordinary shares are a trifle easier at 26s. 6d. The report of the Aluminium Corporation, which had been awaited with considerable interest, is now out, and shows a net profit of £14,300, this being the first time for the past half decade that the company has escaped a loss. The preference shares are, therefore, to get their 7 per cent. dividend, although some criticism is directed against the payment by those who think it would have been better to fortify the financial position by refraining from making a distribution yet. Nothing has been allowed this year for depreciation, the directors stating that the question will be dealt with in the next report.

All the cable manufacturing shares are strong. India-Rubbers have risen 5s. to 11½. Henleys and Callenders are wanted by Manchester, which also is a buyer of the other companies' shares in this group. Babcock & Wilcox gave way a trifle, but firmed up again to 2½. Castner-Kellners have recovered the dividend recently deducted, and at 3½ they are 3/16 higher on the week.

With reference to dividends paid free of tax, as there seems to be a slight misapprehension amongst some readers, may we repeat that the yields per cent. which are given in our tables have been calculated without making any allowance for income-tax at all. For some time, we endeavoured to show the equivalent return where dividends were paid tax free; but, in consequence of the various alterations which took place and the different deduction made by the companies from their dividends, we reverted to the simpler practice of working out the returns "flat," leaving the necessary allowances to be made by those who are interested. To take one concrete example: The return on Eastern Telegraph ordinary stock comes to 5½ per cent.; but as the dividends are paid free of tax, deduction of 5s. in the £ would render this equal to nearly 7½ per cent. when compared with other shares the dividends on which are subject to tax before the cheques are sent out.

The strength of the telegraph market continues to stand out as one of the features of the Stock Exchange. Westerns have risen 7s. 6d., Eastern ordinary is up 2 points, "China" shares are again up ½, and Anglo-American preferred is a point to the good. In addition to these, all the rises of the previous week have been held. Considerable animation has revived in Marconis. The ordinary shares gained 7s. 6d. upon their last week's price, but at 2 13/16 shares came in, and there was a small reaction which has left the price ½ up. Rumour is busy in the discussion of what dividend the company is likely to pay. With the parent shares, those in the subsidiaries have also rallied, Americans hardening to 16s. 3d., and Canadians to 9s. A prominent feature in this section is the strength of Marconi Marines, which rose straight from 30s. to 39s. without a break, though at the latter price something of a halt was called to the breathless advance.

Mexican news is bad. Carranza has developed unexpected treachery, and is said to have seized a station on the Southern Pacific Railroad. President Wilson has ordered mobilisation of the American Militia, and prices of Mexican securities are naturally flat. So far as the utilities are concerned, no quotable changes have been made, but the various issues are not exactly in eager demand.

Holders of the 5 per cent. convertible debenture stock of the Consolidated Gas, Electric Light, and Power Co., of Baltimore, should note that their option of conversion into common

shares will expire on July 1st. The stock is an excellent security, but the shares have fine prospects, and receive 7 per cent. dividends at present.

Brazil Traction fell a point to 63, although other things connected with Brazil are mostly good. Prices in the railway market are making rapid strides. British Columbia deferred is harder, and a satisfactory feature is the further recovery in Anglo-Argentine Tramways first preference shares, the price putting on another $\frac{1}{2}$ to 3 11/16. The Argentine Republic has recovered very slowly from the effects imposed upon it by the war; and there can be no doubt that when it fairly turns the corner, prices will go ahead just as sharply as did those of companies trading in Brazil. The 4 per cent. debenture stock is better at 76; the $\frac{1}{2}$ per cent. has improved to 75, which is about a couple of points lower than the 5 per cent. debenture stock.

Bombay Electrics are good at 16 $\frac{1}{2}$. The British Electric Traction issues are also firm, the 5 per cent. debenture stock changing hands the other day at 84, and the $\frac{1}{2}$ per cent. second debenture stock at 70 $\frac{1}{2}$. Calcutta Tramways ordinary have been done within the last few days at 64, which is £1 a share lower than they stood upon the outbreak of war.

The rubber share market is steady, notwithstanding a further decline in the price of the raw material to 2s. 5 $\frac{1}{2}$ d. per lb. Business is accordingly quiet, and interest has drifted away to a large extent into other and more active departments of the industrial section of the Stock Exchange. At the same time, the decline in rubber has not led to any particular selling. Copper shares have weakened, in consequence of the smart drop in the price of copper. Base metal shares of various kinds are under something of a cloud. Armament issues, on the other hand, tend to improve, in sympathy with the strength shown by iron and steel shares generally.

Aluminium Corporation, Ltd.—The report for 1915 shows continued improvement, and a further improvement in net profits, which, after providing for debenture interest and other charges, amount to £14,257, plus £3,285 brought forward. The directors recommend a dividend of 7 per cent. less tax, upon the preference stock, leaving to carry forward £4,539 to the next account, when the questions relating to depreciation will be dealt with. The driving of the Buva Tunnel was completed early in the present year, and has already fully justified its construction. Arrangements have been made to increase considerably the water power, and the consent of the Treasury has been obtained to the issue of another £100,000 of first mortgage debentures. It is therefore proposed to obtain the approval of the existing debenture holders to the creation and issue of this amount, increasing the total authorised issue to £250,000.

French Thomson-Houston Co.—The report of the Cie. Française pour l'Exploitation des Procédés Thomson-Houston for 1915 states that the net profits amounted to 4,821,778 francs, an increase of 272,000 francs. In order to strengthen the financial position, 40,000 6 per cent. bonds of 500 francs each were issued. A dividend of 7 per cent. is proposed, leaving 197,614 francs to be carried forward.—*Financial Times*.

Eastern Telegraph Co., Ltd.—Preference dividend at the rate of 3 $\frac{1}{2}$ per cent. per annum, less income-tax, for the quarter ended June; also a first quarterly interim dividend of 1 $\frac{1}{2}$ per cent. on the ordinary stock, free of tax.

Ruston, Proctor & Co., Ltd.—Final dividend on the ordinary shares making 8 per cent. for the year, plus a bonus of 2 per cent., both less income-tax. £15,000 has been placed to reserve and £16,300 carried forward.

Anglo-Argentine Tramways Co., Ltd.—We understand that the directors have decided not to pay an interim dividend on the second preference shares.

Bullers, Ltd.—An interim dividend at the rate of 5 per cent. per annum (5s. per share), free of tax, is announced.

MUNICIPAL ELECTRICAL EXTENSIONS AT KILMARNOCK.

(Continued from page 669.)

THE transmission line to supply the eastern area was not completed until the end of the summer: thus this line is not so revenue-producing as the western route. However, a number of the mills are considering offers for completely electrifying their plants. This transmission line is similar in design and capacity to the western section. The sub-stations at Galston, Newmilns, and Darvel are erected in close proximity to the power line, and in each case the line loops in and out of these sub-stations, so that the circuit can be divided up. At a point between Kilmarnock and Galston a tapping is taken into the sub-station of Messrs. A. Strang & Co., Ltd., where a 50-K.V.A. transformer is installed, and arrangements are made whereby a supply can be given to the village of Hurlford.

At Galston the sub-station is similar to those at Troon and Irvine, but the transformer ratio is 11,000/415 volts. Low-pressure mains are laid from this sub-station into the

demand for energy warrants the extension. As mentioned, the transmission line is looped into this sub-station, and continues on to the Burgh of Newmilns. Between Galston and Newmilns the supply is fed off to the Loudoun Pit, and

an 11,000/3,300-volt transformer is installed. Here one 100-H.P. and one 50-H.P. motors are running day and night, driving turbine pumps placed at the bottom of the pit shaft; the adoption of electric winding is also under consideration.

The sub-station at Newmilns is erected under a railway arch, and L.T. mains run to the various mills. New mills are in course of erection, and the manufacturers are driving throughout by electricity, utilising a motor on each loom. It is essential that the loom drive shall be steady and not jerky when starting up;

with a modern spring adjustment on the motor, the starting-up trouble has been overcome, and the three-phase A.C. motor is recognised to be a complete success in every

HIGH-PRESSURE SWITCHGEAR, AND CUBICLES.

B.T.H. 2,500-K.W. TURBO-GENERATOR.

town. The supply here was available in the middle of January, 1916: the Wholesale Co-operative Blanket Works have some 150 H.P. installed, and a number of smaller consumers have been connected. Ducts are laid with the low-pressure mains for installing H.P. mains immediately the

respect. There is no doubt, therefore, that many of the manufacturers, now that the electric drive on lace looms is proved to be satisfactory, will eventually discard their steam engines and adopt the electric drive.

Owing to the mills not being in close proximity to one

another at Darvel, as is the case at Newmilns, 3,300-volt mains are laid in the burgh to the various mills. The sub-station is similar to those already described, the transformer ratio being 11,000/3,300 volts.

The supply at Darvel has only been available for a few weeks, and only one mill is as yet electrified, but applications from others have already been received. Messrs. Stirling & Auld, prior to taking the Corporation supply,

HIGH-PRESSURE SWITCH PILLAR AND TRANSFORMER KIOSK.

generated their own electricity by means of an 80-H.P. suction gas engine and belt-driven alternator.

To cope with the demands from the Burgh of Kilmarnock, and its recently-extended area of supply, extensive alterations have taken place at the power station, and extensions to the engine room and boiler house, and a switch annexe, have been built. A turbo-alternator set of 1,500 kW. was installed in January, 1915, and a further similar 2,500-kw. set was put on load in April, 1916, bringing the total plant capacity to 5,550 kW., there being nine sets in all, three of which are turbo-alternators. Both the 1,500 and 2,500-kw. turbines are of the B.T.H. horizontal Curtis type, running at 3,000 R.P.M., and driving 3,300-volt, 50-cycle alternators, with the exciters on the ends of the shafts. The 1,500-kw. set is designed for 25 per cent. overload and 50 per cent. momentary overload, but the 2,500-kw. set is designed for 50 per cent. overload for a long period. On both alternators a Heenan & Froude air filter is provided.

The condenser on the 1,500-kw. set is of the surface type, with the air, circulation, and extraction pumps driven by an auxiliary turbine manufactured by Messrs. Mirrieles Watson.

TEE OFF E.H.P. TRANSMISSION LINE TO SUPPLY IRVINE.

The condenser on the 2,500-kw. set is of the Worthington surface type, the air, circulating, and extraction pumps being driven by a B.T.H. steam turbine. The exhaust steam from the two auxiliary turbines can be passed into a

direct-contact feed-water heater situated on the top of a hot-well tank, or put into the main turbine condenser. With the 2,500-kw. turbine a Lea recorder is installed.

CALLENDER K TOWERS CROSSING BOG LAND (see p. 668).

The high-pressure switchgear supplied by the British Thomson-Houston Co. consists of one Tirrill regulator panel, three machine panels, two converter panels, and six feeder panels. Immediately behind the control board and in the switch annexe are built concrete cubicles containing bus-bars, switches, &c. The whole of the bus-bars and isolating switches are duplicated, and the doors of the cubicles are interlocked with the switches.

In order to make full use of the efficient turbo-alternators, one 500-kw. and one 300-kw. Bruce Peebles motor-converters are installed in the power station to supply the direct current for lighting and tramways, and these also run in parallel with the converters at the Langland Street sub-station. These machines have the same voltage regulation as the D.C. generators, and can be run in parallel with them.

In the boiler house one 20,000-lb. Babcock & Wilcox boiler has been added, and a similar one is in course of erection at the works, making a total of eight boilers, three of which are of the Lancashire type. Owing to the cheap grade of fuel which can be had around Kilmarnock, this new boiler is fitted with "undergate" forced draught. This was the first of Messrs. Babcock and Wilcox's manufacture, and it has been found that a very small and cheap class of smudge can be burned economically and well. B.T.H. steam-flow meters are installed in connection with the chain-grate stokers. An induced-draught plant is at present being erected, and much better evaporation is expected from the boilers when

this plant is working. A railway siding runs direct over the coal-bunkers in front of the boilers, and the usual bunker elevators are in use for taking the coal into the stoker hoppers.

The pumping plant consists of three Weir double-acting feed pumps, and a rotary feed pump will be installed shortly. Although the works are situated on a bank of the river Irvine, a shortage of water was experienced during the summer, the river being dammed at a number of places. To overcome this difficulty, 36-in. ferro-concrete pipes have been laid from the nearest dam to the works, and an ample supply of water is now available. The condenser and pumps are now always flooded.

The maximum load during the winter of the year ending May 15th, 1915, was 1,340 kw., and the average day load for the last four months has been 2,000-2,200 kw. This load would have been some 500 kw. better had sufficient plant been available, but owing to the delay in getting the 2,500-kw. turbo-alternator into commission, it has been necessary to restrict a number of the large consumers from taking the whole of their requirements.

The majority of the large consumers are under agreements for 10 to 15 years, the Corporation covering itself against increased cost of coal by inserting a coal clause in these agreements.

The transmission lines were erected by Messrs. Callender's Cable and Construction Co., Ltd.; the total length of overhead mains is 19.78 miles, and the total number of poles 581, spaced, as a rule, 55 to 60 yards apart.

The a.c. supply-pressure is kept constant by means of a Tirrill regulator; the alternators are star-wound, and the neutral point is connected to earth through a limiting resistance.

The Town Council of Kilmarnock is doing everything possible to further the interests of the electricity department, and a showroom has recently been opened. The tariff charges for lighting and power are reasonably low in Kilmarnock, and even in the outer areas the lighting is at the same rate, but the power charges are 10 per cent. above the Kilmarnock rates. However, at this figure the power consumers are finding the electric drive more economical than their old steam or gas engines.

The construction of the outside extension was not commenced until June, 1914, and was greatly delayed owing to the difficulty in getting material consequent on the war, but practically the whole scheme will be completed in three months' time, except for local extensions. Up to May 15th, 1916, some 2,050 h.p. in motors had been connected.

The 11,000-volt transformers were supplied by Messrs. Ferranti, Ltd., and are of the oil-cooled type; the end

all the transformers have their coils clamped in order to withstand, as far as possible, short circuits and overloads. Tappings of 11,000, 10,800, 10,600, 10,400, 10,200, and 10,000 volts are taken out of the transformers, in order that the correct voltage may be obtained. The kiosk transformers are air-cooled, and are of the well-known "Berry" make.

The underground cables were supplied by Messrs. Callender's Cable and Construction Co., Ltd., and were laid by the Kilmarnock Corporation Electricity Department.

SIEMENS 100-H.P. MOTOR DRIVE AT SPINNING MILL.

In conclusion, we must express our indebtedness to Mr. William Bexon, the burgh electrical engineer, for providing us with particulars and views of the extensive supply scheme under his control, towards the success of which his efforts have so greatly contributed.

GERMAN SUBSTITUTES AND ECONOMIES IN ELECTRICAL CONDUCTORS.

THE oft-repeated boast that Germany has within her own borders many years' supply of copper, and has secured inexhaustible supplies in allied or occupied territory in the Near East, has been accompanied by an ever more extensive commandeering of domestic copperware, and, in the electrical field, by the most vigorous efforts to find a substitute for copper conductors. At first iron wire and cables were employed, but these soon proved very inconvenient, apart from the fact that the conductivity of iron is only about one-eighth that of copper. Aluminium is, of course, quite a useful substitute for copper in practically every electrical application, and the fact that the enemy has gone the length of formulating rules concerning the use of zinc and iron in wiring and in machine windings merely indicates that the shortage of aluminium is as serious as that of copper. The conductivity of zinc is more than twice as great as that of iron, and the metal is non-magnetic, and more flexible and convenient in its mechanical properties. In this respect the latest zinc wiring on the German market is claimed to be almost equal to copper. Under favourable circumstances, this is probably the case, but it is never possible to rely on a single zinc conductor being sound throughout its length, and the mechanical properties of zinc are inferior and treacherous at temperatures much above or below normal atmospheric temperature. Zinc cables may not be laid during frost, and, once laid, they must not be moved except with very great care, and only between narrow limits of temperature. Electrolytic corrosion, at the expense of the zinc, is very apt to occur at all junctions with dissimilar metals, and mechanical contact clamps are preferable to soldered joints, owing to the low

PREEBLES 500-KW. MOTOR CONVERTER AT GLENFIELD AND KENNEDY'S WORKS.

turns are specially insulated to withstand increased pressure, and each transformer has approximately 5 per cent. reactance. A number of the transformers have their coils clamped by means of the above makers' patented spring clamp, and

melting point of zinc and the risk of coarsening the crystalline structure and rendering the metal brittle by heat. For this reason, zinc wiring or windings may not be used in hot situations, and joint-boxes must be as small as possible, and filled with a compound melting at somewhere below the boiling point of water. Zinc may not be used for overhead lines, and zinc windings are not safe in motors to be used out of doors, neither are they safe in totally-enclosed machines; indeed, they are not reliable enough under any circumstances to be considered safe for use in electrical apparatus for military service. As an approximate rule, zinc conductors may be worked at half the current density, giving the same temperature rise as in copper conductors.

Only a few weeks ago fresh rules were published by the V.D.E. concerning the use of aluminium and zinc lighting wires, pendant and workshop flexibles, as well as rubber-insulated and armoured aluminium cables. A further economy, prescribed "for the duration of the war and a suitable time thereafter," relates to the thickness of lead on lead-sheathed cables. This is to be reduced to values indicated by the following summary, in which the approximate equivalents of the I.E.E. values are added for comparison. Double-lead sheathing is prohibited for the present.

Effective copper section.	Thickness of lead sheathing.	
	New V.D.E. Rules.	I.E.E. Rules (approx.).
1 to 10 sq. mm.	1.0 mm.	1.5 mm.
10 to 50 " "	1.2 " "	1.8 " "
95 " "	1.3 " "	2.0 " "
150 " "	1.5 " "	2.3 " "
240 " "	1.7 " "	2.5 " "
400 " "	2.0 " "	3.0 " "
1,000 " "	2.5 " "	—

Concentric and multicore cables may have a single lead sheathing, the thickness specified advancing by steps of 0.1 mm. from 1.1 mm. for cables 10 mm. or less in diameter (under the sheathing) up to 3 mm. for cables 70 mm. in diameter.

By agreement with the Association of Central Stations and with cable manufacturers, it is arranged that all conductors insulated with "regenerated rubber" shall have a bright green identification thread.

The war-time fittings wire, for use only in or on low-pressure lighting fittings, consists of a solid aluminium or a 7-strand aluminium or zinc wire of 0.75 sq. mm. cross-section, covered with 0.8 mm. of vulcanised rubber, which may be "regenerated" material. Over this there is the usual impregnated cotton or silk braiding, and the test for the finished material is ability to withstand 1,000 v., A.C., for half an hour between the cores of 5 metres of twin conductor or between two single wires twisted together.

Pendant wires are insulated similarly, and subjected to the same electrical test, but the conductor section is increased to 1 sq. mm., and consists of 19 aluminium or zinc strands. One, or, if preferred, two tension flexibles are stranded with the current-carrying cores, and the whole, after braiding, must be flexible enough to pass without injury over a 25-mm. roller in the case of single cords, and over a 35-mm. roller in the case of double cords.

Flexible for domestic service, subjected to small mechanical stress and lower pressure, is to consist of aluminium or zinc wires of at most 0.3 mm. diameter, suitably twisted together. The smallest permissible section is 1 sq. mm. in aluminium and 1.5 sq. mm. in zinc; the largest permissible sections are 2.5 mm. and 4 sq. mm. respectively. Each core must have at least 1 mm. (radial) of rubber sheathing (which may be "regenerated"), and over that a braiding. The test for this class of wiring is ability to withstand 2,000 volts A.C. for half-an-hour on 5-metre test lengths after immersion in water for 24 hours. Workshop flex is of similar construction, but sections up to 16 sq. mm. are permissible, and wires 0.4 mm. in diameter may be used in sections exceeding 1 sq. mm. Vulcanised rubber insulation is specified, and this must be covered with impregnated tape or paper. Two or more cores are placed together under a strong outer covering. All wiring conductors must have strands not exceeding 0.3 mm. diameter.

The following extract from the wiring table for aluminium and zinc wires may be compared with the I.E.E. limits for copper.

Conductor section.	Maximum permissible current.		
	Aluminium (V.D.E.)	Zinc (V.D.E.)	Copper (I.E.E. approx.)
1 sq. mm.	8 amps.	—	6 amps.
4 " "	20 " "	13 amps.	24 " "
10 " "	34 " "	23 " "	38.57 " "
25 " "	80 " "	52 " "	64.103 " "
50 " "	125 " "	83 " "	98.158 " "
95 " "	190 " "	125 " "	150.245 " "
150 " "	255 " "	170 " "	204.327 " "

* Rubber and paper insulation respectively.

In addition to last year's rules sanctioning rubber-insulated zinc cables for use in low-pressure permanent installations, rules have been issued for rubber-insulated aluminium wires of the same general construction, but permitted in sections down to 1 sq. mm., this conductor having 7 strands and at least 1 mm. thickness of rubber. In armoured aluminium cables the minimum conductor section is 1 sq. mm. The following figures show the maximum permissible sustained current flow in a few sizes of aluminium cables laid in earth, and give a good idea of the rating permitted:—

Aluminium conductor section, sq. mm.	Single core cables 750 v.	Maximum sustained current, cables laid in earth.							
		3,000-volt cables				10,000-volt cables			
		1	2	3	4	1	2	3	4
1	12	32	28	26	—	—	—	—	—
10	75	55	50	44	55	42	50	46	42
50	200	145	125	115	140	115	135	120	105
150	390	275	240	220	275	220	255	230	210
240	515	360	320	295	360	295	—	—	—
400	695	455	435	—	490	415	—	—	—
1,000	1,200	—	—	—	—	—	—	—	—

The specific resistance of the aluminium and zinc conductors covered by the above tables may not exceed 0.030 ohm and 0.0067 ohm respectively, per sq. mm. per metre at 20° C.

Bus-bars and other interconnectors can be made of zinc without difficulty, except that precautions must be taken against corrosion at contacts where iron screws are necessarily employed. Rules have been framed also for the use of zinc wires and iron slip-rings in electrical machinery and transformers, but in these applications the defects of the substitutes are very pronounced. Zinc windings with anything like reasonable losses cannot be easily accommodated, particularly on rotors, and iron is one of the worst metals from the sparking point of view. From the provisions of the V.D.E. rules it appears that zinc windings are scarcely practicable in machines or transformers exceeding 250 kw., and that serious difficulties are often encountered in apparatus of 50 to 100 kw. In all cases the first cost of the zinc-wound apparatus seems to be at least as high as that of standard construction, and the cost of running losses is, of course, much greater. There is no reason to believe that zinc conductors will ever be used otherwise than under the compulsion of necessity.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Bennis Automatic Elevators.

An automatic mechanism has recently been added to the design of the Bennis independent elevators. The Bennis bucket elevator consists of a strong steel chain to which buckets are attached at regular intervals: the coal is fed into the elevator boot by means of the Bennis rotary safety feeder at a suitable speed, rendering choking of the bucket by over-supply impossible. The shoot which feeds the fuel from the elevator head to the hopper is swung on a balanced lever supported by the elevator head: the tail end of the shoot is supported by means of a chain, rod, or wire rope. The elevator feeds the coal into a small hopper forming the upper end of the shoot. When the shoot is empty, the weight on the balance lever draws the belt on to the driving pulley through a parallel link motion, so that the elevator starts up. When the shoot fills, it overbalances the balance lever and pushes the strap fork on to the loose pulley, and the elevator is brought to a stop.

When the shoots are about half empty, the balance lever comes into operation again, and the elevator starts up. By this means there is always a sufficient supply of coal to keep the hoppers full, but the elevator is never allowed to overflow. The rate of revolu-

tion of the rotary feed can be altered by the raising or lowering of a handle. The device, views of which are given in figs. 1 and 2, can be applied to any existing elevator, and diminishes the cost of attendance, an important matter in these times.

FIG. 1.—ELEVATOR WITH SELF STARTER.

FIG. 2.—ELEVATOR HEAD, SHOWING BALANCE LEVER AND BELT FORK.

The apparatus is manufactured by MESSRS. ED. BENNIS & CO., LTD., Little Hulton, Bolton, and 28, Victoria Street, S.W.

Isolating Switches.

A line of substantial isolating switches for use on high-pressure systems has been designed by the BRITISH THOMSON-HOUSTON CO., LTD., of Rugby, for pressures up to 11,000 volts, and currents to 1,200 amperes. The switches are made in several patterns, of which Type I is illustrated in fig. 3. The switches are, with few

FIG. 3.—200-AMP. ISOLATING SWITCH ON CAST-IRON BASE.

exceptions, of wrought copper, carried on white porcelain insulators, and are designed to be operated by means of insulated hooks on wooden handles. Interlocking mechanism and safety catches can be provided if required. For three-phase circuits rotary switches are made.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

"O Ye of Little Faith."

Why is it that the electrical men of this country have such little faith in advertising and modern methods of selling? The seventh instalment of your contributor's article on the "Selling Side of Electricity Supply," has evoked this outburst from an otherwise peaceful citizen. One would think that the product, and the accessories to that product, which we are so interested in, are unworthy of expenditure in the matter of advertising and sales promotion.

Your contributor shows a lack of knowledge of true advertising by stating that artistic embellishment is necessary to the success of a piece of advertising matter! A calendar or diary is not the best form of advertising, neither is it the first form of advertising to adopt! What is the matter with a piece of blotting paper printed on one side? It is cheaper than the calendar, and is needed in most households; but how poor must be the claims of the product if, in order to secure attention, we must give away something that is "useful."

To suggest that any form of advertising should be prohibitive on account of expense, is at once to label it as unsound in principle, and therefore not in any sense good business.

Again, what value does he place upon the claims of electrical domestic appliances, when he says that the meter-reader should not waste his time canvassing. Why talk of increasing sales by giving the meter-reader an increase in wages of 6d. per week?

Do not the merits of the electric iron, toaster or vacuum cleaner warrant the adoption of ordinary commercial methods; and is it impossible for a good traveller, receiving a salary of about £5 a week and commission, to earn this sum by selling electricity and domestic appliances? If such is the case, why discuss the question?

In a recent advertisement a manufacturer was appealing to central-station engineers and contractors to acquaint themselves with electric cooking and heating by using the appliances themselves. Can we hope to increase the demand for articles which do not merit a place in our own homes?

Until we have confidence in our wares, and look upon advertising (by which I mean the employment of men as well as printed matter) as an investment instead of an expense, we can only grow in spite of ourselves and through the sheer merits of our products.

I believe I am one of the few who have little faith in the co-operative idea of advertising—except as an adjunct of individual effort. The business of the world has been built by sane competition, and so long as we adopt methods which tend to stifle this, progress will be slow.

Advertising to be successful need not involve a vast expenditure, but it should be suited to local conditions and give the fullest possible information to prospective clients.

Co-operative literature cannot be made direct enough in its appeal to ensure an adequate return—it is necessarily too general.

Let each central-station engineer, contractor, and manufacturer who believes in advertising secure the assistance of a capable advertising man, and collaborate with him in spending the appropriation in the most direct way possible. If he feels inclined to put 10 per cent. of this money into a pool for a broader campaign, then he will be doing the right thing; his motto should be 90 per cent. direct, 10 per cent. indirect, until such time as he feels that the whole of the money can be best spent in his own way and in his own locality.

After 14 years' experience in advertising and selling in the electrical industry, I have found the fac-simile typewritten letter (with name and address filled in so well as to render it equal in all respects to an individual type-written original) to be one of the most productive forms of advertising. Added to this, should be an occasional business-like leaflet, which relies on photographic illustrations and the interest of its message rather than "artistic embellishment" to secure a reading.

Both will eventually find a resting-place in the waste-paper basket, but what matters if an adequate percentage has actually created a sale? We can afford to send these inexpensive forms of advertisements out again and again to those who have not purchased, and then secure the advantages of cumulative effect.

The central-station engineer is in a most favourable position in that he has a complete list of consumers, and by using the post he can eliminate all waste in advertising.

In the case of the London companies, conditions may be so different as to render it more profitable to take a London newspaper, in order to reach their consumers at a minimum expense. At least one supplier of domestic electrical appliances has found the London Daily Press a paying medium, but then he is interested in all districts.

All these considerations are simple of solution when one has facts and figures to work upon; and the more one thinks of advertising in connection with electricity generally, the more one realises the vast possibilities in the field.

During the last few years manufacturers have shown a greater appreciation of the claims of the trade paper in the matter of advertising. It is a hopeful sign, and I doubt not but that other sections of the industry will fall into line eventually.

A. J. G.

Salaries for Engineers.

At this period one hardly likes to criticise an important Government department, which we all believe is doing good work, but a word of protest seems not out of place against the suggestion contained in an advertisement—in your issue of June 10th—of the Admiralty, that a fair salary for the services of a M.I.E.E. is £250 per annum.

I understand that men competent to supervise power and lighting plants are required, and for such it is only right that an adequate salary should be offered—especially as the appointments are not permanent. If the salary named is a fair return for the services required, then there can be no need for engineers who are sufficiently qualified to be full members of the Institution. The successful candidates will, I believe, be ranked as second assistants—not a particularly high degree. As it stands, the advertisement is distinctly open to the interpretation that the electrical department of the Admiralty has not much respect for the Institution and its standards of professional competency.

A.M.I.E.E.

60-cycle Transformers on 25-cycle Systems.

Could any reader explain why some transformers, designed to operate on a supply having a frequency of 60 cycles, work satisfactorily on a 25-cycle system, disregarding regulation and temperature, whilst others, although of the same type and output, cannot be used?

We are running certain transformers under this condition, and have several others to which we cannot use.

Is there any way whereby these transformers could be used up, to save having them re-designed?

William Lovell.

London, N., June 15th, 1916.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

COLOMBIA.—A Resolution, dated December 29th, 1915, of the Minister of Hacienda notifies that goods dispatched to Colombia must be declared in the Consular invoices in the terms of the nomenclature of the Colombian Customs Tariff. Firms exporting goods to Colombia should therefore obtain from the importers or their agents the information necessary to enable them to do this.

VENEZUELA.—According to a recent Presidential Decree, electric batteries when imported into Venezuela must be declared in the Consular invoice as "pilas electricas," and will be dutiable under Class III of the Tariff at the rate (including surtaxes) of 0.391 bolivar per kilog. gross. (Bolívar = 9.6d.; kilog. = 2.2046 lb.)

Note.—It is important to preserve the exact (Spanish) wording mentioned above in the declaration for Consular invoice.

CHILE.—In virtue of a Law, dated February 29th, the fees to be charged from April 1st to December 31st next by Chilean Consular Officers are to be levied at the rates hitherto in force (viz., those fixed by the Law of September 21st, 1909), with an increase of 50 per cent. Particulars of the fees chargeable under the Law of 1909 are obtainable from the Commercial Intelligence Branch of the Board of Trade.

NEWFOUNDLAND.—The free entry of material for installing wireless telegraphy on board ships engaged in the trade and fisheries of Newfoundland was among the proposals made by the Minister of Finance and Customs in his Budget speech of April 18th. The Act embodying this proposal was passed on May 4th.

IN our last issue we referred briefly to the annual meeting of this Association, which took place in London on Thursday and Friday last week, at the Institution of Electrical Engineers.

As was the case in the previous year, the proceedings were severely curtailed, though, judging by the numbers attending the meeting and the nature of the business transacted there, it is certainly open to question whether such drastic treatment of the annual gathering is not a mistake. If "public interest" is to be taken as a criterion, then the three papers considered on Thursday last week—which, so far as the authors' abstracts at the meeting are concerned, might equally well have been "taken as read"—deserved a better fate than to be crowded into one day, as they were devoted to pressing questions of the hour, of the first importance not only to the electricity supply industry, but also to the State, and might well have been discussed at greater length.

Mr. Lackie's paper dealt mainly with the arrangement and operation of the steam-raising plant in a modern coal-fired boiler house, though the discussion embraced several other topics and led to interesting disclosures on the subject of gas-firing. We confess that we were rather surprised that the paper contained no reference to the higher steam pressures and superheats, towards which developments in central-station practice have been tending for some time; fortunately, in the discussion, Mr. J. P. Gregory's intimation that a boiler-turbo unit of 1,500 kw. had been operating satisfactorily for over a year with steam at up to 400 lb. pressure and 700 deg. F. temperature, showing an overall thermal efficiency of over 19 per cent., afforded an indication that progress is being made by our engineers in this direction. The whole question of boiler pressures requires careful consideration now.

There appears to be no obvious reason why a factory for the commercial production of electricity should be rectangular in outline, any more than any other factory, and the care often displayed in fitting the boiler-house or houses to the modern turbine room is remarkable; we appreciate Mr. Selvey's remarks on this matter, though we cannot quite understand his apparent repugnance to gas-firing.

To us it seems that the suggestion of Mr. Christie, to separate the fuel plant from the modern boiler-house and treat it as a specialised department, has many points to recommend it.

It was unfortunate that Mr. W. Yorath Lewis, whose diagrams of Niclausse boiler plants were dis-

played upon the wall, was not called upon to speak until the sitting was about to close.

The paper by Mr. H. S. Ellis on independent stations *v.* bulk supply was criticised in some quarters because it was based on published statistics relating to works costs, &c., which are, of course, admittedly unreliable for certain purposes, such as, for instance, individual comparisons, but are, nevertheless, useful where average results of groups of stations are concerned. The future of the individual station is closely bound up with the question of interlinking supply areas, to which we have referred at some length in recent issues, and it is evident that if the highly efficient high-superheat plant referred to by Mr. Gregory is adopted to any extent, the life of the smaller generating stations as independent plants may be prolonged.

It is not at all unlikely, however, that linking-up may come about solely on the score of reliability, and, to turn to the third paper, by Mr. Kerr, on agricultural electricity supply, such linking-up in agricultural districts would probably be the means of developing a profitable load *en route*, from supply to farms, country houses, and villages in the vicinity of the line.

Mr. Kerr's paper is, we believe, the first one read in this country dealing specifically with the electrical aspects of agriculture from the central-station man's point of view, and draws timely attention to a matter in which we lag seriously behind many Continental nations, as well as the Canadians and Americans.

The paper recapitulates many matters which have, of course, appeared in the various articles on the subject appearing in our pages from time to time, and it is not now a question of whether electricity supply is valuable to the farmer and welcomed by him, or of whether it will pay the central station to supply the farmer, but solely a question of how to render such a supply available at an early date, in all reasonably accessible districts.

We have on previous occasions urged the pressing necessity of taking immediate action in this matter, the urgency of which is dictated alike by the favourable opportunity created by the present labour shortage, and by the need for checkmating the energetic campaign in favour of oil and petrol engines for farm work, which has already made considerable headway.

The discussion, though wholly favourable to Mr. Kerr so far as it went, rather tended to show that there are still many engineers and committee-men who are disposed to adopt a "Wait and See" policy. The achievement of practical results in the direction of agricultural electricity supply would obviously be facilitated were supply engineers—municipal and company alike, for the matter cannot be confined to municipal circles—to arrive at some common understanding as to the methods to be employed in installation work on farms, in running farm services, in formulating scales of charges, and generally in conducting this class of business; experience already gained should be within the reach of all, and no effort should be spared to secure both organised and standardised methods of dealing with the agricultural business. The matter is one on which it would be interesting to have the views of station engineers already engaged in this class of work, and an attempt should be made to secure the co-operation of the electrical and agricultural machinery makers. Possibly a society—or at any rate a committee—of representatives of all the interests involved might be formed to deal with these matters, and we should be happy to afford any assistance in our power towards attaining this end.

The Economic Pact.

THE Prime Minister has announced in the House of Commons this week that if there is any general desire for discussion of the findings of the Allied Economic Conference he will find an opportunity therefor. While we must not attach too much importance to remarks that may fall in the course of a Parliamentary debate on this great subject, it would be of some value to see whether House of Commons opinion is as substantially sound on the matter as is opinion generally, and particularly in commercial circles, throughout the country. We heartily agree with those who say that there is no time to be lost in making such preparations as are necessary for carrying the Allied policy into effect. The French Cabinet has already signified the adhesion of the French Government to all the resolutions adopted, and Mr. Asquith has intimated that the result of the Conference is binding on the House of Commons. Each of the nations in the Entente will take steps suited to its own position and circumstances, but all are determined that both now and after the war they will not allow either their resources, their trade, or their people's interests to be exploited to the advantage of enemy countries or to the detriment of themselves. Of course, it is quite true, as some people have been saying, that the precise manner of dealing with the matter will be affected by the kind of peace that is secured. An inconclusive peace might leave much power in the hands of the Central Empires, limiting the ability of the Entente to carry the Conference's intentions into effect. But there is to be no inconclusive peace, and if Prussian militarism is to be stamped out the Prussian military party must be disposed of, or chained for generations. If the Allies' military and naval victory be so complete, as we believe it will, that there will be a break-up of Prussianism and a removal of its leaders from the head of German affairs, there will still be the commercial magnates and organisations to deal with. The break-up of the idol of World Domination may, as time passes, pave the way for new and better ideals among the millions of Germany, but the need will remain for those who, against their will, were plunged into this unparalleled war, to secure their position for the future, until the chastening of Germany has smashed the idol of commercial and industrial "penetration" and "domination." Therefore, it has been necessary to make these very definite recommendations for meeting the measures which the Central Empires are understood to be developing to defeat us all economically after the war. But the recommendations are to become more than mere recommendations. We observe that an attempt has been made to secure opinions in favour of a great gathering of industrial and commercial authorities to discuss how they should be carried into effect, but we doubt whether such a conference is either possible or desirable just now. The Government and the Board of Trade must know the mind of the country by this time on most of the points in the recommendations, and Mr. Asquith has promised to make "at an early date" a general statement as to the steps that are to be taken to give effect to the convictions so strongly expressed by the Conference. We await that statement with interest. There is no room for half-measures or for any half-hearted way of dealing with the matter. Step by step the Government has been assisted along a progressive way by the opinion of the majority of the nation, but we trust that Mr. Asquith's statement will show that the Cabinet needs no further pressure from the people, is of one mind, and ready for prompt, thorough, and energetic action in regard to these vital questions.

Mr. Asquith's promised statement is described as a "general" one. It will doubtless be sympa-

thetic and will deal chiefly with the main principles by which we are to be influenced in the carrying out of our policy; the manner of dealing with particular industries will be dependent upon the findings of the After-the-War Trade Committees which are now sitting. Mr. Runciman in his best moments said that Germany must be prevented from ever again raising her commercial "head." In later expressions of his views the "head" became only a Hunnish military "helmet." The Conference, at which he was unfortunately prevented from being present, seems to suggest the need for an economic straight-jacket to be fitted on to the enemy, only to be removed at the good pleasure of the Allies.

Lead. THERE has been another considerable fall in the price of pig lead within the last few weeks which must be largely ascribed to the attitude of the authorities under whose control the market remains entirely as heretofore. The supply of spot or prompt metal has been throughout quite liberal, and offers of Government metal having at times been rather pressed, this has accelerated the downward tendency, which, moreover, has been lately assisted by the general depression in metals. The tendency, at the same time, has been very irregular, quite according to the extent of the demand from consumers for early delivery. The value of the latter has dropped to well below £30 a ton, and the fact is worth noting that forward positions have been obtainable at a steadily widening discount. Statistical data are now complete since supplies under Government control are no longer included in the official returns, so that these are of no use whatever in making attempts to gauge statistical merits. The authorities alone would be able to throw light on that point, or to what extent supplies are coming in or have been absorbed for munition purposes. Very big tonnages, no doubt, have been required in that direction, but there is good reason for believing that the authorities have already made full provision for all their requirements for some months to come. They are thus well able to accommodate consumers for current needs, and for this reason the sagging of prices is not unlikely to continue.

The efforts of the Government in getting prices down from an unduly inflated level have proved successful in the long run. There has been a severe fall from the highest seen this year, namely £36 10s., but prices still stand pretty high, making allowance that present indications as regards the course of the war lend themselves to a gradual return to more normal conditions. Unless a change of attitude becomes manifest on the part of the authorities, or arrivals unexpectedly fall far short of requirements, those dealers who are suggesting a recovery in values seem rather premature in their views. It is true that prices across the Atlantic are still at a high parity level as compared with our market, but there are now already vague signs of some American interests contemplating the placing of forward contracts for shipment to this side which may be regarded as the forerunner of a further letting down of prices in America. So long as America is still able to divert considerable quantities of metal to the Far East and elsewhere against old contracts entered into at high prices, no important development may be experienced in that quarter; but there is no doubt that with decreasing domestic requirements, American producers will soon feel the need of stimulating export business once more. Attempts in that direction would now probably be facilitated by the fact that exports from this country are still virtually prohibited, attempts made for some time past to obtain permits having proved abortive.

THE ECONOMIC PACT OF THE ALLIES.

THE representatives of the Allied Governments who met in June in Paris at the Economic Conference declare that the Empires of Central Europe are to-day preparing in concert with their Allies for an economic contest to continue after the re-establishment of peace. Agreements now under preparation between our enemies have the obvious object of establishing domination over the production and the markets of the whole world, and of imposing on other countries an intolerable yoke.

In face of this grave peril, the representatives of the Allied Governments state that they consider it their duty, on grounds of necessary and legitimate defence, to adopt and realise from now onwards all the measures requisite on the one hand to secure for themselves and for the whole of the markets of neutral countries full economic independence and respect for sound commercial practice, and on the other hand to facilitate the organisation on a permanent basis of their economic alliance. The following resolutions are therefore submitted for the approval of ourselves and our Allies, and in view of the unanimity of the conference, the definite nature of its propositions, and their importance as a basis for the preparation of a Government policy which shall be equal to the emergency, we print them in full. It behoves our own and the Allied Governments to proceed at once to embody the recommendations in Acts. The Conference, by its closing sentences, has declared that there must be no delay, and, though there will be tender-speaking voices and critical minds that will be all too solicitous for the interests of the enemy, we believe that the great bulk of the nation will be behind legislators if they take strong action immediately to ensure that the work of the Conference shall not be thrown away.

The recommendations relate to three periods:— (1) During the remainder of the war; (2) during the period of reconstruction, commercial and otherwise, in Allied Countries; (3) for after period (2) when permanent measures will be needed for mutual assistance and collaboration among the Allies.

Measures for the War Period.

I.—The laws and regulations prohibiting trading with the enemy shall be brought into accord. For this purpose:—

(a) The Allies will prohibit their own subjects and citizens and all persons residing in their territories from carrying on any trade with (1) the inhabitants of enemy countries whatever their nationality, (2) Enemy subjects wherever resident, (3) persons, firms and companies whose business is controlled wholly or partially by enemy subjects or is subject to enemy influence and whose names are included in a special list.

(b) They will prohibit the importation into their territories of all goods originating in or coming from enemy countries.

(c) They will devise means of establishing a system enabling contracts entered into with enemy subjects and injurious to national interests to be cancelled unconditionally.

II.—Business undertakings owned or operated by enemy subjects in the territories of the Allies will all be sequestered or placed under control; measures will be taken for the purpose of winding-up some of these undertakings and of realising their assets, the proceeds of such realisation remaining sequestered or under control.

III.—In addition to the export prohibitions which are necessitated by the internal situation of each of the Allied countries, the Allies will complete the measures already taken for the restriction of enemy supplies, both in the mother countries and in the Dominions, Colonies and Protectorates:—

(1) By unifying the lists of contraband and of export prohibition, and particularly by prohibiting the export of all commodities declared absolute or conditional contraband;

(2) By making the grant of licences for export to neutral countries from which export to enemy territories might take place conditional upon the existence in such countries of control organisations approved by the Allies; or, in the absence of such organisations, upon special guarantees such as the limitation of the quantities exported, supervision by Allied consular officers, &c.

Transitory Measures for the Period of Commercial, Industrial, Agricultural, and Maritime Reconstruction of the Allied Countries.

I.—The Allies declare their common determination to ensure the re-establishment of the countries suffering from acts of destruction, spoliation and unjust requisition, and decide to join in devising means to secure the restoration to those countries, as a prior claim, of their raw materials, industrial and agricultural plant, stock and mercantile fleet, or to assist them to reequip themselves in these respects.

II.—Whereas the war has put an end to all the treaties of commerce between the Allies and the Enemy Powers, and whereas it is of essential importance that, during the period of economic reconstruction which will follow the cessation of hostilities, the liberty of none of the Allies should be hampered by any claim put forward by the Enemy Powers to most favoured-nation treatment, the Allies agree that the benefit of this treatment shall not be granted to those Powers during a number of years to be fixed by mutual agreement among themselves.

During this number of years the Allies undertake to assure to each other so far as possible compensatory outlets for trade in case consequences detrimental to their commerce result from the application of the undertaking referred to in the preceding paragraph.

III.—The Allies declare themselves agreed to conserve for the Allied countries, before all others, their natural resources during the whole period of commercial, industrial, agricultural and maritime reconstruction, and for this purpose they undertake to establish special arrangements to facilitate the interchange of these resources.

IV.—In order to defend their commerce, their industry, their agriculture and their navigation against economic aggression resulting from dumping or any other mode of unfair competition, the Allies decide to fix by agreement a period of time during which the commerce of the Enemy Powers shall be submitted to special treatment and the goods originating in their countries shall be subjected either to prohibitions or to a special régime of an effective character.

The Allies will determine by agreement through diplomatic channels the special conditions to be imposed during the above-mentioned period on the ships of the Enemy Powers.

V.—The Allies will devise the measures to be taken jointly or severally for preventing enemy subjects from exercising, in their territories, certain industries or professions which concern national defence or economic independence.

Permanent Measures of Mutual Assistance and Collaboration among the Allies.

I.—The Allies decided to take the necessary steps without delay to render themselves independent of the enemy countries in so far as regards the raw materials and manufactured articles essential to the normal development of their economic activities.

These measures should be directed to assuring the independence of the Allies not only so far as concerns their sources

ment of national industries and resources; to customs duties or prohibitions of a temporary or permanent character; or to a combination of these different methods.

Whatever may be the methods adopted, the object aimed at by the Allies is to increase production within their territories as a whole to a sufficient extent to enable them to maintain and develop their economic position and independence in relation to enemy countries.

II.—In order to permit the interchange of their products, the Allies undertake to adopt measures for facilitating their mutual trade relations both by the establishment of direct and rapid land and sea transport service at low rates, and by the extension and improvement of postal, telegraphic and other communications.

III.—The Allies undertake to convene a meeting of technical delegates to draw up measures for the assimilation, so far as may be possible, of their laws governing patents, indications of origin and trade marks.

In regard to patents, trade marks and literary and artistic copyright which have come into existence during the war in enemy countries, the Allies will adopt, so far as possible, an identical procedure, to be applied as soon as hostilities cease.

This procedure will be elaborated by the technical delegates of the Allies.

Whereas for the purposes of their common defence against the enemy the Allied Powers have agreed to adopt a common economic policy, on the lines laid down in the resolutions which have been passed, and whereas it is recognised that the effectiveness of this policy depends absolutely upon these resolutions being put into operation forthwith, the representatives of the Allied Governments undertake to recommend their respective Governments to take without delay all the measures, whether temporary or permanent, requisite for giving full and complete effect to this policy forthwith, and to communicate to each other the decisions arrived at to attain that object.

THE BENJAMIN ELECTRIC WORKS.

RECENTLY, by the courtesy of the Managing Director, Mr. Guy Campbell, we were enabled to make tour of inspection through the works of The Benjamin Electric, Ltd., in Rosebery Avenue, E.C. The workshops, which were established seven years ago, have been continually extended until they now occupy the whole of the space available at this site, and are packed as full of machinery and workers as they can be—indeed, they are overflowing on to the roof, where a copper-depositing outfit is being installed. While the building is not ideally adapted for the purpose, the business has

FIG. 1.

FIG. 2.

FIG. 3.

VIEWS IN THE BENJAMIN ELECTRIC WORKS.

of supply, but also as regards their financial, commercial and maritime organisation.

The Allies will adopt such measures as may seem to them most suitable for the carrying out of this resolution, according to the nature of the commodities and having regard to the principles which govern their economic policy.

They may, for example, have recourse either to enterprises subsidised, directed or controlled by the Governments themselves, or to the grant of financial assistance for the encouragement of scientific and technical research and the develop-

grown up in it and developed to its full capacity, and like the hermit crab, it is in need of a change of shell to provide more roomy accommodation—but that must wait until after the war; at the moment the works are so busy that the temporary disorganisation that would be incurred by making a change is out of the question.

The principal line of manufacture is, of course, the well-known Benjamin reflectors, but special types of lighting

fittings, Goliath lampholders, large spinnings, &c., are important features of the company's products. The spinning of extraordinarily large vessels from sheet aluminium—sometimes as much as $\frac{1}{2}$ in. in thickness and 7 ft. in diameter at the commencement—is, indeed, a speciality of these works, and is rarely seen in course of execution in other factories.

These vessels, or tanks, are being made in considerable numbers for use in certain processes connected with the manufacture of munitions in which absolutely perfect

FIG. 4.—EXPERIMENTAL LABORATORY.

freedom from leaking joints is necessary, so that spinning is the best method of production. At the time of our visit tanks about 2 ft. in diameter and 2 ft. deep were being made; they were beautifully finished, the surface of the metal being smooth, and the cylindrical shape of the vessel perfect. Spinning is an operation which demands not only a high degree of skill, but also very severe muscular effort on the part of the workman, who, in fact, when dealing with these large jobs, has to be assisted by a labourer; the spinner, moreover, is scarce, and, naturally, a good one can command high wages. Spinning is employed in the manufacture of certain types of Benjamin reflectors, especially those which are made of copper—though steel also is spun

FIG. 5.—DIAGRAM SHOWING OPTICAL DESIGN OF DISTRIBUTING REFLECTOR.

when required; other patterns are pressed out of the sheet, and, consequently, the spinning lathes, heavy presses, and annealing ovens form prominent features of the equipment. We give herewith a view in the spinning department (fig. 1), showing such work in progress, whilst fig. 2 shows one of the heavy power presses, fitted with safety control. A still larger press, which is used for drawing large and deep bowl reflectors, is illustrated in fig. 3 (back view).

These presses were made by Messrs. Taylor & Challen, Ltd., and Messrs. J. Hands & Sons, of Birmingham, and are driven by electric motors. The heavy machines are all installed on the ground floor, together with the annealing stoves and enamelling ovens; enamel is applied by a pneumatic process, which results in an admirably smooth and uniform finish to the coating. A special aluminium enamel has been developed by the company, which when applied to the interior of a reflector gives high reflecting power, and at the same time prevents the steel from rusting, and is easily cleaned; as a rule, however, the reflecting surface is coated with white vitreous enamel, combining high reflecting efficiency with a sufficient amount of diffusion to produce a soft illumination.

An inherent feature of the Benjamin reflectors is that they are not simply "made," but are *designed*, on scientific

FIG. 6.—BENJAMIN HALF-WATT REFLECTOR FITTING, DISTRIBUTING TYPE.

principles, to produce particular results; and the achievement of the desired end is not merely presumed, but is definitely ascertained by actual trial. For these purposes a room has been set apart as an experimental laboratory, in which the designs of the reflectors are prepared and the result is afterwards tested photometrically. We illustrate in fig. 4 the interior of the laboratory, and in fig. 5 the method of arriving at the correct shape for a "half-watt reflector fitting," the final form of which is shown in fig. 6. This reflector is of the distributing type, and its radial

FIG. 7.—CHARACTERISTIC CURVE OF FITTING, WITH HALF-WATT LAMP OF 400 M.H.C.P.

section is part of a true ellipse, of which one focus coincides with the source of light; assuming the reflecting surface to be perfectly regular, all the rays emanating from one focus that are reflected from the surface must pass through the other focus, and the result is practically to produce a secondary light source in the form of a ring near the edge of the reflector.

The characteristic curve of distribution of light resulting from this design is shown in fig. 7, from which it will be

FIG. 8.—ILLUMINATION CURVES.

seen that the intensity of illumination is greatly increased, especially at an angle of about 50° with the vertical. It is not sufficient, in lighting an area, to consider only the effect of a single lamp; the combined effect of all the lamps on each unit of area ought to be taken into account,

and this can be done by means of the curve. As a first approximation to the result, the illumination due to two adjacent lamps can be taken, and this useful information is given by the Benjamin Electric in connection with many of their reflectors, for stated conditions. For example, in fig. 7 two lamps are shown spaced 30 ft. apart and 20 ft. above the working plane; in fig. 8 are given the illumination curves for the space between the lamps, showing a remarkable uniformity of illumination, which will be preserved, but with different intensity, in all positions provided that the lamps are spaced apart (in this case) one-and-a-half times their height above the working plane. In addition to such information, the company include in their lists a variety of useful data, and a rapid method of calculating the wattage required to produce a given intensity of illumination.

Besides the distributing type of reflector above illustrated, a concentrating type is made, as well as a wide range of angle, intensive and extensive, cluster and other patterns, and a variety of lampholders and accessories. In particular, the porcelain Goliath screw lampholder, designed to take the place of the German lampholders with which the market was flooded before the war, has had an enormous sale; these holders are provided with a patent gripping device which effectually prevents the lamps from unscrewing, a great trouble in windy weather. The special machinery for making these and other accessories is installed on an upper floor, of which fig. 9 shows a section; and another floor is devoted to assembling the parts, as shown

FIG. 9. PART OF MACHINE SHOP.

in fig. 10. In the tinman's shop special fascia reflectors for shop windows were being made at the time of our visit, as well as a number of "daylight" fittings, provided with special glass light filters which, with half-watt lamps, give a light practically identical with daylight; we understand that this is a speciality of the Benjamin Electric. Special fittings for powder works, with deep spun copper reflectors, have been made in great numbers, the company having supplied them to many of the Government factories.

While the company does no installation work, it has on many occasions designed schemes for lighting important areas, such as railway goods yards, &c., having acquired exceptional experience in such work, and is always willing to advise either purchaser or contractor; thanks to the system of scientific design combined with experimental verification, it is able to produce the desired results with certainty, and we were much impressed with the scientific methods of investigation that are practised in the laboratory. Moreover, although in the first instance the company marketed American products, almost the whole of its output is now produced in the shops in Rosebery Avenue, only a few items, for which there is a small demand, being imported. That the electric lighting industry has benefited greatly by the introduction of the types of reflector identified with the name of Benjamin cannot be gainsaid, and we congratulate the management of the company upon its success, which we hope will be maintained in the future also.

THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION, 1916.—II.

On Friday morning last the concluding session of the meeting was held, to receive and discuss the Report of the Council and the Balance Sheet, and the Report of the Electric Vehicle Committee. Several passages in the Report gave rise to animated discussions, especially a proposal to end the impasse with regard to the Model General Conditions, some of which have been "receiving the consideration" of the Association of Municipal Corporations for nearly two years, by adopting the Model General Conditions of the I.E.E. Strong feeling was shown adverse to this proposal, and the matter was left *in statu quo ante*. The composition of the Council was another rather controversial matter, the discussion on which occupied a great part of the sitting; it was admitted that the engineers in charge of the big undertakings were men of ability and experience, but it was urged that those responsible for the smaller ones were not without merit, and as the small undertakings constitute the bulk of the membership, they should be directly represented in greater proportion than at present, a point which, to some extent, was ultimately conceded. The subject of British trade after the war called forth some

FIG. 10. ASSEMBLING DEPARTMENT.

excellent speeches in favour of the utter exclusion of enemy manufactures, a view which was heartily endorsed by the applause of the members. Little time was left for other questions, which were rapidly dealt with—including the report of the Electric Vehicle Committee, which was not discussed—and the meeting closed "in perfect harmony."

During the morning the result of the ballot for new members of Council was announced, as follows:—

President, Mr. F. M. Long. Senior Vice-President, Mr. S. J. Watson. Junior Vice-President, Mr. F. Ayton. Engineer Members: Messrs. J. Christie, S. T. Allen, and J. H. Bowden. Committee Members: Coun. Sinclair (Swansea) and Ald. Walker (Manchester).

The following is an abstract of the report of the Council:—The membership of the Association now stands at 377, made up as follows:—

Committees (Members)	...	168
Chief Electrical Engineers (Members)	...	172
Honorary Members	...	6
Chief Assistants (Associate Members)	...	4
Assistants (Associates)	...	27

Model General Conditions of Contract.—The British Electrical and Allied Manufacturers' Association expressed the hope that the I.M.E.A. would now recognise the Institution of Electrical Engineers' conditions as standard. The Council have, however, been unable to take any further steps in the matter, pending the receipt of the report of the Association of Municipal Corporations.

I.M.E.A. Bill.—At the suggestion of the B.E.A.M.A., joint meetings of representatives of the I.M.E.A., the B.E.A.M.A., and the Electrical Contractors' Association were held, at which it was believed that a complete settlement agreeable to all parties had been arrived at. After reference to the full Councils of the respective Associations, however, the E.C.A. finally declined to continue negotiations and decided to oppose the Bill so long as powers to sell are retained therein.

Eastbourne accident and the Board of Trade.—The Council had had under consideration the report of the Electrical Adviser to the Board of Trade on the subject of the fatal accident which occurred on December 26th last, arising out of the collision of a motor car with a switch pillar. The Eastbourne Electricity Committee expressed a desire that the Council should approach the Board of Trade with a view to getting the recommendations contained in the above-mentioned report modified. The question is still engaging the attention of the Council.

Coal Supplies.—On the invitation of the Institution of Electrical Engineers, the Association appointed a representative (Mr. Chattock) to attend a national conference of representatives of the gas and electrical industries for the purpose of considering the question of coal supplies on May 6th, 1915. As a result of the deliberations a deputation of 34 representatives was appointed to present the case to members of Parliament, asking for their assistance in urging the Government to give effect to the recommendations passed at the meeting, calling for increased output, railway transit facilities, and proper regard to the requirements of public utility undertakings dependent upon their supplies on sea-borne coal, when requisitioning coal steamers.

Baile Smith, a member of the I.M.E.A. Council, took a prominent part in the negotiations with the Coal Export Committee, and subsequently he was successful in getting an amendment made to the Price of Coal (Limitation) Bill, giving power to public utility undertakings to have the Bill made retrospective to include already placed contracts. Baile Smith received the thanks of the Council for his valuable service. The whole question of coal supply as affecting members of the Association was referred to a sub-committee, with instructions to make recommendations and to assist members in any difficulty, with advice as to proper procedure.

In March, 1916, a summary of the report and recommendations of the sub-committee, which had been adopted by the Council, was communicated to the members. This was to the effect that while there had been, in many cases, serious difficulty in getting the necessary supply, there was a serious shortage in connection with a few undertakings only; the Board of Trade had, on February 7th, 1916, instituted Committees on Coal and Coke Supplies in 11 districts throughout the country, and the business of these Committees was to see that the resources of their respective districts were used to the best advantage, and that the requirements of important industries were fully met. The Association had approached the Board of Trade, urging them to restrict the exportation of small coal and to limit exportation to large bunker coal.

Since the District Committees had got to work it had become evident that they had very little power to obtain coal for public utility undertakings. Steps had therefore been taken to urge upon the Government the desirability of giving the Board of Trade powers to distribute coal where it was required, and to organise local coal for local use as far as possible, and so relieve congestion on the railways. It was also urged that more steamers should be provided to bring coal down from the North to the South of England.

The Council.—The Council elected Ald. Miller, of Croydon, a member of their body for the current year, and appointed Coun. S. Evans, of Sheffield, to fill a vacancy caused by the death of the late Coun. Crowther, of Sheffield.

The Council had had under consideration a communication from Mr. Purse, of Carlisle, making observations on the constitution of the Council, and some suggestions having for their object more particularly a definite representation of the smaller undertakings on the Council, and the substitution of a postal ballot for the present procedure whereby the ballot is restricted to those members attending the annual meeting. The Council were of opinion that it would be unfortunate to draw any distinctions between members as representing the large or small undertakings or otherwise, and believed that satisfactory representation was gained under the existing Articles of Association.

British Trade after the War.—The Council had had before it the report of the Sub-Committee of the Advisory Committee of the Board of Trade on Commercial Intelligence, with respect to measures for securing the position, after the war, of certain branches of British industry, and after having given the report careful consideration unanimously passed the following resolution:—

"That this Council, while being anxious in every way to encourage British trade and the purchase of home manufactures, and being prepared heartily to support measures taken to this end by legislation or otherwise, view with deep concern recommendation 6 (b) of the Sub-Committee of the Advisory Committee on the Board of Trade to the effect that: 'All Government Departments, local authorities and statutory bodies entrusted with the control of moneys raised by taxes or rates, should be under legal obligation to purchase, so far as possible, only goods produced within the British Empire.'

"The Council is strongly of the opinion that in the event

of this recommendation being adopted, the interests of municipal electrical undertakings and their consumers—which latter embrace some of the largest manufacturing concerns in the country—will be seriously jeopardised, and that municipalities should in no way be subjected to any restrictions than those imposed on private concerns."

Honorary Treasurer's Report.—The chief features of the accounts are a reduction in the cost of postages, printing and stationery, and in general expenses. The income from subscriptions remains stationary, and there is a decrease in the income from sales and advertisements derived from the proceedings. The net result is a surplus for the year of £77, as against £62 last year. The balance sheet shows a slight decrease in the liabilities and a surplus of assets over liabilities of £926.

Financial Organisation.—As a result of the Council having received a number of communications from engineer members intimating that difficulties were being experienced by them in efficiently managing the undertaking for which they were responsible, by reason of the systems of financial control adopted by the local authorities owning such undertakings, it was decided that the matter was of such importance as to warrant the appointment of a special sub-committee to consider the whole question and to report thereon. Mr. W. Wyld was requested to assume the duties of hon. secretary.

The Sub-Committee came to the conclusion that the difficulties experienced were not peculiar to electricity supply undertakings, but were common to all municipally-owned trading departments, and that the matter could better be dealt with by a joint committee composed of members of various interests concerned. To this end the co-operation of the Municipal Tramways Association (Incorporated), the Municipal Waterworks Association, and the Institution of Gas Engineers was invited, with the result that these bodies have appointed representatives to serve on a Joint Committee, and meetings of the Committee so formed are being held.

A request has been forwarded to all engineer members of the I.M.E.A. to submit to the hon. secretary of the Sub-Committee particulars of troubles which are being experienced by them in connection with the financial control of the undertakings with which they are connected.

REPORT OF THE ELECTRIC VEHICLE COMMITTEE.

The report states that *The Electric Vehicle* has been regularly brought out quarterly, and the Committee feels satisfied that it is proving a valuable means of educating the public as to the advantages of the electric vehicle for the different purposes for which it is specially recommended.

The Committee, jointly with representatives of the Tungsten Lamp Association, has considered the question of the sizes of bulbs, and the voltage, of incandescent lamps for use on electric vehicles. The result of the joint deliberation was the issuing of a recommendation that the standard voltage should be 12 volts, the lamps to be coupled across a section of six cells in a lead-plate battery or the equivalent number in a nickel-iron-alkali battery. It was recommended that the sizes of bulbs should be those fixed by the British Engineering Standards Committee in their Report, No. 69.

Standards have also been fixed for the overall sizes of cells, the rating for lead-acid electric vehicle cells, lead battery plates, inspection plugs, charging voltage, charging plug and receptacle.

The Committee has been in communication with representative electrical engineers in our Colonies with a view to the British Electric Vehicle Standards being adopted throughout the British Empire.

The Committee is again indebted to municipalities, electric supply companies, manufacturing firms, and others for financial assistance amounting to £142.

During the past year the following additional bodies have become represented on the Committee:—Garage Proprietors, Institution of Municipal and County Engineers, Municipal Tramways Association, Light Railways and Tramways Association, British Electrical Federation, Ltd.

Many new vehicles have been put into commission during the year, so that, at the present time, the estimate of vehicles in use in the United Kingdom is in the neighbourhood of about 680. This number includes 43 electric warehouse or works trucks, the use of which is likely to extend considerably in the near future; 33 municipalities operate between them, or have on order, 73 vehicles. The total number shows an increase during the twelve months of 197 vehicles.

The Committee thanks the hon. secretary, Mr. F. Ayton, for the very able and efficient manner in which he has handled the work of the Committee.

The accounts show a surplus of income over expenditure of £46, and a surplus of assets over liabilities of £141.

In the discussion on the Report of the Council, Mr. R. A. CHATTOCK suggested that the question of the Model General Conditions should be settled out of hand; it had been hung up by an instruction to the Committee, but he moved that the instruction be rescinded, and that the Model General Conditions of the Institution of Electrical Engineers be adopted provisionally for a year or two; they could be altered to suit individual cases. Mr. H. FARADAY PROCTOR seconded

the motion, but it was vigorously opposed by so many speakers that eventually it was withdrawn. In closing the discussion on this point, Mr. A. C. CREAM pointed out that the I.P.E.E. Conditions were designed to be fair to all parties, and not merely to aid the purchaser.

On the subject of coal supplies, Bailie SMITH expressed gratitude to the Council for its action, which had resulted in a great saving.

The constitution of the Council was attacked by Mr. F. W. PUNSE, who called for the inclusion of members representing the smaller stations; various suggestions were made with a view to attaining this end, and finally a proposal of Mr. E. E. HODDLEY, that at least one seat should be reserved for the representative of a town of less than 50,000 inhabitants, was adopted as a recommendation to the Council.

It was agreed that arrangements should be made for the adoption of a postal ballot for the election of the Council.

On the subject of British trade after the war, Mr. C. C. ATCHISON expressed regret at the attitude taken up by the Council, but said that luckily the Paris Conference had cut the ground from under their feet. He deplored the proposal that local authorities should not adhere to British machinery.

MR. WALKER moved a resolution urging the Government to take immediate steps to deal with the situation that would arise directly peace was declared; chaos would reign in the industrial world, the output capacity of manufacturing plant had been increased by 30 to 50 per cent., and local authorities' supply undertakings were dependent upon the maintenance of industrial prosperity.

Mr. CHATTOCK seconded the motion, and Bailie SMITH energetically called upon engineers to act for themselves instead of waiting for the Government to move; he hoped that no municipality would accept anything from enemy countries in the future. Another speaker agreed, holding that the Government should reverse its customary attitude and encourage trade, instead of neglecting it. Enormous assistance could be given in this way, and if it were done quickly there would be a trade boom after the war. The Chairman of the Kilmarnock Electricity Committee, in an able speech foreshadowing a victorious peace, said that it was the duty of the Association to support the Government in getting its house in order ready for that event. The country had been duped for years into assisting Germany to organise for war; they should urge the Government to put an embargo on all goods from enemy countries. A resolution on the foregoing lines was passed, and the Report and Balance Sheet were adopted.

The place of meeting next year was left to be settled by the President and Council.

On the motion of Mr. H. PARADAY PROCTOR, a resolution pledging the Association to assist, with evidence and financially, the Hackney Borough Council in an action with reference to preferential charges was adopted.

Mr. A. B. MOUNTAIN, of Huddersfield, was elected an hon. member, and the proceedings closed with votes of thanks to the president and other honorary officers.

Boiler House Design and Operation.

By W. W. LACKIE.

(Abstract.)

In the design of a modern boiler-house the main object has come to be to have the maximum of steaming capacity in the minimum of space. Twenty years ago, in the design of a generating station, it was a simple matter to install an additional boiler for each addition to the engine-room plant; economisers were seldom installed, and the stations were run non-condensing.

The growth in the demand for electric energy, the much improved load factor, and the introduction of the use of the steam turbine for the driving of electric generators about the year 1904, brought about a change in the relative space required for engine-room plant and boiler-house plant. Instead of having 1 h.p. per sq. ft. of engine-room floor space, we have to-day turbine rooms with 5 h.p. per sq. ft., and in designs for new power stations, using 15,000 to 30,000-kw. sets, this figure may go up to 20 h.p. per sq. ft. of engine or turbine-room floor space.

It is now recognised that even with improvements in boiler-house design, where very large turbo-generators are in use, every pair of such sets requires a separate boiler-house. Several present-day power houses have an evaporation of 50 lb. of water from and at 212 deg. F. per sq. ft. of ground space occupied by the boilers, but it is possible with improved design of the boiler-house plant to approach an evaporation of 100 lb. from and at 212 deg. F. per sq. ft. While the engine-room and boiler-house floor space were 20 years ago about equal, and remained so even for 10 years thereafter, to-day in a large modern generating station the ground space occupied by the boiler-house is from 1½ to 2½ times the space occupied by the turbine-room.

It is now recognised that a modern boiler-house should consist of three storeys at least: the basement or ground floor containing ash-handling plant; the second floor containing the boilers proper, and the third or upper floor containing economisers and coal-conveying machinery, and probably coal storage.

In stations where boilers of 50,000-lb. capacity are installed, it is necessary to erect a separate chimney for each boiler or each pair of boilers. One is practically compelled to adopt

steel in preference to brick for chimneys in a modern boiler-house, as with steel the chimney can be erected from the third floor, on which the economisers are placed, whereas if brick is used the foundations and superstructure up to the second floor simply mean a waste of valuable space and a mass of brickwork which serves no useful purpose.

The space actually occupied by boilers at present, with the necessary passages between them, does not as a rule exceed 33 per cent. of the total boiler-house floor space, and of this 33 per cent. the grate area only accounts for one-half.

Let us consider the case of a boiler-house which has to supply steam to two 15,000-kw. sets. The steam required for each set will amount to between 180,000 and 200,000 lb. per hour. This steam under modern conditions would be supplied by four boilers, each capable of generating 50,000 lb. of steam. Each boiler will require to burn at least 7,000 lb. of coal per hour, depending upon the calorific value of the coal. Grates of 250 to 270 sq. ft. will be necessary, which means that each boiler will actually occupy, with passages between, about 500 sq. ft., eight boilers will require 4,000 sq. ft., and the boiler-house will have a floor area of 12,000 sq. ft. Fig. 1 shows a plan and cross-section of such a boiler-house.

Twenty years ago water-tube boilers of 4,000 to 6,000 sq. ft. heating surface were considered large; to-day boilers are made with a heating surface from 10,000 to 20,000 sq. ft. In Detroit five boilers each with over 20,000 sq. ft. heating surface are in use.

The boiler-house should be designed to admit of an ample supply of natural daylight. This is managed by placing the boilers back to back, with a firing floor down each side instead of down the middle between the two rows of boilers. Light can then be had from windows in the side walls as well as from the roof. This, however, means a larger floor area and a space between parallel boiler-houses, and further increases the area occupied by the power station. Adequate daylight can be got from roof lights with proper design of the roof, and fig. 1 shows such an arrangement.

There is still a tendency to-day to construct the combustion chamber of boilers much too small. A combustion chamber should be of such dimensions as to allow ample space for complete combustion to take place and the products of combustion thoroughly to mix before coming on to the heating surface. The older boilers had 2 to 2½ cu. ft. of combustion chamber per sq. ft. of grate area; to-day similar

FIG. 1.—SECTIONAL ELEVATION AND PLAN OF BOILER-HOUSE.

boilers have 5 cu. ft. The Detroit boilers before referred to have 9 cu. ft. per sq. ft. of grate area, and this fact is very largely responsible for the high efficiency of these boilers at widely varying loads.

Steam flow meters are as necessary on boilers as an ammeter is on a generator, as they indicate what each boiler is doing, and whether all the boilers are doing their fair proportion of the work.

CO₂ recorders are an index of the working efficiency of the boiler-house; a word of warning, however, is required against assuming that high CO₂ always means high efficiency. There may be a large quantity of CO present. There should be thermometers or pyrometers with dial faces on every boiler, giving the temperature of the superheated steam leaving the boiler, also the temperature of the gases at the damper.

We may at an early date see an increase in the boiler pressure from 160 and 200 lb. to 250 lb. The Commonwealth Edison Co., of Chicago, in 1910 adopted 250 lb. at their North-West station.

A station of 50,000 kw. capacity and burning 200,000 tons of coal per annum requires coal-handling facilities for a supply of 1,000 tons of coal per day, together with facilities for handling 100 tons of ashes per day. This means a railway siding capable of holding from 100 to 200 full trucks, and probably another siding of equal dimensions to hold the

empty trucks. The length of railway sidings for a 50,000-kw. station would not be less than half a mile, or an addition to the site equivalent to 4,400 sq. yd. The wagons have to be tipped, and coal-conveying plant has to be provided capable of handling 200 tons per hour. Coal-breaking machinery should be installed, for while we have been in the habit of using small coal, circumstances may in the near future render it economical to buy and break larger coal.

Large coal storage accommodation is advisable and will prove economical; not less than from two to four months' fuel supply should be retained. This margin enables coal to be delivered in fairly regular quantities throughout the year, and may result in lowering coal prices.

The cost of energy for lifting coal from canal barges or from trucks, and placing it overhead in coal hoppers or in the coal store, is a small item. In one Glasgow station we have a coal transporter fitted with a one-ton grab. This transporter cost £2,600, and handles coal at the rate of 40 tons per hour; the cost of energy, labour, and repairs brings the cost of handling coal in this way just under 1d. per ton. In another station truck-loads of coal are elevated 50 ft. at one end of the coal store to an overhead platform, whence the coal is tipped into an overhead hopper or to the coal store, and the empty trucks are lowered by a second elevator at the other end of the coal store. These two elevators, complete with electrically-operated capstans, cost £2,000. The inclusive cost of handling coal in this way is 3½d. per ton, the higher cost being due to the amount of labour necessary for handling the trucks. These figures are conclusively in favour of the grab and transporter. Where coal has to be carried a short distance from coal store to boiler-house, bucket or tray conveyors appear to be the right thing. On the other hand, for longer distances, the telpherage system works out slightly cheaper.

For the removal of ashes, bucket conveyors have proved to be costly in upkeep on account of the wear of the axles and pulleys, caused by the fine hard grit of ash dust, but even with this drawback, bucket or tray conveyors seem to be the cheapest method of removing ashes. Suction ash plant is finding much favour on account of the absence of moving parts in its design, but the capital cost is about three times that of bucket conveyors. The cost of energy for operating suction ash plant works out at about 5d. per ton handled, at 1d. per unit. Suction plant is now made to do other work. It can be constructed for the purpose of elevating riddlings and small unburned fuel to a hopper or tank over the coal-conveying plant. It can also be made suitable for the removal of soot from economiser soot chambers, and flue dust from the base of the chimneys.

A modern boiler-house calls for comparatively large overhead ash storage, from which ashes can be dropped into wagons or other vehicles for removal. The removal and disposal of ashes is becoming a serious matter. A few years ago ashes had a market value, and we could get as much as 4d. or 5d. a ton for them; to-day we have difficulty in getting the ashes from our stations carted away at 2s. a ton. It has been suggested that it would pay the large electrical undertakings to purchase 3-ton or 5-ton electrically-propelled wagons for the removal of ashes, especially where convenient railway facilities are not available.

Coal-weighing machinery for each boiler or group of boilers is absolutely necessary if proper records are to be made of the boiler-house efficiency. It should always be possible to ascertain the amount of coal used in each eight-hour shift and at the end of each week or month, so that the coal used per kw.-hr. generated may be ascertainable. These weighing machines should preferably be fixed between the overhead coal hopper and the boiler stoker, but some stations in America have a travelling gantry, fitted with a weighing machine at each end, the gantry travelling along the whole length of the boiler-house between two rows of boilers. The duty of the operator on this gantry is to move up and down the boiler-house and to weigh out regularly to each boiler a predetermined amount of fuel.

The total condensate from the turbine-room condensers should be measured by a Lea or other water recorder, and this should have an integrating attachment. Having ascertained the amount of coal used and having measured the condensate, we can get the amount of water evaporated per lb. of coal used.

No very great increase in the efficiency of steam boilers can be looked for. The heat balance of many of the steam plants in operation at the present day is as follows:—

Heat absorbed by boilers	78 per cent.
Heat lost in flue gases	15.5 per cent.
Heat lost in radiation and unaccounted for	6.5 per cent.

That is to say, the total loss on which any reduction can take place is 22 per cent., but it is only a small proportion of this figure which can be attacked with a view to lowering it. It would be doing negative work to discharge the gases from a boiler at a temperature lower than that of the water in the boiler.

An evaporation of 4 lb. of water per sq. ft. of heating surface in the boiler was, until recently, considered standard practice, but to-day water-tube boilers are designed, in conjunction with special economisers, to evaporate at the rate of 6 lb. normal load, and at overload 8 and even 10 lb. per sq. ft. of heating surface of the boiler. The heating area in most water-tube land boilers is of the order of 50 times the grate area. With such proportions the general practice is to

emit the gases from the boilers at a temperature of 500 deg. to 550 deg. F., i.e., from 100 to 150 deg. F. above the temperature of the steam at the boiler working pressure. The proportion of heating surface in economiser to heating surface in boiler varies, but 35 per cent. may be taken as a fair average. With such a proportion, allowing for heat drop in flues, the gases at the outlet to the chimney will have a temperature of from 325 deg. to 350 deg. F., and the economiser will have utilised about 7 per cent. of the heat of the gases emitted from the boiler. The inlet water to the economiser from the hot-well will, with present-day practice, be raised to a temperature of 200 or 220 deg. F. Until recently the evaporation per sq. ft. of heating surface of boiler and economiser combined was therefore roughly 3 lb. per sq. ft. of heating surface. Modern practice tends to diminish the heating surface in the boiler from 50 times the grate area to 35 times the grate area and to increase the area of the economiser to 80 per cent. of that of the boiler heating surface. The result is to put up the evaporation of the boiler at overloads to 8 lb. per sq. ft. of heating surface and the temperature of the gases now emitted from the boiler is considerably raised, being about 650 deg. F. The heat, however, is taken up in the economiser and the temperature of the feed water to the boiler is considerably increased. The net result is that we get an evaporation of 4½ lb. per sq. ft. of heating surface of boiler and economiser combined. The overhead economiser is suitably proportioned to give the very highest combined efficiency. Boiler plants arranged in this way probably give a higher efficiency than was the case with previous designs, inasmuch as the radiation losses are less and the loss between the boiler and the economiser is reduced to an absolute minimum.

(To be concluded.)

WAR ITEMS.

Lighting Prosecution.—For allowing light from un-screened lamps to shine through four windows and the door of the boiler-house at the electricity works at Middleton (Lancs.), James Faulkner, of Oldham Road, Middleton, was last week fined 7s. A police officer said that when he saw defendant about the matter, he said the windows and door were opened for about an hour on Thursday nights to allow of ventilation while the boilers were swept out.

To be Wound-up.—The Board of Trade has ordered the following to be wound-up:—

Eiermann & Tabor, Lauderdale Buildings, Aldersgate Street, London, E.C., bronze powder and metal leaf manufacturers. Controller: P. W. Straus, 7, Great Winchester Street, E.C.

The Bakelite Co., Ltd., Orb Works, Cowley, Middlesex, makers of insulating material. Controller, Sir W. B. Peat, 11, Ironmonger Lane, E.C.

Griesheim-Elektron, Ltd., 3, Thames House, Queen Street Place, London, E.C., and Salford, merchants in dyestuffs and chemicals. Controller: W. Eaves, 15, Fountain Street, Manchester.

Exemption Applications.—An application for exemption made by Mr. E. Inkpen (36), electrician, of Camberley, has been refused.

At Exeter, Mr. F. T. Baker, electrical engineer, who has lost five of his staff and an apprentice, was given exemption until November 30th.

Hastings Tribunal has given conditional exemption for three months to Mr. A. Tester, electrical contractor, and Mr. R. Merrifield, repairer of electrical plant, with Mr. Wordley.

By arrangement with the military, the Reading Corporation Tramways Committee has decided to release for military service all motor-men under the age of 27, and to retain the rest. Sixty per cent. of the staff have enlisted, and the pre-war staff of 200 has been reduced to 84, 47 of whom are being taken for the Army.

On the appeal of Mr. J. T. Spencer, conditional exemption has been granted by the Reading Tribunal to G. P. Wilkins (29), electrician.

At Northampton, on Monday, the Electric Light & Power Co., Ltd., appealed for eight of 15 employes recently ungraded by a Government Inspector. It was stated that the pre-war staff consisted of 77 men and 10 boys; now there were 71 and 16 respectively, but the heavy demand for power for factories had increased the output by 55 per cent. Temporary exemption was allowed in each case.

Exemption has been allowed to Mr. J. W. Gibson (30), manager of the Holsworthy Gas & Electric Supply Co.

The Leigh (Lancs.) Tribunal has granted one month's temporary exemption to the electrician at a local picture house.

At Oldham, exemption was granted to the attendant and electrician at the Castleshaw filtration works on the application of the Corporation waterworks engineer.

At Salford, an electrical contractor appealed for a wireman—his brother—aged 19, and said he had only three men left, including himself. He was indispensable to the business, and applicant had written to the Ministry of Munitions, but had not yet received any reply. The appeal was adjourned for a fortnight so that the decision of the Ministry of Munitions might be obtained.

At Reigate, Messrs. Tamplin & Makovski, electrical engineers, appealed for a foreman, fitter, and turner, an electrical engineer, a maintenance engineer, an engineer, a foreman and skilled hand, and a skilled wireman. It was stated that the firm had lost 18 of their permanent staff. The foreman fitter and turner, the foreman and skilled hand, and the maintenance engineer were conditionally exempted; the engineer was directed to be medically examined, and the other cases were dismissed.

The Maidenhead Tribunal has granted exemption until October 1st to A. R. Mills (21), engine driver and stoker, and Geo. Arthur Cox (22), shift engineer, engaged at the Corporation electricity works.

Leighton Tribunal has granted conditional exemption to nine employees at the destructor works of the U.D.C. The staff has been reduced from 25 to 17.

Six months' exemption has been granted at Hemel Hempstead to Mr. F. Bishop, electrician, of Cotteswells. Mr. Bishop was invalided from the Naval Service, and is now certified fit for home garrison duty.

At Rochdale, exemption was claimed by Mr. G. L. Adamson for W. Bentley (22), electrical wireman, engaged on work directly affecting Government contracts. Mr. Adamson said that 50 per cent. of the employees had been lost. Twenty-one days were granted.

As the result of appeals at Epsom, Mr. F. Fairs, estate electrical engineer, of Stoke d'Abernon, has received exemption until June 30th; Mr. H. J. Proctor, electrician, of Cobham, until September 30th; and Mr. E. E. Newbald, electrical engineer and contractor, of Epsom, for three months.

On the appeal of the Woking Electric Supply Co., Samuel Chas. Bicknell (37), wireman and repairer, has been exempted for three months, and Philip S. White (39), cable joiner's labourer, for one month.

Mr. J. S. Mander (32), assistant engineer with the Ascot and District Electrical Co., has been granted a month's exemption, until July 15th. It was stated that it had been found impossible to fill Mr. Mander's place, and that, alternately with another employee, he had charge of the generating machinery.

Hertford Tribunal has granted exemption until September 30th to Mr. A. H. Sharrat, electrical engineer.

Mr. Lambert applied to the Maidstone Tribunal on behalf of the Corporation for the exemption of Mr. J. P. Macrow (29), electrician, regarded as indispensable to the tramways system, and conditional exemption was conceded.

The Blackpool Tramways Committee has given instructions to the manager to apply to the Tribunal for exemption till the end of the season for a dozen motor-men. It has been found impossible, Mr. Furness informed the Committee, to secure suitable men of non-military age, and therefore, for the first time, he was compelled to apply for the temporary exemption of drivers.

The County Appeal Tribunal at Preston, last Friday, heard an appeal by an electrician, but disallowed it, recommending that the appellant should undergo a trade test with a view to his skilled services being used to the full in the Army.

The branch manager of an electrical firm at Lewes (Sussex) has been conditionally exempted on undertaking to join the Volunteer Training Corps.

(though hardly likely), they might be coupled star and put across the mains singly; in this case the maximum density would be about 40 per cent. greater than normal.

D. D. Rayner.

Wolverhampton, June 24th, 1916.

Throwing-Off Motor-Starting Rheostat from a Distance.

In the interesting first instalment of his articles on "Control Gear for D.C. Motors," in your issue of 23rd inst., Mr. Butler does not mention (in connection with the last diagram) that the short-circuiting tumbler switch should spring back to its normal position when released. This action is very necessary, as otherwise the switch would often be left in the "shorting" position, and the starter would not hold on.

We have no difficulty in modifying our own standard construction to do what is required, and the same can be fitted for either lever or push-button actuation. As regards the bridging of the "way" contacts in passing over, this principle was adopted some time ago in our inductive-circuit switch.

The special motor-stop switch arrangement is all the more necessary when two or more are to be fitted, as the lengths and resistances of the leads tend to increase in such cases. At first sight it may seem impossible to connect more than one of the special stop-switches in circuit, but the problem resolves itself into connecting the top or normal contacts in series, and the "shorting" contacts in parallel. We shall be happy to send a diagram of connections to anyone who is interested.

A. P. Lundberg & Sons.

London, N., June 26th, 1916.

The late Prof. Silvanus Thompson.

May I be allowed to add a word to your tribute to Dr. Silvanus Thompson, from the point of view of an old student?

I was at Finsbury 10 years ago, and though I only spoke to him directly perhaps half a dozen times, and have never seen him since, he has always filled a unique place in my mind. "The Doctor" inspired the greatest affection and confidence in all his men, and was at all times ready to give help and advice to those who went to him.

I remember one of his last lectures in my second year, in which he dropped technical matters, as he sometimes did, and was talking of our future lives and prospects; and he told us then that if ever in our future lives we were in any moral or personal difficulty and felt the need of a "father confessor" he was always at our service; and I should never have had the slightest hesitation in going to him with the full assurance of a patient hearing and wise counsel.

Kipling's lines—

"He scarce had need to doff his pride or slough the dross of Earth—

'E'en as he trod that day to God so walked he from his birth,
In plainness and gentleness and honour and clean mirth.

Who had done his work and held his peace and had no fear to die."

—might have been written of him, and all those who came under his influence will feel that they have lost a very dear friend, and the world a very perfect gentleman.

S.

Discounts.

Some little time ago you inserted an article on discounts, which showed the waste of time arising from the unnecessary complication of multiple discounts commonly used in the electrical trade. The T.L.A. secretary then pointed out that the T.L.A. issued sheets giving equivalent discounts. To this the writer of the article naturally replied, "Why not use the equivalent right away?"

One notes with delight that this suggestion has been adopted in the new circular sent out, and that one discount is now used to do the trick. What about other branches? The I.R. cable makers might take the hint and do likewise with great advantage.

Hope.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

60-cycle Transformers on 25-cycle Systems.

In reply to your correspondent Mr. William Lovell, re "60-cycle Transformers on 25-cycle Systems," it is very difficult, in the absence of further information, to answer his first query; but assuming the supply voltage is the same in each case, then the flux generated when working on a 25-cycle system will be 2.4 times that on a 60-cycle system, which will mean a magnetising current, probably, considerably in excess of the full-load value, depending upon the degree of saturation. For instance, if ordinary Lohys iron be used in the magnetic circuit, and worked at a maximum density of about 6,000 C.G.S. lines per cm.² for 60-cycle supply, then the maximum density on 25-cycle supply would be 2.4 times; i.e., 14,400 C.G.S. lines per cm.², which would enable the transformer to supply the load, disregarding regulation. Considering another transformer with the same outward appearance, but whose magnetic circuit is built up of Stalloy iron, worked at a maximum density of, say, 11,000 C.G.S. lines per cm.² for 60-cycle supply, then the maximum density on a 25-cycle circuit will be 26,400 C.G.S. lines per cm.²; the iron being very highly saturated a large magnetising current would be drawn from the mains.

In order to avoid any alteration to the transformers, I would suggest that they be coupled in banks of two in series; the maximum density would then be only 20 per cent. greater than normal, and should allow them to supply a reasonable load.

If the transformers are three-phase, with delta-connected primaries

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

New Telegraphic Apparatus.

An interesting application of resonance has been made by Mr. Alban Roberts, a New Zealand inventor, to telephony and telegraphy, and should prove of great utility. In both cases the principle involved is the tuning of a column of air enclosed in a tube after the style of the old "pitch-pipe," in one case to produce any desired pitch at the source of vibrations, and in the other to intensify by cumulative resonance vibrations of a particular frequency, and thus to exercise a selective function.

Taking the familiar reaction between a telephone receiver and transmitter as a basis, Mr. Roberts has devised a buzzer which possesses no make-and-break contacts, and which emits a perfectly clear and sustained musical note for any length of time; as shown

in fig. 1. the watch-type receiver R and transmitter M are coupled in circuit through an induction coil C with a battery B, and are fixed facing each other at a distance apart of a few centimetres, in a cylindrical case which confines the column of air between them, and thus strengthens the reaction. Directly the circuit is closed, a clear, musical note is emitted, in the usual way. The back of the receiver is partly removed to allow of the attachment of a tube T, in which moves a piston P; by varying the distance between the diaphragm of the receiver and the piston, the natural pitch of the enclosed air-column is varied over a range limited only by the length of the tube and the dimensions of the receiver, the natural frequency of the diaphragm of the receiver

FIG. 1.—DIAGRAM OF THE ROBERTS BUZZER.

being completely suppressed or overcome by that of the pitch-pipe. This arrangement, which Mr. Roberts has demonstrated to us, forms an excellent buzzer with variable note, consuming very little current, and of very simple construction; the signalling circuit can be taken off the secondary terminals of the coil in shunt to the receiver, and the timbre and pitch of the note are admirably adapted for the purpose to which buzzers are applied.

The sound intensifier or amplifier depends upon the same principle, and is purely acoustic in its action. It consists, in one form, of a tube T fitted with a movable piston P, and one or two side tubes *t*, ending in sockets in which telephone receivers R connected with the source of electrical oscillations (such as a wireless antenna) fit closely; to a pocket in the upper end of the tube T is connected a pneumatic head-set such as is used by medical men in connection with the stethoscope, consisting of rubber tubes *r r* which end in ear-pieces *e e*, attached to the steel spring *s*.

The operator, with the head-set in place, varies the position of the piston in the tube until resonance is obtained with the incoming signals—which is indicated by the manifold increase in the strength of the sounds, as we can testify from experience. Reception can then proceed without further adjustment, but, if desired, a shunt can be applied to the telephone receivers to break down all the oscillations to which they are subjected; obviously those which are not reinforced can be made practically inaudible, while the note which has been selected for intensification remains clear and distinct. The device thus forms a means of tuning out irregular and undesirable oscillations, and retaining only those which are useful; it has the advantage that it can be added

FIG. 2.—DIAGRAM OF THE ROBERTS AMPLIFIER.

FIG. 3.—BUZZER AND AMPLIFIER IN MODEL FORM.

to any wireless installation without alteration to the latter—instead of listening to the receivers directly, the operator places them in the sockets on the Roberts intensifier, and puts on the head-set of the latter. It is a simple and cheap device, and should find many applications in connections with military signalling, wireless telegraphy, &c. Fig. 3 shows the buzzer connected up to the intensifier—both apparatus in their experimental form, but quite efficient.

We have described the devices in their simplest form; the inventor has devised other forms for applying resonance to both sides of the diaphragm of the receiver, damping down the signals with mechanical means (such as an iris diaphragm, instead of the electrical shunt), providing means to deal with the received signals in the resonating air column electrically, and so on. The practicability of using the same line for a number of different signalling points without confusion is an important feature of the system.

Mr. Roberts may be addressed c/o Messrs. Spencer & Son, 56A, Highbury Grove, London, N.

Electrically-Heated Linotype Metal Pots.

A comparatively new application of electric heating is that of keeping in a molten condition the metal in the pots of linotype machines from which the slugs bearing the characters are cast. The printer finds the electrical method free from the disadvantages of gas and gasoline heating, and the slugs produced are practically perfect owing to the close and accurate regulation of temperature. An electric linotype pot is made by the Cutler-Hammer Manufacturing Co., Milwaukee, Wis. Each unit consists of a series of resistor ribbons of metal alloy encased first in mica, then in metal ducts, and sealed by autogenous welding inside a steel casing. The two main units are immersed directly in the metal in the pot, while two more are disposed about the throat and mouthpiece of the pot to ensure proper temperature at these points. The circuit is initially closed by an ordinary snap switch. Thereafter the circuit is automatically controlled by a special thermometer, set to maintain the temperature desired, which limits the range within 10° either way from the predetermined point. This special thermometer consists of an air-tight metal tube filled with mercury, the enlarged end of which rests in the pot. The other end of the tube is formed into a spiral and attached to a lever. As the temperature rises and falls the mercury in the tube expands and contracts, causing the spiral to open and close and the lever to move back and forth between two contact points. This makes and breaks a relay circuit, in turn controlling the current in the heating elements. In first heating the pot from a cold condition the input is 1,600 watts, and is maintained for about 50 minutes. When the proper temperature point is reached the thermometer cuts it down to the operating rate of 550 watts. As the peak load comes from midnight until morning, the electric linotype pot makes a very attractive addition to central station lines. — *Electrical World*,

LEGAL.

MONOMETER MANUFACTURING CO. v. ELECTRIC AND ORDNANCE ACCESSORIES CO., LTD.

MR. MUIR MACKENZIE, one of the High Courts Official Referees, on June 27th, concluded the hearing, at the Royal Courts of Justice, of an action, part heard at Birmingham, in which the Monometer Manufacturing Co. sought to recover from the Electric and Ordnance Accessories Co., Ltd., of Birmingham, the cost of a certain specially constructed and designed installation, consisting of furnaces for melting aluminium and other metals, together with the necessary plant for drawing off and carrying away the metals so melted.

Mr. Colam, K.C., appeared for the plaintiffs, and Mr. Hugo Young, K.C., for the defendants.

By a contract made on January 7th, 1915 between the parties, the plaintiffs agreed to manufacture for the defendants three furnaces for melting aluminium, each with a melting capacity of 1,000 lb., fitted with from 8 to 10 burners each, and with the necessary parts for drawing off the metal into certain smaller furnaces, such parts to consist of a suitable base to bring the outlet pipe over the orifice of the smaller furnaces, which had a melting capacity of 140 lb., so that the metal might be drawn direct from the larger furnaces into the smaller. The plaintiffs agreed to supply these for £230 each, less 2½ per cent. discount, one furnace to be delivered at the Ward End Works within four weeks from the date of the contract. Plaintiffs also agreed to supply 19 furnaces, to be used in conjunction with the three larger ones, each with a melting capacity of 140 lb., without parts for pouring, but each to have three burners with a specially-designed top. These were to be supplied for £52 each, and four of them were to be delivered at the works within four weeks from the date of the contract. Next,

there were to be two other furnaces to be used in conjunction with the others, with a capacity of 110 each, to be fitted with pouring spouts and valves, for which the charge was to be £62 each. There were also three furnaces for melting aluminium swarf, each with a capacity of 600 lb., fitted with water-cooled chills, for casting ingots of aluminium, which were to be supplied complete for £248 each. The burners were to consume only about 60 ft. of gas per burner per hour, and it was also agreed that all

the furnaces should be bricked with special silica bricks, to cut down the consumption of gas per burner by about 10 per cent., and to reduce the consumption to a point lower than that of any other system of furnace heating. All the furnaces were to be fitted with special burners, described as Monometer low-pressure gas burners, Monometer patented gas chamber, and all the latest improvements.

The DEFENDANTS said that the furnaces were not according to contract, and would not satisfactorily do the work for which they were required, and they counterclaimed for damages and for the return of money paid. They said that the plaintiffs contracted that the furnaces should be reasonably fit for melting aluminium to be cast in chilled moulds for fuses, for producing a molten product of pure aluminium absolutely free from particles of iron or other foreign matter, and free from porosity and other flaws and defects, and that the pots forming parts of the plant should not produce scale, but should produce castings suitable for pressing and machining all over. Another condition was that the specified number of burners would produce such a temperature as would be required satisfactorily to melt aluminium for the production of castings. These conditions the defendants said were not complied with by the furnaces supplied. The defendants stated that they required the furnaces and plant for the purpose of melting aluminium for castings in chilled moulds for the purpose of manufacturing fuses, for which manufacture they had prepared plans of a proposed new foundry for an estimated output of between 50 and 60 tons of castings per week. The defendants further alleged that the delivery was not made to time, and that when delivered the furnaces did not work satisfactorily, and that they were not reasonably suitable for the work.

The plaintiffs' case was completed at the hearing at Birmingham, where the evidence of Prof. Arnold and other expert witnesses was taken, in support of the plaintiffs' contention that the furnaces were capable of carrying out the work for which they were intended.

Further evidence was called for the defence at the resumed hearing in London to prove that the specified number of burners did not produce such a temperature as was required sufficiently to melt the aluminium for the castings, and that the necessary degree of liquidity could not be produced with the consumption of gas indicated, and that in fact a much larger consumption of gas was used in attempting to obtain the liquidity. It was said that although attempts were made to make the furnaces comply with the contract conditions they had not been successful.

Mr. WILKOT, the works manager for the defendants, was recalled, and further cross-examined by Mr. Colam, when he said that the scum in the lading pots was sometimes half an inch in thickness. The cold metal was put in at the top as the molten metal was drawn off at the bottom, and in this way the accumulation of scum might have been assisted. He had all through complained of the excessive oxidation. The Monometer furnaces had been offered as being capable of minimising the oxidation, but practice had proved, in his opinion, that they did not. His view was that the principal cause of oxidation was the long time it took to melt the metal. The quicker the melting the less the oxidation. The average heating power was not sufficient, and consequently they could not get their output. When he complained the plaintiffs expressed their astonishment and made certain alterations, but they did it on their own responsibility, and not in consequence of any request from him. In making the contract, he wanted to get furnaces without compressed air or other forced draught and the plaintiffs represented that their furnaces met this requirement.

In re-examination, the WITNESS said that to supply the shops he had to have a certain output from the foundry, and he wanted the quickest and best way of getting the metal down, but the plaintiffs' furnaces took a much longer time to get it down than had been represented, and that necessarily affected the output.

Mr. NUTHALL, head foreman at the defendants' works, also gave evidence as to alleged shortcomings of the Monometer furnaces.

Mr. THOS. TURNER, Professor of Metallurgy at Birmingham University, who said he had been interested for more than 30 years in the production of aluminium and was acquainted with the practice in the chief Birmingham aluminium foundries, gave evidence as to what was meant in the trade by the term "aluminium" and aluminium castings. The term to a chemist would mean pure metal, but in the trade it meant an aluminium alloy consisting of a percentage of zinc or copper. The melting of ordinary aluminium in an iron pot would have very little effect upon the pot, but in the case of an alloy of zinc the iron pot would be affected by the zinc, which would make a distinct crystallised compound. The zinc would take up the iron which was attacked very shortly after the melting point of the zinc was reached, and for practical purposes the iron pot ceased to be an iron pot. He attributed the accumulation of scum to excessive heat or to a longer time being taken in the melting. If the metal was a long time melting, there would be oxidation. The scum on the top of the lading pot would affect the molten metal underneath, because there would be a certain amount of oxidation distributed below any large amount of scum, and the effect upon the castings would be that they would be less sound and harder to machine.

In cross-examination, the Witness said that if he ordered aluminium articles, he would expect to get an alloy; but if he ordered aluminium from a metal merchant, he would expect to get aluminium of 99 per cent. pure. Sometimes a little magnesium was present in aluminium castings, and sometimes he found a little iron. Pure aluminium would not attack the pots, but when there was a mixture of zinc with it, the zinc would do so. Zinc always attacked iron and would do so even though there was aluminium

with it. It was a common thing to coat iron pots, but he objected to say what the coating was, as it was a secret process.

Pressed to say what the process was, Witness said that it was a French secret brought over by a Frenchman. It was in the form of a wash, and had to be renewed from time to time. It was largely composed of chalk or whiting, and was mixed with something which made it stick.

Other witnesses said that in consequence of the Monometer plant failing to do its work properly, there was delay in the defendants' output, and they had to place some of their work in other hands. One witness (Mr. Monroe, their accountant) said that up to the end of July the furnaces produced 1,300,000 castings, which represented about 20 tons a week, instead of 50 tons required. There was necessity for an even larger output than 50 tons required. Up to the end of July there was no intention to get rid of the Monometer furnaces; on the contrary, they were endeavouring to get the Monometer people to work them.

After further evidence had been given for the defence, the Official Referee reserved judgment.

D. DAVIS & SONS, LTD., v. THE ASSESSMENT COMMITTEE OF PONTYPRIDD UNION, OVERSEERS OF RHONDDA AND THE RHONDDA URBAN DISTRICT COUNCIL.

THIS case came before the Court of Appeal, composed of Lords Justices Swinfen Eady, Phillimore and Baikes, on June 21st, upon the appeal of the respondent Assessment Committee, Overseers and Urban District Council from a judgment of a Divisional Court, consisting of Justices Ridley, Lush and Low.

The short facts appeared to be these:—

D. Davis & Sons, Ltd., are the owners and occupiers of certain mines and their appurtenances, and in 1904 they made with the Assessment Committee an agreement by which, for the purposes of rates, the assessment of the property was to be calculated on the output of coal, the agreement being determinable by one year's notice. Some small electric stations were attached to the appellants' pits, and for some years they purchased a large amount of power from an electric power company, but in 1907 they erected an electric power station of their own, and from that time the small stations went out of use, and the company reduced the amount of power that they purchased. Down to April, 1913, the assessments on the company's property were made in accordance with the agreement, the electric power station not being assessed separately from the rest of the colliery. In April, 1913, the Assessment Committee, having given previous notice determining the agreement, assessed the electric power station separately from the rest of the colliery; but they still assessed the latter in accordance with the agreement. The Divisional Court held upon the question of the company's appeal against the poor rate that although the Assessment Committee of 1904 had no power to bind subsequent Assessment Committees, yet as the Assessment Committee of 1913 could not repudiate the agreement so far as concerned the power station, since they had affirmed it as regarded the rest of the company's property, there was no power to rate the power station separately as long as the rest of the property was rated in accordance with the agreement. The Court therefore, held that the rate was bad and remitted the matter back to Quarter Sessions, with an intimation to that effect. Hence the present appeal.

At the conclusion of the arguments of Counsel, their Lordships affirmed the decision of the Divisional Court, and dismissed the appeal with costs.

POWER v. PRINCE OF WALES DRY DOCK CO.

AN unusual claim under the Employers' Liability Act, for personal injuries, came before his Honour Judge Bryn Roberts, at the Swansea County Court, the other day, when Wm. Power, boiler-maker, of Cardiff, sued the defendant company, of Swansea, for £47 odd for damages sustained through the alleged negligence of the defendants, by which he received a severe electric shock that rendered him incapable of work for over a fortnight. The plaintiff was in the employ of the Oxy-Acetylene Welding Co., who were sub-contractors to the Dry Dock Co. in carrying out certain work on the steamship *Lille* at Swansea, in March last. Plaintiff was engaged in trundling some gas cylinders from the stokehole into the engine room, and at the same time some of the defendants' men were engaged with an electric drill, for which purpose an electric cable was conveyed from the quayside to the engine room. The cable trailed along the floor of the engine room, and as the plaintiff brought in the third gas cylinder he received an electric shock that rendered him insensible for some time. It was afterwards discovered that the insulation of one of the electric wires had been cut in several places, presumably by the collar of the cylinder, and it was supposed that by this means the current escaped along the iron floor of the engine room. For the defence it was urged that there was no negligence, and that if there were any, it could easily have been avoided.

Mr. DAVID FULTON, the chief electrician to the Swansea Harbour Trust, who supplied the current, and other witnesses, deposed that they had experimented with a cable under the same conditions, and not more than 175 volts was possible to go through the body. They suffered no ill-effects whatever from the shock. Mr. Fulton added that the biggest shock he ever sustained in his life was of 1,600 volts; but he admitted that less than 100 volts had been known to kill. The latter, however, was alternating current.

His HONOUR said there was negligence in allowing the cable to trail along the floor when it might easily have been hung up out of danger, and he awarded the plaintiff £23 and costs.

STEALING ELECTRICITY.

A FINE of 40s. was imposed at Llanbilleth upon Esau Protheroe, a local collier, for fraudulently consuming electricity, the property of the Abertillery U.D.C., between March and April. Defendant pleaded guilty. Mr. A. H. Dolman, Abertillery, diverted the current from the meter by means of a pin, and conveyed it direct to the lamp.—*South Wales Daily News*.

BUSINESS NOTES.

South African Electrical Requirements.—The *South African Mining Journal* for May 27th says:—"All the municipalities are quietly in the market for switches, copper, and everything connected with electrical power driving machinery. As regards household goods, under this heading, the recent frosts have created a brisk demand for radiators, and in this respect it is pleasing to record that the complete framework of these have been made in Johannesburg for several seasons past, and these now presented are an improvement over last season's. A large dealer thinks that the local makers will oust the imported article, as any metal worker can make them in his spare time, &c. However, they are about 15 per cent. dearer than the imported goods. It must not be omitted to mention that the higher voltage lamps are getting scarce, as it is very difficult to obtain 2,000 candle-powers for the mines, and not easy to get the 1,000 kind."

Wolverhampton Electrical Trade.—In the annual report of the Wolverhampton Chamber of Commerce, the following reference is made to the electrical engineering trade:—"Throughout the year the demand made by the Allied Governments for electrical plant of all descriptions has been exceedingly heavy, many innovations having been introduced for special electrical requirements. Local factories have been, and are still, working day and night to meet the requirements. There is a distinct indication of an increase of trade with the Colonies, due to the supplies from enemy countries having been cut off."

Nottingham as an Industrial Centre.—A well-organised effort is being made to popularise the advantages possessed by Nottingham as a centre for new manufacturing industries. A glance at the map shows the ample nature of the railway connections between the city and the great seaports, also the excellence of the waterway connections. Powers have been secured by the Corporation under which they will spend £160,000 for increasing navigational facilities, but, unfortunately, this work is inevitably held up until a year after the war. At a time when new industries are being established, or when existing companies and firms are contemplating the building of new works, the claims of the district, with its ample fuel supplies, the cheapness of raw materials, &c., are well worthy of consideration. A Special Committee has been appointed to undertake the commercial development of the city, and an Industrial Development Officer has been appointed to devote his whole time and energies to the department. Communications may be addressed to him at the Guildhall, Nottingham.

New T.L.A. Lamp Discount Scheme.—MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., of 38 and 39, Upper Thames Street, E.C., have sent to two booklets explaining the new lamp discount scheme that has just been inaugurated. One of the booklets deals with the scheme from the point of view of the trade reseller, and the other from the point of view of the trade user. They have already been distributed to a number of their customers, and copies will be supplied to any of our readers who are interested in the purchase of Wotan or other makes of T.L.A. lamps. In order that the scheme may be thoroughly and generally understood, we may say that it is based on the quantity of lamps purchased and delivered during 12 months, and the discounts are regulated in accordance with certain stipulated minimum quantities or equivalent net money values. The money values are introduced to cover half-watt type lamps, which, of course, are higher in initial cost. The total annual turnover in all makes of Association lamps will, therefore, regulate the terms at which Wotan, half-watt type, or tantulum lamps can be supplied. The booklets give an example of the method of procedure. A new customer will commence to buy lamps at 20 per cent. but immediately his total purchases of T.L.A. lamps amount to 500 he will automatically become entitled to buy at 22 per cent. In order to avail himself of these terms he must notify the secretary of the T.L.A., and, in addition, he will receive from his supplier, or suppliers, a credit note for the difference between 20 per cent. and 22 per cent. on the original lamps purchased. As each succeeding step is reached the increased discount will be obtained by means of the same procedure. There are, of course, a number of customers who were graded at a definite figure under the previous arrangement, and they will now receive the terms specified for a quantity of lamps based on their past purchases. This will bring them into the new scheme at, approximately, the discount to which they are entitled in accordance with their established turnover, and increased discount will be allowed should they improve on their previous figures. The terms for the trade user have been somewhat revised, and if lamps are purchased in quantities of less than 50, a discount of 15 per cent. only is allowed. Providing the lamps are ordered in quantities of 50 and over for delivery at one

time, the standard schedule of discounts are applicable. It is therefore claimed that the scheme is absolutely equitable, and ensures to each trade buyer a discount directly in proportion to his turnover. As the discounts increase in a succession of easy steps the scheme should be an incentive to business extension. All invoices will be subject to one discount (i.e., the one corresponding to the minimum quantity taken), plus the usual 2½ per cent. (cash) approved monthly account. This obviates the multiplicity of discounts, which are sometimes confusing, and often cause inconvenience and misunderstanding.

Australian Insulators.—According to the *Melbourne Age*, the assurance was given by the Postmaster-General to Mr. Fenton (V.), in the House of Representatives, on May 11th, that the Postal Department was encouraging the manufacture of insulators in Australia, with a view to becoming independent of importations. The following comparative statement shows the extent of the Australian orders, as against importations:—

Year.	Australian.	Imported.
1911	£800	£12,747
1912	421	11,190
1913	399	17,115
1914	4,490	14,444
1915	9,359	5,063

Bankruptcy Proceedings.—THE COLSTON ELECTRICAL WORKS, LTD., 9, Denmark Street, Bristol.—The winding-up order in this matter was made on the petition of a creditor. The liabilities amount to £1,573, to meet which there are net assets of £991, the estate disclosing a deficiency of £582 as regards unsecured creditors, whilst as regards contributories there is a deficiency of £2,234. The company was registered in December, 1913, with a nominal capital of £3,500, to acquire, as a going concern, the business of electrical engineers promoted by G. J. T. J. Parfitt and W. J. Webber, trading as Parfitt, Webber & Co., at 9 and 10, Denmark Street, Bristol. By an agreement of January, 1914, the vendors agreed to sell to the company the goodwill, plant, machinery, stock-in-trade, implements, utensils, book debts, and contracts, &c., which the vendors were entitled to in connection with the business, for 1,600 fully paid-up shares, the company to discharge all the trade liabilities of the said business, and the liability of the vendors' firm to the Capital and Counties Bank, Ltd. The business was taken over from July, 1913, and from that date down to January, 1914, the date fixed for completion, the vendors were deemed to have been carrying on the business on behalf of the company. The directors appointed were Miss H. L. W. Parfitt, Bath; A. E. Finch, Weston-super-Mare, electrical engineer; and E. W. Brock, Keynsham, glass tile manufacturer. At a meeting of directors, A. E. Finch was appointed chairman. An agreement was entered into in January, 1914, whereby A. E. Finch was to act as manager at a weekly salary of £3, and on the same day E. W. Brock was appointed secretary. The company was registered as a private company, and no capital was offered to the public for subscription, and no prospectus was issued. A meeting of the six largest creditors was convened by E. W. Brock in May, and an offer was made of a composition of 12s. 6d. in the £, payable as to 2s. 6d. forthwith, 6s. in one month, 2s. 6d. in two months, and 2s. 6d. in three months. Mr. Brock also issued a notice, signed by him as secretary, without consulting the other directors, convening an extraordinary general meeting of the company for the purpose of submitting an extraordinary resolution for voluntary liquidation and the appointment of a liquidator. Three shareholders apparently attended this meeting, the resolution was passed, and on May 30th, notwithstanding that the hearing of the petition for a winding-up order was to be heard by the Court on the following day, the liquidator purported to have been appointed sent out a notice convening a meeting of the creditors of the company to be held for the purpose of confirming his appointment as liquidator. In these circumstances the meeting was abortive. The failure was said to be due to loss of £725 through bad debts in 1914, and want of capital. From its inception the company has never had sufficient capital, and in 1914 it lost £650 through the failure of the Bristol International Exhibition, Ltd., and £75 through the failure of G. J. T. J. Parfitt in February, 1915. The usual books of account have been kept, but the cash book has not been balanced, and the books in general have not been properly posted. The following are the creditors:—

British Ever-Ready Co.	£194	Hodge, Jacques & Co.	£11
Bristol Corporation Electricity Department	14	Joyner, C. & Co.	10
Calender's Cable & Construction Co., Ltd.	43	National Telephone Finance	14
Cryse & Co., Ltd.	38	Metallic Seamless Tube Co.	22
Drake & Gorham, Ltd.	16	Premier Accumulator Co.	20
Edison & Swan United Electric Light Co.	133	Willey & Co.	20
Haslam & Streeton, Ltd.	77	Winsmith, John, & Co.	12
		Wright, Harland	17
		Parfitt, Webber & Co.	731

R. E. CONNOLD, late electrician, now R.N.A.S., late 6A, The Parade, Canterbury.—The public examination of this debtor was fixed for June 17th, at Canterbury. Debtor was unable to obtain leave to attend the Court. The case was, therefore, adjourned.

South American Trade.—The Hon. R. C. Parsons, chairman of the King's College Delegation, presided at a lecture given by Colonel Don Pedro Suarez, Consul-General for Bolivia, at King's College last week, on the subject of "Bolivia, its Geography and Industries," and said that the greatest bar to British trade in South America was the refusal of the British merchants to adopt the metric system, and their unwillingness to make goods to suit other peoples' necessities. This refusal had sent great quantities of trade into German hands.—*Morning Post*.

Dissolutions and Liquidations.—READER'S PATENTS AND ENGINEERING CO., LTD.—A meeting is called for July 26th, at 3, Portland Street, Southampton, to hear an account of the winding up from the liquidator, Mr. E. W. C. Whittaker.

STANDARD CABLE MANUFACTURING CO., LTD.—Creditors should send particulars of debts, &c., to the controller, Mr. J. S. Feather, 35, Great Tower Street, E.C., by July 31st.

SHIP CARBONS, LTD.—Creditors should send particulars of debts, &c., to the controller, Mr. W. Hancock, 90, Queen Street, E.C., by August 7th.

BLEICHERT'S AERIAL TRANSPORTERS, LTD.—Creditors should send particulars of their debts, &c., to the controller, Mr. W. Hancock, 90, Queen Street, E.C., by August 7th.

ECONOMISERS, LTD.—A meeting is called for July 28th, at 18, Theobald's Road, to hear an account of the winding up from the liquidator, Mr. W. F. Johnson.

HOBART ELECTRIC TRAMWAY CO., LTD.—A meeting is called for August 3rd, at 5, Bucklersbury, E.C., to hear an account of the winding up from the liquidator, Mr. F. J. Warner.

JOHN ROBERTS & SON, boiler coverers, Salt Street, Manningham, Bradford.—Messrs. J. W. Roberts and S. Haigh have dissolved partnership. Mr. Roberts will attend to debts, and carry on the business at 29, Princes Crescent, Bare, Morecambe, under the same style.

Book Notices.—"Trade as a Science." By Ernest J. P. Bann. London: Jarrold & Sons. Price 2s. 6d. net.

"Large Electric Power Stations." By G. Klingenberg. London: Crosby Lockwood & Co. Price 25s. net.

"Electrical Engineering." By E. J. Berg and W. L. Upson. London: Hill Publishing Co. Price 17s. net.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXV. No. 6. June, 1916. New York: The Institute.

"Science Abstracts." A and B. Vol. XIX. No. 222. June 26th, 1916. London: E. & F. N. Spon, Ltd. Price 1s. 6d. each net.

"Scientific Paper of the Bureau of Standards." No. 276. "Protected Thermo Elements." Washington: Government Printing Office.

The *Magazine of the Finsbury Technical College and Old Students' Association* for May contains a portrait and obituary notice of the late Prof. R. Meldola, F.R.S., the continuation of a paper on "Humphrey Pumps," by J. G. Bulger, and a further Roll of Honour of remarkable length.

Board of Trade Inquiry.—The Commercial Intelligence Branch of the Board of Trade has the name and address of a firm of agents and importers of electrical material at Brescia, Italy, which wishes to secure the agencies of United Kingdom manufacturers of electrical plant and machinery, measuring instruments and gauges, apparatus and material for electrical plant, and porcelain and insulating material in general. Reference No. 202.

The Commercial Intelligence Branch of the Board of Trade has received inquiries from Home firms for makers or producers of manganese dioxide for Leclanché batteries, and electrical novelties.

Catalogues and Lists.—THE BONECOURT WASTE HEAT BOILER CO., LTD., Parliament Mansions, Victoria Street, S.W.—New catalogue dealing with gas-fired boilers and waste-heat boilers, describing the Bonecourt surface-combustion system; in view of the increasing importance of economising fuel and recovering the by-products from coal, the contents of this brochure are exceptionally interesting. Tables are given showing the standard sizes of the boilers, the performance of each tube with different kinds of gas, and the draught required, with illustrations of the details of the plant and the lay-out recommended. The results of a test by an independent expert are included, showing the efficiency of an unlagged Bonecourt boiler and feed-water heater to be 92.7 per cent. It is claimed that an evaporation up to 20 lb. of steam per sq. ft. of heating surface per hour is obtainable, and that 48,000 lb. of steam per hour can be generated on a floor space of 225 sq. ft. A battery of boilers for 12,000 H.P. occupies a space of only 48 ft. by 33 ft., and a CO₂ content of 18.1 per cent. in the flue gases is recorded. The boiler can be utilised for recovering heat from the exhaust gases of gas engines, coke ovens, steel furnaces, &c. A new method of mixing the air and gas has prevented back-firing, and the refractory material is now made on a greatly improved system, so that over 3,000 cu. ft. of producer gas can be burnt per hour in one tube 6 in. in diameter and 15 ft. long.

MESSRS. MOSSAY & CO., LTD., 41, Tothill Street, Westminster, S.W.—Illustrated pamphlet (20 pages), describing the "Orwell" electric vehicle of 1½, 2½ and 3½-ton sizes. A number of improvements and additions to the equipment of the vehicles are included.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—Price list No. 4,310, describing and illustrating their type EK, form B, iron-clad switch fuses.

MESSRS. BRUCE PEEBLES & CO., LTD., Edinburgh.—Twenty-page illustrated pamphlet (No. 21 C), in their standard form and size, containing full illustrated specification, detailed tabulated data, output ratings, weights and dimensions, of the Peebles self-contained continuous-current dynamos and motors. Sixteen frame sizes, which are listed, can be manufactured in any of the usual types.

EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., Ponder's End.—Two illustrated and priced leaflets of Edison electric fans of various types. The company has also issued a very handy pocket book in a distinctive red cover, containing "Edison discount tables" from 1/5 to 50 per cent. The book is issued for the convenience of the members of the trade, and it contains various tables not to be found in the ordinary discount books, but useful in making up discount on T.L.A. lamp prices, such as 22 per cent.,

24 per cent., 27 per cent., 28 per cent., 32 per cent., 34 per cent., 36 per cent., 39 per cent., &c.

MESSRS. BELLING & CO., Derby Road, Edmonton, London, N.—Two-fold circular, containing description of their electric immersion heaters, with diagrams showing the methods of their application, also giving dimensions and prices.

Trade Announcements.—**MESSRS. MARBRO, LTD.**, have removed to larger premises at Palace Wharf, Rainville Road, Fulham, S.W. Telephone No.: "Hammersmith 1215."

The electrical and engineering advertising business of Mr. A. J. GREENLY will in future be conducted as A. J. Greenly & Co., and will have additional offices at 37 and 38, Strand, W.C.

THE GENERAL ELECTRIC CO., LTD., announce that the address of their Cork branch, from whence all orders from the South of Ireland are attended to, has now been altered to 76, Grand Parade.

For Sale.—**MESSRS. PERCY HUDDLESTON & Co.** will sell by auction, on July 11th, at Dalling Road, Hammersmith, a quantity of electrical apparatus, &c. Full particulars are given in our advertising pages to-day.

Copper Prices.—**THE WEEK'S CHANGES.**—F. SMITH AND Co. report, Wednesday, June 28th:—Electrolytic bars drop from £139 to £130; ditto sheets, £157 to £150; ditto rods, £146 to £137; ditto H.C. wire, 1s. 5½d. to 1s. 4½d.

JAMES & SHAKESPEARE report, Wednesday, June 28th:—Copper bars, sheet and rod (best selected), drop from £160 to £152.

LIGHTING AND POWER NOTES.

Aberdeen.—**ENGINEER'S REPORT.**—Mr. Bell, the Corporation electrical engineer, in a report regarding new generating plant, says:—"The Council's decision not to proceed with the additional installation suggested in November last precludes the installing of plant for the winter of 1916, and the question now to be considered is the provision of new generating plant before the winter of 1917. The output for the 10 months ending May 31st is 2,030,360 units above the previous corresponding period, being an increase of 19.1 per cent. The remaining two months will, at a conservative estimate, add a further half million units increase, which would make a 23 per cent. increase for the year—a figure only once exceeded in the history of the undertaking. Additional motors of 2,027 H.P. have been coupled up since July 31st last, and applications for a further 1,291 H.P. have been received. No. 1 turbine has now generated 281 million units, being 19 millions in 22 months and 94 millions in the last seven months. A further 500-kw. converter has been ordered since the last report, and, therefore, the 1,000-kw. set recommended in November last can meantime stand over. A 5,000-kw. turbine alternator, if ordered now, can be delivered for next summer, and will, I estimate, cost £18,000."

Australia.—**POWER STATION PLANT.**—For the power station plant and equipment for the Commonwealth naval dockyard at Cockatoo Island, one tender only for engines of Australian manufacture was submitted—viz., for reciprocating engines; the tenders had been originally invited under the heading of four alternative schemes—viz., geared turbo-generators, reciprocating sets with exhaust turbines, reciprocating sets and exhaust geared turbo-generators, and Diesel engine sets. Acting on the advice of the British Admiralty, who endorsed the recommendation of local experts, the Naval Board has adopted the first alternative scheme, and orders have been placed for Parsons-Crompton geared turbo-generator sets. It is stated that for reciprocating engines the price quoted by the Australian manufacturers and that submitted from abroad showed a difference of something like 70 per cent.—*Sydney Morning Herald*.

Barnsley.—**PRICE INCREASE.**—Having considered the report of the borough electrical engineer on the working of the department for the past year, and in view of the loss thereon, the Electricity and Lighting Committee has decided that the price of energy be increased by 1d. per unit for lighting, and 10 per cent. for power consumers.

Beckenham.—**PRICE INCREASE.**—The D.C. has decided that the charge for electricity for lighting shall be raised to 7d. per unit, to take effect from Saturday last.

Bedford.—The R.D.C. has given consent for the T.C. to supply current to the new works of Messrs. W. H. Allen, Son and Co., to be erected in the rural district.

Bolton.—Despite the Summer Time Act, the electrical engineer reports no appreciable decrease in the consumption of electricity. Lighting restrictions had already considerably reduced the quantity used for lighting purposes.

Colwyn Bay.—**PRICE INCREASE.**—Owing to the heavy increase in the price of fuel, the U.D.C. has decided, from the close of the present quarter, to advance the price of energy from 5d. to 5½d. per unit.

Coventry.—**PRICE INCREASE.**—The Electric Light Committee recommends an increase of the scale of charges for the supply of energy for power proportionately to the increased cost of coal.

Darwen.—Fire broke out, on Monday, at the Darwen electricity works, and the man in charge of the engine room, Joseph Munroe, was burned about the face in a plucky attempt to stop an engine. The fire brigade extinguished the flames.

Dundee.—**YEAR'S WORKING.**—The total units sold last year amounted to almost 18½ millions, an increase over the previous year of 3½ millions; the net income, which showed an increase of fully £12,700, was £78,295. The costs also showed a large increase, being £10,000 in excess of the previous year. The coal account itself practically represented the entire increase, this item being £9,800 more than in the previous year. The accounts closed with a net profit of £409.

Gosport.—**RESTRICTION OF OUTPUT.**—The Gosport and Alverstoke Electric Supply Corporation has notified its consumers that owing to the difficulties in obtaining skilled labour, it is feared that it may be necessary in the near future to restrict, if not entirely cancel, the supply of electricity for power, heating, and lighting, and also for the service of the tramways.—*Portsmouth News.*

Heston and Isleworth.—**YEAR'S WORKING.**—The engineer reports that, as the result of the "Summer Time" Act, the output has fallen 200 units per day. He estimates the approximate loss during the summer at £400 to £450. The Electricity Committee reports that there was a deficit on last year's working, after taking into account expenditure on new plant and the previous year's deficit of £1,049, which arose mainly from the high price of coal. Each unit sold cost for coal 55d. against 38d. in the previous year. The total number of units sold was 1,288,371 against 1,162,995 in the previous year, and the increase of expenditure—due entirely to the rise in the price of coal—after allowing for the reduction in consumption per unit due to the larger amount generated, was well over £900. The prices of coal showed an increase on last year, and the Committee had no other course open to it but to raise the charges by 12½ per cent. In his annual report, the engineer, Mr. P. E. Rycroft, states that the income was £11,246, an increase of £751, and the working expenses £7,031, giving a profit of £4,214; but interest and loan charges were £4,927, which caused a deficit of £712. The main cause of the deficit was the cost of coal, which was £1,088 in excess of the previous year. The total units generated were 1,564,473, an increase of 55,246, but the units sold increased by 125,376. The works costs had risen from 1'03d. to 1'23d. per unit, and new business had been very difficult to obtain.

Hornsey.—**YEAR'S WORKING.**—There is a deficit of £2,789 on the net revenue account of the electricity undertaking for the year ended March 31st last. The total expenditure for the 12 months, including the purchase of meters, amounted to £11,035, an increase of £170 compared with a year ago. On the other hand, the total receipts showed a falling-off of £1,720, the respective figures being £20,570 and £22,290. The balance, transferred to net revenue account, shows a reduction on the previous 12 months of £2,189. The balance to the credit of this account is now £3,984. The Council has again found it necessary to increase the prices for energy and meter rent, this time by a further 15 per cent., provided they do not exceed the authorised maximum rates.

Hull.—**YEAR'S WORKING.**—The annual report to the T.C. on the working of the electricity undertaking states that the revenue from all sources amounted to £89,208, and the total working expenses, exclusive of special charges, to £47,178, leaving a balance of £42,030. Of this amount, interest and sinking fund absorbed £33,950, income-tax £2,106, and special charges £1,727, leaving a net balance to be carried to the reserve fund of £4,217. The revenue from lighting showed a decrease of £5,000 on the figures for the year 1914-15. On the other hand, the increase in revenue from power amounted to £9,517, approximately 22 per cent. over last year's figures. The units sold for all purposes increased from 12,969,776 to 14,795,426, being an addition of 14 per cent., and the additional income under this head was £4,207. The revenue from power supplies more than compensated for the decrease on the lighting side. The works costs and total cost were the lowest recorded by the undertaking. The total connections to the mains were:—Power, 20,470 kW.; and lighting, 8,320 kW. The city accountant stated that the income for the year increased by £6,908 on the previous year's working. During the year capital outlay amounting to £2,476 was met out of revenue, and £6,760 out of loans. The total capital expenditure on the undertaking was £540,099.

The town clerk has been instructed to take the preliminary steps towards getting an order to authorise the Corporation to supply electricity to the new sanatorium at Cottingham.

India.—**ELECTRIC LIGHTING.**—It is stated that the Mukhis and the leading Sind merchants of Hyderabad are forming a company on the lines of the Karachi Electric Corporation to supply electricity to the town of Hyderabad. The preliminary details have been settled. The firm of Messrs. Mukhi Hiranand Tarachand are to be managing agents for the company. The engineers of Messrs. Tata & Sons' electric works near Bombay are to be consulted. It is proposed to utilise the River Indus for the supply of power.—*Indian Engineering.*

Kingstown.—The U.D.C. has made an arrangement with the Munster and Leinster Bank for a loan of £6,000 at 4½ per cent., for three years, to cover the preliminary expenses in connection with the electric lighting scheme.—*Irish Builder.*

London.—**HAMPSTEAD.**—**PRICE INCREASE.**—The B.C. has decided, owing to the cost of coal, to increase the charges for electricity by 2½ per cent. from January 1st, making, with the 10 per cent. then made, a total advance of 33½ per cent. on the pre-war charges.

ST. PANCRAS.—**PRICE INCREASE, &c.**—The Electricity Committee has had under consideration the question of revising the charges for energy, in view of the serious financial loss falling upon the undertaking, and having due regard to the continuance of the 10 per cent. at present added to all accounts, recommends the following increased charges, which are estimated to produce an additional income of £18,000 during the year:—(1) Present charge of 1d. per unit for power, heating and cooking to be increased to 1½d.; (2) present rebate of 20 per cent. allowed for "factory" lighting (exclusive of offices, showrooms, &c.) to be abolished, and a flat rate of 3d. per unit charged in lieu thereof; (3) present two-rate system of 6d. per unit between the hours of 4.30 p.m. and 8.30 p.m., and 1d. per unit afterwards, to be abolished; (4) present maximum-demand tariff of 6d. and 1½d. per unit to be increased to 6d. and 2d., and the introduction of a flat rate of 3d. per unit for cinema theatre supplies; (5) kW. demand system of charging of £4 per annum, plus 1d. per unit, to be abolished; (6) meter rents to be charged on a sliding scale in regard to all supplies, instead of only, as at present, where a factory lighting rebate is allowed, and for cooking and heating purposes, &c., and where the maximum-demand indicator is used. The Finance Committee is in full agreement with the above proposals, and in view of the fact that, as a result of the agreement come to with the L.C.C. to accelerate the periods of repayment of loans, an additional sum of £1,454 a year will have to be paid from revenue during the next three years, has recommended that the interest of about £1,500 a year earned by the reserve fund account should be taken into revenue, instead of accruing to the reserve fund as heretofore. Arrangements have been made for laying an E.H.T. main in Gray's Inn Road to supply current for power purposes; this work will necessitate the re-arrangement of the switchboard at the Tavistock Place sub-station, at a cost of about £462. The Committee has received a reply from the Board of Trade in reference to representations made as to the necessity of an adequate supply of coal for the undertaking, suggesting that in any case in which the Council is unable to renew a contract, it should communicate with the Coal Supply Committee for the district in which the colliery concerned is situated, and that immediate steps be taken to renew contracts which will shortly expire. The Committee has also received a reply from the Admiralty Coasting Trade Office, stating that every effort will be made to assist the Council to secure supplies.

POPULAR.—**YEAR'S WORKING.**—The annual report of the electrical engineer and manager, Mr. J. H. Bowden, shows that the energy sold amounted to 21½ million units, an increase of 4½ millions, or 27½ per cent.; the net income from the sale of energy was £88,490, an increase of 20½ per cent.; and the working expenditure was £52,179, an increase of 45 per cent. The gross profit was £36,311, a slight decrease on the previous year; and after deducting interest £11,530, repayment of loans £12,860, and sundry charges £563, there remained a surplus of £11,814, a decrease of 20 per cent. With the unappropriated balance of £10,220 from last year, there was a total surplus of £22,035; a sum of £3,500 was transferred to the rates, about £8,000 was applied to sundry items of capital expenditure, alterations, &c., £1,000 to the staff as a bonus, and £617 was transferred to the superannuation and pensions fund, leaving an unappropriated balance amounting, with other items, to £11,667. The Council has decided that after providing a working balance of 10 per cent. of the total income, 40 per cent. of any available surplus shall be carried to the general fund for relief of rates; 20 per cent. up to an amount of £6,000, and 10 per cent. above that figure, as bonus to the staff; and the balance to meet capital expenditure. The agreement between Poplar and Stepney enables an output of 25 million units per annum to be attained before extensions at Poplar are necessary. The average price of coal rose from 12s. 5½d. per ton in the previous record year to 17s. 11½d. last year; but the working costs have only risen from 0'51d. to 0'58d. per unit, which is claimed as the record for the metropolitan area for the past year. The average price of 0'988d. per unit is also stated to be a record; deducting the supply to Stepney, the price for the Poplar area becomes 1'087d., which is claimed as a record to date. The capital employed per kW. of plant installed (£307) is believed to be the lowest in the country, and the output is said to be the largest yet published in connection with any metropolitan municipal undertaking. The load factor was 30·2 per cent., compared with 28·8 per cent. in the previous year. The sale of energy for private lighting was 1,125,005 units; for domestic supply (fixed charge + 3d. per unit), 935,414; for power, 16,647,703; for bulk supply, 2,556,946; and for public lighting, 241,546 units. The accounts are published in a remarkably complete and detailed form.

ST. MARYLEBONE.—**A.C. PLANT.**—In recommending payment of the final instalment on the extra-high-pressure three-phase generating plant installed on the recommendation of the general manager, Mr. A. H. Seabrook, the Committee reported on the results of the whole scheme. During the year ended March 31st, 1914, 24 per cent. of the total energy generated at the station was supplied from this plant; to March 31st, 1915, it generated 94 per cent., and for the year ended March 31st, 1916, 96 per cent. The turbo-generators, although contracted for to work at 3,000 kW. each, actually give 4,200 kW. continuously, and have done 5,000 kW. as a maximum. The steam consumption of the plant during the 24 years has been at least up to the contract guarantee. The steam consumption per unit generated (including all losses) has been reduced from 21·17 lb. with the old plant to 16·34 lb.

with the new; the coal consumption has been reduced from 349 lb. (10 per cent. slack) to 287 lb. (42 per cent. slack) per unit. The saving in coal last year by the new plant was £6,534. Though the station and mains staff had no previous experience with this system of generation and transmission, no breakdowns had occurred. The actual expenditure amounted to £32,981 for plant and mains.

The Electricity Committee reports that women have been engaged to replace men wherever possible. One is employed as storekeeper at the generating station stores; with the exception of the chief technical clerk, all clerical work at the station is done by girls, and girls are now being engaged for the switchboard galleries at the generating and sub-stations. The Committee has appointed a lady as district representative in the sales department, and arrangements are being made for the employment of women as lamp-lighters, meter testers, and in any other capacity where they can replace men.

Luton.—**EXTENSIONS.**—The electrical engineer hopes shortly to be in a position to submit tenders for the additional boiler, economiser, and ash and soot-handling plant required in connection with the generating station extensions. The demand has increased 36 per cent. over the corresponding period last year. Applications in hand include 5,125 8-c.p. lamps for lighting; 376 H.P. motors, and 513 kw. for heating.

Manchester.—**SUMMER TIME.**—After a month's experience of conditions under "Summer Time," the electricity department anticipates a reduction of 550,000 units of energy at the Stuart Street station from May 21st until the end of September, equal to 1 per cent. of the total output of the station, and a reduction of 600 tons in the consumption of coal; at the city stations the reduction in output is estimated at 200,000 units, or 2 per cent., with a reduction in coal consumption of 300 tons.

Nelson.—The electrical engineer having reported on the engines at the electricity works, it was decided that no repairs be undertaken to the engine now disabled, and that a Sub-Committee be appointed to deal with any emergency that may arise in connection with the generating station.

Newton Abbot.—The U.D.C. has accepted an offer from the E.L. Co., of a reduction of £55 for discontinued lighting during June, July, August and September, the period of the contract to be extended for the time the lamps are not used.

Norway.—According to a recent official return, the number of electricity generating plants in Norway at the end of the fiscal year, 1915, amounted to 1,515, with a capacity of 649,127 kw., these figures comparing with 1,427 and 560,406 respectively at the end of the preceding twelve months.

Perth.—The balance on the year's work is fully £330 to the good, and there will be no increase in the charges.

Rawtenstall.—**PRICE INCREASE.**—The Electricity Committee has decided that the price of electricity to power consumers other than those under an agreement containing a coal clause shall be increased 5 per cent.

Ripon.—**PROV. ORDER.**—The City Council has decided to apply for a provisional order for the supply of electricity to the city.

Rochdale.—**ARBITRATION.**—Tyre Yarns, Ltd., of Castleton, have asked that a dispute between the firm and the electricity department respecting the interpretation of certain clauses in their agreement for the supply of electricity shall be submitted to the arbitration of the Board of Trade, and the T.C. has instructed the town clerk to take the necessary steps to this end.

Southend-on-Sea.—For some months past the Electricity Lighting Committee has been in communication with the various contractors for the plant ordered for the proposed sub-stations at Leigh and Thorpe Bay, with the object of effecting an amicable arrangement to meet the difficulty which arose in consequence of the action of the L.G.B. in prohibiting the raising of loans by local authorities during the war. The plant ordered included five Diesel oil engines manufactured by Messrs. Bellies and Morcom, Ltd., three 200-kw. dynamos manufactured by the Phoenix Dynamo Manufacturing Co., Ltd., and two 180-kw. dynamos manufactured by the British Thomson-Houston Co., Ltd., the amount of the accepted tenders totalling £16,359. With the exception of two six-crank engines, all the machines mentioned were ready for delivery last summer. The Committee has now succeeded in provisionally effecting an arrangement.

It was reported at the last meeting of the Lighting Committee, that a tradesman who carried out the work of cleaning the interior of various houses and also furniture by means of a vacuum cleaner, had, for the purpose of operating the machine, used the current supplied under the contract rate to such premises. The Committee resolved to charge the tradesman in question at the rate of 6d. for a period not exceeding three hours, or 1s. per day in respect of the current used for the purpose referred to, and that this rate be charged for all current used in vacuum cleaners where the consumption thereof does not exceed one quarter unit per hour.

The Committee appointed to consider the question of effecting economies in public expenditure expresses the opinion that it would be impracticable, at the present time, to reduce the amount of the estimate (£3,900) for street lighting during the current financial year. With the view, however, of lessening the future outgoings,

it has advised the Corporation to request the Highways Committee to consider the question of substituting electricity for gas in the streets at present lighted by the latter.

Stalybridge.—**PLANT EXTENSIONS.**—L.G.B. sanction has been received by the Stalybridge, Hyde, Dukinfield and Moseley Tramways and Electricity Board, for the borrowing of £30,000 for extensions, and the work is to be put in hand at once.

Walthamstow.—The Lighting Committee of the D.C. has given instructions for the whole of the street lighting to be discontinued until the end of August. The Committee has recommended the purchase of automatic switches for the public lamps at a cost of about £150. The Finance Committee has approved of the expenditure, and recommends application for borrowing powers.

West Ham.—The electrical engineer has been authorised to proceed with the work of extending the supply of electricity to the works of the India-Rubber, Gutta-Percha and Telegraph Co., Ltd.

Westleigh.—Electrical plant to serve a variety of purposes is to be put down at the Parsonage Collieries, Westleigh, Lancs., belonging to the Wigan Coal and Iron Co., Ltd., who are sinking extensive new mines there. Additional electrical power is to be introduced at other collieries in the same neighbourhood.

TRAMWAY and RAILWAY NOTES.

Birmingham.—**CAR DERAILED.**—A serious accident occurred at Handsworth, on Thursday last week, 39 persons being injured, four of them somewhat seriously. The car was making the journey from Darlaston to the city with a full complement of passengers and had reached a point opposite Soho Road Station when, through an accident to the brakes, it left the rails, ran into the pavement, smashing the stones for many yards, and finally fell over on its side in the roadway. The passengers both inside and outside were thrown violently against each other, many being pressed downwards against splintered glass. Most of the injured, who were suffering from shock and bruises, were taken on ambulances to the general hospital. The majority were sent to their homes after receiving treatment.—*Morning Post.*

Blackpool.—Despite the abandonment of the Whitsuntide holiday, Mr. C. Furness, general manager of the Corporation tramways, reported on June 22nd that the tramway traffic practically held its own compared with last year. This he considers a very good result, for he was prepared to see a decline of about £1,500.

Brentford.—**TRACK REPAIR.**—The D.C. has decided to call the attention of the B. of T. and the Commissioner of Police to the noise made by the cars owing to the worn-out state of the track, with a view to pressure being brought to bear on the company to carry out repair work.

Huddersfield.—The Tramways Committee has agreed to a further amendment to the existing agreements to allow of their continuance until the conclusion of the war. The Committee has decided that men who are called up for military service before their holidays are due shall receive holiday pay, this applying to temporary men where they have been in the employment of the department for the necessary period.

Keighley.—After allowing for interest and sinking fund charges, the net revenue accounts for the tramways show a deficit of £168 for the year, and for railless trolley vehicles a surplus of £51.

Newcastle-on-Tyne.—**YEAR'S WORKING.**—The financial statement of the working of the Corporation tramways shows that for the past year the traffic expenses were £93,831, as compared with £79,328 for the preceding year. The increase of £14,503 was made up principally by increased wages and war bonuses to the traffic staff. Of the total traffic expenses, 87.40 per cent. represented wages. General expenses totalled £34,745, an increase of £9,165, of which rates alone accounted for £6,000. General repairs and maintenance had cost £38,055 against £31,120, an increase of £6,935. Power expenses at £17,436 showed an increase of £3,496, due to the higher prices of fuel and an increased consumption. On the maintenance of power and sub-stations £3,087 had been spent, as against £3,969. Public lighting, £4,320, showed a decrease of £760, attributable to the fact that in recent years new lamps had gradually been installed to supersede less efficient types. The total working expenses were £192,649, an increase of £32,191. The total income was £324,695, as against £293,264, an increase of £31,431. The traffic income of the undertaking was £314,732. The gross profit on the year's working was £132,046, which was increased by interest to £135,764. Out of this sum there had been paid £10,834 for income-tax (an increase of nearly 100 per cent.), £75,000 for interest and redemption of loans, £8,164 contribution to the rates out of profits, £13,144 allowances to men on active service and their dependents, and other smaller items, which left a net profit of £23,389 as against £24,822 in the previous year to be appropriated for the reserve and renewals fund, which now totals £77,000. During the past year there had been spent on renewals to the permanent way,

additions to plant and cable, and in the purchase of land £21,052, so that almost the whole of the surplus of the undertaking for the past year had been absorbed, and there was a net £2,000 in round figures to carry to the reserve and renewals fund.

Preston.—FARES.—The T.C. is to be recommended by the Tramways Committee to sanction the discontinuance of the issue of transfer tickets, and to agree to the issue of ½d. tickets on the present transfer stages.

Swansea.—The B.C. has approved of the recommendations of the Tramways and Electric Lighting Committee that the Council accept the Tramway Co.'s offer to convey the freehold of the power station, instead of the leasehold interest, and that the necessary steps be taken to carry the matter to completion.

Walthamstow.—The D.C. is recommended to put in hand at once the work of repairing the tramway track in Chingford Road.

West Ham.—FARES AND STAGES.—The Tramways Committee has reconsidered a recommendation, referred back at the last Council meeting, with reference to the adoption of a revised list of ½d. stages, and the substitution of 1½d. workmen's return tickets for the existing 1d. returns, together with certain resolutions adopted by the Leyton Tramways Committee, with reference to the revision of ½d. fares and the overlapping stages, or their abolition, and the revision of workmen's fares, which are considered to be too low. The Committee now recommends that in lieu of the previous recommendation, the following be adopted and carried into effect:—(1) A universal 1d. fare for a continuous journey on any one car within the borough; (2) children's stages to remain in force as at present; (3) a 1½d. workmen's return fare for a continuous journey on any one car within the borough—return tickets to be issued on all cars scheduled to arrive at a terminus before, and up to, 8 a.m.; (4) existing through fares, where necessary, to be adjusted to comply with the above scheme.

LOAN APPLICATION.—The T.C. is recommended to apply to the B. of T. for sanction to a loan of £1,000 to cover the cost of doubling the track at the Connaught Road terminus, and to advise the Board, in reply to their letter with regard to the possibility of postponing the whole, or a portion, of the scheme, that the matter is one of extreme urgency at the present time, due to heavy traffic from the docks and Arsenal, and should be completed as early as possible.

TELEGRAPH AND TELEPHONE NOTES.

Hull.—The Corporation having applied for sanction to borrow £4,000, the L.G.B. stated that in the present circumstances it was undesirable to have recourse to borrowing. The telephone engineer explained that this was capital expenditure by the Post Office before the Council took over the telephone, and recommended that all capital expenditure from January last should be met out of the reserve fund, and that in connection with all future new installations the subscribers be requested to defray the expense. The recommendation was adopted.

Argentina.—*La Electricidad y la Maquinaria* states that Alexander Schwimmer, the representative of a North American Syndicate, has applied to the Municipal administration for leave to set up an automatic telephone system in Buenos Ayres. The tariff which the promoters offer is 10 to 15 per cent. lower than the prices now charged by the Union Telefonico for the existing service.

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—U.D.C. Cable. See "Official Notices" June 23rd.

Aberdeen.—July 7th. Corporation. One 5,000-KW. turbo-alternator with surface condenser and auxiliaries, for the Electricity Department. See "Official Notices" June 23rd.

Australia.—PERTH.—July 19th. P.M.G. Supply of insulators (Schedule 510). See "Official Notices" June 9th. August 16th. P.M.G. Distilling apparatus (Schedule 502), telegraph and measuring instruments (Schedule 498). See "Official Notices" June 16th.

MELBOURNE.—July 26th. Victorian Railway Commissioners. 400 signal lightning transformers.*

August 8th. Deputy P.M.G. Standard battery material:—Porous pots, jars, zinc and carbon rods, and chemicals. Sched. 1,327. High Commissioner's Office, 72, Victoria Street, S.W.

SYDNEY.—August 17th. Portable internal-combustion engine and dynamo (3½ KW.) for the Departmental Stores, Sydney, for P.M.G.*

August 24th. P.M.G. Automatic switchboard and apparatus for North Sydney Exchange. Schedule No. 511.*

BRISBANE.—July 31st. P.M.G. Power board and accumulators. Schedule No. 381.

Barrowford.—July 8th. U.D.C. Automatic control electric screen-cleaning gear for the sewage disposal works. Mr. F. Sutcliffe, Surveyor to the Council.

Bradford.—Guardians' Union House Committee. Installing an adequate telephone system at Bowling Park Colony.

Leeds.—July 3rd. Electricity Department. Two over-ground transformer chambers at Holbeck, and one underground transformer chamber at Hunslet. Mr. C. N. Hefford, Manager.

Manchester.—July 11th. Electricity Committee. (a) Electric or hydraulic coal-wagon lift and turntable; (b) saddle tank steam locomotive. Specification, &c., 21s. (returnable), from Mr. F. E. Hughes, Secretary, Electricity Dept., Town Hall.

New Zealand.—INVERCARGILL.—September 28th. Borough Council. Steam turbo-alternator, condensing plant, and switchgear. Specifications from the Tramway Office.

Plymouth.—July 20th. Corporation. Rotary steam boiler feed pump for the Electricity Department. See "Official Notices" to-day.

Rochdale.—July 12th. Electricity Committee. Paper-insulated cables for 12 months. Mr. C. C. Atchison, Engineer and Manager, Dane Street.

Rotherham.—July 3rd. Corporation. Twelve months' supply of tramway stores and materials, coal, cable, meters, &c. See "Official Notices" June 16th.

Spain.—July 14th. The municipal authorities of Sollana (Province of Valencia). Concession for the electric lighting of the town during a period of five years.

Warrington.—July 11th. Electricity Department. 7,000 tons of slack coal for six months, or alternatively 12,000 tons during 12 months. Mr. F. V. L. Mathias, Borough Electrical Engineer.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Barnsley.—Electricity Committee. Contracts for coal: 4,000 tons, Wilby & Sons; 4,000 tons, Williams.

Bolton.—Electricity Committee:—

J. B. Scholes & Sons. 15,000 tons of Ellerbeck and rough Arley slack, and 2,500 tons of Roscoe's (Peel Hall Colliery) rough slack, with option of further 2,500 tons. Earl of Ellesmere.—5,000 tons of slack.

Brentford.—District Council. Automatic starters for the pumping station: Igranic Electric Co., Ltd.

Brighton.—Board of Guardians. Electrical fittings: H. J. Galliers, £35.

London.—Included in the tenders which have been accepted by the Metropolitan Asylums Board for the supply of general stores, &c., during the period ending June 1917, is one from the General Electric Co., Ltd., for three items of the schedule. **ST. PANCRAS.**—Borough Council. Tenders received for 1,000 yards of E.H.T. three-core cable, required for the supply of power to industrial works:—

Union Cable Co., Ltd.	4564
Western Electric Co., Ltd.	accepted 568
Precht-General Cable Works, Ltd.	379
Johnson & Phillips, Ltd.	590
B.T. & Helsby Cables, Ltd.	590
Stearns Bros. & Co., Ltd.	594
W. T. Henley's Telegraph Works Co., Ltd.	597
W. T. Glover & Co., Ltd.	608
Callender's Cable, &c., Co., Ltd.	632
Macintosh Cable Co., Ltd.	630

Subject to satisfactory sureties, the tender of Messrs. Beattie and Co., Ltd., for coal to the generating stations for one year has been accepted. The approximate estimated quantities for the respective works given in the schedule were 16,125 tons beans, 5,375 tons nuts, and 3,600 tons large hard steam. Messrs. Beattie's prices (£1 6s. 3d. for hard steam, £1 4s. 5d. for beans, and £1 5s. 8d. for nuts) are subject to any advance or reduction authorised under any alteration of the Price of Coal (Limitation) Act, to the Coal Exchange Strike, &c., Clause, the Official Government Clause, and to the increase or reduction in railway rates and charges.

Rawtenstall.—2,000-KW. turbo-generator (G.E.C.), James Howden & Co., Ltd.; condenser plant, Mirreles, Watson and Co., Ltd.

Southampton.—Messrs. Walton & Clough, contractors for the coal conveyors for the electricity works, have been authorised by the Ministry of Munitions to treat this contract as war work, provided it does not interfere with the output of munitions. Accordingly, two of the conveyors may be delivered in July.

Electricity Committee. Accepted tender:—A coal breaker, £148, Jenkins & Co.

Watford.—The Electricity Committee recommends the D.C. to enter into an agreement with Messrs. E. Foster & Co. for the supply of 45 tons a week of Kingsbury slack coal at 20s. 2d. per ton for a period of 12 months. The Committee also recommends the acceptance of the offer of the Tudor Accumulator Co. to renew their contract for a period of 10 years on the same terms as before.

FORTHCOMING EVENTS.

Tramways and Light Railways Association.—Today—Friday. At 2.30 p.m. See "Notes" to-day.

Physical Society of London.—Today—Friday. At 4 p.m. At the Imperial College of Science, South Kensington, S.W. Ordinary meeting.

NOTES.

Electric Vehicle Committee.—A meeting of the Electric Vehicle Committee was held in London on June 16th, Mr. A. C. Cramb presiding, in the absence of Mr. R. A. Chattock. It was announced that for the present year the following had been nominated by their respective Associations to act as their representatives on the Committee:—

The Society of Motor Manufacturers and Traders.—Mr. T. C. Pullinger, of Arrol Johnston, Ltd., Heathhall, Dumfries.

The Tramway and Light Railways Association.—Mr. W. T. Robson, general manager, Corporation Tramways, Southampton.

The Incorporated Association of Electric Power Companies.—Mr. J. S. Highfield, chief engineer, Metropolitan Electric Supply Co.

A Sub-Committee consisting of Mr. E. S. Shrapnell-Smith, Mr. E. W. Curtis, and the hon. secretary was appointed to draft a letter to the Board of Trade, with a view to getting electrical commercial vehicles excluded from any declaration that might be made prohibiting the import of foreign-made commercial motor vehicles.

The Committee's attention had been drawn to the fact that industrial electric trucks imported into the country were not being provided with the standard charging plug. The Committee was unanimously of the opinion that these trucks ought to be provided with the standard fitting, and the secretary was instructed to write to the manufacturers to this effect.

The date of the next meeting was fixed for Friday, July 28th, at 2.45 p.m.

Allied Labour Conference.—An important conference of Allied Labour Federations will take place at Leeds on July 5th and 6th to consider a lengthy programme on general Labour subjects affecting trade unions in the Allied countries. Representatives of the General French Confederation of Labour, and the Italian, Russian, and Portuguese confederations, will attend as the guests of the British General Federation of Trade Unions, whose annual conference will be held during the same week. Among the subjects to be discussed are:—An international eight-hour day, a general Saturday half-holiday, the Sunday cessation of labour, the industrial protection of women and labour, and an international approximation of laws relating to Labour. There will also be considered the question of stopping immigration from enemy countries, and the appointment of a Government Committee representing all sections of industry and Government departments.—*Daily Telegraph*.

Institution and Lecture Notes.—**Diesel Engine Users' Association.**—The June meeting of the Diesel Engine Users' Association was held at the Institution of Electrical Engineers last week.

Mr. A. J. C. DE RENZI (Newcastle-under-Lyme) made a suggestion that the Association should hold one meeting in each year in an important centre outside London.

A motion by Mr. H. LESLIE DIXON (Leatherhead), seconded by Mr. C. O. MILTON (Maidenhead), that the Association should support the application of the Suffolk Electricity Supply Co., Ltd., to the Board of Trade for the voiding or suspension during the war of the German patent in regard to "Improvements in Internal-combustion Engines" to enable tar oils to be used as fuel, was discussed, and carried unanimously.

A paper was read by Mr. GEOFFREY PORTER (president) on "Oil Engines and Steam Engines in Combination," in which he discussed the problems met with in extending a comparatively inefficient steam-driven generating station of about 1,500 kw. capacity, of which there are large numbers in various parts of the country. He dealt with the subject from the point of view of capital costs and working costs, and produced tables showing comparisons of actual results obtained by the introduction of Diesel engine plant at various works. All the examples of generating stations in which Diesel engine plant had been put down as an extension to the steam plant showed a remarkable diminution in working costs. An important advantage of the Diesel engine over steam plant was that any irregularity or inefficiency in working became obvious at once, and could receive prompt attention, and the author was convinced that a Diesel engine plant could much more readily be kept in good economical working condition than the average steam plant. The question of fuel oil supplies was one of the greatest importance, and the present war had opened their eyes to the manner in which this country had become dependent on others for absolute necessities. The fuel oil question could be, and would be, solved by their own chemists and engineers. Continental users and manufacturers of Diesel engines had used tars and tar-oils with success for many years, and they should do so too. In working their coal deposits they were living on their capital; the greater the reason, therefore, to use it to the best advantage.

The next meeting of the Association will be held on Wednesday, July 12th.

The Tramway Congress in London.—To-day the eighth annual Congress of the Tramways and Light Railways Association is being held in the Westminster Palace Hotel (Room 1). The annual general meeting takes place at 2.30 p.m. At 3 o'clock, Mr. W. Tuke Robson (general manager, Southampton Corporation tramways) will read a paper on "Tramway Transit and Comfort: a Plea for the Passenger." After this has been discussed, there will, at 4 o'clock, be a visit by motor-bus to the L.G.O. training school at Milman Street, Chelsea, where members will be received by Mr. H. E. Blain, operating manager of the L.G.O. and the Underground Railways. The class rooms, &c., will be inspected, and in the cinematograph hall special films will be exhibited showing London traffic schemes, with special reference to rules of the road for trams, buses, and other traffic, methods of training, &c. After tea Mr. Blain will give a short address on "The Safety Movement"; and in the evening the members' dinner will be held at the Trocadero Restaurant, at 7.30 for 7.45. Evening dress is optional.

Volunteer Notes.—1ST LONDON ENGINEER VOLUNTEERS.—Orders for the week by Lieut.-Col. C. B. Clay, V.D., Commanding.

Monday, July 3rd.—Technical for Platoon No. 9, 16, Regency Street, S.W.; Squad and Platoon Drill, Platoon No. 10; Signalling Class and Recruits.

Tuesday, July 4th.—Officers' Training Class, 6 to 7; Recruits, 7; lecture, 7.15, "Constitution and Duties of a Field Company," Company Commander Bentley.

Wednesday, July 5th.—Platoon Drill, No. 2 Platoon.

Thursday, July 6th.—Platoon Drill, No. 6 Platoon; Recruits, 5.45 to 7.45; Instructional Class, 5.45.

Friday, July 7th.—Technical for No. 10 Platoon, 46, Regency Street, S.W.; Squad and Platoon Drill, No. 9 Platoon.

Saturday, July 8th.—Instruction Class, 2.30, Company Commander Fleming.

Sunday, July 9th.—Entrenching duties: Parade, Victoria (S.E. and C. Railway Booking Office), 8.35 a.m.

MACLEOD YEARSLEY, Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, June 29th, 1916:—

Week-End Parades.—*Saturday.*—The Battalion will Parade at Wembley Park at 3 p.m., under the Commandant. The Examination, Officers' Instruction Class, which was postponed from last Saturday, will take place on this Parade.

A party, as strong as possible, is required for Entrenching work on Saturday, July 1st. This party will Parade at Liverpool Street Station (Low-Level entrance, G.E.R.), at 8.40 a.m., and return to London by the 5.20 p.m. train.

Sunday.—The Battalion will Parade at Liverpool Street Station (Low-Level entrance, G.E.R.), at 9.30 a.m., and proceed by train for Entrenching duties, returning to town about 6 p.m.

Public Regimental Recruiting Meeting at the Guildhall on Friday, 30th inst., at 12.30 p.m., presided over by the Lord Mayor.

Musketry.—Competitors for the "Holland Cup" who have sent in their names to shoot at Bisleigh on Sunday, July 2nd, will report in uniform to Sergeant J. W. S. Burmester, at 9.45 a.m., at No. 8 Platform, Waterloo Station.

All members who took part in the competition for the Cup presented by Brigadier-General the Hon. F. C. Bridgeman are requested to attend Saturday's Parade at Wembley Park.

G. H. F. DUNCAN, Acting Adjutant, O.B.C.

Professional Classes and the War.—A meeting was held at the Mansion House last week in furtherance of the objects of the Professional Classes War Relief Council, the Lord Mayor presiding. Cardinal Bourne placed under three heads the professional people who required temporary assistance: (1) Those dependent for their livelihood upon fixed salaries despite rising prices; (2) those who were not dependent upon fixed incomes, but were becoming increasingly prosperous before the war, and (3) those whose whole means of subsistence had been practically brought to an end owing to the war. Mr. Marshall Hall, K.C., M.P., was of opinion that among the classes concerned collective assistance was far preferable to individual aid. Dr. (Mrs.) Scharlieb dealt with the work of the Maternity Committee, and Sir William McClure explained the educational and musical work. Lord Justice Phillimore pointed out that the professional classes had done much for the country by enlistment and other national service, and were the greatest sufferers from the war. The Council had already relieved 7,000 cases, and most of the money had been subscribed by professional people less severely affected by the present economic conditions. A donation of £100 from Lord Loreburn was announced.—*Morning Post*.

Engineer Examiners.—It is announced by the Secretary of the War Office that 250 examiners of engineers' work are urgently required for service at home. The rates of pay are 50s. to 60s. weekly, plus allowance of 21s. weekly up to three months at one station; also a special war increase of 4s. a week, and overtime at common-time rates after 48 hours per week. Applications should be addressed, "Room 268, A. G. 2 B, War Office," enclosing credentials.

Appointments Vacant.—Junior engineers-in-charge, for the Newport electricity department (45s.); assistant, with experience of suction gas plant and overhead wiring, for the Holmfrith U.D.C. electricity works; chief assistant engineer and manager of the electricity undertaking (£160), for the Leek U.D.C. For particulars, see our advertisement page to-day.

London P.O. Engineering Department.—On Thursday last week the Postmaster-General opened new offices which have been erected in Denman Street, London Bridge, to accommodate the headquarter staff of the Post Office Engineering Department, London District, which numbers 350 members. At a meeting that was held on the premises, Mr. A. Moir, superintending engineer of the district, presided. Sir W. Slingo, engineer-in-chief, welcomed Mr. Pease and the secretary, Mr. G. E. P. Murray, and stated that the total expenditure of the department last year reached over 6½ millions sterling. The architect, Mr. E. Cropper, said the site covered 8,000 sq. ft. and the building consisted of seven floors, with a total area of 45,000 sq. ft. It was designed by his predecessor, Mr. Rutherford, and cost £26,000. The Postmaster-General said that the staff had been depleted by the war, and consisted of 160 men and 40 women; the old building now provided for three district engineers and assistants. The number of women employed on the engineering staff in the Metropolitan district had risen from 13 before the war to 141. The total number of all ranks in the district in July, 1914, was 5,541, of whom 2,132 voluntarily joined the Colours, 25 obtaining commissions; 58 had fallen in the war, and 68 had been invalided home. Seven had received the D.C.M. Since taking over the National Telephone Co.'s system the department had opened four large new exchanges and five smaller ones, and arranged for 19 others; 14,000 miles of O.H. wire had been removed, and 36,000 subscribers had been added. The staff now maintained 53 telephone exchanges and 12,000 private branch exchanges, and 251,142 telephones—one-third of the whole telephone service of the United Kingdom. Over 300 million calls originated in the area last year. There were in London over 600 telegraph offices, and the Central Telegraph Office dealt with one-third of the 91 million messages that were dispatched per annum. The total length of cables in the district was 70,849 miles, and the single-wire mileage was 1,037,790 miles. The cost of new construction and maintenance was over a million a year. The number of complaints received from the public had diminished from 1,25 per diem per 1,000 direct lines to 0.5. About 7,000 additional telephones had been installed for the War Office during the year, and 1,500 for the Ministry of Munitions. The work of the Post Office engineers had been accorded the highest praise during the war.

The secretary expressed appreciation of the work of the staff, and Mr. Moir replied, pointing out the advantages of the concentration of the staff, and presented Mr. Pease with a key with which he proceeded to open the new building.

Accident.—Whilst James Lancaster, an electrician, of Shipley, was engaged last week in fitting a nut at the rear of a switchboard on the electrical equipment at Briar Field Mills, Shipley, the fire came into contact with a live wire, which fused. Lancaster's clothes caught fire, and he was severely burnt about the face and hands, and suffered from shock. After first aid had been rendered he was taken to hospital and detained there.

Foreign Languages.—The Senate of the University of London has elected a Professor of the Spanish language.

Sir James Roberts, Bart., has offered £10,000 to the Leeds University for the establishment of a Professorship of Russian language and literature, and the offer has been accepted.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Having been offered, and accepted, another appointment, Mr. W. H. ALLEN has resigned the post of engineer and manager of the Loughborough Corporation electricity department, which he has held since the inception of the undertaking, some 12 years ago.

A Yorkshire paper states that Mr. A. B. MOUNTAIN, the borough electrical engineer of Huddersfield, has resigned his position, and, on the recommendation of the Electricity Committee, the Huddersfield Town Council has decided that the following arrangements shall come into operation on September 1st:—Mr. Mountain to be consulting engineer, up to December 31st, 1919, at £300 per annum and expenses; Mr. J. W. Turner to be borough electrical engineer at £400 per annum (his present salary is £250); Mr. E. Lunn, station superintendent, to have his salary increased from £240 to £265; Mr. J. A. Swift, commercial assistant, to have his salary increased from £200 to £225; and Mr. Phillips to be appointed mains foreman at £182 per annum.

Nuneaton T.C. has granted a war bonus of £40 a year to the acting electrical engineer during the absence of the electrical engineer on military service.

Huddersfield T.C. has advanced the salary of its tramway manager, Mr. R. H. WILKINSON, from £400 to £500 per annum.

Mr. C. L. E. STEWART, borough electrical engineer of Rawtenstall, is laid up, but it was stated at the Council meeting last week that he was much better.

On the occasion of his marriage, Mr. JOHN DOWNIE, chief

clerk of the Aberdeen Corporation electricity works, was last week met by the staff and employees and presented with a barometer and clock. Mr. Bell made the presentation, and Mr. Downie suitably replied.

General.—In May, Prof. J. H. DOBSON, general manager of the gas, electric supply and tramways department of the Johannesburg Municipality, left on active service with the Forces for the German East African campaign. He has been appointed officer commanding, South African Pioneer Battalion, with the rank of major.

At Blackpool, on June 21st, the marriage took place of Mr. WM. H. MILLER, A.M.I.E.E., of Belfast and Fleetwood, and Mrs. F. BROWNE, widow of Mr. Frank Browne, of St. Helens and Liverpool.

The marriage took place at Wellington, New Zealand, on June 10th, of Mr. WILSON ORMEROD, A.M.I.E.E., and Miss E. B. Bean, only daughter of Capt. Fredk. T. Bean, of the Bedfordshire Regiment, of Clapham Common, S.W.

The Times states that "an engagement is announced between Mr. GEORGE VERITY, J.P., hon. colonel, R.E. (I.), of 7, Basil Street, S.W., and Mrs. Charles Hamilton Walter, of 35, Hyde Park Gate, S.W." Mr. Verity is, of course, the chairman of the well-known firm of Verity, Ltd.

Mr. J. J. LIGHTFOOT (secretarial department), County of London Electric Supply Co., has been gazetted as second-lieutenant, Royal Engineers (T.), Wireless Section.

Mr. H. G. PRICE has resigned his position as secretary of the Nottingham Society of Engineers, and a successor is being advertised for at £25 per annum.

Roll of Honour.—Amongst those mentioned in dispatches for gallant and distinguished conduct in the field is the late Private W. R. JENKINSON, of the 13th Cheshire Regiment, who, before the war, was an electrician at Port Sunlight, Birkenhead. He fell in action last January.

Private WALTER ASHCROFT, of the Loyal North Lancashire Regiment, formerly employed at the Bolton electricity works, has been killed while on sentry duty.

Sergeant S. LEVEY, of the Rifle Brigade, formerly employed by Messrs. Hans Renolds, Ltd., Manchester, has been killed in action, aged 25.

Private J. A. WARREN, of the King's (Liverpool) Regiment, formerly employed at the Chloride Electrical Storage Co., Clifton, has died from wounds, aged 29.

Lance-Corporal E. W. ICKE, of the Manchester Regiment, formerly employed at the British Westinghouse Works, Trafford Park, has been wounded by a rifle grenade.

Private J. BOND, of the Royal Canadian Highlanders, who has died of wounds, was formerly employed as an electrician by the Lancashire & Yorkshire Railway Co.

Private T. BULLOCK, of the Highland Light Infantry, formerly with Messrs. Taylor, Tunncliffe & Co., electrical china manufacturers, of Eastwood, Hanley, has been killed in action.

Private J. MILLINGTON, formerly on the staff of the Potteries Electric Traction Co., has been killed in action. He served through the South African war.

Seaman ROBERT CHANT, of H.M.S. *Invincible*, who lost his life in the North Sea fight, had been in the employ of the Lancashire Dynamo Co., Trafford Park.

Corporal ARTHUR DAVY, of Urmoston, previously reported missing at Gallipoli, and now officially reported killed, was 25 years of age, and, prior to the war, was assistant secretary to the general manager of the British Westinghouse Works, at Trafford Park.

HIRAM HART, an electrical fitter, formerly in the employ of Bolton Electricity Committee, has been killed on active service.

HAROLD WILLISHER, wireless telegraphist on the *Tipperary*, who was presumed lost in the North Sea battle, is a prisoner in Germany.

Second-Lieutenant WALTER J. CRIDGE, of the 15th Sherwood Foresters, was wounded in the face recently in France, and he is now at the 4th Northern General Hospital, Lincoln, where he is going on well.

Sergeant-Major O. LAING, 21st County of London Regiment, 1st Surrey Rifles, has been awarded the Military Cross for an act of great gallantry in saving a wounded comrade. Sergeant-Major Laing was on the staff of Messrs. M. Bateman and Co., of Brooke Street, Holborn, and was known to many houses in the lighting industry.

The following casualties among men of the County of London Electric Supply Co., Ltd., with the Forces are reported:—

Private H. BEAZLEY, 9th Battalion (Buffs) East Kent Regiment, killed in action; Lance-Corporal E. CAPON, 5th Royal Berkshire Regiment, wounded, March 11th; Chief Petty Officer A. GARDEN, Royal Navy, died of injuries (North Sea); Private T. HYAM, 9th Battalion (Buffs) East Kent Regiment, killed in action; Private R. REEVES, 9th Battalion (Buffs) East Kent Regiment, killed in action.

Private H. F. GILL, Royal Engineers, Wireless Section, secretarial department, County of London Electric Supply Co., has been awarded the Military Medal for services in the field.

Obituary.—Mr. W. TODHUNTER.—Mr. W. Todhunter, a member of the electrical staff of the Telegraph Construction and Maintenance Co., Ltd., who, as stated in our last issue, passed away on June 19th at the comparatively early age of 59, was born at Emsworth, Hants. He was educated at Blackheath, and, like most of the Todhunters, showed an

aptitude for mathematics. He joined the company's service on board the *Great Eastern* in 1875, and remained with them up to the time of his death. His first submarine cable expedition was in 1874, when he assisted in the laying of the Anglo-American cables. He has also been principal assistant on cable expeditions to all parts of the world until 1907, when he took charge of the electrical department in repairing and renewing the Eastern Telegraph Co.'s Bombay-Aden, Durban-Mozambique cables and numerous repair expeditions for various telegraph companies. His last expedition was laying the duplicate New York-Guantanamo-Colon cables for the Central & South American Telegraph Co. With his experience of over 43 years, his death is a severe loss to the electrical department of the company. He was much admired as a genial companion, and respected by all whom he met in the course of his career. He has been a member of the Telegraph Cable Masonic Lodge since 1903. The funeral took place on Saturday last at Shooter's Hill Cemetery.

MR. W. J. COCKHAM.—The death has taken place, from pneumonia, of Mr. Wm. James Cockham, electrical engineer, of Barnstable, aged 53 years. Deceased was for some years in business in the town.

MISS ISABELLA FARADAY.—The *Times* records that Miss Isabella Faraday, a descendant of Michael Faraday, has died at Kirby Stephen. Miss Faraday founded the Michael Faraday Homes near Wargingham, Surrey, where over 100 old people are housed.

MR. MARK BROWN.—The funeral took place at Blackpool Cemetery, on June 21st, of Mr. Mark Brown, foreman arc lamp trimmer at Blackpool Corporation electricity works, where he had been employed for 22 years. Mr. Chas. Furness, electrical engineer, and a number of fellow workmen attended.

MR. WILLIAM HANNING.—According to the daily Press, Mr. William Hanning, a former president of the British Chamber of Commerce in Paris, who was well known in engineering circles both in England and in France, died in Paris on Sunday.

CITY NOTES.

Marconi's Wireless Telegraph Co., Ltd.

The report for the year ended December, 1915, states that there was a gross profit of £581,125 for the year, and that the net profit was £377,818, which is better by £145,101 than for 1914. Including £69,497 brought forward, the amount is £447,315. There is still no agreement with the Government as to the basis of remuneration and compensation for the use of the company's high-power stations since the beginning of the war and for other services rendered in connection therewith. It has, therefore, again been impossible to include in the accounts any sum in respect of these matters. A large number of contracts have, however, been entered into with Government departments, for all of which payments have been regularly received. It is stated that sums are payable by the Government to the company under the following four heads:—

1. The Post Office, for remuneration and compensation in respect of the use of the company's high-power stations since the beginning of the war, the staffing and management of those stations, and other services in connection therewith. (It is hoped that a substantial payment on account may be received shortly.)
2. The Admiralty, for the use of the company's patents since the expiration, on March 31st, 1914, of the Admiralty agreement of 1903, no new agreement having yet been concluded. (There have been difficulties in arriving at a settlement of this matter and delay has been unavoidable. We have, therefore, received an assurance that every dispatch will be given to deal with the matter as quickly as possible.)
3. The War Office, in respect of the use of the company's patents, without agreement, during the whole time wireless telegraphy has been used for settlement under the Patents and Designs Act, 1907.)
4. The Post Office, for compensation in respect of their withdrawal from the contract for the Imperial chain of stations, with regard to which no agreement has been arrived at, and the company has therefore been obliged to leave the amount of compensation to which it is entitled to be settled by a court of law.

Shares in associated companies and patents are taken at their cost price, viz., £1,383,658, which shows an increase of £23,532. The company's holdings in associated companies, except for some additions, have undergone no change during the past year. The par value of the shares held in associated companies now stands at £2,484,370, exclusive of shares which have no capital denomination. After crediting £100,000 allocated from profit and loss account of the preceding year, the general reserve account now stands at £967,530.

The Marconi International Marine Communication Co. has continued to show substantial development of its business and a further increase in profits. Dividends for the past year amounting to 12½ per cent. have been declared, and £33,842 has been carried forward.

The Russian company, Société Russe de Télégraphes et Téléphones sans Fil, has continued to do a large business. A dividend at the rate of 15 per cent. for the year 1915 has been declared.

The French company, La Compagnie Française Maritime et Coloniale de Télégraphes sans Fil, has declared a dividend for the year 1915 at the rate of 10 per cent. on the ordinary shares and 31·25 francs on the founders' shares.

The Amalgamated Wireless (Australasia), Ltd., has paid a dividend of 6 per cent. for the year.

The Wireless Press, Ltd., has paid a dividend of 25 per cent. in respect of the year.

The Marconi Wireless Telegraph Co. of America, has again earned increased profits for the past year, but its principal resource is expected to

be derived from the transatlantic service, which, in consequence of this company's stations being in permanent service, has been obliged to remain idle. It is apprehended that the compensation to be received in respect of this company's American stations will now embrace the loss incurred by the reduced utilisation of the American stations.

Owing to the unfavourable rates of exchange, large sums of money have had to be placed on deposit with foreign banks, principally in allied countries, until such time as the exchanges become normal. Had these moneys been remitted on December 31st last there would have been a loss in exchange of £25,757. Temporary investments at the end of the year showed a depreciation of £27,606. It has, therefore, been deemed right to debit to profit and loss account both these sums, which amount to £53,363. There have since been substantial improvements, and it is contemplated that if held until hostilities cease the loss will be completely recovered. In the event of eventual realisation without loss, the amount so written off will appear as profit in another year. In view of the state of war, and having regard to the large sums of money abroad, and to the uncertainty as to when any of the moneys due to the company from the Government will be received, the directors deem it prudent to husband their resources, and recommend the declaration of a final dividend upon the ordinary shares at the rate of 5 per cent., which, together with the 5 per cent. interim dividend paid on February 1st, 1916, will make 10 per cent. for the year. They will, however, further recommend that a substantial bonus shall be declared and paid out of the moneys due from the Government as soon as they are received.

Annual meeting: To-day.

Aluminium Corporation, Ltd.

MR. S. G. BIBBY presided, on June 22nd, at the annual meeting. He said that the difficulties referred to at the last meeting were eventually successfully overcome, although the first six months of the year were better, as regarded output and profits, than the following half, due to the drought and shortness of their water supply. This was not likely to occur again now that they had been successful in tapping the Duly water. The boring of the tunnel was completed in April last, and they were now reaping the benefit of the Duly water, and already it was making all the difference as regards output, this having increased by approximately 30 per cent. during the five months of the current year as compared with the same period of 1915. The more water they could control the greater the output; the Duly tunnel had amply justified its construction. As the shareholders only gave a meagre response to the offer of debentures, they had to arrange for temporary loans. Loans appeared at £28,000 in the accounts, but they had been reduced since the close of the year to £15,000. Loans to subsidiary companies had increased by £6,442, these advances being made to enable the subsidiary companies to increase their output, so as to cope with this company's increased consumption. An Act of Parliament would be applied for shortly for simplifying the capital account. Having regard to their present position and prospects, they recommended that a start be made to reduce the accumulating preference stock dividend by paying 7 per cent., less income-tax. Their faith in the company has justified itself, and during the past year it had proved itself to be a national asset. Conditions were extremely abnormal in consequence of the demand for aluminium. That need not worry them, however, as recent developments of new uses would have the effect of increasing the demand and consumption when they returned to normal peaceful times. The abnormal demand had created a much higher selling price than before the war, but the cost of production had very considerably increased. There had been serious difficulties as to their supplies of raw materials, labour, freights, &c., and all these had told heavily again them, and they were likely to be still further increased as long as the war lasted. The Treasury had approved of their increasing the debenture issue, and they were now negotiating for the placing of a further £100,000 6 per cent. debentures to rank *pari passu* with the existing issue. This would give the funds for proceeding with the erection of the Cowlyd and Trarshall dams, which were essential to increased output, and would trouble the water storage. An additional pipe line was absolutely necessary, and would be proceeded with as soon as practicable. Arrangements had been made for the installation of a new generator, and work had been commenced upon a bridge over the River Conway, enabling them to bring the L. & N.W.R. direct into the works. They were doing their best towards placing the company upon a sound and substantial dividend-earning basis, and the present year promised to be one of considerable progress.

James Keith & Blackman Co., Ltd.

MR. T. W. ARSOP, presiding at the annual meeting recently, said that the balance sheet was not an unsatisfactory one. The business done was a record, 18 per cent. more than in 1915, notwithstanding the decrease in lighting, which was an important part of their business. The dividend was 10 per cent. free of income-tax—practically 12 per cent., and they were wiping goodwill and patents out altogether. They were increasing the reserve to £40,000. In the carry-forward of £12,056 they had provided for excess profits tax. Orders were being maintained; the works were now ready for anything of a profitable nature which might come along; and they looked forward with hope

and confidence to a steady, successful, and secure future. Mr. JAMES KEITH, the managing director, who followed, said that while the lighting department of the business diminished at home, owing to the Government restrictions, the turnover had largely increased in other directions. They began the current year well. They had had to get a lot of new and special machinery for urgent Government requirements, but they had been careful only to obtain such machinery as would be necessary for their regular and special work long after the war would be over. Their present principal trouble was in getting and retaining skilled workmen. All in the Empire must now and henceforth so organise as to effectively bar business relations with, and unfair competition from, the Huns and their relations.

Lancashire Power Construction Co., Ltd.

DR. H. F. PARSHALL, presiding at the annual meeting on June 22nd, said that the progress of the Lancashire Electric Power Co., in which they held all the shares and debentures, had been very satisfactory, with a substantial increase in the profit on trading. As to the first five months of the present year, the results were appreciably better than those for 1915, and if progress was maintained during the whole of 1916 the trading profit would be substantially better. From an engineering point of view, the progress had been comparatively uneventful. No addition had been made to the power plant, which had worked economically and well throughout the year. With regard to mains, they had extended them, and the system generally had been reinforced and consolidated, and therefore there was no large capital expenditure for them to face in order to keep up a sufficient supply. The outlook for future business was good, and on terms more consistent with the advantages given by the company and than those which had so far been obtained. It was not necessary for him to mention specific contracts, but there were several of importance. The units sold during the year showed a substantial increase over those sold in 1914, as did also the revenue. The growth of business with local orders showed an increase, but not as great as might have been anticipated, owing to the restricted lighting regulations. Still, the increase showed that their investment in those local orders would ultimately be a profitable one. The cost for fuel per unit sold was greater than in 1914, the increase being due to the higher price of fuel, but the total operating costs had been reduced, although there had been an increase in the rates. While on the subject of generation, he desired to point out that the Government appeared to be favourable now to a central supply system. In the past they had certainly not been given much consideration in that connection, and local authorities which could not generate as cheaply as the company had been allowed to go on with generating systems when, in the interests of the public or of economy, they should have come to the company for a supply. They had most pleasing and satisfactory relations with some of their larger neighbours, but some of their smaller neighbours had been very anxious to go on with their own undertakings, even at a loss. It was satisfactory to know that the principle of centralisation, after all these years, was now being recognised in a practical way by the Government, for he thought it could be said without fear of dispute that generation in England was more wastefully carried on than in any country in the world; that was to say, the relative cost of fuel per unit generated was vastly greater than in any other country. That was due to the fact that almost every local authority had been allowed to set up its own undertaking. In London half a million tons of coal were wasted yearly. If the principle of centralisation became generally adopted, their Lancashire undertaking would become a very important one, because they were in the centre of the district, with every facility for extension and generating on the most economical lines—and they could attain to very much lower generating figures than smaller undertakings less favourably situated. Owing to the handicap of not being, he feared, as favoured as the local authorities, they had had to feel their way, going on with small generating units, and, as a result, their fuel economy had not been as low as it might have been if they could have gone ahead at full speed from the beginning. Their fuel consumption, however, was lower, considering the class of fuel they were using, than of most other similar undertakings in the kingdom. Although they might have been in a better position had they been allowed to go ahead with bigger units, yet, as they stood to-day, they were very favourably situated to give a proper supply if they became the nucleus for giving a general supply in their district. They were proposing to extend their power station by the addition of another large generating unit to meet the general growth of their business and to give a safe margin for the continuity of the supply. The expenditure had been approved by the Government authorities, who had also approved the ordering of this machinery, and they were able to carry out the extension without asking for any new capital. When this unit was in working order they might expect an improvement in their cost of generation—at least, in their coal consumption; and they could also safely say that on the present basis of working, this unit would take them up to the point where they would be earning their fixed charges something like three times over. They had a considerable issue of profit-sharing notes. He thought that a dividend on them would be forthcoming when the new unit was fully employed, because they could then pay a fair dividend and,

at the same time, have a sufficient margin over for carrying on the business. Having regard to the present general financial situation, he thought they must provide for necessary extensions out of earnings.

Globe Tele- graph & Trust Co., Ltd.

The net revenue for the year ended May, 1916, after deduction of expenses, amounted to £226,066, plus £27,655 brought forward. £122,932 has been distributed in interim dividends, leaving £130,808. A final dividend of 3s. per share, less income-tax, on the preference shares makes 6 per cent. for the year; 8s. per share is to be paid, free of income-tax, on the ordinary shares, making 7 per cent., free of tax, for the year. The balance to carry forward will be £36,849. It is proposed that the 'directors' fees shall be paid free of income-tax. Annual meeting: July 4th.

Waygood-Otis, Ltd.

MR. II. C. WALKER, presiding at the annual meeting, said that one part of their works was occupied for the Government, to the detriment of operations in the other part. They had met with loss on a number of contracts, some of large amounts, which were placed at pre-war prices, but which, owing to the delay in building work generally, were hung up, or had had to be completed at the advanced costs of labour and material due to the war. They were obliged to carry out their undertakings though involving considerable loss. The speaker said that he did not regard the present state of affairs with any apprehension. When they were able to resume normal business they would be able to do it with conspicuous success, and he hoped that they would soon be able to pay the arrears in the preference dividend.

Hart Accumulator Co., Ltd.

The report for 1915, presented at the annual meeting held at Stratford on June 22nd, stated that the profit was £10,331, plus £11,394 brought forward. The dividend on the preference shares requires £423, and a dividend of 5 per cent., free of income-tax, on the ordinary shares absorbs £4,353, leaving £16,949 to be carried forward. Buildings, plant, tools, &c., have been augmented by £1,285, which has been charged to capital, and due depreciation on same has been made. The maintenance of the works, plant, &c., has been kept up at a cost of £1,697, which has been paid for out of revenue.

Anglo-Argentine Tramways Co., Ltd.—With reference to our paragraph of last year, the circular issued to the second preference shareholders reads:—"The directors regret that owing to increased expenditure, due to the abnormally high cost of fuel, it would be inexpedient at present to declare an interim dividend on the 5½ per cent. cumulative second preference shares for the half-year ending June 30th. The board entertains no doubt that when normal conditions again prevail regular payment of dividends on these shares will be resumed and arrears paid."

J. Stone & Co., Ltd.—The report for the year ended December 31st shows a profit, after full allowance for depreciation and provision for special Government taxes, &c., of £133,157, plus the balance brought forward of £189,039, making a total of £322,197. The directors recommend a dividend of 10 per cent. per annum and a bonus of 3s. per share on the ordinary shares, leaving £207,147 to be carried forward.—*Financial Times.*

Consolidated Electrical Co., Ltd.—A dividend of 2½ per cent. on the ordinary shares for the year is announced. The income for the year ended March, 1916, was £5,437, as compared with £5,344 for the previous year. The general charges were £1,215, compared with £1,191. The directors record the death of Mr. T. Taunton, who had been secretary from the company's formation.

Shawinigan Water & Power Co.—There is to be offered to shareholders \$1,361,250 of new stock, the Treasury having given permission.

Stock Exchange Notice.—The following have been ordered to be quoted in the Official List:—
Barcelona Traction, Light & Power Co., Ltd.—£436,700 7 per cent. 50-year prior lien "A" bonds, Nos. 1 to 4,367, of £100 each, in lieu of the scrip.

STOCKS AND SHARES.

TUESDAY EVENING.

Investment markets in the Stock Exchange have come to something of a halt in the matter of business. This is partly due to the difficulty that there is in obtaining stock, and also to the inclination on the part of investors to await further developments from the various war theatres. Everyone has heard some of the highly interesting rumours which have been current in the City during the past few days, but of the truth of these no confirmation has been received. Expectation, however, stands on tip-toe; and, meanwhile, Stock

Exchange interests must be content to look after themselves to a large extent. The price of Consols shows a tendency to rise once more; and the industrial market of the Stock Exchange attracts more interest than any other part. A gratifying feature is a respectable series of advances in price amongst electricity supply shares.

More than half the shares in our list of electricity companies show rises, the improvements ranging from 1s. 3d. to 5s. From this, it might have been supposed that there was an active business being done in them. In point of fact, however, the number of shares changing hands is very small. Proprietors decline to sell, and, at the same time, there is a steady demand from investors who have noticed that this is one of the few sections which has hitherto failed to respond to the investment movement. Jobbers complain that there are no shares about, and that they have only buyers.

We reminded holders of the convertible debenture stock of the Consolidated Gas, Electric Light & Power, of Baltimore, last week that they should observe that the time for converting their debenture stock into common shares expires to-morrow (July 1st). Since then, the price of the stock has risen from 90 to 95, while the shares spurted from 110 to 120, there having been some little reaction from these prices. The shares, it need scarcely be said, are of the semi-speculative order, while the debenture stock is a first-class security of its kind, so that its holders may feel that they would prefer to retain this rather than exchange into shares of a more volatile description.

The price of the debenture stock has been run up on the conversion rights, and, when these expire, probably the price of the debenture will gracefully decline. Therefore the holders of the debenture stock, though they should feel disinclined to convert into common shares of the company, may be advised, even at this eleventh hour, to realise their stock, with a view to re-investing the money in something of the still more gilt-edged variety, which also stands a good chance of improving in price.

The Shawinigan new issue is now out, and the Treasury has given consent for holders on this side to subscribe for their proportion, which is one new share for every 10 now held, to be paid for at 115. A distinct novelty is introduced into this issue by the company's giving option certificates whereby those holders who do not wish to take up their shares now, may defer doing so until next April, when they will have to pay 120 if they elect to take up the shares at that time. Last year's dividend was 6½ per cent., and the company is doing well. These American utility companies, by the way, are considerably to the fore at the present time, a jump of about 75 points within less than a fortnight in Cities Services shares having attracted mild interest and attention to the group as a whole.

Brazilian Traction is a disappointing market, the price having given way 1½ points to 61½, notwithstanding the fact that the Rio exchange is well maintained in the neighbourhood of 1s. 0½d. Other Brazilian stocks are mostly firm, so that the decline in Traction is taken to suggest that there may be something of a tap on hand, and that until it is turned off the price of the shares will remain depressed.

The Mexican group is weak. Few suppose that there will be open war between the States and Mexico, but events are moving rather rapidly now, and the situation is obviously very strained. The revolutionaries—or whatever Carranza and his friends style themselves—appear to be respecting private property, as, indeed, they have done hitherto. But it is quite comprehensible that holders of Mexican securities should feel anything but happy at the unexpected and uncomfortable turn which affairs have taken.

Anglo-Argentine Trams keep steady, despite the directors' decision to postpone payment of the interim dividend on the second preference shares. This is rendered advisable by reason of the increased expenditure due to the abnormal cost of fuel.

The Marconi report came out at the end of last week. The directors have decided to repeat last year's dividend payment of 10 per cent., but they hold out hopes of a substantial bonus at the end of the year. The immediate effect was a fall in the price of the shares to 23. Profit-takers hurried in to scalp their gains while they could. Directly this bout of selling was over, a sharp rally occurred, the price being taken up to 23, so that on the week there is a net improvement of 3s. 9d. The other shares of the Marconi group are also higher, with the exception of Marconi, which, after touching £2, eased off to 37s. 6d.

The Home Railway market has fallen upon quiet days, though to-day's rise in Consols helped prices considerably. Metropolitan fell 1. Underground income shares ½, and others in this division were similarly dull. Central London stocks are still wanted, and the prices well maintained, the assented ordinary again exhibiting an improvement.

This remark applies also to the prior-charge issues of the various lines, steam and electric both. The best-class debentures have been forced up to a level at which the return is barely 4½ per cent. on the money, or ½ per cent. less than the Government is now offering on Exchequer Bonds. The inference obviously is that there are people looking for such a drop in the value of money after the war as shall justify them in taking a lower rate nowadays upon an irredeemable security, than they can get from a Government bond terminable within a few years. As to which, of course, he who lives longest will see most—or his children will.

Babcock & Wilcox have risen 5s. to 3. Castner-Kellners are ½ higher, following upon their rise of 3/16 last week, at 34. British Aluminium lost sixpence, but British Westinghouse preference are 1s. 6d. better, while other things in the manufacturing list are decidedly hard in tone. India-Rubber shares are 15s. up, and Electric Constructions are 9d. to the good. General Electric preference hardened to 94.

The Telegraph market pursues the even tenour of its rising way. There was a slight reaction towards the end of last week, but what little stock came to market was avidly snapped up, and every change which we record is again in the upward direction. Eastern ordinary has gained 3 points, and Eastern Extensions at 14½ are 7s. 6d. higher. Globe ordinary and preference have moved with the rest of the market; and were it not for the difficulty of supplying the requirements of the buyers, there would be a free and good market in the whole list.

This week dealings have started in the new stocks of the British Electric Traction Co. The common is quoted at 37-39, and the 6 per cent. preference stock at 79-80. The latter looks quite a fair stock of its kind, and the yield at the present price comes to 7½ per cent. on the money, so that there would appear to be scope for appreciation. The debenture stocks, of course, remain the same as before, and the quotation for the Firsts is 81, while that for the Seconds is about 10 points lower.

The rubber share market is slightly better than it has been lately. For this the issue of another batch of excellent reports and good dividends is responsible, because the price of the raw material continues to afford little stimulus to purchases. Further weakness has occurred in copper shares in consequence of the dulness in the metal; but the armament group is sympathetically strong with most of the shares in the iron and steel market.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING MAY, 1916.

IN comparison with the returns for the preceding month, the May figures for electrical exports and imports show markedly increased values in nearly all sections of the table.

The exports reached the respectable total of £499,384, as compared with £353,266 in April; the imports were valued at £302,583, as against £256,999 in the previous month; while the re-exports were considerably in advance of the April figures.

The increased value of the exports was due principally to improved business in the machinery and cable sections, cable exports showing an increase of £57,000, and machinery £46,000; are lamp parts and carbons were the only sections to show a reduction as compared with April.

The imports reached the highest recorded total this year, the machinery, cable, goods, and telephonic and telegraphic sections showing increased values.

The re-exports reached £20,889, as compared with £15,391 for the previous month.

India, New South Wales, Russia, and France* were our best customers during the month, and to Victoria, Argentina, New Zealand, and Holland also we supplied considerable quantities of material.

The total value of electrical material received from the United States of America during the month showed an advance of £13,000 on the April figures.

Registered Exports of British and Irish Electrical Goods from the United Kingdom.

Destination of exports and country consigning imports.	Electric goods and appliances.	Wires and cables, rubber and other insulations.	Electric lighting accessories.	Electric glow lamps.	Electric arc lamps and lamp parts.	Electric meters and instruments.	Electric machinery.	Electrically-driven machinery.	Batteries and accumulators.	Carbons.	Telephonic cable and apparatus.	Telegraphic cable and apparatus.	Total.

TOTAL EXPORTS: £499,384

TOTAL RE-EXPORTS: £20,889

TOTAL IMPORTS: £302,583

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

CONTROL GEAR FOR DIRECT-CURRENT MOTORS.

By E. F. BUTLER.

(Concluded from page 699.)

In larger sizes, and for heavier work, the contacts on the slate should be reinforced by carbon rollers, to take any arc away from the contacts. A skate on the arm makes contact with these rollers when passing from one segment to another. Such an arm will usually have a square hole in which contact-blocks can slide freely. Adjustment of pressure is effected by means of a suitable spring acting on a short arm pressing on the top of the contact. It is best to have two contact blocks, as they can bed independently, and the block which first makes contact should be of carbon.

Flexible pigtails are often fitted to shunt the current from the tension spring. The fitting of these is often a source of weakness. The usual arrangement is to drill a hole in the carbon, push in a short piece of brass rod, to which the pigtail is fixed, and hope for the best. Owing to unequal expansion, these pieces of brass often work loose and fail to make good contact. Furthermore, when renewing the carbons it is easy to split them in attempting to fit the pigtails. A way of getting over the difficulty is shown in Fig. 3. A

FIG. 3.

hole is drilled through the carbon, and another at right angles into this hole. A piece of round brass is tapped out and inserted. A set-screw is fitted to this, and two nuts at the top serve to hold the pigtail.

In the full-on position a laminated contact on the side of the arm presses against brass pillars on the slate and takes the full-load current. The pressure of this is usually taken against the pull of the no-volt coil, which in a good many cases is not sufficient to make a firm and reliable contact.

The next thing to consider is the resistance. Resistance elements in the form of wire or strip are most common. The construction is usually carried out in such a way that the maximum length of wire is got into as small a space as possible, and the usual form is a spiral, either with or without a core.

When no core is used, it is a good plan to provide separators or distance pieces to prevent the possibility of the coils touching or short-circuiting one another, either from vibration or sagging. This separator may take the form of a substantial sheet of uralite, having holes drilled and spaced correctly, which is slipped over the coils before they are connected up.

Coils wound on a core or former should have plenty of room to expand without buckling; if made of hygroscopic material, earthenware ends should be fitted. It would be an advantage if any coil could be removed independently for renewal or repair. In any case, all the side covers should be easily removable for inspection, and in small and medium sizes the resistances might well be arranged so that they could be removed bodily with the slate.

In order to keep down the sizes and numbers of resistance coils as much as possible, makers sometimes connect a number of coils in parallel to get the required resistance, and while this is often satisfactory, it means extra joints; furthermore, the wires, having a much smaller cross-sectional area, very easily get eaten through in damp locations.

The latest development of resistances in the form of coils

is the enamel embedded type, and it seems very likely that these will be very largely used in the future. When properly made they are electrically and mechanically sound. In one form, largely used for Admiralty and dockyard work, a steel tube is covered with a coating of enamel, which will not soften at any ordinary working temperature. The resistance wire is wound over this, and to hold the wire in position a current is passed through it of sufficient strength to soften the enamel: the turns of wire sink in, and are held in place. A second coating of enamel is applied, which serves to preserve the wire from atmospheric influence, and also prevents any surface leakage. Previously to being dipped, suitable tappings are connected in where necessary, and the whole forms a robust self-contained unit. It is impossible to repair a burnt-out coil, but, on the other hand, burnt-out coils are very rare.

The metals available for resistances are somewhat few; iron is very much used, and also the nickel alloys. The latter are characterised by a very low temperature coefficient, which makes them of special value for use in regulating resistances, where it is desirable that a resistance, when once adjusted, shall keep its value permanently.

The most common alloys are nickelin, constantin, managanin, and eureka. Iron is most useful in the form of grids, and when so used, the following points may be noted:—

The formation of rust should be prevented as much as possible, the use of aluminium paint being the most common way.

Only mica insulation should be used; fibre is not uncommon, but very quickly perishes. Grids should be placed vertically, to facilitate cooling. When used on cranes, it will often be found preferable to bolt them up to the roof of the cab. If placed on the floor, which appears to be the usual method, the covers will get dented in, and short-circuit the grids, or there will be trouble due to irregular notching, which will quite likely be found due to the presence of spanners, screw-drivers, and miscellaneous ironmongery in general.

A three-point suspension is useful to prevent sagging, and it may be noted that stamped grids are much stronger and less liable to break than cast ones. An offspring from the grid is the mat or sieve resistance, which, in its usual form, consists of a woven asbestos mat, with the resistance wire threaded backwards and forwards through it. These mats are cheap, and a very fine grading of resistance can be obtained by their use.

The weakest point is in the connection; the mats are usually of very fine wire, and often connected several in parallel, and it seems difficult to make a sound connection to carry the current. This type of resistance has not been found satisfactory for controllers or regulators where it is necessary to keep the resistance continuously in circuit. When so used, the asbestos perishes and the wires short-circuit; furthermore, it is necessary to renew the whole resistance when one portion gives out, as the mats fall to pieces when taking them apart.

Materials of which the resistance decreases when heated up by the passage of the current are not in very general use. Messrs. Reyrolles, Ltd., are probably the leading makers of this type of control gear, and use this class of material to advantage. Its reliability is shown by at least one installation with which the author is familiar. The firm in question is one of the largest colour and poster printers. The starters have been in daily use since 1903, and have given no trouble. The makers of these starters also fit a magnetic blow-out to break the current at the first contact, as did the B.T.H. some years ago, and this seems such a simple and efficacious device that it is a wonder that it is not more widely adopted.

A few more details concerning the ordinary type of starter may be given. The buffer on which the arm rests when in the off position usually consists of a spindle passing through the slate and fixed by a nut, the other end carrying a disk of poor-quality rubber. The most common troubles with this arrangement are the breaking-up of the rubber and the working loose of the spindle in the slate. The usual result in either case is that the arm hits the end of the slot in the cover when the motor is stopped, and gets smashed, or else hits the spindle and knocks a piece out of the slate. It is good practice to use two buffers placed

close together, so that the arm hits them both. Alternatively, a cast socket with lugs, bolted through the slate and using a spring in place of a rubber buffer, can be used. There is a point with regard to the starter arm which is worthy of notice, and that is the design of the end through which the spindle passes. A very common design is shown in fig. 4 at A. This has the fault that a very small

FIG. 4.

amount of wear is sufficient to throw the top end of the arm away from the slate. This often happens to such an extent as to cause sparking and heating of the contacts. A better arrangement is shown at B; the greater length of the spindle, together with the much larger facing and the addition of a shoulder, makes a much more mechanical job, and has a longer life.

The greater part of the foregoing remarks applies, to a very large extent, to starters and regulators used for series motors. In the case of small motors, regulators are often of the plain type, with no automatic features. Of course, this affords no protection to the motor in the event of the failure of the supply, and so it is usual to incorporate some more or less protective devices. In one form, ratchet teeth are cut round the bottom of the starter-arm, and the keeper of the no-volt release is made sufficiently long to engage with them, the end being turned up for the purpose. This arrangement suffers from the defect that the tension of the spring varies with the position of the arm; it is often too strong to hold the arm on the last contacts, and too weak to release when on the first contacts, the trouble being aggravated when the teeth begin to wear. In the most suitable form two arms are used, one acting as a switch, the other as the regulator, the resistance being cut out from right to left. The insulated handle is fixed to the regulator arm, and on moving this hand over, the switch arm is carried on to a contact button, which passes current round the motor, energising a coil which acts both as a no-volt and overload coil, and holds the switch arm on. The backward movement of the regulator arm cuts out the resistances, and so increases the speed of the motor. A somewhat similar arrangement can be used for varying the speed of a shunt motor by altering the strength of the field. In this case the insulated handle is fixed to the regulator arm. When this arm is moved, it pushes in front of it the arm which cuts out the armature resistance and runs the motor up to speed, the shunt resistance being short-circuited until the last stop is reached. The regulator arm can then be moved backwards, and the resistance inserted in the field in so doing. When the current is interrupted, both arms are returned to the off position and the shunt resistance is short-circuited.

A very common fault, and one which has done much to prejudice electric driving, is the abominable and inexcusable practice of having the starter and shunt regulator independent of each other, thus making it possible to start up the motor with a weakened field. In printing works especially, attempts to "inch" under such conditions have been, and still are, a source of trouble. Whenever shunt regulation is desired, it should be made impossible to start up except on a full field. This can be accomplished by means of the double-arm starter just described; or, if a separate regulator is desired, as in the case of an existing starter, or of some type of push-button control, then an electrically-interlocked regulator should be provided. A simple and reliable interlock (Igranic Co.) is shown in fig. 5. It will be seen that the essential part consists of a small coil *c*, similar to a no-volt coil, connected in series

with the shunt fields, having a soft-iron keeper *k*, and a pair of contacts, *A B*.

Assuming that the motor were stopped by simply opening the double-pole switch, then the spring *s* would pull the keeper away from the iron cheeks, and so short-circuit the shunt resistance. The spring is strong enough to prevent the keeper from being attracted, but not strong enough to pull it away once it is attracted. When the motor is started, or re-started, the shunt resistance remains short-circuited until the regulator handle is moved to the "all out" position, pushes the keeper from the face of the magnet, and so unshort-circuits the shunt resistance, and enables it to be inserted in the field circuit.

Although speed regulation by means of resistance inserted in the armature circuit is not much used, as it is wasteful, and the speed varies with the load, it is sometimes convenient. Shunt regulation can be used in addition if required. The connections are as shown in the diagram, fig. 6.

One modification of the ordinary type of starter may be mentioned in passing, and that is the retarded or slow-motion type, which ensures that the resistance is cut out steadily and not too quickly.

The simplest way is to have a starter-arm with teeth cut round the lower end. A small worm-wheel is mounted underneath, free to rock through a short arc, and having a spindle with a crank at one end. The crank is pulled down until the worm engages with the teeth on the starter-arm, and is held down whilst being revolved. When the resistance is all cut out, the crank is released and the worm drops out of gear.

The troubles inseparable from the use of the ordinary type of starter—namely, flashing on the contacts, making

FIG. 5.

and breaking the circuit on the first stud, and the uncertain rate of cutting out the resistance—led makers to try and devise a starter which, without having any great complications, would get over these defects. Some makers are still trying to design a fitting or find out something which will not cost much (this is important), but when added to the ordinary starter will give it interlocking, non-arcing features, automatic acceleration, and dynamic braking. They usually give up the idea, or end by evolving a totally different class of apparatus.

The first step towards the evolution of a better type of control gear followed upon the realisation of the fact that the proper place to make and break a circuit carrying current is at a switch. A starter is not intended to do so, and will not do so. When the starting current of a motor, together with the self-induction of the fields, is to be broken, suitable arrangements must be made to deal with it, namely, auxiliary carbon contacts, operating in an arc-resisting chamber, a magnetic blow-out—in fact, all the essentials of a circuit-breaker, excepting that to avoid excessive pressure rises the break may be arranged to take place more slowly. A piece of apparatus which fills these requirements, and has stood the test of experience, may be described.

Briefly, this type of starter comprises a double-pole breaker which takes the place of switch and fuses, a no-volt and overload release, and a device for preventing too rapid

acceleration. The starter itself looks very much like an ordinary one, but has the addition of a concentric ring on its base.

A contact on the starter-arm consists of a wheel, part of the periphery being an insulator and part metal, which engages with this ring.

On moving the handle forward, this wheel rotates until the brass portion makes contact with the ring, completes the "pull-in" circuit, and closes the double-pole breaker, which consists of two clapper switches. Moving the handle further forward puts an economy resistance in series with the holding-up coils of these switches. If the handle be moved

FIG. 6.

over too fast, the overload operates and opens the circuit of the clapper switches, and as the economy resistances are still in circuit, there is not enough current passing to pull them in again and so the handle must be put back to the "off" position.

If the handle be moved backwards while starting up, the roller turns round slightly and the insulating portion touches the brass quadrant; again, the clapper switches open and the arm must be moved right "off."

This type of apparatus also has the advantage that push-buttons can be connected up in series and operate by breaking the "hold-up" circuit. This makes it of particular value for such purposes as printing works and saw-mills.

Having dealt with a number of types of starters largely from the standpoint of design, this article may be fittingly concluded by a few words, more in sorrow than in anger, to the user and the wiring contractor.

The fixing-up of control gear is often done in a slipshod and unworkmanlike manner, probably more often than not. It is a far too common sight to see the double-pole switch and fuses, starter, and sometimes speed regulator and ammeter, fixed to any convenient part of the wall, which may have to be plugged in four places for each item, with cables festooned from one fitting to another, possibly held together at intervals with tape. Sometimes battens are fixed, and the control gear is screwed on to them, attempts at earthing being made by trying to tighten a stranded cable under a countersunk screwhead without washers. It is much more satisfactory to make a sound job, both mechanically and electrically, by mounting the whole of the control gear on steel bars or channels. These should be spaced to take the widest fitting, usually the starter; the other portions can be mounted on ironwork carried across between the uprights, and preferably riveted to them. The whole can be fixed to the wall by means of bolts cemented in, or run in, with lead. To facilitate subsequent repairs, it is advisable to crank the ends of the uprights, or to pack them out from the wall, so that it is possible to work behind the panel.

IRON CONDUCTORS FOR HOUSE WIRING.

A CONTRIBUTOR to the *Elektrotechnische Zeitschrift*, obviously desirous of making a virtue of necessity, has drawn up what is probably the best case possible for iron as a house-wiring material. The author states that after overcoming his initial natural prejudice against iron wiring, he realised speedily its numerous advantages, and is now prepared to recommend its use after, as well as during, the war (!). His premises and conclusions are certainly worth consideration, since the exhaustion of the world's copper supplies is due at a much earlier date than the exhaustion of its coalfields. From the notes and examples given below, it will be clear that iron as a house-wiring material is a much more feasible proposition than the use of that metal for transmission and distribution cables and for the windings of electrical machinery.

When there was no more efficient filament lamp than the carbon type, and when electric lighting was a luxury accessible only to the rich, so that the problem was to supply large installations of inefficient lamps, the use of copper as a wiring material was practically essential, and relatively enormous sections of even that good conductor were frequently required. Now, however, the use of tungsten lamps is universal, and there are thousands of small lighting installations having only a few metal-filament lamps supplied through copper wiring, which is rarely worked at anywhere near the permissible voltage drop. For example, the I.E.E. rules specify that the minimum cross-section of any house-wiring conductor (except fittings wires), must be not less than that of an 18 s.w.g. conductor. Such a conductor, rubber insulated, may be worked at 7.2 amperes so far as concerns heating. Taking an average lighting load of 350 watts for a suburban villa, this corresponds to 1.75 amperes at 200 volts, and assuming the whole load to be concentrated at the end of a single pair of leads (which it is not), the length of run might be about 105 yards for a pressure drop of 5 volts (2 per cent. plus 1 volt, as allowed by I.E.E. Rule 40). In other words, the smallest permissible size of copper conductor is unnecessarily large, both from the standpoint of conductivity and temperature rise, in such an installation, and there is a *prima facie* case for a wiring material of lower conductivity.

The permissible voltage drop in house lighting installations being 2 per cent., plus a constant allowance of 1 volt (i.e., 3 per cent. total in 100 volts, and 2½ per cent. in 200-volt circuits), the C.P. variation in metal-filament lamps is about 10 per cent., as against 15 per cent. in carbon-filament lamps, and it must be remembered that the actual voltage drop is very rarely the maximum possible, and then only for the lamps at the far end of the circuit; further, the full 10 per cent. change in C.P. will only occur if all intervening lamps be switched on, and then off. Usually only 15 to 30 per cent., and rarely 50 per cent., of the lamps in a private house are in use at any one time, so that the maximum pressure drop is very rarely more than half the possible value, and the variations in pressure are yet smaller. Arguing on these lines, a number of German electricity supply stations which took 1.5 per cent. voltage drop as the basis for designing house-wiring installations prior to the war have decided to allow 5 to 6 per cent. maximum drop in future.

In order to see what can be done with iron wiring on this basis, let us assume conductors of 1½ and 2½ sq. mm. section (approximately Nos. 17 and 15 s.w.g. respectively) supplying, say, five, and ten, 30-watt lamps (in turn) grouped at the end of a single pair of leads. The length of run of these leads, corresponding to 5 per cent. voltage drop at the terminals of the lamps, will give a very fair indication of the utility or otherwise of iron conductors of the above sizes. Taking the specific resistance of iron as 0.143 ohm per metre per sq. mm., the results may be thus tabulated:—

Supply pressure	110 volts.	220 volts.
No. of 30-w. lamps	5	10	5	10
Permissible run	Yd.	Yd.	Yd.	Yd.
(single length)	17 s.w.g. wire	23	11½	92	46
of circuit for	15 s.w.g. wire	38½	19	154	77
5% pressure	Circuit branched:
drop; using iron	17 s.w.g. wire	35	17½	139	69
wires.	15 s.w.g. wire	58	29	232	116

The two lower lines in this table show the probable run permissible in the same cases as before, but assuming the circuit to be branched, as is invariably the case in actual house-wiring. The exact increase in run permitted by this branching depends on the distribution of the lamps, but it is safe to assume that the most distant lamp may be $1\frac{1}{2}$ times as far from the service point as when all the lamps are supposed grouped at the end of two wires.

There are many thousands of small lighting consumers having, say, eight 30-watt lamps, or their equivalent, installed, and it is obvious from the above table that No. 16 s.w.g. iron wiring could be used in such cases without any fear concerning voltage drop, the effective length of the branch circuits in such houses being less (generally much less) than corresponds to the 5 per cent. maximum pressure drop held to be permissible. By using larger iron conductors (say, up to 7/16 s.w.g.), and by using copper or zinc for the heavily loaded portions of more extensive wiring installations, the possibilities of economy in wiring are greatly extended. An immense amount of copper at present used only for mechanical reasons would be saved. Electrolytic troubles at the junction of dissimilar conductors could be avoided by the use of suitable junction-boxes, and the prevention of rusting on the exposed portions of iron wiring at connecting points does not appear to offer insuperable difficulties, so far as concerns ordinary house wiring. German reports concerning the ease of installing iron wiring are not very favourable, but, on the other hand, it is pointed out that practically no skilled labour is available for the work; and, further, that installation would be much facilitated were rubber-insulated wires available, so that the conductors could be drawn into conduit—but rubber is as scarce as copper in Germany! There seems good ground for the belief that German manufacturers will continue to use iron as a substitute for copper in many electrical applications after the war, and it certainly seems that house wiring is not merely one of the least objectionable of these applications, but one which is distinctly worth closer investigation, even by those to whom the copper markets of the world are still open.

A NEW RÖNTGEN RAY TUBE.

At a recent meeting of the Dresden Electrotechnical Association, Prof. F. J. Koch discussed the latest developments in X-ray equipment, and described a new tube construction due to Lilienfeld. According to Koch, the inconstancy of vacuum in a Röntgen tube operating on a high-pressure rectifier may be attributed to sudden fall in the potential of the electrodes, after attaining the potential difference required to break down the initial resistance of the tube, permitting energy stored in the capacity of the starting-transformer windings to set up oscillatory discharges through the tube. The vacuum is also affected by release of occluded gas on the one hand and by consumption of residual gases in the tube on the other hand. The higher the vacuum the "harder" the tube, but once a steady state has been attained, a skilled operator can maintain practically constant "hardness" for a long time by choosing a suitable current strength.

Lilienfeld has discovered that the nature of the discharge is independent of degree of vacuum, up to a certain point, if an incandescent cathode be employed in the vacuum tube. This principle is applied in the Coolidge tube by using a glowing tungsten spiral as cathode; diffuse cathode rays are sent off in all directions, and generate Röntgen rays where they impinge. The efficiency of the tube decreases rapidly with load, so that control of effect is not easy. With a view to overcoming this difficulty, Lilienfeld adds to the ordinary Röntgen ray tube a special ignition tube containing an incandescent cathode in the shape of an ordinary metal lamp filament. The main and ignition tubes may be excited by two transformers working in phase, or a single transformer (T, fig. 1), may be used for both purposes. In fig. 1, G represents the incandescent cathode, K the main cathode, and A the anticathode. A variable high resistance R is shunted between K and A, and adds considerably to the homogeneity of the rays. The cathode G is made incandescent by an auxiliary transformer H, and when T develops the breakdown pressure, ignition current flows between G and K. The latter being tubular, cathode rays pass into the Röntgen tube itself, break down its high cathode resistance, and establish discharge between K and A. As compared with R, the internal resistance of the tube is so small that most of the current passes through it, and only a small part through the high-pressure resistance.

As regards general construction, the anticathode is water-cooled, and since the glass shows no fluorescence (electrons being produced artificially), a fluorescent screen is mounted inside the tube to

indicate its working. It is claimed that this tube gives constant radiation at all loads, that the hardness or penetrating power of the rays can be varied easily and accurately either by altering the ignition current or by varying the setting of R, and the hardest or softest rays can be obtained at a moment's notice (irrespective of previous conditions) and maintained indefinitely in greater intensity than is possible with other tubes. The quantity of rays varies directly with the current strength, and the radiation is relatively homogeneous. Since no reflected cathode rays fall on the glass, the latter does not become hot in working; also no guard screen is necessary on account of Röntgen-rays from the glass. Sharp negatives are obtained; and the life of the tube is practically equal to that of an

FIG. 1.

ordinary glow lamp (so long as the anticathode is not prematurely damaged by overload), i.e., the life is determined by the incandescent cathode instead of by consumption of residual gas by the cathode rays. The new tube is made with as high a vacuum as possible.

A valve-tube with incandescent cathode is claimed to give excellent results, and to render unnecessary rectification of the high-pressure transformer current. In order to keep the field stress in the spark transformer approximately symmetrical, Koch places a "directional resistance" (porcelain-sheathed aluminium rod in electrolyte contained by an iron vessel), in parallel with the transformer primary.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

NETHERLANDS.—In virtue of a Ministerial Resolution dated April 27th, iron moulds used for the construction of concrete ducts for electric cables are classed as machinery in the Dutch Customs Tariff, and will be admitted free of import duty.

MEXICO.—The Board of Trade have received information to the effect that, in virtue of a Mexican Decree published on May 24th, the fee to be charged by Mexican Consular officers for the certification of invoices of goods shipped to Mexico has been fixed at 3 per cent. of the value of the goods covered by the invoice. It is understood that this new rate was to come into force on June 15th as regards shipments from the United States or Cuba, and on July 1st as regards shipments from other countries.

SOUTH AFRICA.—According to a decision, dated April 17th, by the Commissioner of Customs, incandescent bulbs for pocket electric torches are dutiable under No. 114 (b) of the Union Tariff at the rate of 3 per cent. under the General Tariff, with a rebate of 3 per cent. on goods manufactured in the United Kingdom or reciprocating British Colonies.

ITALY.—A Decree, dated May 21st, has been issued by the Lieutenant-General authorising the competent Italian Ministries to prohibit, during the period of the war, the importation into Italy of bulky goods and articles of luxury. The Decree came into force on June 4th.

UNITED STATES—HAYTI.—Ratifications were exchanged on May 3rd of a Treaty which was signed in September last between the United States and Hayti, having for its objects, *inter alia*, the remedying of the present condition of the revenues and finances of Hayti and the carrying out of plans for its economic development and prosperity. The Treaty is to remain in force for 10 years from May 3rd, 1916. It provides for the appointment, upon nomination by the President of the United States, of a General Receiver to collect, receive, and apply all Customs duties on imports and exports; and, further, that the Customs duties shall not be modified in a manner to reduce the revenues therefrom without a previous agreement with the President of the United States.

3,380. ALTERNATING-CURRENT ELECTROMAGNETS. Waygood-Otis, Ltd. (Elevator Co.). March 7th, 1916. Patent No. 100,519.
3,533. MULTIPLE-CONTACT MICROPHONES. Signal-Ges. January 19th, 1916. Patent No. 100,156.
3,658. STARTING MECHANISM FOR INTERNAL-COMBUSTION ENGINES. British Westinghouse Electric & Manufacturing Co. April 6th, 1915. Patent No. 100,246.
3,659. STARTING MECHANISMS FOR INTERNAL-COMBUSTION ENGINES. British Westinghouse Electric & Manufacturing Co. March 24th, 1915. Patent No. 100,197.
4,109. JOINT FOR AN ELECTRIC CABLE. A. E. TANNER & E. A. CLAREM. March 26th, 1916. (Addition to 6,980/15). Patent No. 100,511.

LIST OF BRITISH PATENTS EXPIRING DURING 1916.

(Continued from page 720.)

- 9,488. April 24th, 1902. A. W. BOUTELL. Electric lamps.
9,803. April 28th, 1902. M. WILDERMANN. Electrolysis.
10,161. May 2nd, 1902. O. J. LODGE & A. MUIRHEAD. Syntonic telegraph.
10,204. May 3rd, 1902. J. HARGREAVES, J. W. STUBBS & J. KEARS. Electrolysis.
10,452. May 6th, 1902. J. E. EVANS-JACKSON. Wireless telegraphy.
11,085. May 14th, 1902. STOTHER & PITT AND E. EVANS. Electric crane.
11,500. May 20th, 1902. G. C. MARKS. Electric switches.
11,698. May 22nd, 1902. W. D. KILROY. Time indicators for stokers.
12,159. May 28th, 1902. C. D. ABEL. Electric lamps.
12,554. June 2nd, 1902. SIEMENS BROS. & CO. Telephone systems.
12,706. June 3rd, 1902. C. H. EHRET. Electric telegraphs.
13,287. June 11th, 1902. C. H. LAKE. Signals, marine; locating sound.
13,521. June 14th, 1902. SIR O. J. LODGE, A. MUIRHEAD & E. E. ROBINS. Wireless telegraphy.
14,133. June 21st, 1902. H. BAKER & CASTNER-KELLNER. Alkali Co. Electrodes; couplings.
14,135. June 21st, 1902. H. BAKER & A. T. SMITH AND CASTNER-KELLNER. Alkali Co. Electrolysis.
14,136. June 21st, 1902. W. A. GORMAN & A. GRAHAM. Telephones, divers, &c.
14,228. June 23rd, 1902. W. SCHUSTER. Clutches.
14,269. June 24th, 1902. E. W. SMITH. Controlling traffic on railways.
14,286. June 24th, 1902. T. A. HEARSON. Electric vehicles.
14,308. June 24th, 1902. J. P. O'DONNELL & E. C. IRVING. Railway signals.
14,373. June 25th, 1902. LANCASHIRE DYNAMO & MOTOR Co. and K. McLEOD. Electric distribution.
14,430. June 25th, 1902. F. H. W. HIGGINS. Telegraphs; gearing.
14,732. July 2nd, 1902. T. B. MURRAY & N. O. FULTON. Magneto-electric machines; dynamos.
14,774. July 2nd, 1902. VICKERS, SON & MAXIM. A. D. WILLIAMSON & Co. L. Sumpster. Electric motors; planing machines, &c.
14,790. July 2nd, 1902. JOHNSON-LUNDSELL Electric Traction Co. Dynamo-electric machines.
14,851. July 3rd, 1902. L. LOHNER & F. FORTSCHE. Dynamos and motor controlling; systems of electric lighting.
15,095. July 7th, 1902. F. CONRAD. Electric testing.
16,034. July 18th, 1902. G. S. BAKER. Toothed gearing.
16,041. July 18th, 1902. A. C. REYNOLDS. Electric resistances and heaters.
16,495. July 25th, 1902. J. F. BOUSFIELD. Welding chain links.
16,539. July 25th, 1902. M. I. PUPIN. Telephone and telegraph cables and conductors.
16,923. July 30th, 1902. H. H. LAKE. Incandescent electric lamps; melting glass.
17,406. August 7th, 1902. A. BIONDEL. Electric lamps.
17,703. August 12th, 1902. R. A. FESSENDEN. Wireless signalling, &c.
17,705. August 12th, 1902. R. A. FESSENDEN. Wireless signalling.
17,706. August 12th, 1902. R. A. FESSENDEN. Wireless signalling.
17,708. August 12th, 1902. R. A. FESSENDEN. Wireless signalling.
18,328. August 20th, 1902. BRITISH THOMSON-HOUSTON Co. Electric switches; motors; controlling.
18,747. August 26th, 1902. R. HADDAN. Telephone systems.
18,766. August 26th, 1902. H. BREMER. Electric lamps.
18,817. August 27th, 1902. BRITISH THOMSON-HOUSTON Co. Electric motors.
18,821. August 27th, 1902. BRITISH THOMSON-HOUSTON Co. Electric motors.

(To be concluded.)

A Fire Without a Flame.—The strangest freak in the history of the Dyston fire department occurred recently, the Paris Store. An electric iron left on a table burned its way through the table, through the flooring, through a 10-in. joist, supported the floor, and was dangling by its wires from the ceiling of the store room below when discovered. The fire department investigated, but did not throw any water, for the iron had fired the building. The only repairs necessary will be to reinforce the burned joist and close the hole in the ceiling and floor.

Electrical World.
